Dublin.—It is stated that Lord De Grey has fixed his departure for to-morrow (Sunday). His Excellency will stay a few days in London, and then proceed to Germany.—It is confidently stated that Archdeacon Pakenham, brother-in-law of the Duke of Wellington, will be the new Bishop of Meath.—It is understood that the Attorney-General has been offered, and has refused, the vacant seat on the bench, and that Mr. Jackson will accept of it. It is also stated that Mr. T. B. C. Smith, Queen's Counsel, will be the new Solicitor-General, if matters can he so arranged as to obtain for him a seat in the House of Commons for the University of Dublin. The continued indisposition of Mr. Justice Torrens, arising out of a severe attack of gout, renders it probable that he will retire from the bench before next term, unless his health be considerably restored before that period. The illness of the Right Rev. Dr. Sandes, bishop of Cashel, has assumed so serious an aspect as to cause great apprehension for his recovery.—The Jury, which was empanelled upon the 22d of June last for the valuation of property required for the Dublin and Drogheda railway, terminated their labours on Saturday. It appears that the gross claims furnished to the company for the land required amounted to 48,000*l.*, and the gross amount awarded by the jury for the fee of the land is 9,448*l.* 0*s.* 8*d.*, and the damages 2,307*l.* 7*s.* 1*d.*, which latter sum includes the amount awarded not only for injury done to the premises taken, but also for the injury and deterioration done to the property of several parties adjoining the railway, making in the total a sum of 11,755*l.* 7*s.* 9*d.*—The Lord Mayor has arrived in Dublin from London; he was present at the Repeal meeting on Wednesday, which presented no features of particular interest.—The Coroner's Inquest on Mr. Byrne, alluded to in our last, is not yet concluded; numerous witnesses have been examined, and the affair continues to excite considerable interest.—The papers give favourable reports of the prospects of harvest.

Tipperary.—The two men, Byrne and Quilty, capitally convicted at the Special Commission, the former for the murder of Mr. Hall, the latter for that of Laffan, were executed in front of Clonmel Jail on Saturday, Quilty denying his guilt to the last. The Roman Catholic priesthood in the baronies of Ormond, Tipperary, joined in a memorial on behalf of this man, averring their belief of his entire innocence. To this appeal the Lord Lieutenant replied, that he had read with the deepest attention the statements in that memorial to invalidate the evidence upon which the prisoner was found guilty, and he regretted to be obliged to add, that he found nothing in their statements to authorise him in setting aside the verdict of the jury which tried the case, and which had such ample opportunities of weighing the value of the testimony on both sides.

Mayo.—It appears from a return just published, that the Irish Government have already expended the sum of 1,173*l.* towards the relief of the distressed population in Dr. M'Hale's arch-diocess of Tuam, in grants varying from 5*l.* to 100*l.*, according to the exigency of the case. A correspondence has taken place between Lord Eliot and the Archbishop respecting the case of a man and his family at Tuam, who were stated to have been for five days without food. The archbishop in his letter expresses his conviction in the truth of this statement, and enters into long details of the general distress of his diocese. He concludes by saying, "when I seriously consider all the delays, and inquiries, and correspondence, and explanations, and impracticable conditions that are annexed to the stingy measure of relief, resembling the fabled food of Tantalus, by snatching from the grasp the fugitive morsel by which hope and hunger are excited—when I consider how the lives of a fine people are trifled with, and their misery mocked, I must confess I have never read, in the annals of civilised governments, anything more painful or discreditable than that men should be perishing of want—as some have already perished—near the very centre of that empire whose strength they are faithfully sustaining, while its vast resources are wastefully expended on a host of overgrown pensioners at home, as well as on every extravagant enterprise and speculation over every region of the globe."

SCOTLAND.

Edinburgh.—At the meeting of the United Associate Presbytery, on Tuesday, the 5th inst., a letter was read from the Moderator of the United Associate Synod, enclosing a copy of a communication from the Rev. Dr. Welsh, Moderator of the General Assembly of the Church of Scotland, requesting the co-operation of the Associate Synod in observing the proposed fast. After discussing the subject at considerable length, the Presbytery came to the unanimous resolution that, as the chief reason assigned by the General Assembly as a ground for fasting, viz., the sins and difficulties of the Established Church of Scotland, is one in which Dissenters cannot sympathise, the Presbytery decline the proposed co-operation. All the other dissenting bodies in Scotland have come to a similar resolution.

Comrie.—On the 10th inst., a shock of an earthquake was sensibly felt here. The weather at the time of the shock was calm, but immediately after it the wind began to blow from the west, a good deal of rain having fallen during the preceding night and morning. The local papers mention that more wind and rain preceded this shock than any which has been felt since the 10th of Sept. 1841, and that the present shock was more sensibly felt than any since that time.

Glasgow.—The papers mention that Madame Petrisci, or Harris, better known as the "Lady Thief," was dismissed from prison on Saturday last, after having completed her period of 18 months' imprisonment, to which she had been sentenced by the Circuit Court, for committing thefts in three of the hotels in this city, which were reported in our paper at the time. During the period of her imprisonment, she was principally employed in light needlework. She left the jail handsomely dressed, and no one who observed her could suppose that she had only an instant before been liberated from the felons' ward. She left the city the same day; and has kept her secret so well, that as little of her real history is known now as on the day of her apprehension.

Perth.—For the last fortnight the salmon fishery has been more successful than for many years past. This fortune, however, is not general to all the stations in the Tay, but is confined entirely to those fishings between Perth and the top of Mugdrum Island—a length of line hardly exceeding seven miles. Below Mugdrum Island the season as yet has proved but indifferent, and above the bridge the quantity caught has not been very great. The value of fish caught last week is reported to be between 2,000*l.* and 3,000*l.* Salmon, grilse, and trout, were proclaimed by the town-crier as selling at 7*d.*, 5*d.*, and 4*d.* a pound respectively, and are still at these prices.

Miscellaneous.

The New Coinage.—It being publicly known that the Bank of England was issuing the new silver coinage, the demand at the Bullion-office, on Friday and Saturday, by tradespeople, was greater than has been for many years, which proves the great scarcity there is throughout the metropolis of small coinage. In consequence of the dividends having been in course of payment since the 7th instant, the run upon the Bank for silver has been very great, and, notwithstanding that 300,000*l.* has been struck at the Royal Mint of half-crowns, shillings, and sixpences, since the issuing of the Royal proclamation of the 3d of June on the light gold coinage, there is yet a very short supply of silver currency, as a very considerable quantity has been sent into the country to the branch banks in the manufacturing and agricultural districts, where it is greatly required at the present moment as the harvest approaches. The officers of the Mint are daily at work in providing the Bank of England as quickly as they can with silver specie, the quantity of new sovereigns and half-sovereigns being sufficient for the public demand. A very large number of guineas, of the reigns of George I., II., III., and other perfect coins that had not been circulated for above a century and a half, have found their way into the Bank since the light gold panic from various parts of the United Kingdom. The demand for silver for the Continent and India has greatly decreased the stock of bullion at the Mint, as the exports during the last month far exceed those of former years. The amounts paid by Government to the East India Company, on account of the war in China and Affghanistan, have had a tendency to create a scarcity both of gold and silver. It appears from an official return that the following sums have been paid since the last two years:—1840, October 27, 150,000*l.*; 1841, July 2, 100,000*l.*; 1842, February 9, 23,442*l.*—Total, 573,142*l.*; besides the remittance of June last of upwards of 50,000*l.*

Antiquities.—The Museum of Narbonne has lately been enriched by some interesting discoveries of antiquities made near that place by the Archæological Commission. Among them are numerous funereal urns and lamps of marble, glass, lead, stone, and terracotta; phials for perfumes, ornamented with various and most curious emblems, and other designs, Roman, Egyptian, and Gallic. On some the glazing remains perfect, although it is thought they must have lain buried at least eighteen centuries. The names of many of the artists who made them are still legible upon the urns—some having Roman, and others Gallic terminations. Among the other objects are some amphoræ; an *ex voto* representing the finger of grace of the Vestal Virgins; fibulæ, or clasps; buttons; iron keys; dice; needles; pins for the hair; metal mirrors; fragments of musical instruments, and a probe for sounding wounds. Near several of the tombs which contained these relics were found a great many oyster-shells, the fish having, it is supposed, been eaten at the funeral feasts. To these are to be added an antique head of the Indian Bacchus, in bronze, of Roman workmanship, in perfect preservation; a Janus Bifrons; an amulet of lead of the god Fascinus, similar to those attached to children to preserve them from the evil eye; a small statue of Minerva with the ægis; a bronze Mercury, in very fine style; a head of Trajan, and some unknown busts.

Natural History.—We are informed by a correspondent that a gentleman in North Wales has a hen of extraordinary instinct:—During her state of incubation, she took charge of two large bantam chickens, which a hen had just forsaken; and, what is still more curious, she now continues to protect and nestle them under her wings, with a brood of 17 chickens. About a year ago, in the farm of the same gentleman, a large cock of the Friesland kind, which was of a blood-red colour for three years, suddenly changed its plumage into a milk white.

Spurious Ancient Coins.—The "Times" states that it "succeeded some time since in stopping the career of a forger of Greek, Roman, and Saxon coins, who by his ability in imitating the scarce types of these series deceived some incautious collectors, and robbed them of considerable sums of money. Another adventurer is now supplying the market with counterfeit coins, for which dies have actually been engraved, and the skill of some able artist engaged. Among these may be pointed out as clever forgeries, and likely to deceive even experienced numismatists, pennies of Stephen, penny of Edward VI., shillings of Philip and Mary, and the ryal of Queen Mary—the last a gold piece of great beauty."

Bee Swarming.—The following account is published in the "Elgin Courant." "During the present forcing weather it may not be amiss to relate an anecdote just furnished by a respectable individual, who vouches for its truth. An old gentleman in Ayrshire, while standing in his garden, waiting for the casting of a hive, had the misfortune to attract the swarm, as it, rather unexpectedly, came off, and the bees, thick and clustering, settled over his throat, his face, mouth, and nostrils. In a moment after, his eyes were blinded by the clinging buzzing throng. Expecting the infliction of instant agony from a thousand stings, he dreaded to make the slightest movement by voice or limb, and there was no person present. A minute or two passed—the heat was intolerable, and the sensation maddening; at this dire extremity of no less than probable pain and death, reason at length suggested—and the old gentleman cautiously raised his hands to his hat, moved it gently, imperceptibly lifting it a few inches above his head, and then steadied the hat in that position. The queen bee must have approved of this model hive, for the old man began to breathe freely, and in a short time the whole swarm took up their abode in the hat, which he subsequently displayed to his friends in triumph and thankfulness, without having received so much as a single sting."

A Coincidence.—A correspondent of the "Times" has

sent to that paper the following dates, which have excited, it says, some alarm among the credulous :—

1794 Fall of Robespierre.
1
7
9 } To which add 1794 gives 1815.
4
1815 Fall of Napoleon.
1
8
1 } To which add 1815 gives 1830.
5
1830 Fall of Charles X.
1
8
3 } To which add 1830 gives 1842.
0
——
1842 ———— ?

The Earl of Rosse's Telescope.—The following particulars, published by the Morning Papers, give some idea of what will be the magnifying power of this gigantic instrument, which is expected to materially aid astronomical discovery :—"The metal is six feet diameter ; it is five inches and a half thick at the edges, and five inches at the centre ; its weight is about three tons. By grinding and polishing, its thickness will probably be reduced one-tenth or one-eighth of an inch ; it will be formed into a telescope of fifty feet focal length, and will, there is every reason to hope, be actually in use this year. The speculum will have a reflecting surface of 4,071 square inches ; whilst that of the telescope made by Herschel, under the auspices of King George III., had but 1,811."

Law.

VICE-CHANCELLORS' COURTS.—*Young* v. *Lord Waterpark.*—The question in this case arose under the settlement made upon the marriage of Sir Henry Cavendish and Lady Waterpark, dated the 11th of August, 1757, by which a sum of 10,000*l.* was provided to be raised for younger children's portions out of certain real estates, now belonging to the present Lord Waterpark. Sir Henry Cavendish had a power of appointing this sum amongst the younger children, and in default of appointment it was to be equally divided—the shares of sons at 21, and of daughters at 21 or marriage, to be paid them the day after the death of Sir Henry Cavendish. In exercise of this power, he executed three several appointments—viz., 2,000*l.* to Lady Mountnorris, one of his daughters, in 1783 ; a like sum to Lady Kilmaine, another daughter, in 1793, and 3,000*l.* to Frederick Cavendish, a son, in 1801. In addition to these three children, Sir Henry had four other younger children, and in 1803 he attempted, in further exercise of his power, to appoint the remaining 3,000*l.* in favour of his son George Cavendish. Mr. Augustus Cavendish and Lady Musgrave, two of the children of the testator to whom no appointment had been made, having died, this bill was filed by Mr. Young, their administrator, against Lord Waterpark and others, to compel the payment of their shares of the 10,000*l.*, and the question was whether the power of appointment in the settlement would have enabled Sir H. Cavendish to appoint the 2,000*l.* to one of the remaining four children, or whether the fund was distributable amongst them as in default of appointment. The Vice-Chancellor said he thought it a very clear point, as he understood the law upon the subject. The first three appointments made were certainly good, and then the 3,000*l.* became liable to be appointed amongst the other children, and in default of appointment to go equally between them. The rule of law was this, that where certain objects of a power were named, the appointment must include all the objects of that power ; therefore the last appointment was bad, and the plaintiff, who represented two of those objects to whom nothing was given, was entitled to have two-sevenths of the 3,000*l.*, part of the principal sum of 10,000*l.*, raised upon the property and paid to him, with interest at 5*l.* per cent. from the death of the testator, the 4th of Aug., 1804.

Baron de Bode v. *the Attorney-General.*—This case, the particulars of which have been often before the public, came on for argument, upon a demurrer, put in by the Attorney-General to a bill filed by the Baron de Bode for the purpose of perpetuating the testimony of certain witnesses. The bill stated that the plaintiff had some time since presented his petition of right to her Majesty, stating his claims to compensation from the English government out of a certain sum of sixty millions of francs, allowed by the French Government, upon the treaty between France and the allied powers, for compensating English residents in France, whose lands had been confiscated after the Revolution, in respect of certain property which had belonged to the plaintiff in Lower Alsace. The bill then stated that her Majesty referred the petition of right to the Lord Chancellor, with the usual indorsement, "Let right be done." That after the petition had been heard the Lord Chancellor directed that a commission should issue to inquire into the truth of all the matters in the petition. The commissioners found that neither the name or claim of the Baron de Bode appeared to have been registered as directed by the act, which provided for the compensation of the claims of British subjects until after the passing of that act. That after payment of all the claims of the duly registered claimants which had been established, a large surplus, amounting to 482,752*l.* 6*s.* 8*d.*, remained in the hands of the commissioners, of which surplus a sum of 200,000*l.* and upwards had been applied to satisfy claims which had been tendered after the time limited by the 9th article of the convention of the 20th of Nov. 1815, admitted under the authority of the Lords Commissioners of the Treasury, and the residue, amounting to more than 200,000*l.*, was paid into the Bank of England on Government account. And further, they found that the value of the immoveable property in Lower Alsace, lost by the plaintiff, together with the interest payable thereon, according to the terms of the convention, amounted to 361,265*l.* It was then stated that many of the witnesses examined before the commissioners were foreigners, and were with much difficulty induced to come to England to give their testimony, and intend to leave England in a few days for the purpose of returning to France, and, as the plaintiff feared and believed, would not be induced again to come to England. That it was the intention of the Attorney-General to traverse the inquisition and finding of the jury to compel the plaintiff again to prove all the matters and things found by the inquisition in the Court of Queen's Bench. The bill, therefore, prayed that the plaintiff might be permitted to examine certain witnesses named, touching the matters proved by them on the inquisition, and that a proper person might be employed to interpret their examination, and that their testimony might be preserved and perpetuated. To this bill a demurrer was put in by the Attorney General on behalf of her Majesty, that the complainant had made no case entitling him to have the witnesses examined as prayed by the bill, or to have their testimony perpetuated ; and also that the complainant had shown no equity against the defendant to entitle him to relief.—The Vice Chancellor said it appeared to him quite unnecessary to hear the counsel for the plaintiff, because without giving any opinion upon the merits of the case, all he had to do was to consider whether the demurrer ought to be allowed or not, and he thought it very clear the demurrer could not be sustained. The passage cited from Lord Redesdale's book on the subject of demurrers, in the second edition, and which remained unaltered in the last edition, was sufficient authority. It was stated for the Crown that the plaintiff had no case, and that the finding of the jury was of no value ; but then it appeared that the bill, after setting forth the finding of the jury, also stated that it was the intention of the Attorney-General to traverse the inquisition and finding of the jury ; and the plaintiff then went on to state, that in the event of such traverse by the Attorney-General, the inquisition could not be made the subject of judicial investigation, or be properly tried before the witnesses had left the country, and that the plaintiff would be therefore deprived of their testimony unless their evidence should be preserved. His Honour thought that what the bill contained, together with what was stated by Lord Redesdale, was quite sufficient reason for overruling the demurrer ; and when the Attorney-General had decided upon traversing or not, then such application might be made to the court as the plaintiff thought fit.

PREROGATIVE COURT.—*Moncorvo* v. *Candida.*—The facts of this case have frequently been before the public. Is is a claim made by the Baron Moncorvo, on behalf of the Portuguese government, of which he is the ambassador in this country, for letters of administration of the goods of the deceased in the cause, who died about 40 years ago, and who was a Knight of the Holy Military Order of St. John of Malta. The claim on behalf of the Portuguese Government is opposed by Signor Candida, who is the "Lieutenant-head and Representative" of one of the branches of the order, now settled at Naples. On behalf of the Portuguese government, it was set up in plea, and contended in argument, that this order had existed for some years in Portugal, and continued to exist there up to 1831 ; that at that time, in consequence of the political disturbances of the country, the holy order was abolished by the government, and all their property confiscated ; that the property which the deceased possessed necessarily fell within that predicament ; and that it therefore was and must be pronounced "forfeit and confiscate to the state" of Portugal. The claim of the representative of the order rested upon grounds entirely different. They trusted to a regulation of their own body, of which the deceased was a member, and by whose rules he was bound. The law upon which their hopes of success depended was to the effect that every member upon entering the order should resign all individual and personal right in his property, and that it should become part of the public fund of the society. Practically the deceased had disobeyed their order. He foresaw storms in the horizon, and he feared that the little bark of the Maltese knights might be wrecked amidst their fury. He looked out for a port of refuge, and found a safe one in the Bank of England. Despite the rule of the holy order, and in defiance even of the Pope's anger, he deposited some of his property in this country, and that is the property now disputed. For the order it is contended that such conduct on the part of the deceased was illegal ; that he was not entitled to invest it wherever he pleased ; that, in fact, it was not his, but the society's. Signor Candida had been appointed to his office by the Pope, who had for many years acted as grand master of the order ; and he was, in his official capacity, entitled to become the receiver on the part of the society. These were the grounds on which the separate claims were founded.—Sir H. J. Fust gave his opinion as to the validity of these claims. He thought that neither party had established their claim, and that neither of them were entitled to letters of administration. The Portuguese government was not : for it could never have had power to confiscate English property situated in this country. They had, unquestionably, full authority to abolish the order in Portugal, and to confiscate all its property ; but such confiscation could not apply to property out of Portugal. Nor was Candida entitled to receive letters of administration : the property, according to the regulation of the order, belonged to the Knights of Malta, but he had shown no authority to assume the character of receiver-general. The Pope, who had assumed the position and duties of grand master, had appointed him for the government of the body entrusted to his care, but not to receive any property in the name of the whole society ; this was naturally the duty of the grand-master. The Court, therefore, could not grant letters of administration to either of the parties before it.

Flott v. *Genge.*—The deceased in this case was the Rev. Henry Masterman, and the only circumstance connected with his life which has any bearing on the present suit is, that having made a will, he obtained his attesting witnesses, from whom, however, by folding up the paper in a particular manner, he concealed his own signature. He subsequently took the paper to a third attesting witness, acknowledged to him his signature, and he attested it ; and the question now was whether this was a sufficient acknowledgment under the new will act. Sir H. J. Fust decided that it was not, in a judgment of great length and elaboration. The leading case under the statute of fraud was, "The Trustees of the British Museum *v.* Whice." That case was tried in the Common Pleas, before the Chief Justice, and in it a will which had been pronounced by the special verdict of a jury to have been already signed, was placed by the testator, without exhibiting his signature, into the hands of the attesting witnesses. This was held to be a sufficient acknowledgment, but that case came within the provision of the statute of frauds, and that statute only required that in devises of real property the will should be signed and acknowledged in the presence of three or more attesting witnesses, &c. Now the new act specified distinctly that the signature itself should be acknowledged by the testator to the attesting witnesses ; and this certainly could not be said to have been done, when, by folding the paper in a peculiar way, the signature was concealed from two of the witnesses. Besides, in "Doe on the demise of Jackson v. Jackson," Mr. Baron Parke had almost gone the length of expressing his opinion that an acknowledgment was not sufficient where a testator had placed his arm across his signature when the witnesses were attesting the will, even though the jury had just decided that the testator intended to acknowledge his signature. The court, therefore, held that in this case there had not been a valid acknowledgment of the signature as required by the act, and pronounced against the paper propounded.

BOW-STREET, *July* 16.—Robert Chapman, a Fruiterer in Covent-garden Market, appeared before Mr. Jardine, upon a summons granted to the Horticultural Society, calling upon him to explain how a Pine-apple, stolen from the Society's garden on the 9th of July, came into his possession. Mr. R. Thompson, superintendent of the Fruit department in the Society's garden, proved that on that occasion he received seven Pine-apples from Mr. Henderson, gardener to Sir G. Beaumont, Bart., of Coleorton Hall, with orders to send them, after the meeting, to Mr. Dulley, Fruit-salesman in Covent-garden Market ; that of these Pines, one, a Queen, weighing about 3 lbs., was stolen from its place very near fruit exhibited by Mr. Chapman ; that it was marked conspicuously with the name of Mr. Henderson as its owner ; and that as soon as it was missed notice was given to the exhibitors and the police. Michael Webber, in the employment of Mr. Dulley, deposed that he was accustomed to receive fruit from Coleorton Hall for sale, that he knew Mr. Henderson's Pines by their marks, and that on Monday morning he found the stolen Pine in a basket on the stand of Mr. Chapman, Sen. ; that 12*s.* a pound were asked for it, and that he bought it for 9*s.* a pound. He added, that in the evening of the same day, Robert Chapman called upon him respecting it, and said he had bought it. Mr. Chapman, being called upon for his defence, stated that he bought the Pine-apple in the garden, in the middle of the afternoon of the day of exhibition, from a person whom he knew by sight, but whom he could not produce ; that he gave 12*s.* and a bottle of wine for it, and that it was carried openly out of the garden. He called Mr. R. W. Dutton, who described himself as a watchmaker, and who deposed that on the day of the robbery he met Chapman with another man, and was invited by the former to drink a glass of wine with them ; that on offering to pay his share, Chapman told him he need not do that, as it was part of the purchase-money of a Pine-apple ; that Chapman afterwards gave him a Pine-apple to carry away for him, which he did. There being no further evidence, Dr. Lindley stated that the object of the Society in bringing the matter before the magistrate was that it might be judicially investigated. Upon Mr. Chapman's own showing, he had purchased the fruit of a man whom he knew perfectly well not to be Mr. Henderson, although the fruit was marked with Mr. Henderson's name as the owner of it ; and it was impossible to say he acted with proper caution in the transaction : the Society was determined to protect the property of exhibitors, and would prosecute in all cases where evidence could be procured : otherwise such irregularities would be repeated, and other robberies might be committed under the pretext of buying. Chapman undertook to give into custody the man who had sold him the Pine, whenever he saw him, and the case was dismissed. He then applied to have the Pine given up to him ; but the magistrate decided that it was now in the hands of the right owner, and refused to make any order upon the subject ; the effect of which is that Chapman has to bear the loss himself.

TATTERSALLS, THURSDAY. — GOODWOOD STAKES. — The Knight of the Whistle was backed in one or two quarters at Monday's quotation, and maintained it, but certainly was not in force. It was otherwise with Helpmate, who was supported zealously, and closed second favourite at 8 to 1. Welfare was also in favour, and on these three nearly the whole of the business turned—the St. Lawrence, Tupsley, Rhodanthe, and Arnagill parties having been dead letters. The Goodwood Cup excited considerable interest, and exhibited two or three changes. The Squire, Middleham, and Sleight of Hand were backed occasionally in the early part of the afternoon, but were not in much request after the first hour. Marshal Soult opened with a declining appearance, but derived so much assistance towards evening that, after a good deal of money had been got at 13 to 1, he sprung three points, and left off second favourite. Charles the Twelfth rose from 20 to 11 to 1 upon a small outlay, holding the third place in the betting. The St. Leger is only worthy of notice as showing an extraordinary decline in Meteor ; 40 to 1 was laid on the strength of his being lame, yet it was mentioned in the course of the day that he had galloped at Epsom, and would accompany Scott's horses to Goodwood. The price current at the close was as follows :—

GOODWOOD STAKES.

8 to 1 agst	Knight of the Whistle (taken)	16 to 1 agst	Daddy Longlegs (ta.)
8 to 1	Helpmate	18 to 1	Corsair (taken)
12 to 1	Welfare (taken)	20 to 1	Studley Royal (taken)
14 to 1	Tupsley	20 to 1	Arnagill
		20 to 1	Retriever

GOODWOOD CUP.

4 to 1	The Squire (taken and afterwards offered)	12 to 1	Sleight-of-Hand (tak.)
		12 to 1	Middleham (taken & afterwards offered)
10 to 1	Marshal Soult (taken)		
11 to 1	Charles XII. (taken and after. offered)	20 to 1	Belcœur (taken and afterwards offered)
11 to 1	Priam		

ST. LEGER.

10 to 1	Cabrera	40 to 1	Meteor

DERBY, 1843.

1000 to 50 each against Catherine colt out of Attila's dam, and Napier, in one bet (taken.)

Lord Westminster's Sleight-of-Hand, Van Amburgh, and two others, have arrived at Goodwood.

MARK LANE, FRIDAY, JULY 22.—Our English supplies since Monday have been trifling, and taken off at that day's quotations.—The arrivals of Foreign being considerable, a decline would be submitted to, were there purchasers for a quantity.—Barley, Beans, and Peas, are unaltered.—The Oat trade is very dull, and fully 1*s.* cheaper.

GAZETTE OF THE WEEK.

INSOLVENTS.—C. Bindley, Birmingham, coach maker and livery stable keeper—S. Knight, West Hoathley, Sussex, cattle dealer—J. M'Gakey, Liverpool, printer.

BANKRUPTCIES ANNULLED.—J. Johnston, Leeds, tow spinner—J. Dawson, Tudeley, and W. Dawson, Tonbridge, Kent, contractors and builders—R. B. Scale, Halstead, Essex, farmer.

BANKRUPTS.—C. M. Darby, 319, Regent-street, St. Marylebone, printer and bookseller—D. Low, 4, Adam's-court, Old Broad-street, City, merchant—J. Atkins, sen., and J. Atkins, jun., Coulsdon, Surrey, lime merchants—J. W Vogel, 4, Cloak-lane, City, bookseller—J. Stuart, Liverpool, draper and tea-dealer—J. Belshaw, Liverpool, sail maker—J. S. Spinks and J. Molson, Liverpool, coal merchants—T. Brooke, J. Lang, J. Wilby, and J. Milnes, Liversedge, Yorkshire, blanket manufacturers—J. Rate, Eastgate, Bourn, Lincolnshire, feltmonger—W. Williams, Goudhurst, Kent, wheelwright—S. Brown, Liverpool, millwright—S. H. Smyth, Cambridge, coach maker—J. Sparham, late of Troston, Suffolk, miller—S. Rushton, Nottingham, ironmonger—W. Seddon and F Jordan, St. Helen's, Lancashire, millers—L. Yablonsky, Birmingham, jeweller—J. Walsh and E. Halford, Nottingham, tailors and drapers—J. Mills, London-wall, canal carrier—H. Faweus and R. Faweus, Stockton-upon-Tees, timber merchants—G. Skipp, Malvern Wells, Worcestershire, cider merchant—C. Timmis, Darlaston-green, Staffordshire, flint-grinder.

SCOTCH SEQUESTRATIONS.—J. King, jun., Glasgow, deceased, writer—J. Hunter, Edinburgh, silk mercer—A. and W. Phillips, Aberdeen, upholsterers.

BIRTHS.—On the 16th inst., at Clapham-common, Mrs. W. A. Franks, of a son—On the 16th inst., at Victoria-square, Grosvenor-place, the lady of John Cross, Esq., barrister-at-law, of a son—On the 16th inst., the lady of T. D. Acland, Esq., M.P., of a son—On the 16th inst., at Kensington, the lady of B. Tristram, Esq., of a daughter—On the 17th inst., at Woodford Hall, Essex, Mrs. W. Morris, of a daughter—On the 17th inst., in Guilford-street, Russell-square, the lady of J. Bogg, Esq., of a daughter—On the 17th inst., at Notting-ham-place, the lady of C. F. Huth, Esq., of a daughter—On the 18th inst., at Southsea, Portsmouth, the lady of Captain W. V. Brooke, 58th Regiment, of a son—On the 19th inst., in Endsleigh-street, Tavistock-square, the lady of W. H. Palmer, Esq., of a daughter.

MARRIED.—On the 16th inst., at Tottenham, Mr. Thomas Twycross, of Winton-hall, Kirkby Stephen, Westmorland, to Mary, second daughter of the late W. Middlecoat, Esq of the Audit office, Somerset-house—On the 19th inst., at St Botolph's, Aldersgate street, Mr. J. T. Hunt, of Denmark-hill, Camberwell, to Miss Mary Steer, of Christ's Hospital—On the 16th inst., at Christchurch, Marylebone, F. H. Simpson, Esq., youngest son of the late J. Simpson, Esq., of Burton-crescent, to Mary Anne, youngest daughter of the late J. Paxton, Esq., of Charlotte-street, Bloomsbury—On the 20th inst., at St James's, Piccadilly, the Earl of Bective, eldest son of the Marquess of Headfort, to Amelia, the only child of Alderman Thompson, M.P.

DIED.—On the 16th inst., at Upper Berkeley street, Eliza Barclay Evans, eldest daughter of the Rev. E. J. Evans, vicar of Kilbroney, Rosstrevor, aged 23—On the 17th inst., in Surrey-square, Mrs Lee, in the 83rd year of her age, relict of the late Mr. Henry Lee, of the same place—On the 17th inst., at his residence, Nascot house, near Watford, in the 87th year of his age, G. W. Ricketts, Esq., late receiver-general for Hampshire—On the 19th inst., at his house, Maize hill, Greenwich, in the 82nd year of his age, after only four days' illness, William Taylor, Esq., Admiral of the Red, the only surviving officer who accompanied Captain Cook in his third voyage round the world, and was present at his death—On the 19th inst., at 56, Eaton place, Susan, youngest daughter of the late E. Godfrey, Esq., and the Countess Dowager of Morton, aged six years—On the 20th inst., at Orton house, Brighton, Henry Wheeler, Esq., of Chester-terrace, Regent's park, and of the Stock Exchange.

Printed by Messrs. BRADBURY and EVANS, Lombard-street, Fleet-street, in the Precinct of Whitefriars, in the City of London, and Published by them at the OFFICE, 3, CHARLES-STREET, COVENT GARDEN, in the County of Middlesex, where all Advertisements and Communications are to be addressed to the Editor.—Saturday, July 23, 1842.

THE GARDENERS' CHRONICLE.

A STAMPED NEWSPAPER OF RURAL ECONOMY AND GENERAL NEWS.

THE HORTICULTURAL PART EDITED BY PROFESSOR LINDLEY.

Withers's Treatise on the Acacia, rev. . . . . . 496 b
Wood, to collect specimens of . 492 c

KINGSTON.

THE ROYAL HORTICULTURAL SOCIETY has fixed their ANNUAL EXHIBITION for THURSDAY, SEPT. 15th, 1842.—For particulars apply to

JAMES JACKSON, Hon. Sec.,
Thames-st., Kingston, Surrey.

WINDSOR AND ETON ROYAL HORTICULTURAL SOCIETY.—The Annual Grand Show of this Society will take place on the 3rd of September.

Windsor, July 28, 1842.

DAHLIAS.

THE GRAND ANNUAL DAHLIA EXHIBITION ON SALISBURY PLAIN, will take place on WEDNESDAY, AUGUST 31st, at STONEHENGE, under the immediate patronage of Lady Antrobus. Full particulars may be had on application to J. KEYNES, Hon. Sec.,

Salisbury, July 26, 1842. Salisbury.

STONEHENGE is Six Miles from Salisbury and Two from Amesbury. There will be accommodation at both places for conveying Exhibitors and their boxes to the Stones.

"MANETTIA BICOLOR."

MESSRS. VEITCH and SON have now ready for delivery Plants of this beautiful New Greenhouse Climber, at 42s. each.

N.B.—A Medal was awarded to this Plant at the Horticultural Society's Meeting in Regent-street, in April last.

Exeter, July 6, 1842.

LILIUM LANCIFOLIUM.

H. GROOM, CLAPHAM RISE, near London, (Removed from Walworth,) by Appointment Florist to Her Majesty, respectfully informs the Nobility, Gentry, and Public, that he has a fine stock of Lilium lancifolium, album, and punctatum, which he can supply at very moderate prices.

He begs to say his Catalogue of Geraniums is ready for delivery, and can be had on application.

MYATT'S BRITISH QUEEN STRAWBERRY, after two years' competition, still maintains its pre-eminence; and, in returning thanks to their numerous patrons and friends, J. and W. Myatt beg to say they can with confidence recommend it as the most superb fruit yet known.

Also their new Seedling Strawberry Prince Albert, which for productiveness and size cannot be equalled. Price per 100, each, 50s.; and their Eliza, 20s. Runners are now ready, and may be had on application to them at Manor Farm, Deptford.

Myatt's famed Victoria Rhubarb, 50s. per 100 sets, or 1s. 6d. per root, will be ready in October.

ECONOMIC LIFE ASSURANCE SOCIETY, No. 34, BRIDGE-STREET, BLACKFRIARS, LONDON. Established 1823. Empowered by Act of Parliament, 3 William IV.

LOWER RATES OF PREMIUM THAN THOSE OF ANY OTHER OFFICE, that entitle the assured *to participate in the profits*, as follows:—

Age.	15	20	25	30	35	40	45	50
Annual Premium per cent.	1 10 8	1 14 7	1 19 0	2 4 3	2 10 11	2 19 9	3 11 9	4 8 0

The BONUS declared in 1834 amounted upon an average to 16l. per cent. on the premiums then paid; and in 1839 a second BONUS was awarded, amounting on the average to 31l. per cent. on the premiums paid during the preceding five years.

No extra charge for residence in any part of Europe, nor for proceeding (in a decked, sailing, or steam vessel) from any one Port thereof to another during peace, to Assurers, not being seafaring men by profession. Licenses are granted to go to any part of the world upon terms proportionate to the risks.

Policies on the lives of persons dying by suicide, duelling, or by the hands of justice, are not void as respects the interests of parties to whom they may have been legally assigned.

Assurances may be effected on any and every day.

By order of the Board of Directors,
CAMPBELL JAMES DOWNER, Secretary.

BRITANNIA LIFE ASSURANCE COMPANY, 1, Princes-street, Bank, London.

This Institution is empowered by a special Act of Parliament, 4 Vict., cap. IX., and is so constituted as to afford the benefits of Life Assurance, in their fullest extent, to Policy-holders, and to present greater facilities and accommodation than can be obtained in other Offices. The decided superiority of its plan, and its claim to public preference and support, have been proved, incontestably, by its extraordinary and unprecedented success.

Extract from Increasing Rates of Premium, for an Assurance of 100l. for whole term of Life.

Age.	Annual Premium payable during				
	1st five years.	2d five years.	3d five years.	4th five years.	Remainder of Life.
20	£1 1 4	£1 5 10	£1 10 11	£1 16 9	£2 3 8
30	1 6 4	1 12 2	1 19 1	2 7 4	2 17 6
40	1 16 1	2 4 4	2 14 6	3 7 3	4 3 4
50	2 16 7	3 9 4	4 5 5	5 6 3	6 13 7

PETER MORRISON, Resident Director.

A liberal commission allowed to Solicitors and Agents.

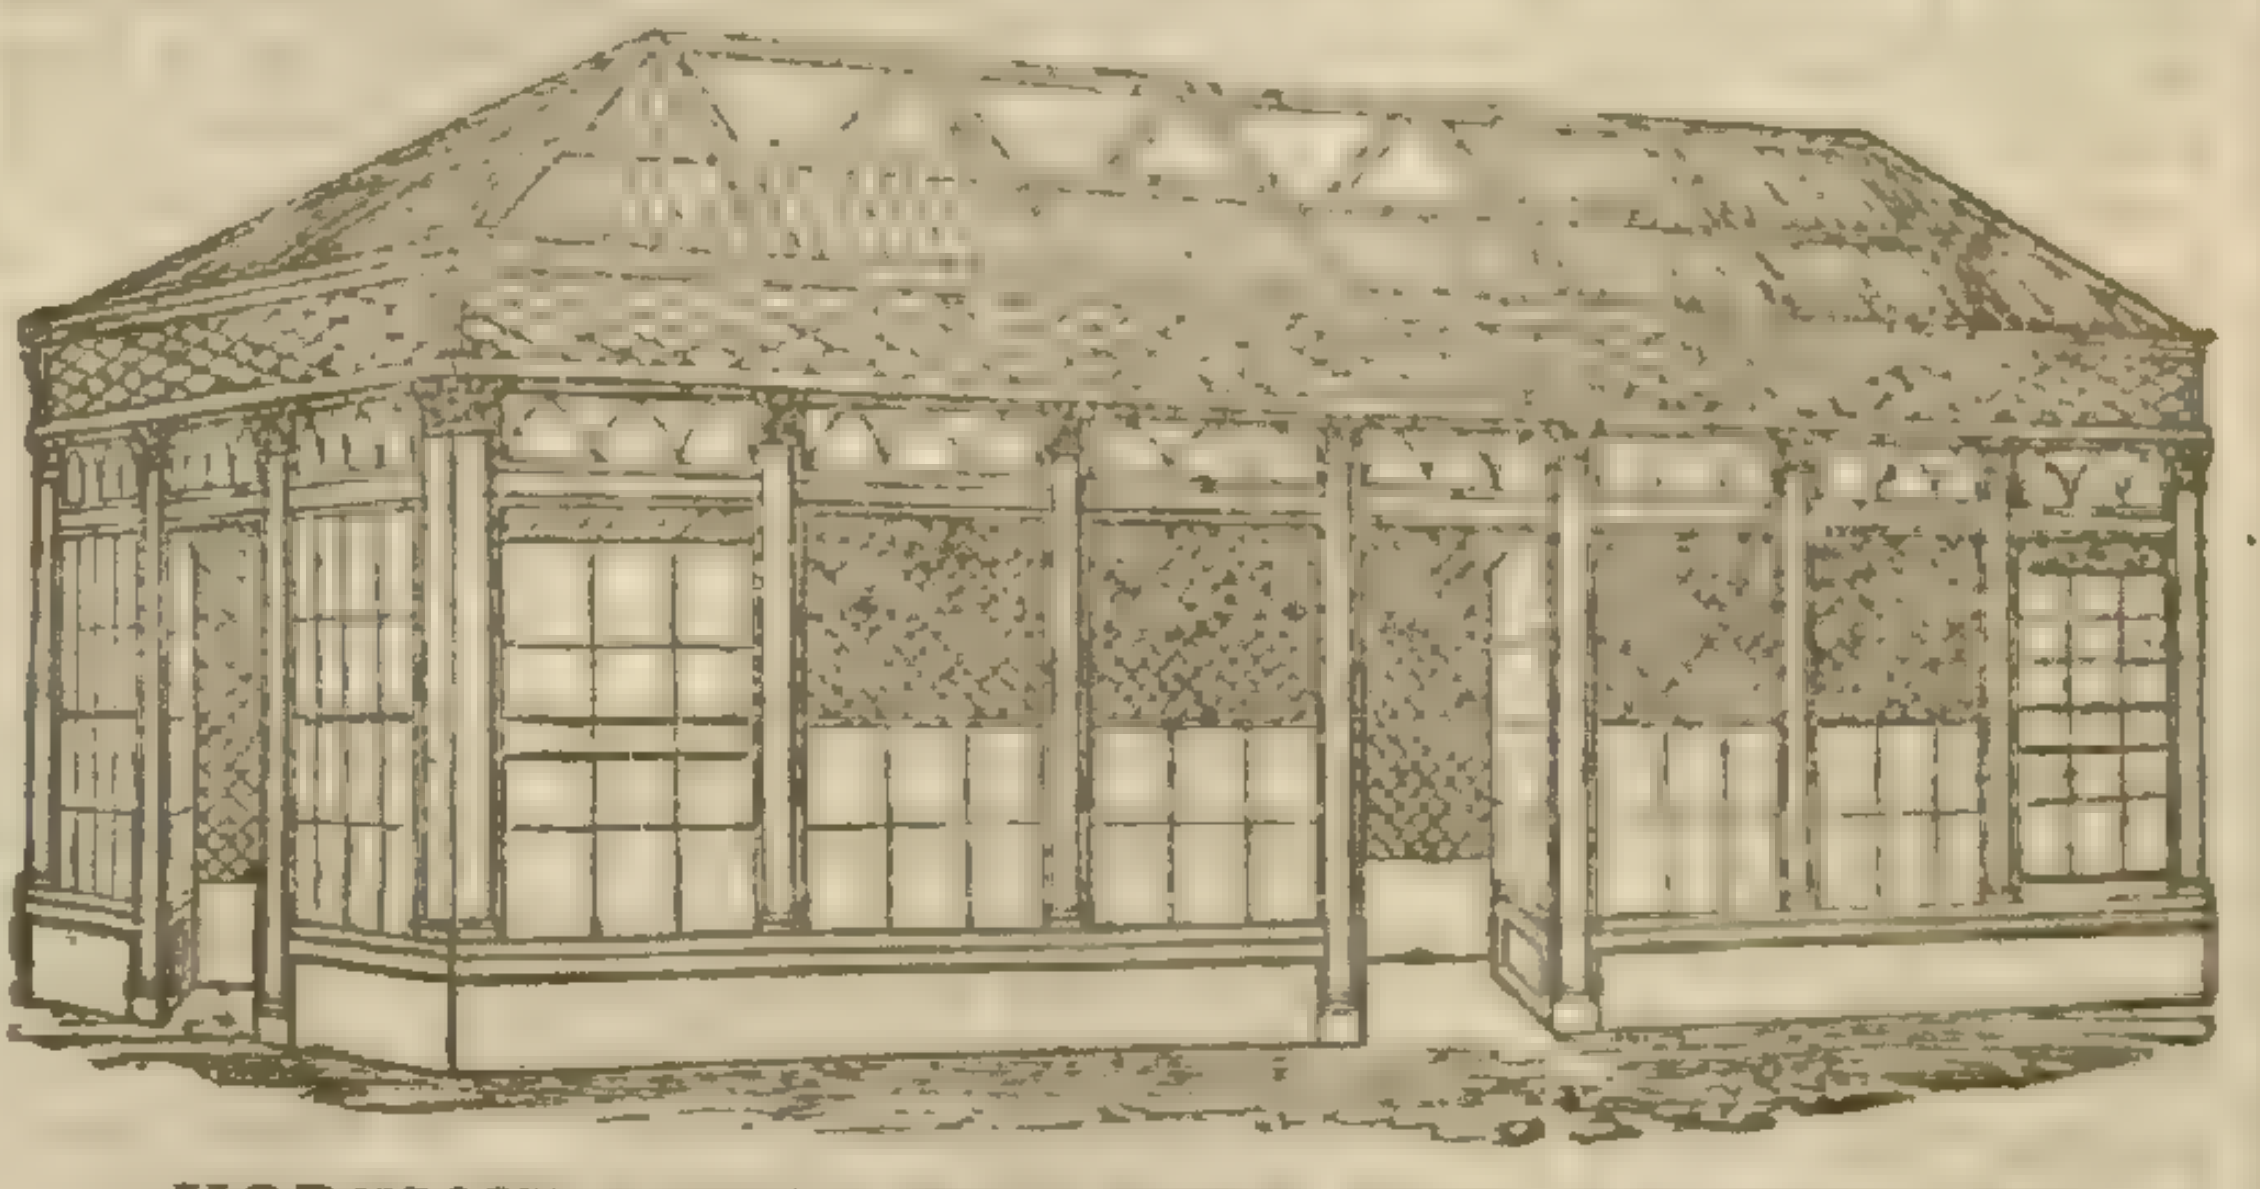
HEATING BY HOT WATER.

HOTHOUSES, and every description of Horticultural Buildings, Churches, Chapels, Public Buildings, Mansions and large Rooms, fitted up with the above apparatus on the most improved and scientific methods.

W. WALKER and Co. (late of Mosley-street, Manchester) beg to announce that they continue to execute works of the above description, in which they have introduced a variety of important improvements of a satisfactory nature, especially to Horticulturists. They have applied this principle on a more extensive scale than has ever been hitherto adopted at the stupendous Conservatory and Hothouses of his Grace the Duke of Devonshire, and in numerous other extensive establishments, with the most complete success.

They have also successfully applied C. W. Williams' Patent Argand Furnace to their boilers, and have made arrangements with the Patentee for its general adoption. It economises fuel, and removes the nuisance and disfigurement of smoke, so much complained of by Gardeners, and is a new and valuable feature in these Apparatus.

Works executed in every part of the United Kingdom with punctuality and despatch.—33, Brown-street, Manchester.



HORTICULTURAL BUILDING AND HEATING BY HOT WATER.

J. WEEKS and Co., ARCHITECTS, &c., GLOUCESTER-PLACE, KING'S-ROAD, CHELSEA, Hothouse Builders and Hot-water Apparatus Manufacturers, beg leave to inform the Nobility and Gentry that their business, which has been extensive throughout the country for many years, is entirely confined to the BUILDING OF HORTICULTURAL ERECTIONS of every description, and the HEATING of them by HOT WATER.

CONICAL and other BOILERS of all sizes; their largest consumes but a small quantity of fuel, only requiring attention once in 10 hours, and will heat a range of Forcing Houses 300 ft. in length.

Their improved plan of BOTTOM HEAT FOR PITS, by means of an open trough under the bed, is now being universally adopted.

References may be had, and their works seen at most of the Nobility and Gentlemen's Seats in the country, nearly the whole of the London Nurseries, and a great variety of Horticultural Erections and Hot-water Apparatus, Models, Plans, Estimates, &c., at their Horticultural Manufactory, Gloucester-place, Chelsea, near Sloane-square.

HEATING BY HOT WATER.

JOHN WALKER, 46, St. John's Square, Clerkenwell, London, having been for many years extensively engaged in Warming Churches, Manufactories, Hospitals, Hothouses, Conservatories, and Private Houses, by means of Hot Water, either in Pipes or Pedestals, can confidently recommend this mode of heating in preference to any other. Numerous references can be given both in town and country, where he has successfully and satisfactorily applied it. Baths fitted up and heated in a superior manner. Orders executed in all parts of the Country with punctuality and despatch.

HOT-WATER APPARATUS, for Horticultural and other Buildings.—STEPHENSON and Co., Agents for the Old Park Iron-works, and Manufacturers, 61, Gracechurch-street, London, solicit an inspection of their improved Conical Boiler. (See Editor's description, *Gardeners' Chronicle*, March 12, p. 175.) To Amateurs these Boilers will be found invaluable. They are complete without furnaces or setting in brickwork, moveable at pleasure, very ornamental in appearance, and require attention only once in 14 or 15 hours, price 5l. 5s. and upwards. Further particulars, with plans and estimates for heating any description of building, may be obtained as above; where also may be seen the improved Wrought-iron Boiler, as applied with Chanter's Smoke-consuming Furnaces at Chatsworth, and many other of the Nobility's Seats. Iron Fencing, Hurdles, Bedsteads, Ornamental Wire-work, Garden Implements, &c. &c. The trade supplied with Hot-water Socket-pipes.

N.B.—Wayte's New Patent Land-pressers and Drills.

HOT-WATER APPARATUS FOR HEATING HORTICULTURAL BUILDINGS, DWELLING-HOUSES, CHURCHES, and MANUFACTORIES, upon improved principles, and at very moderate charges, erected by DANIEL and EDWARD BAILEY, 272, HOLBORN.

D. and E. BAILEY having devoted much time to the consideration of this subject, and had much experience in the erection of apparatus for the above-mentioned purposes, have, by improvements suggested in their practice, rendered their mode of heating not only very efficient, but very simple, and have combined durability in the apparatus with economy in the charge. They have erected apparatus in England, Scotland, and Ireland, for many noblemen and gentlemen, and have had the honour to be employed by the Horticultural Society of London, in executing the works of their splendid Conservatory, lately erected at Chiswick.

D. and E. BAILEY also construct in metal all descriptions of Horticultural Buildings and Sashes, and invite noblemen, gentlemen, and the public to an inspection of their various drawings and models, at 272, Holborn, where they have the opportunity of exhibiting, amongst other metal works, an extremely complete and convenient kitchen apparatus, or range, adapted for the continued supply of hot water, and an arrangement of the oven more complete than has hitherto been brought before the public.

D. and E. BAILEY were the first to introduce metallic curvilinear houses to horticulturists, and can refer to the Conservatory attached to the Pantheon as one of their works, besides many others in this country and on the Continent.

D. and E. BAILEY have prepared a quantity of the Galvanic Plant Protectors, which are now ready for immediate delivery; they beg to introduce to public notice a new Trough Pipe, for Orchidaceous or other Houses where vapour is constantly, or at intervals, required, and which may be seen at their manufactory.

HOTHOUSES, CONSERVATORIES, &c., Made and Fixed complete in all parts of the Kingdom. One, two, and three-light Cucumber and Melon Boxes and Lights of all sizes kept ready for immediate use, packed and sent to all parts of the Kingdom; warranted best material. Two-light Boxes and Lights complete, from £1 8s. Garden-lights made and glazed, 1s. per foot, at JAS. WATT'S, SASH MANUFACTORY, CLAREMONT-PLACE, Old Kent-road. REFERENCE GIVEN.

EDWARD BECK, MANUFACTURER IN SLATE, Isleworth, Middlesex, respectfully informs Horticulturists, that his IMPROVED SLATE TUBS for Orange Trees and Conservatory Plants, mounted upon rollers, Slate Cisterns, Shelves, and Edgings for garden paths, may be seen in use at his house upon application to the gardener.

PUNCH'S GUIDE TO THE WATERING PLACES, illustrated with upwards of ONE HUNDRED HUMOROUS CUTS of the principal Characters and Subjects, will be published on the 30th inst., price 3d.: being No. 55 of "Punch, or the London Charivari."

Part XIII., containing "the Guide," is now ready, price 1s. 4d.

⁂ The Second Volume of this highly popular Periodical, enriched with many hundreds of Woodcuts, may be had, price 8s. —Back Numbers always on sale at the

Office, 13, Wellington Street, Strand.

This day is published, price 1s., No. II. of the New Series of

THE MAGAZINE OF DOMESTIC ECONOMY AND FAMILY REVIEW. Contents:—1. Larder and Kitchen.—2. Legal Economist.—3. Fashions.—4. Chemistry; Domestic and Agricultural.—5. Statistics; Income Tax.—6. A few more Words on Adulteration.—7. Relative Value of Different Kinds of Food for Cattle.—8. Agricultural Report.—9. Garden Walks.—10. Cure for Hydrophobia.—11. Review of New Works.—12. Miscellaneous Domestic Matters.—13. Correspondence.—14. Meteorological Diary.—15. London Markets, &c. &c.

On the 1st of June was published, in cloth boards, price 6s. 6d., the Seventh Volume of this popular Magazine,—completing the First Series.

London: W. S. Orr & Co., Paternoster-row; and sold by all Booksellers in town and country.

In Monthly Nos., 8vo, with Four beautifully-coloured Plates.
Price 2s. 6d.

PAXTON'S MAGAZINE OF BOTANY. The Number for July, 1842, contains highly-finished drawings of *Habránthus Praténsis, Borónia Anemonæfólia, Cinerária Webberiàna, Tropæ'olum Edùle*: likewise Papers on Gardening as a science; on Suspending Plants in Greenhouses and Stoves. Reviews—Sir Uvedale Price on the Picturesque; Loudon's Encyclopædia of Trees and Shrubs. Floricultural Notices of new and beautiful Plants figured in the leading Botanical Periodicals for June, and of those in flower at the principal Suburban Nurseries and Gardens; together with a complete Calendar of Monthly Operations for the Garden.

This work comprises, monthly, four admirably-coloured plates, and twenty-four pages of interesting and useful letter-press. The admirers of flowers are requested to observe—

1. That all the drawings are taken from nature, and are consequently made from plants which have flowered in Britain.
2. That, with few exceptions, they are all done by one artist, whose abilities are of the highest order, and who travels himself to the places where the plants are in flower.
3. That they are lithographed by the same individual, and, being coloured in a superior manner, have all the spirit and elegance, and much of the finish, of the original drawing.
4. That about one-half of the drawings are from plants which have never before been figured in this country, the rest representing the most popular novelties, as well as the more neglected, though sometimes far handsomer, old species; the majority being such as can be cultivated by every one possessing a flower-border and a greenhouse or frame.

It may, in conclusion, be safely asserted that, both for the beauty of its embellishments, and the utility of its contents, this work is well adapted to the wants of all who delight in gardening; and as the improved system of having the plates lithographed commenced with the present year, and as it is intended that each volume shall now be perfect in itself, the present is a desirable opportunity for those who wish to become subscribers.

London: W. S. Orr and Co., Paternoster-row.

IMPORTANT TO AGRICULTURISTS, &c. &c.
Just published, and sold by Ridgway, Piccadilly, and Longmans, Paternoster-row, price 1s.,

A WORD OR TWO ON GUANO, and a NEW MANURE—ARTIFICIAL GUANO.

By W. H. POTTER, M.R.A.S., Agricultural Chemist.

The New Manure is prepared from a careful analysis of Guano, is more effective, and free from moisture, sand, &c. Price 15s. per cwt. cash.—Chemical Works, Upper Fore-street, London.

HORTICULTURE.
Saturday, Sept. 3d, will be published, price 3d., 16 pages royal 8vo, to be continued Weekly,

THE GARDENER & PRACTICAL FLORIST, No. 1. —A new Work, comprising Original Papers by distinguished Writers on the Culture, Properties, and best Modes of Exhibiting Plants, Fruits, and Flowers; Critical Notices of New Books, Flowers, Plants, Implements, and other subjects connected with Horticulture; Observations on the Proceedings of Public Societies, and the Management of Public Gardens; and the spirit of all valuable Works on the various branches of the Science; forming a TEXT-BOOK FOR THE FLORIST, a Guide to the Amateur, a Library for the Gardener, and a useful Book for the Million.

London: Richard Groombridge, Paternoster-row, where Advertisements, Books, Plants, Communications, &c. for the Editor may be forwarded.

ADAPTED FOR SCHOOLS, PRIVATE TEACHERS, AND STUDENTS.

COOLEY'S ELEMENTS of EUCLID, With Explanatory Appendix and Exercises. Price 4s. 6d. bound.

"The best edition of the Elements which has yet appeared."—*Athenæum.*

"Cannot be easily surpassed."—*Dublin University Magazine.*

COOLEY'S GEOMETRICAL PROPOSITIONS: a Key to the Exercises appended to the Elements. Price 3s. 6d. bound.

COOLEY'S FIGURES of EUCLID, with Enunciations. Price 1s. 6d.

London: Whittaker and Co.: sold by all Booksellers.

DARLEY'S SCIENTIFIC LIBRARY, for the Use of Schools, Private Students, Artists, and Mechanics. It is the purpose of this Work to furnish a Series of Elementary Treatises on Mathematical Science, adapted to the wants of the Public at large. To youth of either sex at public and private schools, to persons whose education has been neglected, or whose attention has not been directed in early life to such studies, and to Artists and Mechanics, these little Works will be found particularly suited. The principles of the various Sciences are rendered as familiar, and brought as near to our commonest ideas as possible; the demonstrations of propositions are made plain for the mind, and brief for the memory; and the Elements of each Science are reduced, not only to their simplest, but to their shortest form.

1. A. SYSTEM OF POPULAR GEOMETRY. Containing in a few Lessons so much of the Elements of Euclid as is necessary and sufficient for a right understanding of every Art and Science in its leading Truths and general Principles. By GEORGE DARLEY, A.B. Fourth Edition, 4*s.* 6*d.* cloth.

2. COMPANION TO THE POPULAR GEOMETRY, in which the Elements of Abstract Science are familiarised, illustrated, and rendered practically useful to the various purposes of Life, with numerous Cuts. (A Second Edition is now ready.) 4*s.* 6*d.* cloth.

3. A SYSTEM OF POPULAR ALGEBRA, with a Section on Proportions and Progressions. Third Edition. 4*s.* 6*d.* cloth.

4. A SYSTEM OF POPULAR TRIGONOMETRY, both Plane and Spherical, with Popular Treatises on Logarithms, and the application of Algebra to Geometry. Second Edition, 3*s.* 6*d.* cl.

"For students who only seek this limited knowledge of these sciences, there are perhaps no treatises which can be read with more advantage than Darley's Popular Geometry and Algebra."—*Library of Useful Knowledge, Article "Mechanics."*

Taylor and Walton, Booksellers and Publishers to University College, 28, Upper Gower-street.

Just published, in 2 vols. 8vo. cloth, price 24*s.*

HISTORICAL MEMOIRS of the QUEENS of ENGLAND. By HANNAH LAWRANCE.

"These laborious and interesting memoirs."—*Athenæum.*

"This very industrious and interesting work."—*Examiner.*

"One of the most pleasing and valuable contributions which English history has received for many years."—*British Mag.*

"Narratives of as much interest as if they were pure dramas."—*Atlas.* Edward Moxon, Dover-street.

Handsomely bound in cloth, with Ninety-three Wood-Engravings, Price 6s. 6d.

ILLUSTRATIONS OF THE BIBLE, AND CONFIRMATIONS OF SACRED HISTORY, from the Monuments of Egypt. By W. C. TAYLOR, LL.D.

From the British Magazine.—"This is an elegant and well-executed little book, on a most interesting subject."

From the Birmingham Herald.—"A valuable and indispensable accession to the library of every Biblical student."

From the Rev. Thomas Hartwell Horne's Introduction to the Critical Study of the Scriptures.—"Nearly three hundred texts of Scripture are more or less explained in this elegantly-executed volume, and in a manner equally curious and interesting."

Tilt and Bogue, Fleet-street.

FAMILIAR ASTRONOMY. By GEORGE DARLEY, A.B., Author of a System of Popular Geometry,—Companion to the Popular Geometry,—a System of Popular Algebra,—and a System of Popular Trigonometry. 12mo, with Engravings, 5s. cloth, lettered.

"There is a vast deal of astronomical information conveyed in a most winning and unassuming manner in this delightful little volume, which, not less for the novelty of its plan than the extent of its intelligence, reflects infinite credit on the taste and talents of its projector and editor, Mr. Darley."—*Sun.*

Taylor and Walton, Booksellers and Publishers to University College, 28, Upper Gower-street.

One Volume, price 7*s.* 6*d.*,

THE LIFE AND TIMES OF RIENZI.

"Not less interesting than Sir E. Lytton Bulwer's eloquent Romance, and scarcely less romantic, is this historical record of the Conspiracy of Gabrini."—*Monthly Repository.*

"To all who have read Sir E. Lytton Bulwer's 'Rienzi,' its perusal is, in a measure, a duty."—*Spectator.*

"A curious and pleasing volume, and full of matter of historical character and illustration."—*Literary Gazette.*

"The publication of this work is well timed . . . . The Life of Rienzi is to us full of interest."—*Athenæum.*

"Those that wish to become acquainted with the true history of a man who was, in some sort, the *Napoleon* of his own age and country, would do well to consult the extraordinary narrative of the 'Life and Times of Rienzi.'"—*Tait's Magazine.*

London: Whittaker and Co.

FUN FOR THE FIRESIDE!!

Bound in cloth, price 5*s.* 6*d.*,

JOE MILLER'S JEST-BOOK.

A Reprint from the first and genuine edition, such omissions and alterations only having been made as were required by the greater delicacy observed in modern conversation; but, that the volume might have some substance, and be a good table or travelling book, copious additions have been made from other old volumes of Facetiæ.

Extract from the Preface.

"Another strange circumstance connected with this work is, that everybody presumes that he himself and everybody else is perfectly familiar with its contents . . . . . . and yet, if the reader will ask his acquaintance, it will appear that not one in five hundred ever set eyes on a copy. It is in consequence of like questions that this edition is published."

London: Whittaker and Co.

HAND-BOOKS FOR THE PEOPLE.

Forming a Useful Manual in time of Need, when Professional Aid cannot readily be procured. Price 2*s.* cloth.

THE HAND-BOOK OF NATURAL PHILOSOPHY.

Price 1*s.* 9*d.*

London: W. S. Orr and Co.; and W. and R. Chambers, Edinburgh.

Just published, price 6*s.* cloth,

THE HAND-BOOK OF CHEMISTRY; with a complete Index of Reference. By G. H. CAUNTER, Esq.

London: W. S. Orr & Co.; and W. & R. Chambers, Edinburgh.

Price 7*s.*, illustrated with Wood-cuts of Birds, Cages, &c.,

A NEW EDITION OF THE

NATURAL HISTORY OF CAGE BIRDS; their Management, Habits, Food, Diseases, Treatment, Breeding, and the Methods of Catching them. By J. M. Bechstein, M.D.

"A very delightful book of its kind. . . . . . It seems to us an indispensable book for the bird-fancier."—*Spectator.*

"It will be welcome to every gentleman's library or drawing-room table. It is superbly got up, with an immense number of vignettes, and, in fact, rivals the beauty of the Annuals."—*Weekly Dispatch.*

London: W. S. Orr and Co.; and W. R. Chambers, Edinburgh.

HODGSON and ABBOTT's PALE ALE.—The above celebrated Beer, so strongly recommended by the Faculty, is to be procured only from E. ABBOTT, Brewery, Bow, Middlesex. The Trade not being supplied, the Pale Ale cannot be genuine if procured elsewhere.

City Office, 98, Gracechurch-street.

THE 'FRANKLIN MEMORIAL.'—The existence of the identical press at which Dr. FRANKLIN worked as a journeyman printer when in London in (1726) having been mentioned in the "Athenæum," many persons were induced to visit the warehouse of Messrs. Harrild, in whose possession it then was, and among them Mr. J. B. Murray, of New York, who expressed a desire that the venerable relic should be preserved in the Museum of the Philadelphia Philosophical Society, as a memorial of his illustrious countryman. To this national good feeling Messrs. Harrild cheerfully responded, declining any price, but, wishing to make it instrumental in forwarding a work of charity in favour of decayed printers, proposed that a donation should be made for that purpose. The Society's constitution precluding any such arrangement, it was at once given unconditionally, and the press is now on its way to America. On its arrival at Liverpool, Mr. Murray, being anxious to carry out the benevolent intentions of the donors, caused it to be exhibited, and a public Lecture was given by the Rev. Hugh M'Neile, on the Life of Franklin. The result was a net sum of 150*l.* So unexpected and welcome an issue has led to the proposal of founding a Memorial of the philosopher, and to make this sum the nucleus of a subscription for the establishing of a pension or pensions bearing his name, in favour of indigent printers. It is proposed to found two pensions, if the funds will admit, one of 30*l.* for a decayed master-printer, whom misfortune has "reduced to the ranks," and one of 20*l.* for a decayed overseer who has served five years in an office with credit, or, failing any such applicant, a journeyman who has retained a situation for the same period—to be called the "Franklin Pensioners." Thus, as was observed by Mr. Murray, "each country will be put in possession of a new Memorial of Franklin: America of her citizen's Press, and England of an endowment bearing his name; directly resulting from the fact of his having worked at an English press; and in accordance with his benevolent and provident disposition." The above-named Lecture has been published, and the proceeds of the sale in England and America, and further subscriptions, will be added to the fund; and contributions, not only of the English public, but of the American nation and the Colonies, are confidently anticipated: in short, wherever an English press has been set up (for it has now become universal*) a collection should be made, and contributed to by all who feel that they are indebted to the printer's art for the intellectual enjoyments of social life. The name of FRANKLIN will ever be associated with that invaluable art, and his example serve to stimulate aspiring youth in the pursuit of its exercise. Many are they who have profited by his precepts; and his interesting Autobiography has served for a chart to the young adventurer by which to steer in the voyage of life. Let all those who have so profited—all who have attained success by following his course—look with compassion on those who have foundered or failed in the struggle with adversity. It is hoped at least that in every printing-office in the kingdom a collection will be made; and that every American residing in England will hasten to inscribe his name in so praiseworthy a record, in testimony of his approbation of the FRANKLIN MEMORIAL. The facilities of the post-office will enable every individual to contribute his mite, which will be thankfully received.

---

* So great has been the spread of the art of printing and the English press, that *one* manufacturer has, in the last 15 years, sent out upwards of 1500 presses to all parts of the world! If but a guinea were contributed by each of the respective parties, it would make a sum sufficient for the object proposed.

TO NURSERYMEN AND SEEDSMEN.

WANTED, by a Young Man of some Capital, who understands the business, a PARTNERSHIP in an Established Concern, where he can take an active part in its management.—All communications, through the post, to be addressed to A. B., No. 3, Grove Terrace, Kentish Town.

A FOREMAN WANTED.

MESSRS. VEITCH and SON are in want of a respectable and industrious person of good address, to act as FOREMAN in the Plant Department of their Nursery. He will have to take charge of and grow a fine collection of Exotics, Florists' Flowers, &c. &c.

N. B. An experienced Propagator is also kept in the same department.—Exeter, July 20, 1842.

WANTS a SITUATION as GARDENER, where one or more hands are kept, a Married Man, under 40, without family, who well understands his business. His wife, if required, can take the situation of Cook and Housekeeper. The most respectable references as to character and ability can be given.—Direct to J. K., Messrs. Noble's, Seedsmen, 152, Fleet-street.

WANTS a SITUATION as GARDENER, a highly-respectable Single Man, aged 32; he has lived in some of the first Establishments in the country for practical and general Gardening; can be highly recommended from the place he has just left, and his general conduct will bear the strictest investigation.—Direct A. B., 32, Soho-square, Oxford-street.

WANTS a SITUATION as GARDENER, a Married Man, without incumbrance; who thoroughly understands his business. His Wife will act as Plain Cook, Laundress, or Dairy-woman. Can have good characters from the place they have just left.—Direct to F. G., Mr. Taylor's, Gardener, Little George-street, Greenwich, Kent.

WANTS a SITUATION as GARDENER.—A Married Man, aged 37, of first-rate abilities, is desirous of obtaining a Situation in the above capacity; who perfectly understands the management of Pines, Vines, and Peaches, together with every kind of Early Forcing; also the Kitchen and Flower Garden; with the treatment of Wood Plantations. Can have the highest testimonials for sobriety and general conduct.—Address, if by letter post paid, to G. H., at Mr. Rohler's, Oilman, 1, Marylebone-street, Regent's-Quadrant.

WANTS a SITUATION as GARDENER, a Single Man, aged 26 years, who thoroughly understands his business in its various branches, and is willing to make himself generally useful; and can have a good character from the place he has just left, in or out doors.—Direct to S. W., Post Office, Edmonton.

WANTS a SITUATION as GARDENER, BAILIFF, and MANAGER, a middle-aged married Man, without encumbrance, who has had very great experience in Forcing, the Kitchen, Fruit, and Flower Gardens, the Valuation and Management of Timber and Growing Plantations, Farming, and the Valuing and Managing Estates, &c.; the Wife to manage the Dairy and Poultry, if required. An undeniable reference as to abilities and general conduct, from a family of the first distinction.—The Advertiser would be willing to contract for laying out Gardens on economical principles.—Address H. D., 52 Grosvenor Place, Pimlico.

FOR SALE, Four Years' "GARDENERS' GAZETTE," separately and neatly bound, for the years 1837, 1838, 1839, and 1840; edited by Mr. GLENNY. Also, the Works on "LANDSCAPE GARDENING," by the late Mr. REPTON; with Plans, &c. &c.; neatly bound.—For particulars address, post-paid, to "J. B., Mr. Low's Nursery, Clapton, Middlesex."

THE "ROYAL ESSENCE OF EGLANTINE" for the Handkerchief, is prepared only by Mr. WHITE, Chemist, 24, Cornhill, London, in bottles at 2*s.* 6*d.*, 4*s.* 6*d.*, and 8*s.* each. Where also may be obtained the "AROMATIC PUNGENT ESSENCE" so useful in Headaches, Fainting, &c., at 3*s.* each.

N.B. Public Offices and Merchants can be supplied with Postage Stamps and Envelopes in any quantity at Government Prices.

GARDEN NETS, FISHING NETS, SHEEP NETS, TENTS.—Net to protect Fruit from Wasps and Flies, 6*d.* and 7½*d* per yard: much approved. Fishing Nets, from 4 to 400 yards long, Drags, Sieves, Flues, &c. &c. Sheep Net, 4½*d.* per yard, 3ft. 6in. high: a strong, neat, durable fence, and one easily removed. Tents for Lawns, Gardens, &c., on a new principle, put up or taken down in one minute, 6ft. high in the lowest part, and 36ft. round, 5*l.*, plain or striped.—ROB. RICHARDSON, Net and Tent Maker, 21 Tonbridge-place, New-road, near Euston-square.

PORTRAITS by MR. CLAUDET'S INSTANTANEOUS DAGUERREOTYPE PROCESS, under the Patronage of her Majesty, are taken daily, at the ROYAL ADELAIDE GALLERY, Lowther Arcade, Strand. The sitting generally occupies less than One Second, by which faithful and pleasing Likenesses are obtained. The introduction of Back-grounds, representing landscapes, interiors of apartments, &c., is the invention of Mr. Claudet, for which he has obtained Letters Patent. Considerable alterations have recently been made for the convenience and better accommodation of Mr. Claudet's visitors. Portraits and Groups of Figures are also taken upon plates of an enlarged size.

ROSS'S WEATHER INDICATOR, or HYGRO-BAROMETER.—In this Instrument the influences of the Weight, Temperature, and Moisture of the Atmosphere are combined so as to indicate its real condition with greater certainty than has hitherto been attained by one instrument. It is constructed upon philosophical principles, and offered to the public as a ready means of ascertaining the actual state of the weather by mere inspection.

ANDREW ROSS, 21, Featherstone-buildings, Holborn, late of 33, Regent-street, Piccadilly.

SUN-BURNS, FRECKLES, TAN, and other Disfigurements of the Skin, prevalent at this peculiar season, are pleasingly eradicated by that unique preparation, ROWLAND'S KALYDOR, a balmy odoriferous liquid, and now universally admired for its sovereign virtues in completely removing all cutaneous eruptions, and in rendering the complexion delicately clear and fair. It is invaluable as a renovating and refreshing wash during travelling, or exposure to the sun, dust, or harsh winds, and after the heated atmosphere of crowded assemblies. Gentlemen will find it peculiarly grateful after shaving, in allaying the smarting pain.

CAUTION.—Ask for "ROWLAND'S KALYDOR," and see that these words are on the envelope, with their signature and address in red: "A. ROWLAND & SON, 20, HATTON GARDEN, LONDON;" the same are engraven on the Government Stamp affixed over the cork.

Sold by the Proprietors, and by respectable Chemists & Perfumers.

HORTICULTURAL SOCIETY OF LONDON.

NOTICE IS HEREBY GIVEN, that after August the 2d, the MEETINGS OF THE SOCIETY in Regent-Street will be DISCONTINUED till Tuesday, October the 4th, in consequence of the Meeting-room being under repair.

The Gardeners' Chronicle.

SATURDAY, JULY 30, 1842.

MEETINGS IN THE ENSUING WEEK.

COUNTRY SHOWS.—Aug 2, Tamworth. 3, Nottingham.

IN another column will be found the commencement of a translation of such parts of Professor Charles Sprengel's important Work on Manures as appear most suited to the objects of English farmers. In this country, everything relating to these matters is now judged of by the majority of people with reference to the views of Liebig; it has therefore become very desirable that the statements of Professor Sprengel, his immediate predecessor in that all important subject, should also be made known. A portion of Sprengel's work on animal manures having been already published in the Journal of the Royal Agricultural Society, Vol. I., we have selected his remarks on inorganic manures as the next in point of interest. While these papers will form a constant subject of interest to the more scientific of our readers, they will also, we trust, be found abundantly supplied with maxims of practical value, from which all who are occupied with the cultivation of land may learn something useful.

SOME time last year (p 449), we published a communication from Mr. Forsyth, Lord Shrewsbury's gardener, at Alton Towers, recommending the adoption of glazed pots for growing plants, in preference to the soft and rude pottery now employed. In our simplicity we saw nothing unreasonable in this proposition, which had the merit of enabling people to use vessels something handsomer than those with which even sitting-rooms are now disfigured. It certainly did appear to us that dirty earthenware is not more becoming to a gay flower than dirty boots to a gentleman; and that a well-selected flower-pot might be as advantageous to a pretty plant as a well-selected dress to a still fairer part of the creation. Little did we dream of the explosion to be produced by Mr. Forsyth's epistle; we had no notion that the ground was mined beneath our feet, and that a spark from Alton Towers would produce as much mischief as a shell in a magazine of combustibles. We soon, however, discovered our error. On all sides poured in remonstrances, advice, sneers, sarcasm, and indignation. In short, we found that we had been sowing dragons' teeth, and the crop that sprang up was like to devour us.

In all humility we suggested that Mr. Forsyth might possibly be right, that no apparent reason existed which could explain the disadvantage of glazed earthenware, and that facts at least were required to settle the question. "Facts!" cried an aged Andrew Fairservice; "why, man, I've been potting plants for more than half a century; I have invariably used soft burnt pots; and if that is not fact enough, I don't know what is." Mr. Fairservice did not, however, tell us to what purpose he had been employing his life in this ingenious occupation, nor did he produce evidence to show that the health of his plants could not be improved; indeed, as his letter bore the post-mark of Chelsea, we confess we entertained some doubt upon that point. Another worthy person wrote us a long epistle expressing his "decided disappointment and diametricle disapprobation" of Mr. Forsyth having so far forgotten what is due to "the most tallented proffesional men," as to recommend a system which "must do nothing but harm." A facetious gentleman favoured us with a copy of verses; and a melancholy man obliged us with a lament over the evil-mindedness of gardeners, who now-a-days were always trying some new-fangled scheme, as if nobody knew anything but themselves.

On the other hand, there were those who argued the matter like reasonable men, and defended the existing opinions in favour of soft glazed pots by an appeal to direct evidence. Among other things it was alleged that the coolness produced by the evaporation through the sides of unglazed pots was eminently salubrious to plants; and in proof of the amount of evaporation thus produced, the following extract from a journal of the late Capt. Dugald Carmichael, published in Hooker's Botanical Miscellany, was adduced:—"In some part of the island of Mauritius the soil is sufficiently plastic to admit of being manufactured into a sort of bottle called *gargoulettes*, which possess the inestimable quality of preserving water at a temperature many degrees lower than that of the surrounding atmosphere These vessels are made very thin, and without any glazing. They are accordingly so porous, that when filled with water it transudes in sufficient quantity to keep the surface constantly wet; and when thus exposed to a current of air, the evaporation from the outside maintains the contents of the vessel in a state of refreshing coolness."

Another correspondent wrote a letter from which the following is still worth extracting:—

"I have been a gentleman's gardener, and foreman in a nursery; am fond of growing plants, and against the use of glazed pots. My experience proves thus much: when hard-burnt or glazed pots have been intermixed with porous pots, and filled with the same soil and plants, placed in a house or out of doors in beds, I have always found that in hard-burnt or glazed pots the plants have never grown like those in porous pots, but have either died or grown weak. I have taken the sickly plants and turned them out, and have found their roots and the soil in a bad state; the soil has dropped away from the few weak roots, and has had a sour unwholesome smell, while those in the porous pots have had a good ball formed, were healthy, and the plants in a thriving state. I have taken those plants from the hard-burnt or glazed pots, and placed them on the potting bench to dry, in a short time repotted them in porous pots, with good drained soil, and treated them according to the season—they have recovered, and made good plants."

But now, at the end of a short year, what do time and facts say? Early in the autumn of last year, rumours began to prevail that plants, *mirabile dictu!* would grow as well in slate as in soft earthenware. Then came a story of a Mrs. Teabody, in Spitalfields, who had been growing a Geranium in a cracked and glazed teapot. with a hole in the bottom, and which had quite taken the shine out of her neighbours'. But these were only rumours. The slate was said to be very different from hard earthenware, and was, moreover, vaguely suspected of being in league with Mr. Forsyth in maintaining his heresy; the old lady's teapot was positively asserted to be no teapot at all, but a Wedgewood; for, said they, how *can* a plant grow in glazed earthenware, when Mr. Accum, the great chemist, in his "Death in the Pot," assures us that glazed earthenware is dangerous to both horse and man? Latterly, however, the outcry seems to have been dying away: the teapot is admitted to have been a Rockingham. and not a Wedgwood—Mr. Accum is no longer spoken of—and the possibility of plants growing in glazed earthenware is quietly admitted. And why? Because in March last Mr. Beck, of Isleworth, produced pots of slate, 6 inches square, in which Calceolarias and Geraniums had long been growing in the most perfect health; because the same gentleman, at the Horticultural Society's exhibition, placed on the table a most noble Fuchsia, whose roots had clung to the inside of the slate tub with as much affection as if it had been dear old pottery; and finally, because, at the last meeting of the Horticultural Society in Regent-street, specimens were exhibited of different plants that had been growing in glazed pots, made for the purpose, which were in all respects as healthy as if they had been prepared by our friend Andrew Fairservice, with the help of his fifty years' practice aforesaid; and perhaps more so.

It appears, then, at last, that we were right in patting Mr. Forsyth on the back, and that Mr. Forsyth was right in being so patted; and we will now add one thing for the peculiar edification of a certain class of Gardeners:—*He who can grow plants well in a glazed flower-pot is a good Gardener; and he who cannot, is a bad one.* This is not a bad test of a man's real value. Gardeners are like coin: there is much excellent and sterling metal current, but there are many counterfeits; you cannot ring a Gardener like a piece of silver; but you may try him by the experiment of the glazed flower-pot. which for him is just as good as for a guinea is the Mintmaster's assay.

IN a late Number of the "Bermudian," a paper published in the Bermuda Islands, we find the following observations, which we recommend to the notice of our country friends interested in emigration:—

"The want of labour in this country has become so palpable, from the inert habits, the unbearable indolence of the working classes, that it has become not only desirable, but absolutely necessary, to endeavour to remedy the existing evil, and meet the exigencies of the colony, by obtaining from abroad persons suitable for the agricultural and other departments of labour. To this end, the House of Assembly have been in committee during the week on that portion of His Excellency the Governor's speech relating to the introduction of white labourers; and we understand it is in contemplation to bring forward a bill for the encouragement of emigration to these islands from the mother country. We hail such a measure as fraught with real benefits to the colony—a measure identified with the interests of every industrious and well-thinking member of the community—and one which will materially assist in the agricultural and commercial advancement of these islands. Latterly the attention of a great portion of the inhabitants has been steadily directed to agricultural pursuits, and many have strenuously embarked therein; the results have been, it is pleasing to record. equal to, if not beyond, their expectation. But a barrier to progressive improvement—and an insurmountable one it will be, unless aid from abroad is called in—exists in the paucity of adequate labour, and the consequent high rate of wages. The planter, who at a considerable expense for hire, and an unusual amount of physical exertion himself, succeeds in putting his crop into the ground, finds, when it is ripe, a difficulty in procuring sufficient help to reap it and transport it to market; and there are instances when he has been forced to see the fruit of his exertions perishing before his eyes, owing to an inability, from the general lack of labour, to obtain the requisite aid for gathering it in. With facts so well authenticated, and so generally known, which might be easily multiplied, it needs no elaborate argument to point out the necessity of taking steps to promote, on an efficient plan, emigration to these islands. From the surplusage of Britain's population, a number of efficient labourers could be obtained, suited to our immediate and increasing wants; at the same time it would be laying the foundation of a sturdy, active, and industrious peasantry, for the assistance and behoof of the present and succeeding generations."

We will add that the Bermudas are perfectly healthy, and that the only evil to be guarded against is an indulgence in the use of spirituous liquors. They are an excellent station for sober, industrious people, but they are totally unsuited to persons given to drinking.

IN another column will be found a letter from a correspondent upon the subject of employing the manufacturing poor in draining land, an operation the immense importance of which every landlord is now acquainted with. We earnestly invite attention to this proposal, which, if carried into effect, would be extremely advantageous to the agricultural interest. and seems to be a good and practicable means of taking off some part at least of the pressure now so severely felt in the manufacturing districts.

WE beg to call attention to a report in another column of the proceedings of the yeomanry of Norfolk, assembled to promote a subscription for a monument to the memory of the late Earl of Leicester. No men are more able to judge of the real value to his country of this lamented nobleman than his neighbours and countrymen; who, like sensible men, have laid down their political feelings (would they would oftener do so,) and with one voice have expressed their admiration of his princely hospitality, his kindness as a landlord, his munificence as a gentleman, and his lasting services to his country as a promoter of agricultural improvements. Let us hope their appeal will be answered—not by the county, but by the country. We have monuments of generals and admirals—of poets and architects—of princes and kings;—may we now see a column higher than any of them to the memory of Thomas William Coke, Earl of Leicester, the model of an English country gentleman!

ON ORGANIC-MINERAL MANURES.—No. I.

By PROFESSOR CHARLES SPRENGEL (translated from the German).

UNDER the name of organic-mineral manures are comprised those materials which (as the name implies) are composed partly of organic remains and partly of mineral substances; thereto belong mould, mud, artificially-prepared compost, rubbish collected in the streets, the soil of sinks, &c. These organic-mineral manures are of great importance in agriculture.

1. *Mould.*—Mould is that kind of soil which occurs often in low lands, is very rich in humus, and at times contains some remains of plants. If the situation is not too damp, and if the higher grounds which surround it are composed of clay, argillaceous, marly, or calcareous substances, it generally possesses such superior qualities, that it can be immediately carried and spread as manure, inasmuch as, under the circumstances just mentioned, it consists of a mixture of earths impregnated with humic acid and other materials strongly promoting vegetation. If, however, this mould is accumulated in wet places, and the surrounding heights are composed of sand, it is, generally speaking, of such an anomalous composition that it will spoil any ground on which it may be carried, unless it undergoes some previous preparation, because in this case it contains much protoxide of iron impregnated with humic acid, and is, at the same time, very deficient in the earths combined with that acid, as well as in the saline substances which constitute a most essential nutriment of plants. The value of every sort of mould depends (as is the case with all substances used as manures) on its component parts. If it is, therefore, intended to form at once an accurate idea of the effect which this manure will produce, it is to be subjected to an accurate chemical analysis; especially the organic remains containing nitrogen are to be inquired into, inasmuch as its value will entirely depend upon their quantity—an analysis of which I have treated in my work on soils (Bodenkunde). The generally-received opinion however is, that any sort of mould is only in so far useful as it supplies the soil with a greater quantity of humus. I have already analysed several sorts of mould which were used as manures, and for the sake of proving what I have just stated, I subjoin the analysis of a mould which came from a valley surrounded by sand-hills,

and which, in its application, did not produce any considerable result.

100,000 parts of it are composed of—

52,910	,,	silica and quartz.
31,269	,,	humic acid.
10,200	,,	coal of humus and vegetable remains.
2,312	,,	alumine, combined partly with humic acid, but mostly with silica.
1,554	,,	protoxide and oxide of iron, combined with humic and phosphoric acid.
0,044	,,	protoxide of manganese, partly combined with humic acid.
0,632	,,	lime, mostly combined with sulphuric acid, but partly mixed with the coal of humus.
0,146	,,	magnesia, partly combined with silica, or mixed with the coal of humus.
0,870	,,	sulphuric acid, partly combined with calcareous earth, partly mixed with coal of humus and vegetable remains.
0,045	,,	phosphoric acid, combined with oxide of iron.
0,008	,,	common salt.
0,010	,,	potassa, mostly combined with silica, and traces of substances composed of nitrogen.

100,000 parts.

If an approximate calculation is made of the quantity of humic acid which is combined with the bases (alumine, manganese, and iron), it will be seen, that this mould contains at least 15,000 parts of free humic acid, acting as such. To this is to be added, that it contained neither humate of lime, humate of potass, or soda, nor any substance containing nitrogen; and another reason why it could not yield a good manure is, that it contained a quantity of humic protoxide of iron. Upon a Magdeburg acre of sandy soil, about 50,000 lbs. of this mould were carried, which was thus supplied with 15,680 lbs. of humic acid, 5,100 lbs. of coal of humus and vegetable remains, (manuring as soon as they are decomposed,) 316 lbs. of lime, 74 lbs. of magnesia, 435 lbs. of sulphuric acid, 22 lbs. of phosphoric acid (provided we assume that phosphate of iron in small quantities be a nutritive substance), 4 lbs. of common salt, and 5lbs. of potash. In this case it will be seen that it was merely the humic acid of this mould which was of any use, because the great proportion of gypsum was superfluous, and the other substances, in which the sandy soil operated upon was deficient, were contained in the manure in such small quantities, that they do not deserve to be taken into the account. This mould was therefore, as we said before, of very little use; so much so, that an additional quantity of common manure was required.

All those kinds of mould which are ascertained to possess superior manuring qualities, and which are found in low places, surrounded by clayey or argillaceous hills, are, on the other hand, composed of the following substances: 33 per cent. humic acid, 6 per cent. coal of humus, 9 p. c. alumina, 3½ p. c. lime, ½ p. c. magnesia, 2½ p. c. oxide of iron, ½ p. c. oxide of manganese, 42 p. c. silica and quartz or sand, ½ p. c. gypsum, ¾ p. c. phosphate of lime, ¼ p. c. potash, $\frac{1}{10}$ p. c. common salt, and 1½ p. c. organic remains containing nitrogen. From the quantity of bases here, it is clear that such kinds of mould cannot contain any free humic acid; they consequently act very differently from the last. At times good kinds of mould contain only 12-13 p. c. of humic acid, and 45-50 p. c. of sand.

Whenever mould contains a great quantity of free humic acid, it must, if it is to yield good results, be either applied to a soil containing a great quantity of free bases, or it must be mixed with loam, lime, marl, ashes, or dung, and left to remain in a heap for a long time, by which means those humates which are so beneficial to the growth of plants will be generated; otherwise the superabundance of humic acid will be detrimental to vegetation. But if the mould should contain much humic protoxide of iron, it must on no account be ploughed in soon after it has been spread, because, if left on the surface, the oxygen of the air will have time to change, by its contact, the protoxide into a peroxide. My own experience has taught me that a field may be spoiled for several years if such a sort of mould is not left on the surface for one whole summer at least. It is best, therefore, to use such mould for top-dressing pastures, as in this case we never need fear that it will injure the subsequent crops.

It would be superfluous for me to detail again in what manner the humic acid of the mould is beneficial to vegetation, as this has been stated repeatedly on former occasions. If it contain organic remains composed of nitrogen, they form by their decomposition nitric acid, which then, combined with the different bases, forms saltpetre, possessing powerful manuring qualities.

Mould improves, chemically, all sorts of soil, even that richest in humus not excepted, because it contains generally from 50-60 p. c. mineral substances, amongst which are, as we have just seen, some very efficient ones. The mould, or the humus contained in it, renders a clayey soil more light, whilst a sandy soil is made thereby more firm, and kept in a damp state. It is, consequently, especially adapted for soils that burn, in which it is often more efficacious than even dung. If the soil is light and sandy, you will make use of a mould somewhat clayey; if, on the contrary, the soil is clayey, a rather sandy mould is to be employed. The quantity which is to be brought upon a certain area is to be determined by the proportion of its chemical ingredients; and although it is assumed that so much mould is to be placed on a field, that the surface soil receives thereby 2 per cent. of humus, it is evident that, for the sake of effecting this with 100,000 lbs. per acre, a mould will be required containing 30 per cent. of humus; but as most sorts of it do not contain more than 15 p. c., 200,000 lbs. per acre will be required. It is the readiness with which mould can be had that will determine the quantity to be used; for every one will first calculate how much the conveying of so many cartloads, or thousands of pounds upon an acre, will cost, for the sake of seeing whether the advantage to be derived from it be proportionate to the outlay of carriage and labour.

The length of time during which the effects of the mould may continue, cannot be easily determined, as it depends on its quality and the quantity used. Large quantities improve the soil after even 20 and more years, whilst small quantities act but for a comparatively short time.

The most efficient mode is to carry the mould on such fields as are summer-fallowed, because in that case the most certain mixture with the surface is effected; which, however, is always much easier than by the manuring with clay, sand, or loam. Before the mould is ploughed in, it is to be well pulverised, which will have the advantage of causing the seed of weeds which may be contained in it to germinate, and of inducing the protoxide of iron contained in every sort of mould sooner to change into the oxide. It is this protoxide which produces the sharpness or acrimony which is so distinctly perceivable in some sorts of mould. It is also advantageous to scatter it in winter over growing rye, and then to harrow it in early in the spring, and roll it. The latter operation is, however, not advisable with a mould which is very light and rich in humus; such mould is better applied when the rye is a few inches long, otherwise it may be carried away by the wind.

If it contains a considerable quantity of vegetable remains undecomposed, it is always advisable to collect it at first into smaller, and then into larger heaps, for the sake of drying it, allowing it to decompose in that way for a year or a year and a half; and this will be still better accomplished if it be mixed with lime, marl, ashes, or dung, or concocted into compost, as I shall state immediately.

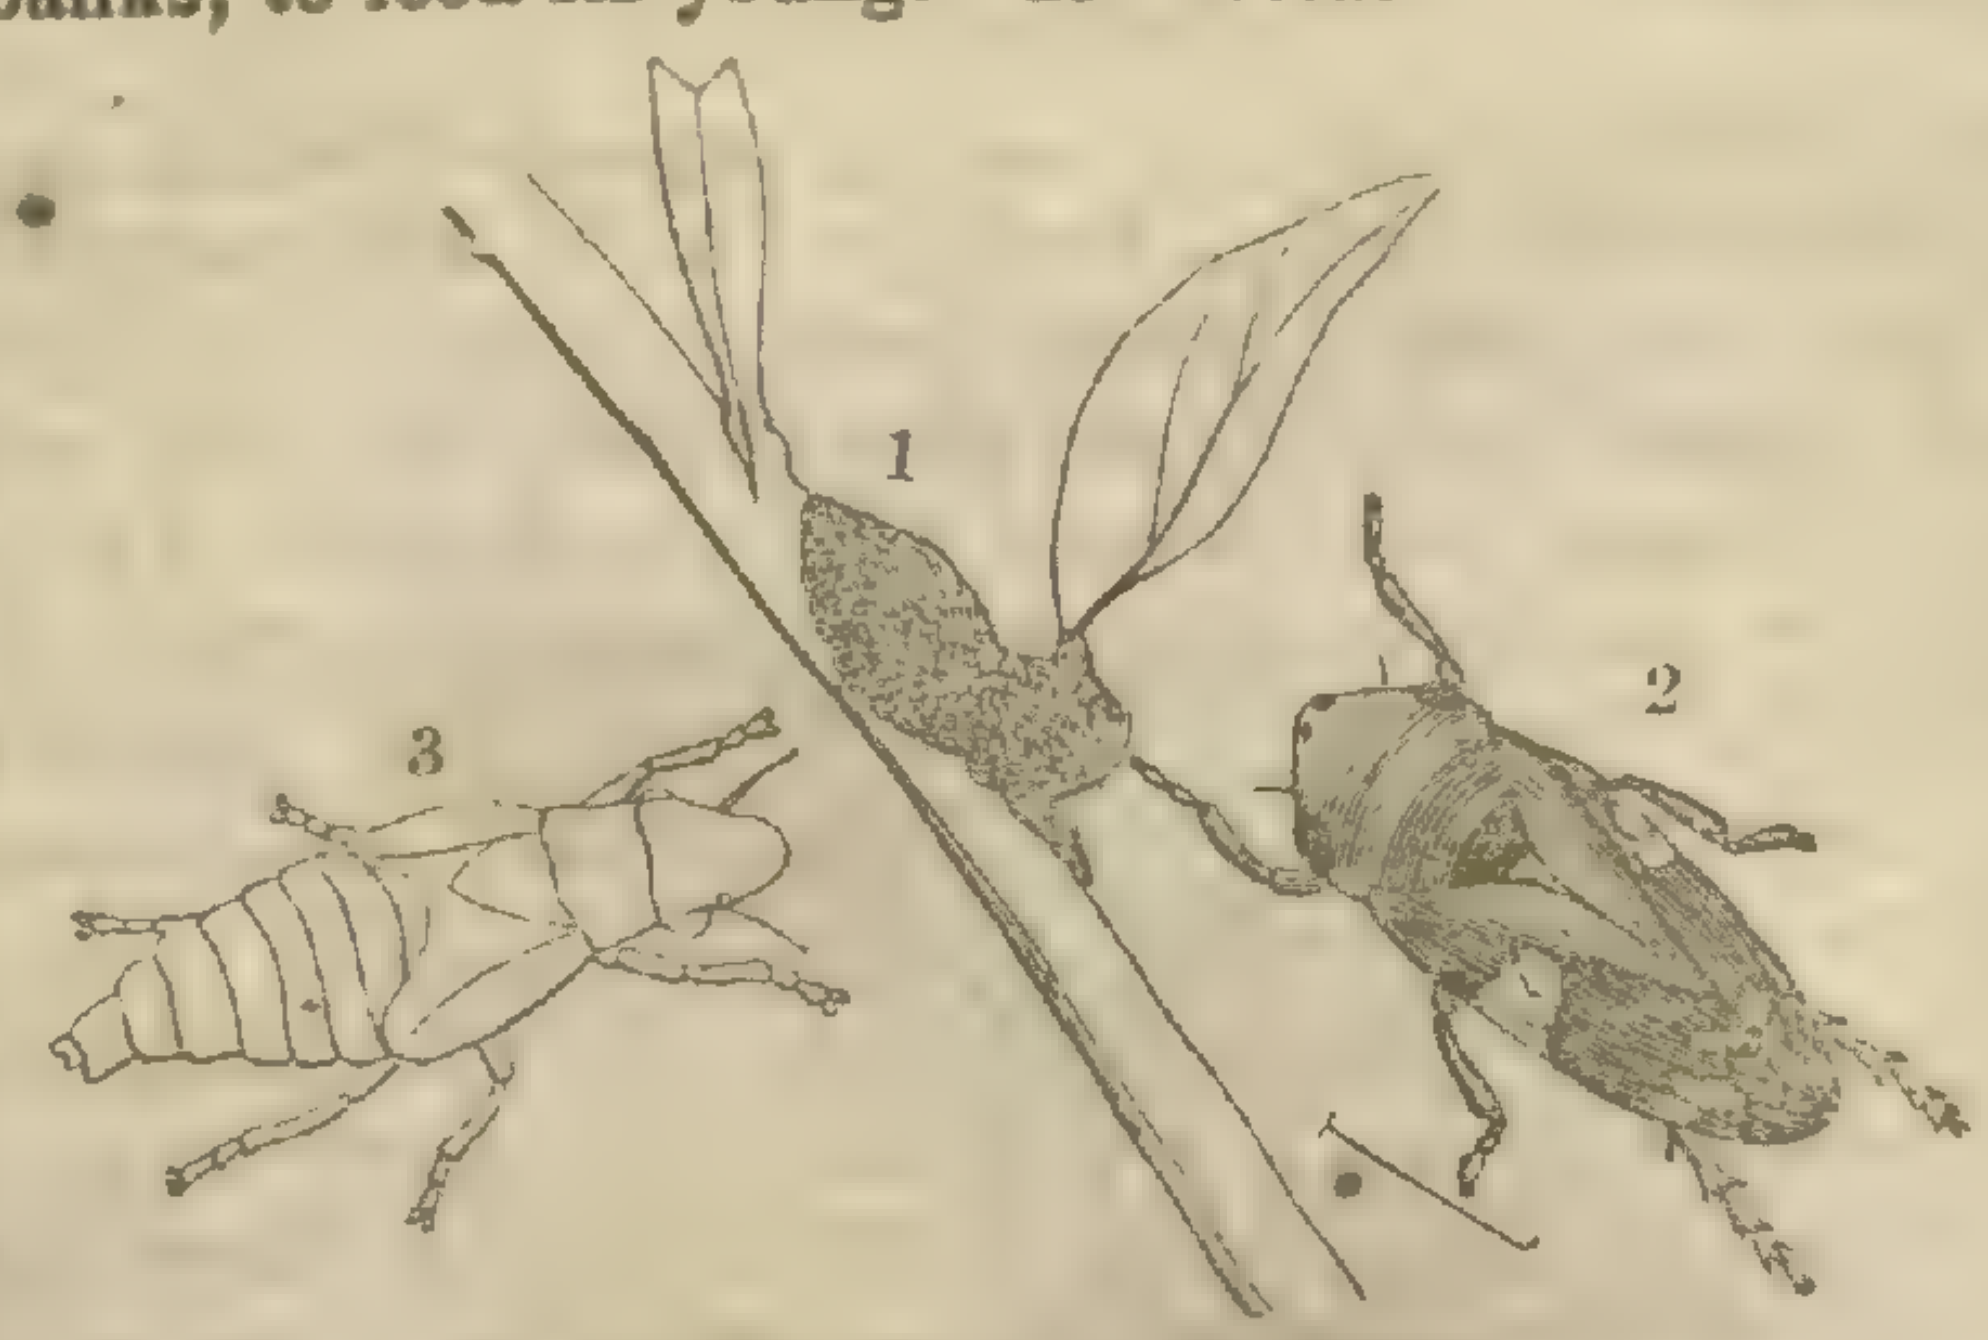
That mould or mud, in which there are many infusorial animalcules, will be very efficacious, is probable, but has not yet been ascertained experimentally. It may be expected that such mould will yield by its decomposition, either in heaps or strewed over a field, a certain quantity of sal-ammoniac or nitric acid; because infusoria, like other animals, contain a great quantity of nitrogen.

ENTOMOLOGY.—No. XXX.

TETTIGONIA SPUMARIA, the Froth-fly.—In April or the beginning of May, small patches of a white frothy matter (fig. 1) are first seen in our gardens upon the young shoots of various plants, and I have observed them much attached to Hollyhocks, Lilacs, Michaelmas Daisies, and Southernwood; they are not only unsightly and render flowers unpleasant to touch, but they are undoubtedly injurious to the growth of the plants. On removing the froth from the stalk, one or two small pale green larvæ will be found concealed in the midst, which shine very much, from the moisture which enveloped them, and they are able to skip away when disturbed; these little animals become by the middle of June, or earlier, as large as the object represented at fig. 1; they are at that time pupæ or shortly become so (fig. 2 mag.), when they are of a green colour with ochreous abdomens, and at the same time perfect. Froth-flies are often resting upon the various flowers surrounding the spot where they were bred; these keep increasing in number during the summer months, and do not disappear until September or October. When the perfect insect escapes from the pupa, it leaves amongst the froth a transparent horny case, which, like the true Cicada, is attached to the stem or stalk by its feet. About the beginning of August, multitudes are often paired on every plant, but when and where the female lays her eggs is still undiscovered, but most probably in the young twigs or buds which are formed to produce leaves the following spring. These insects are called Froth-flies from the secretion with which they cover themselves; this, no doubt, is the sap of the plant which affords nourishment to the animal in its different stages, the rostrum being thrust, as in the Aphides, into the stalk, and it seems to be ejected in the form of frothy matter, which at once protects their tender bodies from the heat of the sun, the cold at night, and the attacks of parasitic flies. This froth is also frequently termed cuckoo-spittle by country people, from its becoming conspicuous about the time when the cuckoo arrives in this country.

From the great variation in the colour and markings of the perfect insects, the supposed species have received different names; for instance, a black one with a white head and thorax is called by Linnæus Cicada leucocephala, another black one with white eyes is named C. leucophthalma, and a third has been described by Fabricius as Tettigonia capitata; they are, however, generally included by modern authors under the Linnæan name of the typical species, which is called T. spumaria, fig. 3; it is of a dirty yellowish white, thickly punctured and clothed with short depressed hairs; the head is somewhat triangular and broad, with an eye on each side at the base, and two minute ones called ocelli on the crown; the rostrum is rather long, extending to the coxæ of the intermediate legs, between which it rests in repose; the antennæ are terminated by a fine projecting bristle, which arises from two small oval joints inserted close to the inner margin of the compound eyes; the face has a black stripe down the centre, with several horizontal black lines radiating on each side, like a comb, and there are two black dots on the point of the forehead; the thorax and scutellum form a large triangular brown space, the fore part of the former being ochreous, and the apex of the latter, which is acuminated, is whitish; the ovipositor is received into a fissure beneath the apex of the abdomen; the wings, when at rest, are deflexed; the superior, called also elytra, are somewhat elliptical, with a few nervures, slightly reticulated at the apex; they are brown, more or less mottled with ochre, having four large whitish patches on the costal margin, the first pair being near the middle, the second pair towards the apex, and between these is a heart-shaped spot on the suture, and a smaller one near the tip; the inferior wings are ample, transparent and eridescent, with a few dark nervures, and suffused with brown at the base; the six legs are rather short, the hinder being the longest and formed for leaping; the hinder tibiæ have two spines on the outside, and the apex is furnished with a coronet of spines all tipped with black; the feet are triarticulate, the two basal joints being small in the four anterior, but long in the hinder pair, and margined with short black spines; pulvelli distinct; claws small and black; the line by the insect gives its natural length.

To suggest any efficient means of extirpating these insects, which one correspondent states "have committed great depredations upon the leaves of some young Peach-trees and Vines, planted this season in a Peach-house and Vinery," is not in our power; in the early stages some check might be given to their increase by cutting off and burning all useless twigs, &c., infested with the froth, and many more might be crushed or wiped off with the hand; when in their perfect state, as they skip off readily, they might, by lightly brushing or shaking the flowering plants over a bag-net, be easily collected into it and destroyed. One of the natural enemies of the Froth-flies is the Gorytes campestris,* a sand-wasp, which has been detected conveying the pupæ of T. spumaria into its cells, formed in banks, to feed its young.—*Ruricola.*



AMATEUR'S GARDEN.—No. XXXI.

EVERY possible means should be used to keep the leaves of Peach-trees on the walls free from the attacks of the Red Spider, which is so apt to increase during dry weather at this season of the year. The leaf is a laboratory in which the most delicate chemical operations are constantly going on, provided it is uninjured and placed in favourable circumstances; it not only assists in bringing the fruit of the present season to a state of maturity, but also sends down matter for the formation and nourishment of the leaves and fruit of the next year; which latter operation is commonly called the ripening of the wood. It is not the quantity of leaves which is so much required for fruit-trees, regularly pruned in spring; otherwise the "stopping" of Vines would be a very bad practice; but it is their quality—that is, each being sound and healthy, and able to perform its functions. If, therefore, the leaves of the Peach-tree are allowed to be injured by the attacks of the Red Spider, the wood is not properly ripened; and consequently the injury done is not confined to the unsightly trees and bad fruit of the present year. But if the leaves are to be kept in a healthy state, a remedy must be applied in time. Any application at present known is of little use, if not applied until the whole of the leaves are covered with the insect; for if even the spider is destroyed, the leaves will have been too much eaten to recover before the autumn comes on, when they must fall from the trees.

When the Red Spider first makes its appearance, the leaves ought to be well washed once in the morning, and two or three times in the evening, with the syringe or garden-engine. It is of no use merely to let the water fall upon them like a gentle shower, for the insects are under the leaves, and as safe as the amateur is under his shed or umbrella. The water must be sent under the leaves with considerable force, so as to break the webs and actually to wash the insects to the ground. Another remedy is the flowers of sulphur. Many gardeners seem to doubt that this is actually a check to them; but if it has ever failed, I think it must have been owing to the difficulty in applying it properly out of doors. It will be of little service if it is merely scattered on the surface of the leaves, for the reason which has just been given. A calm day should be chosen for the purpose, and the under side of the leaves as well as the upper, the stems, and the wall, should be well dusted over; and if the disease is not too far gone, there is little doubt that a cure will be effected. I would advise the amateur to look carefully after his trees, both in the house and out of doors, in time; and he will have no difficulty in keeping them clean by attending to the above directions. Those who may not know what the Red Spider really is, are referred to page 164, Vol. I., where it is figured and described.

Leaf-mould is of great service to the amateur for many purposes; and as the leaves are already beginning to fall, I would recommend him to sweep them up by themselves, instead of mixing them with the other rakings of rubbish;

---

* Curt. Brit. Ent., pl. and fol. 524.

and to lay them in a heap in the compost yard, where they will make excellent soil in a year or two.—*R. F.*

HOME CORRESPONDENCE.

Distressed Manufacturers.—The extensive circulation of your Paper induces me to ask you to give publicity to the following proposal; namely, that the distressed manufacturers might be greatly relieved by the agricultural body, in the neighbourhood of our great manufacturing towns, employing many of them in draining their farms. In that part of England they commonly fallow for Wheat; therefore here, before Wheat-sowing, they might well drain all their land by employing these people, under proper direction, to dig the drains, to break the stones, or cut the wood requisite to be laid in them,—and thus improve their land beyond anything they ever think of. Meadows and Grass land they may continue to work on till Christmas. Thus the present distress may be made the instrument of lasting improvement, and farms rendered nearly doubly productive.—*W.* 4.

On destroying Insects by means of Boiling Water.—I send you the following remarks on the utility of boiling water for the destruction of insects generally, in addition to those I made a few weeks ago on the destruction of the Otiorhynchus picipes. I have found it to kill effectually all such Beetles as feed on plants in the day-time; for instance, such as we so frequently see devouring the crops of Peas and Beans, as well as those which sometimes completely strip whole plantations of Raspberries of their foliage. Preparatory to using the boiling water, the ground between the rows of any crop should be raked fine; and when a little time has been allowed for the insects (which will have fallen off and made their escape during the operation) to re-ascend the stems, one person should shake the plants gently to dislodge them again, and throw them on the ground; another closely following and pouring a moderate quantity of boiling water over the whole surface of the ground about him. To destroy those that feed in the night, and secrete themselves in the earth during the day, it will be necessary to prepare the ground as before, and make drills or small furrows near the plants, and fill them with tanner's bark, bruised bean-stalks, or aught else that would afford concealment to the insects; and in the day-time to pour boiling water over them, which will effectually destroy them, without injury to the plants, even should a moderate quantity fall on the stems. The Black Beetle which feeds on ripe Strawberries may be destroyed in the same way, by forming traps in the paths. The Woodlouse and Earwig, which often prove injurious to wall-fruit, may be successfully destroyed, by first making drills in the earth close to the wall, &c., providing a cover for them of the materials mentioned above, and then by applying hot water in the day-time. This should be done before the fruit is ripe, although it may be performed after; for the insects may be dislodged by carefully stirring the clusters of leaves, and gently sponging the branches among which they are lurking; and when they have retired to the hiding-place provided for them, the boiling water may be applied. To destroy woodlice in Cucumber and Melon frames, pits, &c., make traps, as before, round the sides; place over them here and there a few leaves, in order to induce the insects to feed and lodge there, and then scald them. Hot water may also be used with advantage in frames and pits when the old Melon and Cucumber plants are cleared away in the autumn, and in the forcing and plant houses when the Vines, Peach-trees, &c., are pruned, and the plants in general are regulated. Everything—walls, frames, bark-pits, earth, &c.—should then be watered copiously; and thus the red spider, thrip, aphides, cocci, &c., which may have been shaken from the trees and plants, will be totally destroyed, and their future depredations prevented. Ants are supposed by some to be useful in destroying the aphides. This, I think, is erroneous, for when they are seen wandering over the plants, they are in search of the excrementitious fluid ejected by the aphides or cocci. When, therefore, they prove troublesome in gardens, boiling water will be found to be the best remedy for them. The water should be poured into the nests, after making holes in the latter with a pointed stake, to enable the water to spread the more readily, and so do the more execution.—*Joshua Major, Landscape-gardener, Knosthorpe.*

Bees.—Having seen many methods of taking honey mentioned by correspondents in the *Chronicle*, I beg to recommend the following, which I have practised with success. Choose a dark shed, not far from the hive, and make an aperture in the roof, by removing a tile. When you wish to take the honey, go in the middle of a warm day (being well protected), and take away the box required, with which go immediately to the shed. Set it down, and shut the door; when the Bees, being confounded by the darkness, will quickly leave it.—*A. Thaxter, Norwich.*

Bees.—Will the author of "My Bee Book," or any of your correspondents who understand the management of Bees, have the goodness to answer the following question?—Will Bees not work in glasses on the top of the hive after they swarm? Last spring, some Bees which I have in a common straw hive were very strong, and swarmed in April, and a second and third time early in May. As the hive was very heavy in June, and as the Bees seemed again getting numerous, I placed a glass upon the top of it, but they do not work in it; and at the present time they are hanging out in great numbers at the mouth of the hive. Before putting on the glass, I washed it over the inside with sugar and beer, to make it more enticing, and have kept it quite dark; but they do not seem inclined to have anything to do with it.—*A Cottager.*

The House-fly.—A correspondent (p. 470) requests information as to the appearance of the house-fly and other insects in different localities, as there is a scarcity of them in his neighbourhood. With respect to the house-fly, they are not less numerous than usual here. With two species of the common white butterfly (Pontia Brassicæ and Rapæ) my garden is actually besieged, and I anticipate your correspondent H. B. has seen enough of them ere this. Those which are now so numerous, are the produce, *ab ovo*, of those which he observed in the spring months. Moths have been plentiful, especially some of the Noctuidæ, such as Triphæna pronuba and inuba, Mamestra Brassicæ and oleracea, Xylophasia polyodon and lithoxylea, Agrotis exclamationis and segetum; but that detestable little moth, Botys forficalis, has been particularly abundant: the larvæ of it spin a kind of web in the heads of Cauliflower, Broccoli, &c., and it is almost impossible to wash them out. Wasps are also pretty numerous.—*C. M., Clapham.*

The Sting of a Bee.—As a late *Chronicle* mentions ammonia or hartshorn as an effective remedy against the sting of the wasp, I beg to add that a few drops of laudanum have proved efficacious in allaying the pain from the sting of the Honey Bee, by being rubbed on the part affected for a few minutes, when hartshorn or spirits of ammonia did not produce the effect required.—*N. S. Hodson, Bury St. Edmunds.*

Florists' Flowers.—On looking over your opinion of florists' flowers among the Notices to Correspondents, I have often been disappointed at not finding the raiser's name mentioned; or if his name is given, the flowers are only numbered instead of being named. This is really unpleasant to a person who is anxious to purchase all the best varieties, as he can have no idea in what quarter they are to be found; whereas, if the name both of the raiser and flower were given, he would know how to act when they were advertised. If the opinion were unfavourable it would be useful to your readers, as every one is sure to send his best seedling for judgment; therefore, if the flowers sent were very bad, he would have none worth purchasing. Nothing appears of more importance to the trade in florists flowers than to have the character of seedlings fixed by some impartial person, whose judgment can be depended upon; for it is discouraging to be told that to obtain the best new flowers of any tribe, he must purchase as many dozens of them as there are growers. It would be more to the honour of the florist, and eventually to his interest, to select one or two of his best seedlings, and send them out at a fair price, if really good, than to associate them with ten inferior flowers, and sell them at a price which, though not large, if the whole twelve were first-rate, makes the good ones very dear, when the others are thrown out. A neighbour told me this spring, that he had ordered several dozen Pansies last year, from seeing advertisements, and that he had paid from 2*s.* 6*d.* to 15*s.* each for them; when they bloomed he could not have sold them for as many pence as they had cost him shillings. I told him that if they were really as bad as he stated, that I would not pay for them. True, said he, but the men requested a post-office order from unknown correspondents, and you know the old adage about "butter and the dog's throat."—*T. R. Pearson, Chilwell.* [We do not intend to alter our practice with florists' flowers. If they send them to us, we tell *them* what they are good for; and if they propagate them for sale, they have our character to rely upon. It is the business of the growers to make their flowers known in our advertising columns, where everybody looks for information upon such points.]

New Fuchsia and Pelargonium.—At the July meeting of the Horticultural Society of Newcastle-on-Tyne, a splendid new hybrid Fuchsia, raised by Mr. Deans, gardener to Miss Cuthbert, Benwell, and named F. Deansii, was exhibited, and was an object of universal admiration, for which an honorary medal was awarded. It is a cross between F. globosa and F. fulgens, but partakes more particularly of the character of F. globosa; although it wants the globular-shaped blossoms peculiar to the latter. The habit of F. Deansii is drooping, and its graceful branches are thickly covered with long elegantly-formed blossoms of a deep scarlet colour. It appears to be of vigorous growth, and is a remarkably free bloomer. Among this charming tribe of plants it is one of the most interesting varieties that has yet been produced, and will be a great ornament in the best collections of its now very numerous family. At the same time there was also exhibited a large plant of a seedling Pelargonium, raised by Mr. Adam Hogg, nurseryman, near Newcastle; which has been named Anne Clayton. The form of the flower is first-rate; and, as a variety in the class of light grounds, it will be readily admitted into choice collections. The lower petals are a fine delicate pink colour, with a slight rosy tinge towards the edge; and the upper petals are nearly covered with a beautiful velvet black spot, finely fringed with rosy pink. An honorary medal was awarded to it; and, whether in the greenhouse or the window, it will be a very striking flower.—*T. L.*—[We state this entirely upon the authority of our correspondent.]

The Culture of the Ranunculus.—Dr. Horner's excellent instructions for growing Ranunculuses, I doubt, are not correct in one point. Being of the same opinion, that the lowest part of the garden would be the most suitable for a plant loving moisture, I have repeatedly shifted our bed to the lowest part of the garden here, which is very steep, but found they always spindled, and grew weaker than in the more elevated portion. I imagine there is something Alpine in the nature of the Ranunculus; the best grower of that flower in this quarter has his garden on an elevated knoll. The directions to take up as soon as ripe, before a second growth commences, are very essential, and the bed cannot well be made too rich of manure well rotted, and close to the roots, and made up in autumn to consolidate. Early planting is generally best, though sometimes they are hurt by frost in our cold climate. Too deep planting is very injurious; if the roots are surrounded with sand, it keeps them fresh and sound. They are here planted rather closer in the row than he recommends; the shade of the foliage is beneficial to keep out drought. They are very apt to go back in the flower, and get yellow in the leaves, and ripen off without flowering, if very dry sunny weather ensues in May. Watering rather does harm unless the surface of the ground is covered with moss, or the bed shaded. This last, however, is apt to draw them up weak in the stem; the elevating of the shade, so as to allow the air to blow freely about them, helps this in some measure.—*R. Lymburn.*

Pink Pipings.—A very good way of making Pink pipings is one I have first seen practised by Mr. Aitkin, of Lanfine Gardens, and differs a little from the more customary way recommended by "T. R." The terminal joint alone is retained, the piping is pared close to the joint, and the leaves are pared off quite close to the bud. The cutting is thus a mere eye or growing point, and having but little surface to evaporate, it seldom fails, if the situation is warm, to keep up the excitement of growth. Vitality is most active in the terminal joint, and the roots are soon protruded, the activity of growth making up for the want of a reservoir of food in the stem. If well watered and covered with a hand-glass, they need no shading; the greater the force of the sun the better; and this method is generally more successful than the other, which often fails in dry weather.—*R. Lymburn.*

Hardy Annuals.—I have made out the following list of hardy annuals, the greater portion of which I have seen in flower during the present season. Being anxious, however, to increase the collection to about 50 varieties, I should be obliged if some of your correspondents would supply me with the names of any new annuals possessing desirable qualities which they may have seen in flower, and also what annual varieties of the Campanula and Lupine are worth growing. Those which I possess are Eútoca multiflora, Platystemon Califórnicum, Nemóphila insignis, N. atomaria, Gilia trícolor, G. capitata, G. grácilis, Collínsia bícolor, Limnanthes Douglasii, Calandrínia speciosa, Anagallis indica, A. carnea, Erysimum quadricornu, Bartonia aurea, B. albescens, Campanula Lorei, C. punctata, C. hispidula, Leptosiphon densiflorus, L. androsáceus, Fedia cornucópiæ, Hugelia densiflora, H. lutea.—*A Constant Reader, Birmingham.*

Fuchsia fulgens.—In the *Chronicle* of the 16th, D. Gellatly has stated that the Fuchsia fulgens dropped its flowers when watered with liquid manure. I shall be obliged to him, or any other correspondent, to inform me whether they have succeeded in flowering Fuchsia fulgens in pots plunged in the flower border during summer, without shedding its flowers.—*A Subscriber.*

Awards of Judges.—We have received a very long letter from Mr. William Barnes, one of the exhibitors at the garden of the Horticultural Society this summer, complaining of the awards of the judges in the matter of Heaths. By the printed regulations of the society, it is directed that Heaths shall be exhibited in collections of twenty species. Mr. Barnes complained to the Vice-secretary of the society, that at the June meeting he complied exactly with this regulation, but that the principal medal was given to another exhibitor, although he did not comply with the rule; and Mr. Barnes says various things respecting this affair, the meaning of which is, that he thinks himself an ill-used man. We find upon inquiry that this statement of Mr. Barnes was laid before the judges, who answered that the allegation was true; but that neither Mr. Barnes nor anybody else complied with the rules, and that as Mr. Barnes' plants were badly grown, the judges gave the medal to the best case of cultivation. In our opinion this is a bad answer; and the judges were not justified, under the circumstances, in awarding the medals to any one; at all events, it is clear that Mr. Barnes has nothing to complain of, although the society has. He, however, asserts that this statement of the judges is not true, and he forwards us what purports to be a list of the Heaths he did exhibit both in June and July, to prove himself in the right; asserting always that the twenty Heaths he exhibited were so many distinct species. We are too much accustomed to the unreasonable complaints of disappointed exhibitors to regard their assertions with much consideration, but we confess we were not prepared to find a man disproving his own assertions so coolly as Mr. Barnes. In his June list, we see among his twenty Heaths *Perspicua* and *Linnæoides*, which are the same species; *Humeana* and *dilecta*, both of which are varieties of *E. fastigiata*; and *gemmifera* and *Massoni*, which are varieties of each other; so that in June he had only seventeen instead of twenty species. In July he had, he says, *E. densa* and *ventricosa*, both the same species; and *Westphalingia* and *translucens*, varieties of each other, thus making eighteen instead of twenty. And yet he contends that he complied with the regulations! We have at present assumed that Mr. Barnes's Heaths were rightly named, and really what he calls them; but we fear he has some mistakes among them, for most assuredly we ourselves saw *E. tricolor* twice over in the collection exhibited in July. Such does not, however, appear from the list he has sent us, to have been the case.

The Confusion of Botanical Terms.—What a nice philosophical instrument that same Dog-Latin is! Why, it has actually 14 words, or 54 syllables, besides many others designated by *alias* (as you informed us in your last number), for the name of the Hawthorn. What a rich superabundant language! No doubt science must flourish under such a system. And then to think of the impenetrable mystery thrown over Botany and Gardening, by the well-contrived and artful mispronunciation of gardeners; who talk Latin and Greek, in fact, but they might as well talk Chinese. Pray proceed in the good work you have begun, and continue to write in favour of it, without losing time; for I can assure you there are a few (I am happy to say, only a few yet) intruding wretches who would much wish to understand Botany and Gardening, though their Latin education has been entirely neglected! I cannot speak of such presumption with any patience. I wish I had the same means that you have, and I would write them down. I trust you will do your best to baffle them.—*Erica Arbūtus.*

Magazin Botanique.—In a late *Chronicle*, a week or two back, I observed, in an article headed "Signs of the Times," the opening of a shop in Clifford-street, by Mr. Harding, who styles himself "Marchand de Bouquets!" I am rather surprised that you did not notice at the same time the Magazin Botanique, opened at No. 3, Maddox-street, by a Mr. Julien; who, I am told, is a very celebrated musician—a rather odd mixture of professions. Although the announcement over the shop would lead any person to suppose that there was a Botanical collection to be seen inside, it is, however, no more than the shop of another Marchand de Bouquets.—*Argus.*

The Seeds of the Laburnum.—Seeing in your Paper of the 16th inst., under the head of Laburnums, and signed *H. C.*, a statement to the effect that neither the wood, bark, nor leaves of the common Laburnum are injurious to cattle, because, forsooth, his cows and sheep got into his plantation, and eat some of his Laburnums, which he found rather to improve their health than otherwise; to which he adds, "the seed, I should say, is not injurious;" I beg to differ with him on this point; for I look upon the seed of the Laburnum to be a deadly poison. Two or three years ago, three of my children ate some Laburnum seed; they soon after became very ill, and seemed to have lost all power of their limbs; and it was only by timely aid and the administration of strong emetics that they recovered. The medical gentleman in attendance stated, that if they had eaten a greater quantity, or had not been promptly attended to, the cases would have been serious. It is to caution parents and others not to allow children to run into such danger that I state the above fact. No good or intelligent agriculturist would think of running such a risk with his cows or cattle; and I fear *H. C.* must be a very young stockmaster.—*W. T.*—[Our correspondent does not seem to understand the question to which *H. C.*'s answer applies. In an article on Familiar Botany (p. 347), the seed of the Laburnum was shown to be poisonous to man; but it was a question whether animals are affected by it in the same manner. To this *H. C.* answered, no; and what proof has *W. T.* that he was wrong?]

Management of Vines.—I expected to have seen in the *Chronicle* a defence of the present "management of Vines," against the sweeping doubts entertained of it by a "Tyro," who seems to intimate that we are as little directed by reason in stopping the shoots, as the animal from which the practice is said to be derived; it is of little consequence to the growing crop, whether the shoots are stopped at the bunch or allowed to run several joints beyond it. I have seen excellent crops obtained by stopping the shoots with the point of a penknife, as soon as the embryo bunch could be discerned, and by never permitting any laterals to remain; so that there is no criterion for a guide. I am convinced that both systems have their advantages: first, by allowing more leaves to remain, greater shade is afforded to the fruit, which is not so liable to shank; secondly, the greater portion of light which close stopping admits to the wood, renders it better fit for another year's office. Surely five or six leaves, which by their colour, size, and texture, show that they imbibe the juices of the Vine, and deposit them in the wood required to be perfected, are far preferable to a host of leaves excluded from the influence of light and air, and decorating a lot of brushwood which must be removed in the winter-pruning. I have frequently, when training up a young shoot to replace a spurred rod intended to be removed, remarked it, though at first weaker than shoots stopped above it, eventually to become the strongest; but it is a problem with me, if the others were allowed the same liberty, whether it would have had the advantage. I have likewise allowed all the laterals to remain upon some shoots, and have chosen others upon Vines of equal strength from which every lateral has been removed; and I never found the wood of the latter to be smaller or less firm than the former, but the buds were more prominent and more easily excited the next season. I am no advocate for much syringing, but I think it would be injurious to a Vine, and produce "elongation rather than growth," besides being at variance with its natural habits, to keep it always in such an atmosphere as would prevent the breeding of the Red Spider in a forcing-house, heated with common flues, and where French Beans and Strawberries were growing. Until "Tyro" can produce facts, by allowing his Vines to ramble at pleasure, and prevent the attacks of that little pest by the means he proposes, I am afraid he will get few to abandon a system of which experience has proved the necessity.—*Vitis.*

The Beech.—I do not find my Beech-hedges or trees act injuriously on plants around them, or otherwise exert a baleful influence. The opinion of your correspondent, I presume, belongs to the class of antipathies which involves the Berberis.—*J. Murray.*

Newsome's Princess Royal Strawberry.—I perceive that Mr. Morris, as also yourself, have made some remarks respecting Newsome's Princess Royal Strawberry, which bear hardly upon Mr. Newsome, and do not appear to be strictly just. Mr. Morris cannot expect his plants to bear extraordinarily fine fruit the first year; and he must be decidedly wrong in stating that they have proved nothing more than the Elton, as the fruit, when perfectly ripe, is darker, and of a different flavour. Mr. N., for whose veracity I can vouch, assures me that he never had a plant of the Elton Pine in his garden; and therefore his seedling could not have been impregnated by that variety. I should consider that Mr. Newsome is justified in considering a seedling plant to be a new kind, when raised from seed of his own growing, and when the fruit is of such fine quality, flavour, and size, as the Princess Royal has proved to be, even though it bore some resemblance to an old kind. I can only say that the fruit in 1841 was truly gigantic in size, and that twelve of them, as Mr. Newsome states, weighed 1 lb.—*T. S. Brooke, Dewsbury.* [We beg to repeat that we have offered *no* opinion upon this subject. We know nothing about the Strawberry in question.]

Myatt's Strawberry.—So much had been said about the difficulty of cultivating Myatt's Pine, that it was my intention of stating, through the *Chronicle*, how well mine had succeeded with no other attention than that given to other kinds. Last August I procured some runners, at a time when the ground was wet, and in very bad condition for making beds for tender Strawberries. However, they must of necessity be planted, and towards the middle of October all the plants were putting forth flower stems; these I pinched off. The following spring the beds were raked, and the surface loosened and cleared of weeds; and in due time indications of a most abundant crop were very manifest. But in the midst of my expectations the plants suddenly began to droop, the flower-stems to drop off, and other symptoms of death made their appearance. The cause of all this was the maggot of the Crane fly, which came in such numbers as to be the destruction of almost all the plants in my garden. Yet, had it not been for this pest, I make no doubt that I should, with this ordinary treatment, have had an abundant crop of this delicious Strawberry; half the plants were quite killed. My soil is good, but of a very strong adhesive nature. The rest of the plants are looking healthy. —*Discipulus.*

Watering Cabbages, &c.—In transplanting Cabbage Plants, Broccoli, &c., it is generally the practice, in dry weather, to water them frequently; which I think does them more harm than good, as it only tends to harden the ground round them, as well as to cause unnecessary labour. The method I pursue is this: After I have opened out the holes in which the plants are placed, I pour a liberal supply of water (say about two quarts) into each hole; and after planting I never give them any more, even in the driest weather. My plants, so treated, have always succeeded perfectly well.—*M. N.*

Preparation of Manure.—It might perhaps be a useful addition to your instructions on the preparation of manures, to recommend a covering, open at the sides and ends, to throw off heavy washing rains and excessive heat of the sun. If the manure heap is kept moist, not wet or dry, it will be soonest fit for use; and if kept cool by shading and turning frequently, there will be less loss than is generally anticipated. It has not yet been proved that if carbonate and humate of ammonia are once fairly buried in the soil, and the soil kept in a moderately moist state, there will be much loss. The experiments of "J. R. L.," formerly recorded in the *Chronicle*, did not give a fair chance to the most volatile agents, as the whole were spread on the surface.—*R. Lymburn.*

PROCEEDINGS OF SOCIETIES.

ROYAL SOUTH LONDON FLORICULTURAL SOCIETY.

July 26.—This, the second exhibition in the Surrey Gardens for the season, was numerously attended; and the display of flowers, particularly of Carnations and Picotees, remarkably good. The winning stand of the latter exhibited by the Rev. A. H. Matthews could scarcely have been excelled, and many of the other stands were not far behind it in merit. The cut Roses sent by Messrs. Lane and Paul were uncommonly good; the collection of the former was very extensive, and was accompanied by several plants of their new seedling Fuchsia. Some of the collections of plants were highly creditable. Amongst those sent by Mr. Clark, gr. to F. Smith, Esq., were well-flowered plants of Crówea saligna, Polýgala oppositifólia, Ixora coccínea, and several Ericas. Mr. Atlee exhibited a pretty specimen of Burtónia conferta, Erica Savileana, and E. Ewerana superba. The principal objects in Mr. Jackson's collection were the Ericas, amongst which the varied colours of E. princeps, E. jasminiflora alba, E. Savileana, and ventricosa superba contrasted well; with these was Calceolária Willmoreana, of the same colour as C. Standishii, and marked much after the same manner, but decidedly superior to it in point of shape. In Mr. Pawley's collection were two well-grown plants of Manéttia cordata, the beautiful vermilion Erica cerinthoides, Oncídium flexuosum, and the singular Cypripédium insigne. Mr. Catleugh had several pretty varieties of Fuchsia, particularly F. róseo alba, of a delicate flesh colour; Helichrysum proliferum; a large plant of Leschenaúltia formosa, and a handsome specimen of Gardóquia Hoókeri. Mr. Townley exhibited Stephanotis floribundus; a well-flowered plant of Nerium splendens, and Jasminum gracile. From Mr. Bushell were Fuchsia fulgens, Maurándia semperflorens, and a large specimen of Gomphocarpus fruticosus in full flower. The seedling Picotees that were placed were:—from Mr. Headley, No. 1, light, red edge, named the Duchess of Cambridge, which promises well; the bloom was not fully developed, but the form is good, the petals even, and the white very pure; it has a fine pod, with plenty of petals to form a crown. No. 2, a light-edged red; 3, heavy-edged purple; 4, light-edged red; 5, a very pretty rose-edged Picotee from Mr. Gaines. A bloom of Twitchett's Fair Rosamond was exhibited; being a Picotee with a distinct rose-coloured edge: it is rather too much barred, but possesses a fine petal, with a pure white ground. A puce-coloured Dahlia, called Redgauntlet, was shown by Mr. Mountjoy, a good-sized flower, of fine properties, and though it does not differ in colour from many others, it is so well formed that it will become a favourite with exhibitors. A very fine white was also shown by Mr. Brown, of Slough, called White Tower; a good sized flower, round, with good depth of petals, and is decidedly an improvement upon the white varieties now in cultivation. The extra prize (a Linnean medal), for cut indigenous plants in flower, given by W. Iliff, Esq., was won by Mr. Coates, to whose collection the Linnean class and order of each plant were attached. The following is the award of the prizes:—CLASS THE FIRST, *Amateurs, members only:* FOR THE BEST 12 BLOOMS OF WHITE-GROUND PICOTEES: *Gold medal,* Trip to Cambridge, Waine's Queen Victoria, Sir R. Peel, Miss Annersley, Princess Augusta, Sharpe's Hector, Burroughes' Sylph, Lady Dacre, Lady Penn, Duke of Wellington, Green's Victoria, and Vespasian, Rev. A. H. Matthews; 2, *large silver do.,* Mr. Headley; 3, *middle silver do.,* Mr. Barnard; 4, *small silver do.,* Mr. Edmonds. BEST 12 BLOOMS OF CARNATIONS: *large silver do.,* Mr. Headley; 2, *middle silver do.,* Mr. Dowler; 3, *small silver do.,* Mr. S. Smith. BEST 24 VARIETIES OF HEARTSEASE: *large silver do.,* Mr. Brydges; 2, *middle silver do.,* Mr. Bawtree; 3, *small silver do.,* Mr. Fyffe. BEST COLLECTION OF CUT FLOWERS: *middle silver do.,* Mr. Bushell; 2, *small do.,* Mr. Rowley. BEST COLLECTION OF MISCELLANEOUS PLANTS: *large do.,* Mr. Towley; 2, *middle do.,* Mr. Bushell. CLASS THE SECOND: *Gentlemen's gardeners:* BEST COLLECTION OF MISCELLANEOUS PLANTS: *Gold medal,* Mr. Clark, gr. to T. Smith, Esq.; 2, *large silver do.,* Mr. Atlee, gr. to H. Beaufoy, Esq.; 3, *middle do.,* Mr. Pattison. ERICAS: *middle do.,* E. Templeæ, princeps, Parmentieri rosea, eximia, ampullácea, Massoni, infundibuliformis, tricolor, Shannoniana, and various others, Mr. Wilson. BEST COLLECTION OF COCKSCOMBS: *middle do.,* Mr. Scorrer. BEST 12 BALSAMS: *middle do.,* Mr. Doran, gr. to T. Hawes, Esq. BEST COLLECTION OF ROSES: *middle do.,* Mr. Foster; 2, *small do.,* Mr. Parsons. BEST 12 CARNATIONS: 1 and 2, Mr. Embleton. BEST 12 WHITE-GROUND PICOTEES: *middle do.,* Mr. Embleton; 2, *small do.,* Mr. Hancock. BEST 24 HEARTSEASE: *middle do.,* Mr. Hancock. BEST COLLECTION OF CUT FLOWERS: *large do.,* Mr. Bruce; 2, *middle do.,* Mr. Bourne. BEST 4 SORTS OF FRUIT: *middle do.,* Mr. Parsons; 2, *small do.,* Mr. Atlee. BEST BASKET OF GRAPES: *middle do.,* Black Hamburgh, Mr. Atlee. BEST 6 SORTS OF VEGETABLES: *middle do.,* Mr. Gooderham, gr. to — Hemming, Esq., of Brixton; 2, *small do.,* Mr. Bourne. CLASS THE THIRD: *Nurserymen, Market Gardeners, and Florists:* BEST COLLECTION OF MISCELLANEOUS PLANTS: *gold medal,* Mr. Jackson; 2, *large silver do.,* Mr. Pawley; 3, *middle do.,* Mr. Catleugh. BEST COLLECTION OF PELARGONIUMS: *large do.,* Sapphire, Cecilia, Louis Quatorze, Augusta, Beauty, Launcelot, Witch, Drusilla, Flash, Una, Nymph, and Coronation, Mr. Catleugh; 2, *middle do.,* Alexandrina, Grand Duke, Prince Henry, Victory, Joan of Arc, Firebrand, Arabella, Beatrice, Captivation, Life-Guardsman, Amaranth, and Caroline, Mr. Gaines. ERICAS: *large silver do.,* Mr. Jackson. ROSES, IN BUNCHES: *large do.,* Messrs. Lane; 2, *middle do.,* Messrs. Paul. BEST 36 VARIETIES, SINGLE SPECIMENS: *small do.,* Messrs. Lane. BEST 12 CARNATIONS: *large do.,* Ely's Duke of Bedford, Brooke's Flora's Garland, Barnard's Duke of Roxburg, Roi des Capucins, Beauty of Woodhouse, Young's Sir R. Peel, Hufton's Prince George, Hufton's Duke of Wellington, Jacques, Georgiana, Mansley's Bonny Bess, Earl of Leicester, and Martin's Splendid, Mr. Norman; 2, *middle do.,* Mr. Franklyn; 3, *small do.,* Roi des Capucins, Pollit's First-rate, Willmer's Hero of Middlesex, Stone's Venus, Brooke's Flora's Garland, Twitchett's Don John, Ely's Lady Ely, Headley's William Cobbett, Jacques's Georgiana, Addenbrook's Lydia, Brown's Kentish Beauty, and Willmer's Timandra, Messrs. Dickson. BEST 12 WHITE-GROUND PICOTEES: *large do.,* Green's Queen Victoria, Sharpe's Hector, Gidden's Mrs. Hennel, Barnard's Bride, Sharpe's Duke of Wellington, Brinkley's Duchess, Barnard's Cornelius, Sharpe's Invincible, Barnard's Mrs. Barnard, Sharpe's Cleopatra, Brinkley's Purple Perfection, and a seedling not named, Mr. Dickson: 2, *middle do.,* Gidden's Diana, Crask's Queen, Sharpe's Hector, Burroughes's Sylph, Sharpe's Wellington, Gidden's Miss Desborough, Squire Annersley, Birtles's Lady Fair, Purple Perfection, Sharpe's Invincible, Gidden's Teazer, and Sykes's Eliza, Mr. Norman; 3, *small do.,* Mr. King. HEARTSEASE, 50 VARIETIES: *middle do.,* Messrs. Lane; 2, *small do.,* Mr. Thompson. BEST SIX SORTS OF FRUIT: *middle do.,* Mr. Martin. PINE: *middle do.,* Mr. R. Chapman. BEST BASKET OF GRAPES: *middle do.,* Mr. R. Chapman. BEST COLLECTION OF VEGETABLES: *middle do.,* Mr. Gaines; 2, *small do.,* Mr. Martin. OPEN TO ALL CLASSES: BEST 24 SUCCULENTS: *large do.,* Mr. Bunney. BEST FOUR ORCHIDACEOUS PLANTS: *large do.,* Mr. Bruce. BEST SIX SPECIMEN PLANTS: *large do.,* Mr. Bruce; 2, *middle do.,* Mr. Coutts. BEST SINGLE SPECIMEN: *large do.,* Mr. J. W. Dowson; 2, *middle do.,* Mr. Schroder. BEST SEEDLING WHITE-GROUND PICOTEE: *small do.,* Duchess of Cambridge, Mr. Headley. BEST SEEDLING CARNATION: *small do.,* Mr. Ward. EXTRA PRIZES OFFERED BY MEMBERS OF THE SOCIETY: *silver cup,* given by Messrs. Dickson, *for the best 12 White-ground Picotees, to Amateur Members only.* Fellowes' Annette, Green's Queen, Beauty of Reading, Mrs. Barnard, Sharpe's Wellington, Sharpe's Hector, Brinkley's Duchess, Brinkley's Purple Perfection, Garret's Lady Dacre, Gidden's Princess Royal, Kirtland's Mrs. Annesley, Wildman's Isabella, Mr. Barnard. *Middle silver medal,* given by Mr. J. S. Prockter, *for the second best do.,* Mr. Edmonds. *One guinea given by T. Barnard, Esq., open to all classes, for the best Bizarre Carnation,* Mr. Headly; *ditto for the best Flake,* Flora's Garland, Mr. Norman. *One guinea given by G. Edmonds, Esq., for the best light-edged Picotee, with white ground,* Mr. Headley; *ditto, for the best heavy-edged,* Rev. A. H. Matthews. *The entrance-money, distributed for the best seedling Picotees,* was won by Messrs. Henbrey, Headley, and the Rev. A. H. Matthews. *The Linnean medal, given by W. T. Iliff, Esq., for cut Indigenous Flowers,* was awarded to Mr. Coates.

FLORICULTURAL SOCIETY.

July 19.—In addition to the list of prizes which we noticed as having been awarded at the last meeting for Seedling Carnations and Picotees, we subjoin the following:—CARNATIONS, *Amateurs, Stand of twelve:* 1, Mr. Headley, for Don John, William Cobbett, Queen of Scarlets, Empress of Purples, Unknown, Mrs. Betts, Wilson's Harriet, and Incognito; 2, Mr. Bucknell, for Lady Rowley, Bucknell's Ulysses, Squibb's Superb, Ely's Lady Ely, Leader, Hero of Middlesex, Ely's Mrs. Barnard, Pixley's Prince Albert, Franklin's Queen of Hearts, Willmer's Solander, Smith's Wellington, Brooks's Flora's Garland, Chambers's Kate, Stone's Venus and Hero of Middlesex. *Nurserymen:* 1, Mr. Orson, for Cartwright's Rainbow, Roi des Capucins, Ely's Mrs. Barnard, Martin's Phœnix, Knott's Alfred the Great, Ely's Lady Ely, Ely's Regulator, Turner's Princess Charlotte, Triomphe Royal, Earl of Leicester, and Fire King; 2, Mr. Norman, for Beauty of Woodhouse, Bishop of Gloucester, Manby's R. Burns, Duke of Rochester, Roi des Capucins, Wilson's Harriet, Ely's Lady Ely, Prince Albert, Martin's Splendid, Smith's Wellington, Page's Caroline, and Solander; 3, Mr. Willmer, of Sunbury, for Bishop of London, Altenbrooke's Lydia, Wood's William the Fourth, Duke of York, Seeley's Princess Royal, Hero of Middlesex, Solander, Huxley's Prince Albert, Bates's Wellington, Wilson's Harriet, Green's Sir Robert Peel, and Willmer's Seedling. PICOTEES, *Amateurs, Stand of* 12: 1, Mr. Barnard, for Green's Queen, Gidden's Sir R. Peel, Brinkler's Purple Perfection, Gidden's Princess Royal, Sharpe's Wellington, Waine's Victoria, Mrs. Barnard, Brinkler's Duchess, Wells's Lady Flower, Crask's Victoria, Wildman's Isabella, and Gidden's Albert; 2, Mr. Edmonds, for Ace of Trumps, Princess Royal, Mrs. Veasey, Gaines's Queen, Mason's Charlotte, Teaser, Queen of England, Cornelius, Lady Dover, Waine's Victoria, Invincible, and John Perry; 3, Mr. Headley, for Waine's Victoria, Headley's Sarah, Unknown, Brinkler's Lord Althorp, Green's Victoria, Hector, Invincible, Vespasian, Gem, Taylor's Eliza, Criterion, Nannette, and a Seedling. *Nurserymen:* 1, Mr. Willmer, for Orson's Queen, Willmer's Princess Royal, Nulli secunda, Willmer's Alcemona, Sharpe's Wellington, Wildman's Isabella, Jessop's Sir W. Middleton, Green's Queen, Gidden's Miss Desborough, Willmer's Queen, Ward's Sir R. Hussey, and Kirkland's Princess Sophia; 2, Mr. Dickson, for Barnard's Bride, Kirkland's Princess Augusta, Gidden's Vespasian, Orson's Queen Adelaide, Sharpe's Duke of Wellington, Brinkler's Purple Perfection, Dickson's Trip to Cambridge, Green's Queen, Sharpe's Invincible, Gidden's Teaser, Annersley's Sampson, Barnard's Mrs. Barnard. The Prize of one Guinea given by Mr. Headley, for the best Carnation, was won by Mr. Bucknell; for the best Picotee, by Mr. Barnard. The prizes given by the Society for the best *Scarlet bizarre Carnation,* was awarded to Mr. Holliday, for Martin's Splendid; for the *best Crimson do.,* to Mr. Willmer, for Maudsley's R. Burns; for the *best Scarlet flake*, to Mr. Headley, for Twitchett's Queen of Hearts; for the *best Purple*, to Mr. Norman, for Maudsley's Beauty of Woodhouse; for the *best Rose*, to Mr. Bates, for Briseis. For the *best heavy-edged Picotees, Red*, to Mr. Barnard, for Sharpe's Wellington; *Purple*, to Mr. Norman, for Kirkland's Princess Augusta; *light-edge Red*, to Mr. Headley, for Headley's Scarlet; *ditto Purple*, to Mr. Headley, for Gidden's Vespasian.

REIGATE COTTAGE GARDENERS' SOCIETY.

On Saturday evening, the 23rd inst., the first anniversary of the Society was held at the Town Hall, for the distribution of premiums for the best cultivated Cottage Gardens within the parish; where the members with their wives and friends attended, and exhibited a very respectable display of vegetables, fruit, and flowers, the products of their gardens. The Earl and Countess Somers, and Viscount Eastnor, with a numerous assemblage of ladies and gentlemen, resident in the parish and immediate neighbourhood, honoured the meeting with their presence. The Treasurer stated, that a year ago, several working men, chiefly agricultural labourers, were invited to hold evening meetings, monthly, for the purposes of mutual improvement, the exhibition of specimens of the productions of their gardens, and by a small monthly contribution of sixpence, to be enabled to purchase and circulate useful books on gardening and rural economy. At these meetings many points interesting and improving to them had been communicated, and had been the subjects of conversation, and these opportunities of friendly converse had proved very pleasing and gratifying to them. Among the various subjects communicated and discussed, had been that of bees and bee-keeping; their natural history and management; and on which they had been favoured with a lecture by Mr. Hanson: the cultivation of the Sun-flower as a source of profit, the seeds being a nutritious food for pigs and poultry from the quantity of oil they contain: on the best sorts of trees, plants, and seeds; the distribution and exchanging of seeds; more especially as regards the all-important root, the Potato: the qualities of various manures; the value of manure in a liquid form, its advantages, and the care to be observed in collecting and preserving it: the blessing, if it may be so termed, of being able to keep and fatten a pig for the use of the family. They were informed of the proceedings of the "Labourers' Friend Society," and of their exertions in promoting the establishment of allotment gardens, to supply, in some degree, the lamentable deficiency of gardens attached to, and in contiguity with, the dwellings of the labouring poor. Likewise, in mitigation of the same evil, many humane farmers were in the habit of allowing their constant workmen to plant with Potatoes such odds and ends of fields and hedge rows as the plough could not very well reach. Among the publications of the "Labourers' Friend Society," their "Useful Hints" were pointed out, particularly those of caution in reference to the public-house and the beer-shop; the deplorable and ruinous consequences to the health of individuals and the happiness of families by resorting to them. The leading article in that valuable and cheap periodical, "Chambers' Journal," of 7th March, 1840, entitled "Self Helpfulness," was pointed out to them, and each member furnished with a copy, as exhorting the working man not to look for and depend on any extrinsic helps; but always to rely solely on his own industry and exertions: to exercise his various talents usefully, by setting a good example to his children, and training them to pursue a similar course of usefulness and respectability; and, in addition to the employments of the day, when not engaged in the garden, and during the winter evenings, various little articles of manufacture might be executed, of cheap and easily-procured materials. The premiums were then delivered to the most meritorious individuals, in rewards of 2*l*., 1*l*. 10*s*, 1*l*., 15*s*., 10*s*., and 5*s*. To each of the unsuccessful candidates,—all, however, being deserving of praise,—2*s*. 6*d*., in addition to a new gardening tool, according to choice; and to one of them, the leathern jerkin and gloves usually worn by a woodman.—The Rev. G. A. Webb then addressed the meeting, observing that though he could offer no information, theoretical or practical, on gardening, he could not but be sensible of the great advantages of a well-cultivated garden to the family of the working man, as essentially contributing to their support, their comfort, and welfare; affording employment to them during their spare time, abstracting them from temptations to evil ways, and substituting the pure and delightful satisfaction attending the cultivation of the earth; the raising useful vegetables and fruits, and more especially flowers, to adorn the happy home of the industrious and praiseworthy labourer with these beautiful productions.—The Earl Somers then expressed his entire approbation of the objects of the Society, and his cordial wishes for its successful course. His Lordship favoured the meeting with several useful suggestions on cottage garden cultivation, and his conviction that the welfare and happiness of the labouring class must be deeply interesting to every benevolent and well-regulated mind; and that he should be most happy to assist in promoting the views and objects of this association.—At the request of the meeting, Lord Somers most kindly expressed his willingness to be considered as the Patron of the Society. All present then retired, well pleased with the proceedings. The meetings are to be resumed after harvest.—The members are honorary and ordinary. The subscriptions of the former are designed to defray the expense of the premiums; and those of the latter to purchase books on gardening, rural economy, and other kindred subjects.

Erratum.—In the report of the last meeting of the Horticultural Society, at Regent-street, a stand of Carnations and Picotees was stated by mistake to have been exhibited by Mr. Willmer, of Sunbury; whereas they were the property of Mr. Willmer, of Chelsea.

COUNTRY SHOWS.

Limerick Practical Horticultural Society, July 16.—The annual summer exhibition of this society was held in the new rooms of the Philosophical and Literary Society, where prizes were awarded to the following competitors:—Mr. Heafy obtained 8 prizes for best *Black Grapes, Plums, Pears, Gooseberries, Carrots, and Parsneps.* Mr. Walsh, gr. to Sir A. De Vere, Bart., 5 prizes, for 6 best *Dahlias*, second-best *Collection of do.*, and *Pansies*; also for the best *Collection of Roses* and *Peas.* Mr. Drury, gr. to Sir H. D. Massy, Bart., obtained 2 prizes, for best-flavoured *Red Currants* and *Cherries.* Mr. Carmody, gr. to W. Monsell, Esq., obtained 7 prizes, for a *Melon, Plums, Cherries, Carrots, Onions*, and *Turnips.* Mr. Fitzgerald, gr. to G. Tuthill, Esq., 2 prizes, for best *White Grapes* and second-best *Gooseberries.* Mr. G. Mac, gr. to Mrs. Cooper, 6 prizes for the heaviest *Melon*, 6 *Balsams, Bunch of Cut Flowers, Potatoes, Collection of Pot-herbs*, and a dish of *Mushrooms.* Mr. Cloheny, gr. to the Rev. J. O'Grady, for a new kind of *Strawberry.* Mr. T. Gaynor, gr. to Capt. Stacpoole, obtained 2 prizes, for second-best *Strawberries* and *Tender Annuals.* Mr. Collopy, gr. to G. Bevan, Esq., obtained 19 prizes, for the best *Collection of Ericas, Greenhouse Plants, Collection of Greenhouse Plants in Flower, Pelargóniums* (named King, Sylph, Jewess, Hebe, Garth's Perfection and Spartacus); for *Seedling Pelargóniums*; for a *Basket of Pelargóniums*, including Climax, Lady Elizabeth Bulteel, Lady Carlisle, Sylph, Conrad, Rubens, Selina, Prima Donna, Bellissima, Bridegroom, Miller's Adonis, Spartacus, William the Conqueror, Jewess, Conservative, Masterpiece, Hebe, Statesman, and Fanny Garth. also prizes for the best *Herbaceous Plants, Pinks*, second *Bunch of Cut Flowers, Hardy do., Specimen Stove or Greenhouse Plants in bloom*, and second best *Black* and *Red Grapes, Cauliflowers, Cabbages, Roses*, and *Dahlias.* Mr. Kemy, gr. to P. Gabbett, Esq., 6 prizes, for *Tender Annuals, Cucumbers*, best *Picotees, Stove Plants, Cabbage*, and *Verbenas.* Mr. Grady, gr. to M. Honan, Esq., 7 prizes, for *Crássula coccínea, Cucumbers, Kidney Beans, Lettuce, Mushrooms*, and for second-best *Collection of Vegetables.* Mr. P. M'Douce, gr. to W. Lloyd, Esq., 8 prizes, for the best *Melon, Pansies, Seedling Pansies, White and best Red Celery*, second-best *Cucumbers, Potatoes*, and the best *Collection of Vegetables.* J. Kelly, gr. to J. Russell, Esq., 9 prizes, for the best *Pine-apple, Orange-trée, Collection of Dahlias*, the second-best *Greenhouse Plants, Hardy Annuals, Calceolarias, Pelargóniums*, and *Collection of do.* Mr. M'Mahon, gr. to M. Fitt, Esq., for best *Calceolarias*, second-best *Fuchsias, Herbaceous Plants*, best 6 *China Roses in pots.* Mr. Gardener gr. to A. Furlong, Esq., 1 prize for the best *Cauliflowers.*

Royal Caledonian Horticultural Society, July 15.—This meeting was held in the elegant Hall lately erected in the centre of the Society's Garden at Inverleith. The display of specimens was extensive, and the following premiums were awarded:—Four finest Shrubby Exotics: *Silver medal*, Mr. G. Stirling, gr. to Viscount Melville, for Aphelexis húmilis, Pimelea decussata, Justícia coccínea, and Cheiranthus mutábilis. Fuchsias: Mr. J. Young, gr. to T. Oliver, Esq., for F. globosa spléndida, fulgens multiflora, and Chandlérii. Orchidaceæ: Mr. R. Middleton, gr. to Dr. Neill, for Oncidium pulvinatum and O. púmilum. Best Exotic Specimen: Mr. Young, for Leschenáultia bíloba; and for the best newly-introduced perennial, Mr. J. Addison, gr. to the Earl of Wemyss, for Achimenes longiflora. Two guineas, offered by Messrs. Dickson and Co., for the four best Cape Heaths, were voted to Mr. D. Fowlis, gr. to Alexander Blair, Esq., for Erica Massoni minor, ampullácea, ventricosa superba, and jasminiflora. Extra Premiums were awarded to Mr. Addison, for E. metulæflora, jubata, ventricosa prægnans, and ventricosa var.; and to Mr. J. Gow, gr. to Count Flahault, for E. ventricosa, spúria, comosa, alba, and bícolor. Two guineas, offered by Messrs. J. Dickson and Sons, for the six best Pelargo'niums, were awarded to Mr. Addison, for spléndidum, Addison's seedling, Bridesmaid, Jupiter, President, and Conservative. A second premium was voted to Mr. Young, for Comte de Paris, Gem of the West, Rienzi, Bridegroom, Sylph, and Conservative. Two sovereigns, offered for the six finest varieties of Calceolaria, were assigned to I. Anderson, Esq., for Yellow Defiance, George Heriot, Margaret, Dunbariana, Ariadne, and Grahamina, being seedlings of his own, and remarkable for the singularity and beauty of their markings. For the four most curious Native Plants, the premium was voted to Mr. Middleton, for Sagina procumbens flore pleno, Anagallis tenella, Cotyledon umbilicus, and Asplénium alternifólium. For the best Annual, the premium was awarded to Mr. R. Arthur, for Limnanthes grandiflora. Many admirable specimens were sent for exhibition only; among which the plants from the Royal Botanic Garden were pre-eminent. From the Society's Garden was exhibited a large specimen of Euphórbia splendens, having all the branches (which are naturally straggling) trained into a circular form. An extensive collection of flowering plants from the nurseries of Messrs. J. Dickson and Son nearly filled the small tent. Among the more remarkable were, Fuchsia Venus victrix, with blossoms of very delicate white and purple tinges; the new Achimenes longiflora, Lisianthus Russellianus, Miltónia spectábilis, Gloxínia rubra, Gesnera zebrina, Guzmánnia trícolor, and Leschenáultia bíloba and violácea. For this collection a premium was awarded to Mr. J. Kelly, foreman of the plant department of that Nursery. Various other premiums were also awarded. The Society's bronze medal was voted to Messrs. E. Sang and Son, for a bouquet of rare tropical *Orchidaceæ*, including Stanhopea oculata, Gongora maculata, Broughtónia sanguinea, Maxillária racemosa, and several others; and to Mr. J. Finlayson, for *Pansies.* Extra Premiums were likewise voted to Mr. J. Gow, for a collection of *seedling Heartsease;* to Mr. R. Fowlis, for a splendid display of *Gladíolus cardinalis*, cultivated by him in the open ground, the bulbs being kept in clusters, and protected only by a layer of tree-leaves during winter; to Mr. J. Smith, for *new French Roses;* to Mr. Alex. Forrester, for *Herbaceous Border Plants;* to Mr. Downie, for a basket containing trusses of *Pelargoniums;* to Mr. R. Watson, for *Cape Heaths:* and to Mr. Jas. Duncan, for *Heaths and Fuchsias.* Mrs. Haig sent splendid plants of Crássula coccínea, and various rare Ericas; Miss Broughton, elegant Fuchsias; Mr. W. Connacher, seedling varieties of Mimulus; Messrs. Lawson and Son, collections of Pansies and Roses; Mr. J. Mackie, gr., Hermitage Hill, specimens of French and African Marigolds; Mr. Geo. James, some good seedling Pinks; Mr. J. Thomson, a promising seedling Pelargonium; and Mr. R. Hall, a basket of Kean's seedling Strawberry.

Thanet Floricultural and Horticultural Society, July 16.—The first exhibition since its establishment was held in the Ranelagh Gardens. The following prizes were awarded. Best miscellaneous collection of Plants, *grown in pots* (10*l*.), Mr. W. Miller; *do., not less than* 12, Sálvia patens, Mesembryanthemum album, Mímulus moschatus, Cytisus racemiflora, Thunbérgia aurantiaca, Fúchsia conspícua, F. magnífica, F. variegata, Loasa aurantiaca, Hoya carnosa. Pelargoniums—Victory, Louis Dix-huit, and Lowndes' Perfection, T. N. Harris, Esq. *Best single specimen*, 1, Sir R. Burton; 2, J. B. Judge, Esq. Pelargoniums, 1, Joan of Arc, Orange Boven, and Maria, T. N. Harris, Esq.; 2, Vulcan, Lord Mayor, and Matilda, Rev. J. G. Hodgson; 3, D. Hooper, Esq. *Single do.*, Leila, Rev. J. G. Hodgson. Herbaceous Calceolarias: Royal Standard and two seedlings, Rev. J. G. Hodgson. Balsams, 1, L. C. Humfrey, Esq.; 2, do. Cockscombs, do. German Stocks, Rev. J. G. Hodgson. Climber: Thunbérgia aurantiaca, T. N. Harris, Esq. Fuchsias, J. P. Powell, Esq.—Cut Flowers. Best six Pelargoniums: 1, Erectum, Jewess, Sylph, Alicia, Comte de Paris, and Masterpiece, Capt. Isacke; 2, Gaines's King, Maria, Sylph, Masterpiece, Victory, and Jewess, Rev. J. G. Hodgson. Best 12 Pansies: 1, Dr. Johnson, Cooke's Perfection, Cooke's Prince Albert, Cooke's Ovid, Cooke's Royal Standard, Delicata, Jehu, Sylvia, Curion, Cream Superb, Marchioness of Anglesea, and Beauty of Hitchin, Rev. J. G. Hodgson; 2, Victory, Robin Adair, Ovid, Royal Standard; Dr. Johnson, Beauty of Hitchin, Azurea, Jehu, Delicata, Tippoo Saib, Peter Dick, Yellow, and Defiance, Rev. J. G. Hodgson. Best six Carnations: Elizabeth, Puxley's Prince Albert, Lady C. Lyster, Wilson's Harriet, and Christian's Excellent, Rev. J. G. Hodgson. Best six Picotees: Gidden's Teaser, ditto, Wood's Victoria, Queen of England, do., and Vesuvius, do. Perennials, J. Slater, Esq. Annuals, Hon. Mrs. Hodgson. Bouquet of forced and hardy Flowers, L. C. Humfrey, Esq.; do. of hardy Flowers only, do. Floral Device, 1, Capt. Isacke; 2, Mrs. Millner.—Extra—Pelargoniums: Prima Donna, Erectum, and Beauty, T. N. Harris, Esq. Fuchsias: Corymbiflora, Youellii, and Chandlerii, J. B. Judge, Esq. *Single Fuchsia:* Gracilis, Sir R. Burton. *A Floral Device*, L. C. Humfrey, Esq.—Fruit: *Melon*, 1, U. Passmore, Esq.; 2, Mrs. Alexander. *Bunch of Black Grapes*, 1, J. P. Powell, Esq.; 2, do. *White do.*, 1, do.; 2, L. C. Humfrey, Esq. *Cherries*, 1, J. P. Powell, Esq.; 2, R. Tomson, Esq. *Gooseberries*, 1, Mr. Moss; 2, Mr. Silver. *Red Currants*, Sir R. Burton; *Black*, do.; *White*, do. *Red Raspberries*, do. *Strawberries*, J. P. Powell, Esq. *Dessert Apples*, 1841, do.; *do.*, 1842, H. Pett, Esq.—Vegetables: *Peas*, 1, L. C. Humfrey, Esq.; 2, —— Prickett, Esq. *Broad Beans*, J. Slater, Esq. *Cabbage*, Mr. Cramp. *Lettuce*, Mrs. Alexander. *Cucumbers*, 1, H. Pett, Esq.; 2, J. Slater, Esq. *Onions*, L. C. Humfrey, Esq. *Basket of Vegetables*, J. Slater, Esq. —Extra. *Strawberries:* Willmott's Superb, — Prickett, Esq. *Pine*, L. C. Humfrey, Esq.

NOTICES of NEW PLANTS WHICH ARE EITHER USEFUL OR ORNAMENTAL.

Epidendrum raníferum. Frog Epidendrum. (*Stove Epiphyte.*) Orchidáceæ, § Epidendreæ. Gynándria Monándria.—Although a good deal like E. nutans, this species is really very distinct, and indeed far handsomer, in consequence of the rich purplish brown spots with which the sepals and petals are profusely decorated. The species is not exclusively from Mexico; Mr. Schomburgk having found it also in British Guayana. This succeeds well in a pot amongst turfy peat, and should be liberally supplied with water during its period of growth. It will be found of easy management, if cultivated in the cool orchidaceous stove. When the growing season is past, it does not require so much water, but should never at any time be kept too dry.—*Bot. Reg.*

Arundina densa. Close-flowered Reed Orchis. (*Stove Epiphyte.*) Orchidáceæ § Epidéndreæ. Gynandria Monándria.—Of the fine Oriental genus Arundina we now possess two species in gardens, this and A. bambusifólia. Two only, A. chinensis and minor, remain to be introduced; the former is found on the islands near Macao, the latter is from Ceylon. This species is a native of Sincapore, whence it was sent to Messrs. Loddiges by Cuming. It differs from A. bambusifólia in its leaves being nearly equal, and not gradually diminishing into small sheaths as they approach the flowers; and in the flowers being very closely, but loosely, arranged; and in the small size of the middle lobe of the lip, which is almost blended with the large lateral lobes. There is a difference, too, in the crested veins of the lip, which are all three crisped in A. densa, while the middle one is straight and even in A. bambusifólia. Not only are the flowers of this very handsome, but they emit a most agreeable perfume.—*Bot. Register.*

Cinera'ria Webberiana. Mr. Webber's Cineraria. (*Greenhouse Herbaceous Plant.*) Compósitæ. Syngenésia Supérflua.—This variety was raised in the spring of last year by Mr. Smithers, gardener to R. Williams, Esq., and in habit somewhat resembles C. Waterhousiana. It has ample foliage, the upper side of which is of a bright green tint, while beneath it is rich purple. The flowers are large, of a deep, rich, brilliant, blue colour.—*Paxton's Mag. of Botany.*

Gesnera longifólia. Long-leaved Gesnera. (*Stove Herbaceous Plant.*) Gesneráceæ. Didynámia Angiospérmia.—This species grows about two feet high, and is closely covered by a dense grey down. The leaves grow in whorls, and are sometimes eight or nine inches long, of a lanceolate form, thick, petiolate, serrated towards the upper end, and by no means wrinkled. The flowers are produced in long close cylindrical terminal whorled racemes, three or four growing together from the axils of short floral leaves. The corollas are brick red, about an inch long, somewhat cylindrical, but inflated above the middle, with a short five-toothed spreading limb, whose divisions are all of the same size and form. There is no trace of the obliquity which occurs in G. bulbosa and its allies. The ovary is half superior, and surrounded by five yellow tooth-shaped glands tipped with red. It is a native of Guatemala, whence it was sent to the Horticultural Society by Mr. Hartweg. Nothing can be more easy than its cultivation; for it requires the same management as is given to such plants as Gloxinia maculata. It is increased from the young shoots, which should be treated in the following way: when they are two or three inches long, take them off and put them in pots filled in the ordinary way with sand; give a little water to settle the cuttings, and cover them with a bell-glass. Then place the pots on a warm flue, or, if in summer, on a warm shelf in the stove, shading them from the sun by placing a sheet of paper over the glasses; they will soon root freely, and may be transferred to small pots filled with a mixture of sandy peat and leaf-mould unsifted. They will afterwards require shifting and plenty of water during the growing season; after which they should be rested by gradually withholding the supply of water.—*Bot. Reg.*

MISCELLANEOUS.

Monument to the Memory of the late Earl of Leicester.—A meeting of yeomanry and tenantry was held on Saturday last, at the Swan Inn, Norwich, for the above object, and was attended by many of the highest respectability from both political parties. Mr. John Hudson stated that he had taken the liberty of calling the meeting together because he felt that it was best that such testimonials should always be commenced immediately. He was glad to see so respectable an attendance, and would propose that Mr. Leamon, of Whitwell, should take the chair. Mr. Leamon stated his cordial concurrence in the object, for to no individual was this country, nay the world, more deeply indebted than to the late Earl of Leicester. The object of the meeting would be to raise a structure of such a nature as would be equally acceptable to the late Earl of Leicester's family, honourable to the subscribers, and to the architect who might rear the monument. Mr. Hudson then briefly moved the resolutions:—

First—That this meeting, deeply impressed with the irreparable loss they have sustained by the death of that great and good man, Thos. Wm. Coke, Earl of Leicester, are anxious immediately to express their gratitude, by thus publicly acknowledging the many acts of kindness, of friendship, and princely hospitality, which, for so long a period, and on all occasions, they invariably experienced at his hands.

Second—That, as farmers, we owe to the late Earl of Leicester a debt never to be discharged, for, whilst many have now to lament the loss of the kindest and most liberal of landlords, in him we all have to deplore the loss of the greatest friend and patron of agriculture the world has hitherto seen.

Third—That this meeting, therefore, deeply impressed with the private worth and virtue, with a due sense of the public services and the encouragement so liberally, so successfully, and so patriotically bestowed on agriculture by the late Earl of Leicester, are desirous of testifying their gratitude, for friendship so sincere and disinterested, for services so great, and for benefits so lasting and extensive, by the erection of a public monument to his memory.

Fourth—That a subscription be immediately entered into for the above most desirable object.

Fifth—That a committee be now appointed to receive and collect subscriptions, to consist of the following gentlemen:—[The list including the names of nearly 100 gentlemen.]

Sixth—That Messrs. Gurneys and Co. be requested to act as treasurers, and that subscriptions be received at the various banks in the county.

Seventh—That this meeting of the yeomanry and tenantry, although feeling it incumbent upon them, in gratitude to their deceased and revered benefactor, to come thus prominently forward, most respectfully and cordially invite the nobility, gentry, and clergy, and all others who participate in their sentiments, to join them in furthering the object in view.

Eighth—That a public meeting of the subscribers be held at the Swan Inn, Norwich, on the 30th day of July, at 11 o'clock for 12 precisely, when a committee shall be appointed, and a chairman and vice-chairman elected to preside over all future meetings.

—Mr. J. Neave had great pleasure in seconding the resolutions, for a more eminent and useful character than the late Earl of Leicester this country never produced. They, the farmers of Norfolk, were doing themselves honour in raising a fund for the purpose of producing some testimonial of his valuable services. He was glad to see the feeling of harmony which existed on this occasion, for they had met with one mind and one heart in sinking all party feeling. He hoped that the object of the meeting would go forth and prosper. A conversation arose as to whether a maximum of subscription should be stated, but it was ultimately determined that the amount of subscription be left open. A committee, consisting of gentlemen without distinction of party, was then appointed to collect and receive subscriptions in all parts of the county.—*Norfolk Chronicle*

Grafting the Peach with success.—I am not aware that any process has been devised for grafting upon the Peach stock with any certain prospect of success. Experiments doubtless have often succeeded in rearing grafts upon Peach stocks, but more often failed. A gardener in my neighbourhood informed me that he once grafted upon one hundred Peach stocks, and all the grafts died, and most of the stocks. He was always successful in grafting upon other kinds. Last year I was induced to investigate the matter, with a view to devise some means of obviating this failure, as it is desirable in many cases to graft in lieu of budding, persuaded that although the discovery might be of no great practical utility, yet it would be an interesting acquisition to the science of arboriculture. The Peach-tree is of more rapid growth than any of our orchard trees; and frequently with us, in congenial soils, the first year from the seed, attains the height of six feet, with stems from one inch to one inch and a half diameter. The circulation, of course, must be very active, and the sudden check from heading down such a tree, will in many cases destroy it. But should it live, the roots continuing in a state of activity, the scion is overflowing, as it were, by the sap; that is, the sap flows so fast from the wounds, as to prevent the process of granulation, by which the scion is united to the stock. To graduate, then, the supply of sap to the wants of the scion, is the primary object; and the measures necessary to secure this condition are just those which tend to preserve the life of the stock after heading down. To carry my purpose into effect, I proceeded contrary to some of the ordinary rules for grafting. In the middle of July, I selected the scions from thirty trees, with four or five eyes, taking care to choose those which contained leaf-buds. The stocks chosen were moderately-growing instead of thrifty stocks, and were trees of the growth of that season from the seed. Before heading down, I passed a long sharp knife down entirely round the tree, and severed all the lateral roots at the distance of three or four inches from the trunk, according to its growth. This done, the trees were headed down at a point where the stem was just the size of the scion, or a little larger, as the scions were inserted a little on one side of the pith. The insertions were made in the ordinary way of cleft-grafting. The scions were then secured by a narrow strip of sheet lead, wound spirally over the whole length of the cleft, and a small ball of grafting clay put over the whole. To my gratification, every scion inserted in this way grew off finely, and the coming season will doubtless make handsome trees. I do not know that the lead binding or mode of insertion is essential, and although I have tried no other plan, yet I presume that other methods will answer equally well, provided the preliminary steps are properly attended to. On other stocks I have grafted with success, with no other binding or protection than the strip of lead, and have used lead ligatures with great expedition and success in budding. The introduction of lead ligatures was merely an experiment with a view to expedite grafting and budding in large nursery operations. Thus far I am inclined to give the preference to the old methods. When heading down the stocks, I took care in every case to leave either one or two small shoots, some leaves, or several nascent buds, in order to continue all the functions of the tree until union had taken place between the scion and the stalk. As soon as the buds of the scion began to put forth, all below upon the stalk was pruned off. When the scions were taken from the trees, the leaves were all removed as in budding, leaving only a small portion of the footstalk. The clay and ligatures were removed in the fall, when vegetation had ceased, and the wounds were all well closed. I am not sure that it is absolutely essential to leave anything growing on the stalk, and regret that I did not try some without.—*Charles G. Page, M.D., in Albany (United States) Cultivator.*

GARDEN MEMORANDA.

Horticultural Society's Garden, Turnham Green.—The growth of the plants in the large conservatory has been very rapid; several Acacias, and two species of Eucalyptus, have already reached the top of the house. The beautiful large variety of Bignónia jasminiflora is blooming freely; its white trumpet-shaped flowers, with tubes of rosy purple, contrasting well with the bright green of the foliage. The most splendid object, however, in the house is Hibiscus splendens, the flowers of which are of the clearest rose-colour, and measure at the least 7in. in diameter. Canavália bonariensis, a beautiful climber, of the papilionaceous order, is also in bloom; the standard is of a bright purple colour, and the flowers are produced on racemes of six or eight together; and Euthales macrophylla is completely enveloped with drooping panicles of bright yellow. Lilium punctatum, in a pot, is producing its large white flowers, covered with curious rosy glandular excrescences: and some more varieties of the same genus are growing strongly in the conservatory border. Mirbélia undulata, a pretty leguminous plant, of a deep rose colour; Burchéllia capensis, a large bush, with heads of bright scarlet flowers; Grevíllea acanthifólia, with prickly leaves, and conspicuous crimson pistils, and many other interesting plants, are also blooming freely. Amongst the Orchidaceous plants in flower are Stanhopea venusta, with flowers of waxy white, marked with dark yellow at the base of the column; a handsome variety of St. Wárdii: Bifrenária aurantíaca, a bright yellow-flowering species, prettily marked with reddish-brown; Mormodes pardinum, with singularly-distorted blossoms of dull yellow and brown, very fragrant; Oncídium Wentworthianum, with long spikes of pure yellow mottled with brown; the pretty On. incurvum, rose and white; and Sobrália macrantha, a new and exceedingly beautiful terrestrial species, with large flowers of rich crimson, which continue to expand successively for several weeks. In the pits we observed the finest plants of Achimenes longiflora and A. rósea which we have yet seen; with strong-growing ones of the new Achimenes pedunculata, not yet showing signs of flowering. In front of the stoves are large patches of Brachycome iberidifólia, of different shades of violet; Lobélia ramosa, deep blue; and Mesembryanthemum tricolor, studded with an innumerable quantity of lovely star-like flowers of white and purple; all beautiful annuals, which everybody ought to possess. In the pits of the hardy department the handsome Rigidella immaculata, with reflexed scarlet petals, is flowering freely; and Bouvardia splendens, with tubes of the brightest scarlet, is a decided improvement upon the old B. triphylla, which it much resembles in habit. Here also are in flower Aplophyllum patavinum, a small yellow Rutaceous plant; Cytisus elegans, a large bright variety; and Talinum teretifólium, with pink flowers, which only expand during bright sunshine. Paulównia imperialis has made vigorous growth, but does not show any signs of flowering. Several Yuccas are in full bloom in the Arboretum; and the flower-garden is gay with beds of Gladíolus psittacinus, the best varieties of Verbena, and different annuals, amongst which the old Nemóphila insignis still maintains a prominent place. In the kitchen-garden we observed the Nocera Onion; it is silver-skinned, buttons remarkably well, and will undoubtedly prove the best pickling kind yet in cultivation. A new Beet, called Whyte's Gigantic, if it does not grow to too great a size, promises to beat even the Castelnaudary for straightness and depth of colour. The Prince Albert Marrowfat Pea is now in full bearing, but does not seem to differ in the least from the Milford Marrow. In the curvilinear Vinery the following new Vines are bearing fruit, namely—the Admiral, which partakes of the general character of the Black Hamburgh; the Zibibbo of Sicily, which, in its present stage of growth, scarcely differs from the old Muscat; and Burckhart's No. 10, of remarkably strong growth, with large woolly leaves and footstalks.—*R. A., July* 25.

Messrs. Dickson's Model Room, Chester.—At this place there are now on view models of various interesting constructions, connected with Agriculture and Horticulture. Those more particularly worthy of notice are:—a section of the Peachhouse at Nannau, with moveable lights, by means of which the trees can be kept either above or below the glass, according as their period of growth may require: a circular flower-stand, which, by revolving upon its centre, presents the various objects in rotation to the spectator; an exceedingly neat rustic bridge, in the shape of the letter X, which is kept in its proper form by means of cross timbers at the top and bottom. A hunting stile, the rails of which, by means of an ingenious contrivance, can be reduced to one third of their original height; and a swing gate, constructed at Abergavenny, in South Wales. Besides these, there are models of drains, draining implements, spades, shovels, &c. Those who have not an opportunity of visiting this collection, can obtain a lithographed representation of them by communicating with Messrs. Dickson.

Reviews.

The Orchidaceæ of Mexico and Guatemala. By James Bateman, Esq., F.R.S., &c. Part 6.

THE last number of this beautiful work contains several highly finished representations. The first is Sobrália decora, which is decribed as being "a pretty and interesting plant, but by no means an adequate representative of the genus to which it belongs. All the species appear quite at home, potted either in peat or sandy loam, or even suspended in the stove, with no other aids or appliances than what may be obtained through the medium of the dense masses of fleshy roots with which, on their importation, they are often found to be well provided; yet under no circumstance do they appear to succeed so perfectly as when grown in a house of moderate temperature and potted in sandy loam." The description concludes with a handsome vignette of a woman of Guatemala, attired in one of the most becoming dresses of her country. The second drawing is that of Stanhópea Martiana, which has flowered recently, in high perfection, in the collection of Mr. R. Harrison. "This is a species of great interest and beauty; and no drawing, however accurate, can convey an adequate idea of the peculiar lustre and transparency of its colours. The singular manner in which the extremities of the huge uncouth horns are twisted into slender cirrhi, will at once distinguish this from all other species of the genus." The third tableau represents the highly beautiful Barkèria Lindleyana, which is said to be "not less attractive than the rare B. elegans. In addition to the beauty and delicacy of its colouring, B. Lindleyana has the advantage of a more tractable disposition than the former species, and may be cultivated with the most perfect facility; its flowers too are freely produced, and continue in perfection for the unusual period of two months. Coming from the mild shores of the Pacific, it does not require a great degree of heat, but appears quite at home in a temperature of little more than 60°. It will not succeed in broken peat, but prefers a mixture of small sticks and twigs, into which, after the true fashion of an air plant, it delights to thrust its little store of fleshy roots." This description is adorned with a vignette affording an example of the conchology of the Pacific. The fourth drawing exhibits the truly elegant Oncídium incurvum, which is stated to be similar in the general aspect of its flowers to On. ornithorhynchum, but is apparently much rarer than that species, even in its native haunts. The last representation is that of the magnificent Schombúrgkia tibícinis, which is decribed as "the most manageable species of the untractable genus to which it belongs. Suspension on a block of wood, in a hot and damp situation, appears to be the condition most congenial to its growth, but a season of rest is necessary to induce it to flower." In such request are the hollow stems of this vegetable held, as trumpets, by the wild urchins of the Honduras, that they are frequently, in their endeavours to procure them, precipitated from the summits of the trees upon which this species is found. Such a catastrophe is well delineated in the beautiful vignette which accompanies the foregoing description.

CALENDAR OF OPERATIONS *for the ensuing week.*

THE observations of a correspondent in the last Number of the *Chronicle* make some further allusion to the sulphur question necessary. We are not prepared to deny that sulphur has the property of destroying the Red Spider upon growing plants, without injury to the latter. Its efficacy in this respect is maintained by many gardeners besides Mr. Stewart; others, again, as strenuously deny it: and this conflicting testimony seemed to us a sufficient reason for the doubt expressed at p. 480. It is possible that when failure has occurred, it has arisen from some error in the application of the remedy; but whatever may be the cause, it is certain that with many persons sulphur has not had the desired effect. One instance may be here mentioned:—last autumn we had the flue which heats a small plant stove well coated over with a white-wash composed of quicklime and sulphur, which had sufficient power, when the flue was warmed, to injure considerably the leaves of some of the plants; but the Red Spider, which the process was intended to kill, did not seem at all incommoded by it. As a further trial, an infested plant of Thunbergia was placed at an angle of the flue, near where the heat entered, and almost in contact with the bricks—in which situation it must have received the full influence of the sulphureous fumes; the plant remained there all night, and yet the insects were as brisk as ever when it was removed next morning. Such a case as this would naturally give rise to doubts of the efficacy of sulphur as a cure for Red Spider. If Mr. Stewart, and others who have been successful, would describe the exact manner in which this remedial process should be conducted, specifying the quantity of sulphur which might be used with safety in a house of a given size, with the degree of heat and the length of time required to kill the insects, some fixed rule of application might be deduced from it, which would render failure of less frequent occurrence.

I.—KITCHEN-GARDEN AND ORCHARD.

In-door Department.

PINERY.—Preparations should now be made for a general shifting of the whole stock, which is best to be done early in the month. Where a selection can be made, choose rough bark for renewing the beds; such will heat longer and less violently than that which is ground small. Sort out and wash a sufficiency of pots of all the sizes likely to be wanted, taking in preference those with a smooth and even inner surface. House the soil while it is dry; if too dry, chop it up roughly, and sprinkle it slightly with pond or dung water. Also prepare plenty of broken crocks for drainage, that nothing might be deficient, to hinder the progress of the work when begun. Any plants that are showing fruit should be top-dressed, or repotted, and taken at once to their winter quarters in the fruiting-house.

VINERY.—When the leaves of early-forced Vines are quite withered, they, with any laterals which may have grown, should be taken off, and vegetation in the Vines checked as far as it can be done, by turning them out of the house, if a Pine-stove, or by giving all the air possible, if in a Vinery. In the latter case, the lights might be taken off, and usefully employed for some temporary purpose, such as the forwarding of wall-Grapes. Give abundance of air to all the Vineries, and maintain a humid atmosphere in those where the fruit is still unripe.

PEACH-HOUSE.—The principal points to be attended to now are, keeping the foliage free from insects, advancing shoots neatly tied in, the borders properly watered, and a sufficiency of air at the houses. Where fruit is nearly ripe, cease watering, and expose every fruit to the sun's rays by removing any leaves that happen to cover it; if this is not done, the shaded fruit will be deficient in colour.

CUCUMBERS AND MELONS.—In such weather as now prevails, the plants generally ought to be dewed overhead twice or thrice a week, observing always to use a finely perforated rose for this purpose, as a heavy stream breaks down the leaves, which often do not return to their proper position. For the same reason, when the plants require water at the roots, it is best not to use a rose, but to insinuate the spout of the watering-pot between the leaves. Sow seeds, or put in cuttings, of some free-bearing Cucumber, for fruiting in the Pine-stoves, or in fire-heated pits.

MUSHROOM-HOUSE.—Take advantage of the dry weather to make spawn. For directions, see the *Gardeners' Chronicle* of last year, p. 520.

Out-door Department.

HERBS FOR DRYING OR FOR DISTILLING should be cut before their flowers expand, and the former laid thinly in a shady place. See that all recently-planted crops are duly watered; the succession crops of Beans, Peas, and Kidney Beans, must also be attended to in this matter, or their produce will be exceedingly scanty. The present droughty season affords incontestable proof that mildew on Peas is greatly furthered, if not actually caused, by an insufficient supply of moisture.

BROCCOLI.—If the planting of the latest crop has been put off for want of rain, it ought to be no longer delayed on that account; puddle the roots of the plants, and give them daily waterings.

CABBAGES.—At the end of the week make another sowing of the sorts most approved. If Red Cabbage is sown now, it will attain a larger size than that sown in spring.

CAPSICUMS.—Let these be regularly watered, and otherwise properly attended to.

CARROTS.—Sow the Horn in a dry situation, to stand through the winter. Look over the main crop, and pull up all that run to flower.

ENDIVE.—Transplant whenever a favourable opportunity occurs. Some prefer planting in drills, when the plants can be partially blanched by drawing the soil close round them as they grow.

GARLIC AND SHALLOTS.—When sufficiently dry, spread these thinly on a dry floor; they can be bunched and hung up on a wet day.

LETTUCE.—Sow on a south border for a late supply.

ONIONS.—The autumn-sown ones will now generally be ripe enough for drawing. Vacant pits or frames furnish a convenient place for drying them.

SAVOYS.—Sow a small bed. These will produce larger heads than those which will be sown next spring.

TURNIPS.—Those for late autumn use should be allowed plenty of room, when they will be less liable to rot in wet weather.

ORCHARD.—Early kinds of Pears should be gathered before they are quite ripe, by which their juiciness will be increased. Keep wall-Vines clear of laterals. Any hothouse or frame lights that are not in use might be fixed in front of the Vines, to forward the maturity of the Grapes. Amidst all the attention which has been bestowed upon the improvement of our hardy fruits, one of the most useful—the Raspberry, has received little or none. We would therefore suggest to those who are engaged in such pursuits, the possibility of obtaining from seed a sort which should unite the size and flavour of our best varieties with that late-bearing property, which is now restricted (unless the "Victoria" is an exception) to the old "Double-bearing Raspberry." It is now too late for cross fecundation, but some of the finest fruit might still be selected for seed.

II.—FLOWER-GARDEN AND SHRUBBERY.

In-door Department.

STOVE.—Sow, without further delay, any seeds received from warm countries, or saved at home, that the young plants raised from them may get strong before the winter comes on. Look carefully over Orchidaceous plants, and remove decaying or rotten pseudo-bulbs, which are apt in this state to injure those next to them; pull out Ferns or other weeds which are choking them, and loosen the soil on the surface of the pots. Any of these plants which are in small pots, and which are growing vigorously, may be shifted into larger ones.

GREENHOUSE AND CONSERVATORY.—As few Greenhouse plants flower at this season of the year, the gaiety of the houses must be chiefly maintained by showy annuals, which should be removed and renewed as occasion might require. The hybrid Fuchsias are useful additions to the list of Greenhouse plants. By growing these freely, and not permitting them to flower earlier in the year, they might be produced in great beauty at this season. Examine Camellias, and if any require repotting, let it be done immediately, that the plants may have time to fill the new pots with roots before winter. The same rule should also be acted upon with other Greenhouse plants.

PITS AND FRAMES.—Seeds of Salpiglossis, Schizanthus, Nemophila, Collinsia, and many other handsome annuals, may be sown now in pots, for flowering in the greenhouse early next spring. Sow likewise Calceolaria, Cineraria, and Pelargonium seed, and prick out any seedling plants that are large enough. Stop the growing shoots of young Leschenaultias, Ericas, &c., to make them form compact and bushy heads.

Out-door Department.

Dahlias will now require considerable attention in pruning and tying, especially if it is desired to grow them fine for exhibition; in which case the flower-buds should be reduced to a moderate number. Place pieces of Bean, or other hollow stalks, among the leaves, for earwig-traps. Continue to gather seeds of the finest annuals as they ripen; and if, at the time of pulling up the stems, some of the seeds are scattered here and there upon the mixed flower-borders, their produce will probably live over the winter, and bloom early.

NURSERY AND FOREST DEPARTMENT.

Nursery.—Attend to the necessary weeding and watering of seedling and other young trees. If the bark rises freely, the less hardy sorts of Roses should now be budded. Buds put in now will remain dormant all winter, and in that state they are less susceptible of injury by frost.

Forest and Coppice Woods.—When time permits, resume the preparation of ground for planting, which should be completed before rainy weather sets in.—*J. B. Whiting, The Deepdene.*

State of the Weather near London for the Week ending July 28 1842, as observed at the Horticultural Garden, Chiswick.

July		Barometer.		Thermometer.			Wind.	Rain.
		Max.	Min.	Max.	Min.	Mean.		
Friday	22	30.128	29.695	66	46	56.0	N.	.02
Saturday	23	30.197	30.153	70	42	56.0	N.	
Sunday	24	30.118	29.927	84	49	66.5	N.E.	
Monday	25	29.902	29.812	77	43	60.0	E.	
Tuesday	26	30.066	29.967	73	48	60.5	E.	.02
Wednesday	27	30.156	30.106	75	53	65.0	S.E.	.56
Thursday	28	30.055	29.896	75	55	65.0	N.W.	
Average		30.088	29.975	74.3	48.3	61.2		.60

July 22. Fine; cloudy; clear and fine at night.
23. Very fine; dry haze at sunset; clear.
24. Cloudless in the morning; hot and dry; very sultry; clear.
25. Fine; light clouds; clear at night.
26. Clear and fine; hot and dry; clear; slight rain.
27. Slight rain; lightly overcast and fine; lightning and rain at night.
28. Thunder and lightning, with heavy rain early in the morning, most violent between 5 and 6 A.M.; sultry; cloudy and fine.

The mean temperature of the week was nearly 2° below the average.

State of the Weather at Chiswick during the last 16 years, for the ensuing Week ending August 6, 1842.

July.		Aver. Highest Temp.	Aver. Lowest Temp.	Mean Temp	No. of Years in which it Rained.	Greatest quantity of Rain.	Prevailing Winds.

Sat.	6	72.2	53.6	62.9	8	0.58	—	3	1	1	3	4	3	1

The highest temperature during the above period occurred on the 31st, in 1826—thermometer 89°; and the lowest on the 6th, in 1833—thermometer 36°.

REPORT ON COVENT GARDEN MARKET,

For the week ending July 29, 1842.

The supplies of Fruit and Vegetables during the past week have been good; but owing to the unfavourable state of the weather, trade has not been very brisk. *Fruit.*—Many of the Pines offered are remarkably fine, at the same prices as quoted in our last report. Peaches and Nectarines are well supplied, and their quality is excellent. Apricots are becoming more plentiful, but have not varied in price. Of Plums there is a fair quantity: Green-gages are selling for 3*s.* per punnet, but they are hardly ripe; other Dessert Plums are fetching 1*s.* and 2*s.* per punnet. Cherries are not so plentiful, consisting principally of Bigarreaus and Morellos: the Wall-fruit fetches from 1*s.* to 3*s.* per lb.; the Standard Fruit from 4*s.* to 12*s.* per doz. lbs. Currants have somewhat advanced in price; but Gooseberries continue steady at last week's prices. Strawberries will soon be out of season; the few offered are from 1*s.* 6*d.* to 2*s.* per gallon. Apples are abundant, consisting principally of Red June-eatings, from 4*s.* to 5*s.* per bushel; and of Keswick Codlings, from 2*s.* 6*d.* to 3*s.* per bushel. We observed some very fine Jargonelle Pears, which were selling at 16*s.* per half sieve. Ridge Cucumbers are plentifully supplied, from 6*d.* to 2*s.* per doz. *Vegetables.*—Cauliflowers have considerably risen in price, the best heads selling from 5*s.* to 7*s.* per doz. No difference has taken place in the price of Cabbages, Peas, and Beans; which continue to be well supplied. Potatoes are somewhat cheaper than in our last account. Turnips and Carrots are particularly good; the former from 2*s.* to 4*s.* per doz. bunches, the latter from 3*s.* to 8*s.* per doz. bunches. Good Radishes may be obtained from 1*s.* to 1*s.* 6*d.* per doz. bunches. Mushrooms are not so scarce as they were last week, but are still fetching 1*s.* 9*d.* and 2*s.* 6*d.* per pottle. *Flowers.*—Amongst the cut flowers we observed Agapanthus umbellatus, Crássula coccínea, Nerium splendens, Combretum purpúreum, and handsome collections of Picotees and Carnations.

PRICES, Saturday, July 30, 1842.—FRUITS:—

Apples, dessert, per bush., 3*s* to 7*s*
Pears, dessert, per hf. sieve, 2*s* to 5*s*
Pine Apple, per lb. 4*s* to 7*s*
Grapes, per pound, 1*s* to 4*s*
— Muscats, per pound, 6*s*
Melons, English, each, 2*s* to 6*s*
— Dutch, 1*s* to 2*s* 6*d*
Peaches, per doz. 6*s* to 20*s*
Nectarines, per doz., 6*s* to 20*s*
Apricots, per doz., 1*s* 6*d* to 4*s*
Plums, dessert, per punnet, 1*s* 6*d* to 2*s*
— Baking, per hf.-sv., 2*s* 6*d* to 5*s*
Greengages, per punnet, 2*s* 6*d* to 3*s*
Strawberries, per gall., 1*s* 6*d* to 2*s*
Raspberries, per gall. 10*d* to 1*s* 3*d*
Cherries, wall, per lb. 1*s* 6*d* to 3*s*
— standard, per doz. lbs., 4*s* to 12*s*
Gooseberries, per hf. sve., 2*s* 6*d* to 5*s*
Currants, White, per hf. sv. 3*s* to 6*s*
— Black, per hf. sv., 3*s* 6*d* to 7*s*
— Red, for wine, 3*s* 6*d* to 4*s* 6*d*
— for dessert, 4*s* to 6*s*
Cucumbers, per doz., 6*d* to 6*s*
Oranges, per doz., 1*s* to 2*s*
— per 100, 6*s* to 16*s*
— Bitter, per 100, 8*s* to 16*s*
Lemons, per doz. 1*s* to 2*s*
— per 100, 7*s* to 16*s*
Almonds, per peck, 7*s*
Sweet Almonds, per pound, 3*s* to 3*s* 6*d*
Walnuts, per bush., new pik., 4*s* to 5*s*
Nuts, per bushel—
— Brazil, 20*s*
— Barcelona, 20*s* to 24*s*

VEGETABLES.

Cabbage, per doz. 9*d* to 2*s*
Cauliflowers, per doz., 2*s* to 7*s*
Peas, per sieve, 2*s* 6*d* to 5*s*
— per half sieve, 1*s* 6*d* to 2*s* 6*d*
— per sack, 6*s* to 10*s*
Beans, Kidney, per hf. sv., 1*s* 6*d* to 2*s* 6*d*
— Broad, per sieve, 2*s* to 3*s*
Potatoes, per ton, 75*s* to 100*s*
— per cwt. 4*s* to 6*s*
— per bushel, 2*s* to 3*s* 6*d*
— Kidney, per bush., 3*s* 6*d* to 5*s*
Artichokes, per doz., 3*s* to 5*s*
Turnips, per doz. bun., 2*s* to 4*s*
Carrots, per doz. bunch, 3*s* to 3*s*
Red Beet, per dozen, 1*s* to 1*s* 6*d*
Horse Radish, per bundle, 2*s* 6*d* to 7*s*
Radish, per doz. hands (24 to 30 each) 1*s* to 1*s* 6*d*
— Turnip, p. doz. bch., 1*s* to 1*s* 6*d*
Spinach, per sieve, 2*s* to 3*s*
Onions, Green, per doz. bun. 3*s* to 4*s*
— Cooking, per doz. bch., 4*s* to 5*s*
Chives, per bun., 3*d*
Leeks, young, per doz. bun., 4*s*
Garlic, per bunch, 4*d* to 6*d*
Shallots, per bch., 3*d* to 4*d*
Lettuce, Cabbage, p. score, 6*d* to 2*s*
— Cos, 6*d* to 1*s* 6*d*
Celery, per bund., (12 to 15), 1*s* 6*d* to 2*s*
Small Salads, per punnet, 2*d* to 3*d*
Parsley, per half sieve, 1*s* to 1*s* 6*d*
Tarragon, per doz. bun., 2*s* to 3*s*
Mint, per doz. bunches, 3*s*
Vegetable Marrow, per doz., 6*d* to 1*s*
Tomatoes, per punnet, 1*s* 6*d* to 2*s*
Capsicums, green, per 1000, 7*s* to 10*s*
— Ripe, per doz., 9*d* to 1*s* 3*d*
Mushrooms, per pottle, 1*s* 9*d* to 2*s* 6*d*

Notices to Correspondents.

Mr. PAXTON'S COTTAGER'S CALENDAR is now reprinted in the form of a small volume, for general distribution, price 3*d.* each copy; it may be ordered of all Booksellers. Gentlemen wishing to distribute copies among their cottage tenantry may have them *delivered in any part of London* by remitting a Post-office order to this Office, at the rate of 5*s.* for every 25 copies required.

F. Z. S.—What you want is one of the many privileges of the Fellows of the Horticultural Society. Any Fellow of that Society can obtain it for nothing. No one else can obtain it at all, except from the nurserymen, who must be paid for it.

A. K. G.—The specimens sent are Ceanothus azúreus and Betónica incana.

A. E.—The plant is Sisyrinchium striatum. The orange excrescence which is prevalent on many Roses is the Uredo Rosæ. We know of no remedy for the prevention of Blight on Cabbages, which is caused by the attack of a small fungus called Cylindrospórium concentricum. The leaves of your Roses have evidently been eaten by insects; by placing Moss around the stems, you might probably be able to capture some of the depredators, and means might then be devised for their destruction.

Kathleen.—The Calycanthus flóridus is perfectly hardy, and will thrive in any soil that is not very stiff and damp; peat, however, is best adapted for it. It may be readily propagated by layers, or from North American seeds, when they can be procured.

R. E.—"Mac Intosh's Practical Gardener" contains the best directions for the different operations in each department of the garden.

A. B.—The average produce of each of the following crops, and quantity of seed required per acre, are said to be—

Wheat, 2½ bushels	produce 40	bushels.
Barley, 2½ do.	40	"
Oats, 5 do.	50	"
Rye, 2½ do.	35	"
Beans, 3½ do.	40	"
Peas, 2½ do.	30	"
Sainfoin and Clover, 3½ do.	—	"
Turnips, 2 do.	35	tons.
Hemp and Flax, 2½ do.	—	

The quantity of seed will of course vary with the quality of the land: where the soil is poor, more seed should be allowed. "Stephens's Book of the Farm" has been repeatedly advertised in our columns, to which we must refer you for its price.

A Subscriber.—The Ash-leaved Kidney is the best early Potato, and may be planted at the foot of a south wall, or in any other warm situation, about the last week in February, provided the weather will permit; the tops must, however, be protected from frost as soon as they appear. You will save time by sowing Carnation seeds, as soon as ripe, in shallow feeders, and placing them in a Vinery to forward their germination. As soon as the young plants make their appearance, remove them to a cooler place, to prevent them from becoming drawn up. A list of good Autumnal Roses is given at p. 457, all of which are perfectly hardy.

J. M. P.—When herbaceous Calceolarias have done flowering, remove all the old flower-stalks and dead leaves from the stems, and top-dress them with a mixture of light loam and silver sand, so as to cover the principal shoots. Remove them to a shady place, where by the end of September they will have formed roots, and may be potted off separately into pots. By repotting them as they require it, good flowering plants will be formed by next spring.

Cadwallader.—The following are good successional Strawberries:—Roseberry, Keen's Seedling, Old Pine, Myatt's Pine where it can be grown in perfection, Elton, American Scarlet, and Coul late Scarlet. If your runners are sufficiently rooted now, you cannot plant them at a better time, as they will get firm roothold before the approach of winter.

P. G., Bristol.—The article on the Turnip-fly in the "Mark Lane Express," was purloined from the columns of the *Gardeners' Chronicle.* We really cannot explain the notions of honesty of some people. There are those who say "Killing is no murder," others are of opinion that stealing is no robbery.

L. F.—There is a great number of Fuchsias already in cultivation, which your seedling closely resembles.

E. E. F.—Balsams require to be grown in a moist warm atmosphere, and to be repotted into rich soil as frequently as the pots become filled with roots, otherwise it is impossible to grow them in perfection. If the roots once get matted together, the progress of the plants is at once checked. It is very probable that this is the case with yours.

A Jersey Subscriber.—The minor edition of the "English Botany" is the cheapest complete work which contains coloured plates of all the indigenous plants of Britain.

Subscriber's Rose appears to be Aimée Vibert, one of the best of the Noisettes. The dwarf Roses will thrive well in a mixture of turfy loam and vegetable mould, to which a small portion of well-decayed manure may be added.

John's Alpine plant is Silene acaulis.

M. P.—Professor Henslow's Lecture on the Rotation of Crops for 11 years, delivered before the Agricultural Society, has never been published. "Stephen's Book of the Farm" is published monthly, and is one of the best publications of the kind.

T. S. P.—The specimen sent is the Rhamnus frángula, or the Black Alder. We would recommend you to try the following Roses for covering a sloping rock, provided there is sufficient soil for their support:—Bennet's Seedling, Ayrshire Queen, and the Myrrh scented. In pruning China, Ayrshire, and Boursault Roses, cut out all the old wood as far as practicable, and all the unripened parts of the shoots of the preceding season. Ceanothus Americanus is not the same as C. azureus; the latter being tender and blue-flowered, the former hardy and white.

M. C. M.—We are of opinion that wood is preferable to freestone for making shelves for Mushroom-beds, on account of its non-conducting properties. The beds should be 3 ft. wide, and at least 18 in. allowed between the surface of each bed and the bottom of the one above it. As ventilation is seldom, if ever, required, one window will be sufficient to light the house, when necessary.

G. M. E.—The Passiflora is P. lunata; the Tropæ'olum is T. brachyceras; and the papilionaceous shrub from Chili is some species of Adésmia.

P. G. L.—The Láthyrus is the true L. grandiflorus, which we never recollect to have seen producing seed before. The Epilóbium from New Holland is Ep. Billardierianum. We know of no named purple Dahlia which *constantly* blooms with one white petal in each flower, although such an occurrence is by no means uncommon. Your seedling will in time cease to do so.

M. B.—We advise you to employ for your greenhouse a second-sized Rogers's Boiler, and 4-inch pipes. We doubt the advantage of using open troughs in your particular case. It will be only necessary to carry the pipes along the front and two ends. We should make them rise about a foot to the end most remote from the boiler.

V. T.—The soil best adapted for growing the Pansy is loam enriched with leaf-mould and cow manure. Your soil probably was too light for the situation chosen, for the bed appears to have been a good one. It is necessary in order to keep up the size and character of the blooms, to keep the plants young and vigorous, for which purpose succession-beds will be required, the first to bloom early in the spring, another in summer, and a third early in autumn. The situation chosen for the beds should be adapted to the season, where they are protected from the heat of the sun, and sheltered from cutting winds.

D. B., Bath.—No. 3 is the best of your seedling Calceolarias; it is a distinct and beautiful variety. The remainder do not differ sufficiently, nor are they so fine, as many sorts we already possess in the same style.

H. C.—Your Apple, very early and handsome enough, but not of first-rate flavour, is not known.

Erica-arbûtus.—There is no remedy, that we are aware of, to check the progress of Mildew on Peas. Spiræa ariæfólia may be readily propagated by layers.

R. N.—Your Cherry is the Ox-Heart.

Bentley's Cherry is the Black Eagle.

H. J.—It is extremely probable that the cause of your Peaches and Nectarines falling off, when partly swelled, is from too little air having been given to the house in which they are grown, during the period of their stoning. If, as you say, they have been plentifully supplied with water, we can assign no other reason, unless they are planted too deeply.

A.—Your plant is a Vitex; but from the specimen sent it is impossible to determine what species. The Pear is Knight's *spurious* Monarch.

S. H.—The Ferns are,—1, Pteris hastata; 4, Pteris serrulata; 6 and 7, Davállia canariensis; 8, Pteris chinensis; 9, Polypódium aúreum; 3 is a Polypódium; and 5 an Aspidium; but we have not time to determine their species.

Glykys.—We know of no such plant as Glycine Harrisóniæ. Acácia Kermesina is a stove plant, and requires the same treatment as the other stove kinds; the flowers *are* crimson.

W. W.—The green Caterpillar, with white-and-lilac markings on each side of the body, and which you found feeding on an Ash-tree, is the larva of the Sphinx Ligustri, or Privet Hawk-Moth, and is not uncommon in many parts of England.

Philomela.—The plants are,—1, Penthorum sedoides; 2, Collómia grandiflora; 3, Aster cordifólius; 4, Cuscuta epithymum.

C. M.—The Carices are,—1, Carex ripária; 2, C. divulsa; 3, C. vesicária; 4, C. paludosa; 5, C. recurva; 6, C. ampullácea; 8, C. vulpina. No. 7 is Scirpus triqueter.

R. X.—Your plants are,—1, Celastrus pyracanthus; 2, Olea Europæa; 4, Solanum pseudo-cápsicum; 5, Solanum tomentosum.

Wm. Lodge.—The blooms of your Pelargonium were too much shaken in their passage to town, to allow of our giving an opinion upon the form of the flower: it appears to be rather small; and though the colour is good, the dull blue in the centre of the flower is of great disadvantage to it.

H. N.—Your Pelargonium, from the smallness of the blooms, can be of no use as a show flower. It will be valuable to those who make up bouquets, from its highly-scented foliage, and from the colour of the flower being high, and superior to any of the scented varieties; the truss is also full of flowers, and very compact, which increases its advantages for the purpose mentioned.

G. G.—Your plants are,—2, Lobélia Erinus; 3, a Mesembryanthemum; 4, Camássia esculenta; 5, Physianthus álbicans; 6, Echinops hórridus; 7, Eryngium alpinum. Your Pelargonium is a clean and pretty flower, but it is not equal to several varieties already in cultivation which resemble it in colour. The lower petals are too narrow, and the flower wants substance. What are we to do with the three-halfpence sent?

G. H.—The Strawberries you sent are the kind called the Green, or Green Pine-apple Strawberry. It is easily cultivated; the principal requisite being to prevent the runners from becoming overcrowded, and thus occasioning mouldiness on the fruit, which is very apt to occur if due precautions are not adopted. It bears profusely, and its green juicy flesh has somewhat of a Pine-apple flavour.

A Willing Subscriber.—Your Strawberry leaves are, No. 1, the British Queen; 2, are uncertain; 3, the Elton.

Mary.—It is not of such questions as yours that we complain, for they are clear, and have an intelligible object. The tumours on your Rose-leaves are produced by an insect, and are of the same nature as galls. Cut one open, and you will find the grub coiled up in a chamber, much more skilfully fashioned than any built by the greatest of human architects. The word Orchidaceous, now in such common use, is derived from Orchis, a pretty wild flower, and signifies, like an Orchis. You may bud Roses upon standards bearing other Roses; so that you may have a dozen or more sorts on the same bush, if you desire it. Your Hydrangeas will, in all probability, flower by and by; when they grow very fast, they always bloom late. Your insect is called the Common Vapourer, or Red-spot Tussock Moth, from the tufts of hairs with which its beautiful caterpillar is ornamented. We are very glad indeed to find that your garden prospers under our advice. See what a good thing it is to read the *Gardeners' Chronicle.*

W. Ab.—Your plant is Andrómeda axillaris.

Dido's plants are Cynanchum Vincetóxicum and Stenochilus maculatus. Early Pears will be much improved by being gathered a few days before they are perfectly ripe.

G. P. is right. The plant is Scheuchzéria palustris.

H. H.—The flower sent is a heavy-edged Picotee, and not a Carnation.

Gloucestershire.—Neither paint nor coal-tar should be used for the interior of the boxes in which you intend to shift your Aloes: the surface of the wood should either be left untouched, or it should be coated over with pitch.

W. J. Epps.—Your Picotee is a fine border variety, the general form and size being good, with a well-formed pod. The petals are too serrated at the edge; and the colour, which should be confined to the margin of the petal, is too much distributed over its surface for a show flower. The Fuchsia you mention resembles Youelli in the general appearance of the flower; how far the plant may differ from that variety in habit we cannot say without seeing it.

As usual, many letters have arrived too late for answers this week.

Erratum.—In an article upon the preservation of Fuchsias in No. 27, p. 436, col. *a*, line from the top 18, "straw" is misprinted for "soil." The sentence should run thus:—"In covering them I used no straw or matting, but allowed the *soil* to fall amongst them, &c."

NEWS OF THE WEEK.

The French Chambers were opened on Tuesday by the King in person; and a more affecting scene can hardly be imagined than his Majesty's appeal to the nation, under the distressing circumstances of his position. The speech alluded, in dignified but affectionate language, to the calamity which had brought them together, and to the necessity of providing against the consequences of his own death, by securing the country at once from any interruption of the constitutional Monarchy. It reminded the Chambers of his old age, and feelingly adverted to the merciful dispensation of Providence in still preserving to him children worthy of his tenderness. The speech concluded by stating that the Regency Bill will be the only business submitted to the Chambers at their present sitting, and that they will be summoned at a later period of the year to resume their ordinary labours. The delivery of the speech, and its reception by the Chambers, are said to have been one of the most touching scenes ever witnessed in a Parliamentary assembly: the King was completely overcome by his emotion, and the Chamber was affected to tears. There is no longer any doubt of the tactics of the Opposition: it appears that they will bring forward no amendment on the address, and will offer no resistance on the Regency; but they intend to contest the election of a President, and at a later period will make an attempt to overthrow the Ministry. The main object of this movement is to compel M. Guizot to retire; but the Ministerial papers announce the readiness of the Cabinet to accept the challenge, and express great confidence in the result. The appointment of presidents to the different committees commenced on Wednesday, and gave a decided advantage to the Government. The funeral of the Duke of Orleans will take place on the 3d of August, for which preparations, on an extensive scale, have already commenced.—From Spain we learn that the Infante Don Francisco de Paula and his family have been ordered to leave Madrid, on account of an intrigue on the part of his

Highness to effect a marriage between the Queen and his eldest son, the Duke of Cadiz. Gen. Zurbano is at Barcelona, and is pursuing extreme measures for the suppression of the Carlists and their allies.—In Portugal, the Chambers are occupied with the usual preliminary proceedings; the the Duke of Palmella has not yet signified his acceptance of office, and the Ministerial arrangements are consequently still imperfect.—Our Levant news mentions a protest submitted to the Porte by Sir Stratford Canning, on the recent cruelties of the Pacha of Tripoli; and announces a decisive victory gained by the Turkish army over the Persians, in which the latter sustained a loss of four thousand men. No fresh disturbances have taken place in the Lebanon, but the affairs of Syria continue in the same unsettled state.

At home, the Mines and Collieries Bill has gone through committee in the Lords, the House having negatived several amendments, having for their object the defeat of the bill or the omission of its most important clauses. The Poor Law Amendment Bill has also passed without alteration, Lord Stanhope's motion, that it be read a second time that day six months, having been rejected without a division. In the Commons, a long debate took place on Monday respecting the apprehension of a Chartist lecturer in Stafford: on a motion by Mr. T. Duncombe for the production of the indictment, the motion was resisted by Government as an attempt to throw discredit on trial by jury, and was negatived on a division by a large majority. The Colonial Passengers Bill has passed after a long discussion on the transportation of Hill Coolies from India to the Mauritius. Lord John Russell's Bill to prevent Bribery at Elections was brought in on Wednesday, and passed through committee after several of its disputed clauses had been withdrawn. Mr. Roebuck on Thursday brought forward a series of resolutions on the report of the Compromises Committee, the main object of which was the suspension of the writs for the towns affected by the report, until further legislative enactments have been adopted. The motion gave rise to a long and animated debate, which terminated in the defeat of the resolution by a considerable majority.

Home News.

COURT.—Her Majesty and Prince Albert, accompanied by the Prince of Wales, the Princess Royal, and the Prince and Princess of Saxe Coburg Gotha, left Buckingham Palace on Saturday for Windsor Castle. On Sunday her Majesty attended divine service in St. George's. Her Majesty reviewed the 15th Reg. on Thursday, and the 2nd Reg. of Life Guards yesterday, in the Home Park. On Monday the Duchess of Cambridge gave an entertainment to the Queen Dowager and the Royal Family, at Kew, in honour of her birthday. On Tuesday the Duchess of Kent left town for Frogmore Lodge. The Prince of Wales and the Princess Royal are quite well, and have been taken out as usual, accompanied by the Dowager Lady Lyttleton. At the close of the ensuing week, the Queen Dowager goes on a tour of visits in the Midland Counties. Her Majesty is expected to honour the Marquis and Marchioness of Exeter with a visit at Burghley House, on Monday, the 8th of August, to remain there till the Thursday following. The Earl and Countess of Brownlow and Earl Howe will also be honoured by visits at Belton-house, near Grantham, and at Gopsall-hall, Leicestershire. Their Serene Highnesses the Duke and Duchess of Anhalt-Cothen, attended by Count de Behr, have gone on a tour in the manufacturing districts, and have already visited Birmingham, Liverpool, Manchester, &c. Their Serene Highnesses, during their tour, are expected to visit the Earl of Shrewsbury at Alton Towers, and the Duke of Devonshire at Chatsworth.

Official Appointments.—The High Stewardship of Westminster has been conferred by the Dean and Chapter on the Duke of Buccleuch, vacant by the resignation of Lord Sidmouth. Her Majesty has appointed Mr. Partridge her portrait-painter extraordinary, and his Royal Highness Prince Albert has conferred on him a similar honour.

Parliamentary Reports.—The Compromises Committee have sent in their report to the House of Commons; it runs to a great length, and enters generally into the particulars of all the evidence, which has since been published in detail. The leading facts of the report are as follows: At the last general election at Harwich, the committee found that a compromise was entered into, by which the petitions against the return of the sitting members were to be withdrawn; on condition that Major Beresford retired by accepting the Chiltern Hundreds within a month after May 3, that Sir D. Le Marchant was allowed to stand unopposed by Mr. Attwood and his agent, and that Mr. Attwood paid by way of deposit, as guarantee, 2,500*l.*, which was to be forfeited provided that the engagements entered into by Mr. Attwood on behalf of himself and Major Beresford were not fulfilled, Mr. Attwood himself stating that he considered that he had paid the sum of 2,000*l.* out and out; the remaining 500*l.* being paid for Mr. Attwood by his agent, Mr. Currie. The Committee found that the number of electors was 182; that among 33 persons a sum of above 3,000*l.* was expended in direct bribes. At Nottingham they found that a compromise was entered into between the agents of Sir J. C. Hobhouse and Sir G. Larpent on the one part, and an agent, who signed as agent of the petitioners against the return, and of Mr. Walter, the defeated candidate, on the other. The arrangement, as set forth in a written agreement, specified that the petitions should be abandoned, on condition that one seat be vacated within four days of the agreement; that 1,000*l.* be paid to cover the expenses incurred in the petition; that Mr. Walter be returned for the vacant seat; that the sitting members engage a certain number of their supporters not to oppose his return, and at the same time deposit 4,000*l.* as security for the due fulfilment of the contract. The committee report that the number of electors was about 5,400: that the sum expended in the election on the part of Sir J. C. Hobhouse and Sir G. Larpent was 12,000*l.*, of which a very large part was expended in an illegal manner; some in direct bribery—some in treating, and other unlawful proceedings—without the personal cognisance of the candidates; and that the expenditure on the part of the opposing candidates appears to have been about 4,000*l.* or 5,400*l.*; the smallness of the sum being attributed to the poll not having been taken. At Lewes, they found that a compromise was entered into by the agents of the sitting members, on the one part, and of Mr. Fitzroy and Lord Cantalupe, on the other, sanctioned and acted on by the principals; by which the petitions on the ground of bribery were to be withdrawn, on condition that, in case the agents should be unable to place Mr. Fitzroy in a majority by a scrutiny, then one of the sitting members should resign, by accepting the Chiltern Hundreds, and that no opposition was to be offered to the return of Mr. Fitzroy, either by Mr. Elphinstone or Mr. Harford. The committee report that Mr. Fitzroy and Mr. Elphinstone were placed on the poll above Mr. S. Harford by a pre-arranged scrutiny, and Mr. Summers Harford was unseated. They found that the number of electors was about 850; that the gross cost of the election to Mr. Elphinstone and Mr. S. Harford, on the one side, was 5,000*l.*, of which sum 2,000*l.* was expended in treating, and about 1,200*l.* or 1,500*l.* in direct bribery; that the two members stated that they were not personally cognisant of this bribery, either before or during the election; and that the gross cost of the election of Mr. Fitzroy and Lord Cantalupe was, as nearly as the committee could ascertain, 2,000*l.* At Reading, a compromise was entered into by the agent of Mr. C. Russell and Lord Chelsea on the one side, and the agent of Mr. T. Mills on the other, and was afterwards signed and acted on by the principals themselves. This agreement stipulated that the petition against the return should be withdrawn, on condition that one of the sitting members vacated his seat in such time that a new election might take place during the present session; and that both of them should use their utmost endeavours to secure the election and return of the petitioner at the next election for the Borough of Reading (whether caused by such vacating, by death, advancement to the peerage, or any other circumstance), without opposition, and to induce the Conservative electors of the borough of Reading to do the same; and that in the event of the petitioner's election not being effected in the way above proposed, the sitting members should forthwith pay 2,000*l.* to the petitioner. The committee report that the constituency of Reading is 1,050; that the expenses have not been clearly ascertained, but that they are too large to have been spent in a legal manner. At Penryn and Falmouth they found that a compromise was entered into by the agent of Captain Plumridge on the one hand, and the agent of the petitioners and Mr. Gwynn, the opposing candidate, on the other; that the petition was to be withdrawn on condition that Captain Plumridge would thereupon, and before the 1st of July, accept the Chiltern Hundreds, and thereby vacate his seat. That no opposition should be given by Captain Plumridge to the return of any person proposed by the party presenting the petition. They report also that this arrangement, though made by the authorised agent of Captain Plumridge, was made wholly without his knowledge or consent; that bribery was common to both sides; that the gross sum expended on the joint election of Captain Vivian and Captain Plumridge was, by the agent, stated to be about 4,000*l.*; and that the gross sum expended by the opposing candidates was, by their agent, stated to have been 4,000*l.* At Bridport they found that a compromise was entered into for the withdrawal of the petition against the return; by which Mr. Warburton accepted the Chiltern Hundreds, and Mr. Cochrane was elected without opposition; that the cost of Mr. Warburton's election was 2,166*l.*, part of which sum was expended in treating; that counter petitions were presented against the returns of Mr. Mitchell and Mr. Cochrane, and mutual indictments preferred on the ground of bribery; that at length an agreement was entered into by which Mr. Mitchell agreed to withdraw all the actions and indictments, and all other criminal proceedings against Mr. Cochrane and his friends, together with the petitions which had been presented against the return of Mr. Cochrane; Mr. Cochrane, on the other hand, agreeing to withdraw the petition against the return of Mr. Mitchell: that the circumstance which led Mr. Mitchell to agree to this arrangement was the fear of being unseated on the charge of bribery by his agents; and that Mr. Cochrane was led to agree to this arrangement from a fear of the consequences of the various investigations to himself and his friends. They found that the sum expended by Mr. Mitchell in the election was 3,300*l.*, of which a large portion was spent, some in treating, some in direct bribery. This bribery, they state, was commenced without the cognisance of Mr. Mitchell, but was continued after it had become known to him, not being interdicted by him; and they add that this fact was learned from Mr. Mitchell himself, and from one of his friends. The report concludes by adverting to the fact that Mr. Cochrane refused to answer several material questions, respecting chiefly the sums expended in his behalf; but they state that all the evidence plainly shows that bribery in the present case did take place, and they entertain no doubt that it was extensive and systematic, and that it was practised by the partisans of Mr. Cochrane, as well as by those of Mr. Mitchell.

Foreign.

FRANCE.—*Opening of the Chambers.*—An extraordinary express reached town on Wednesday from Paris, bringing an account of the opening of the Chambers on the previous day. The King was accompanied by the Duke de Nemours, the Prince de Joinville, the Duke d'Aumale, and the Duke de Montpensier. The procession was headed by a party of cuirassiers, with their band, followed by a strong detachment of the National Guard on horseback. The Royal carriage was surrounded by a brilliant staff, a marshal of France riding at each door. All the domestics were in deep mourning. The attendance of troops of the line, national and municipal guards, was unusually large, and in some parts a double rank of troops of the line was drawn up in rear of the National Guards. The usual salutes were given by the drums and bands when his Majesty passed; but the people preserved a respectful silence. The precautionary measures were unusually strict, and it was impossible to obtain the slightest view of the King, in consequence of the number of officers who rode near the doors of the vehicle; but cordial expressions of sympathy and regret were heard on all sides as the carriage passed along. The Chamber was extremely crowded, a larger number of Peers and Deputies being present than on any former occasion. After the Ministers had taken their seats, the arrival of the King was announced: shortly afterwards his Majesty entered, and was enthusiastically cheered by the assembly. The King stopped on the stairs and bowed repeatedly, evidently much affected by the warmth of his reception. Fresh shouts of "Vive le Roi" attended his appearance on the estrade, which he again acknowledged with great earnestness of manner. His Majesty and the Princes then took their seats, and when silence was restored, he proceeded to read the following speech:—

"GENTLEMEN, PEERS, AND DEPUTIES,

"In the grief which overwhelms me, deprived of that beloved son whom I thought destined to succeed me on the throne, and who was the glory and the consolation of my old days, I felt the necessity of hastening the moment of your assembling around me. We have a great duty to fulfil together. When it shall please God to call me to him, it is necessary that France and its constitutional monarchy be not for a moment exposed to any interruption in the exercise of the royal authority.

"You will have, then, to deliberate on the measures necessary to obviate, during the minority of my well-beloved grandson, this immense danger. The blow that has just struck me does not make me ungrateful towards Providence, which still preserves to me children so worthy of my tenderness and of the confidence of France.

"GENTLEMEN—Let us to-day ensure the repose and the security of our country. I will summon you later to resume on affairs of state, the usual course of your labours."

The circumstances attending the reading of the speech are said to have been unparalleled in the history of parliamentary sittings. The King's emotion was so great that he found it impossible to give utterance to the words. He made the attempt a second time, and again he was unsuccessful. The auditory burst forth into one long cry of "Vive le Roi!" which seemed to give him courage. He at last found utterance, but his voice was thick, and broken with agitation. At the word "consolation" the King could no longer withstand the torrent of his grief; he laid down the document, and burst into tears. The whole auditory was deeply affected, none present could resist the contagion, and all the accounts agree in stating that there was not a dry eye in the chamber. Loud, long-continued, and reiterated shouts again greeted him. He then resumed, and his voice became stronger until he spoke the words *mon fils*, when it again faltered. At *ma tendresse* tears again prevented his proceeding, and the shouts of the auditory were again necessary to give him confidence to conclude. At the end his Majesty rose, crossed his arms on his breast, and, in an effusion of gratitude for his reception, after bowing to the Chamber, sunk back on his seat, and sobbed convulsively, hiding his features in his handkerchief. It was altogether one of the most affecting scenes ever witnessed, and it was long before the persons present could recover from their emotion. The Duke de Nemours and the Duke d'Aumale sat on the right of the King, and the Prince de Joinville and the Duke de Montpensier, on the left. They all appeared exceedingly cast down, and the Duke de Nemours was much changed in appearance, being thinner and paler than usual. The King looked in good health, but bore evident marks of the severe suffering he has undergone. After the speech, the King advanced to the front of the estrade, and repeatedly acknowledged his affectionate reception. The cries of "Vive le Roi" were again loud and long-continued. The Minister of the Interior administered the oath of office to some of the members of the Lower Chamber, elected or re-elected since the last session. The Minister of Justice having then, in the usual form, announced that the session of 1842-3 was duly opened, the King and the Princes retired, and returned by the same route and with the same *cortége* to the Tuileries. The effect of these circumstances on the Bourse was favourable. The funds opened at an improvement on Monday's prices; they continued to rise steadily, and are still firm.

The Late Duke of Orleans.—Dr. Duval, the physician who attended the Duke of Orleans in his last moments, has published the following account of the melancholy scene :—" When I arrived at the house where the Prince lay, M. Not was there, and M. Ley came at the same time that I did. We were the only medical men about him from half-past eleven till one o'clock. The Prince was stretched on two mattresses. His head, reclined on his chest, waved from side to side as his body was stirred; his respiration was deep and difficult, his eyes half shut. There was no sign of outward fracture, merely some severe contusions, with blood on his right eye and ear. Blood was first let, and produced little effect, except that the Prince tried to remove the band on his arm from the bleeding. We imagined the Prince might have some consciousness of his state, but the autopsy has shown this to be impossible. The violence of the shock had been such, that if not broken by the disarticulation and breaking of the bone, it would have killed him on the spot. Cold lotions were applied to his head and stimulants to the respiratory organs; friction was employed, still no sign appeared of intelligence, but merely automatic movements. At mid-day the Royal family came in. The Queen flung herself at the foot of the bed : never did a mother's grief burst forth in expressions more full of grief and distraction. The King asked, was there a fracture? We gave a negative answer, though with some hesitation. On this the King tried to console the Queen, stating that accidents of a similar kind had occurred to himself. The patient, however, grew worse. Sixty leeches were applied to the back of the head, when the Prince uttered a few words in German. He tried to tear off the leeches. At half-past one sinapisms were employed ; the pulse became better, but the respiration worse. The involuntary motion of the limbs ceased, and a convulsive trembling began. This by degrees subsided into tension and stiffness. Anxiety and despair were on every countenance. The Queen, in agony, supplicated the Almighty for one gleam of consciousness to be given to her son. She offered her existence for such a boon. The Duc d'Aumale said, 'What will Joinville feel on such news?' The King's resignation was more poignant than the louder agony of those around him. The physicians durst not look up; they had no hope to give. Several more physicians arrived ; and at 2 o'clock the curate of Neuilly came to give extreme unction to the Prince. Convulsions were renewed. At three o'clock there was no pulsation but of the carotids. Medication was suspended. In this the King and Queen saw the announcement of the approaching end of their son, rushed towards him, embraced him in sobbings, and paid him the last adieus. 'How announce such a misfortune to Helena!' exclaimed the Queen. At half-past four the illustrious patient expired."—A funeral service for the repose of the Prince's soul was performed on Monday in all the churches of Paris and the departments. The churches of the Metropolis were fitted up in a magnificent style for the occasion. On Sunday next, the day after the body of the Duke is to be transferred to Notre Dame, the chapter of the cathedral and the clergy of that parish will be admitted to sprinkle the coffin with holy water; and on Monday and Tuesday all the parishes of the Metropolis will perform the same ceremony in succession, for which a rota has been issued by the Archbishop. The preparations for the funeral on the 3d of August are on the grandest scale. All the singers of the Conservatoire and Académie Royale are engaged for the choir, and M. Auber is composing a funeral mass for the solemn occasion. Nearly all the municipal councils which had voted funds for the celebration of the *fêtes* of July have decided that they shall be appropriated to works of charity, in memory of the Prince. The King is reported to have appointed to the household of the Count de Paris the officers who formed part of the military suite of his deceased father. The most respectable meeting of British residents of Paris ever witnessed assembled on Saturday, the Duke of Montrose in the chair, and voted an address of condolence to the King and Royal Family.

The Capital.—We regret to state that typhus fever prevails to a great extent in the hospitals of Paris, and that scarlet fever is also general. So high and unfavourable has been the temperature during the last month, that no surgical operation that could be postponed has been performed during that period, from fear that erysipelas would supervene. The church of the Madeleine was opened on Sunday for public worship. It was crowded at each service, but municipal guards having been stationed at the doors to preserve order in entering, no inconvenience was experienced.

The Provinces.—The papers state that M. Guizot met with an accident on Friday which might have been attended with fatal consequences. On leaving his house at Auteuil in his carriage, the horses plunged forward and dashed the pole of the carriage against a tree, which was shivered to pieces. M. Guizot fortunately escaped unhurt.—M. Lenormand, Ex-Commissary of Police at Toulouse, has been condemned by default to be divested of his civil rights, and to pay a fine of 400 francs, for connivance and other corrupt practices in the execution of his office.—The provincial journals announce that the harvest is proceeding favourably in all parts of the country.

SPAIN.—The intelligence of the death of the Duke of Orleans reached Madrid on the 17th, on which day the Regent ordered the Court to go immediately in mourning for forty days. Private correspondence states that the eldest son of the Infante Don Francisco de Paula was to have arrived on the 16th. The departure of his father from Madrid is again alluded to, the Infante and his wife having made themselves obnoxious to the Regent by their encouragement of Opposition Deputies and intimacy with Generals whose politics were of the extreme opposition school. Other accounts state that a plot was set on foot by the Infante, to bring about a marriage between the Duke of Cadiz, his eldest son, and Queen Isabella, for which purpose an appointment was procured for him in the Queen's regiment of Hussars. It is also stated that to effect their object, the partisans of his Highness had endeavoured to act upon the feelings of the national guard. It is generally supposed that the Infante and his family will go to Santander, and that the Prince will be sent to join another regiment at some distance from the capital. In order to expedite their departure, Government had advanced 10,000 piastres to pay the expenses of their journey. The printers' strike had not ceased on the 18th. Accounts from Barcelona of the 19th bring additional accounts of the proceedings of Gen. Zurbano, in the accomplishment of his mission to put down the Carlists and overawe the Republicans. After shooting about a dozen persons in Girona, he had issued orders for the execution of two inhabitants of St. Esteban de Llemana, one for having given a letter of recommendation to the monk who accompanied the late Carlist Chief Felip; and the other, for having given some food to this monk, who had taken refuge in a cavern. He had also issued an order to the Military Commandants " to shoot every individual taken prisoner by the Carlists who should agree to pay to them a ransom for his deliverance; every individual who should enter any town or village on the part of prisoners in the hands of Carlists to ask for money for the ransom from the family of the detained; and every individual who shall be the bearer of the whole or any part of this ransom."—The British frigate Belvidera, of 46 guns, anchored in the port of Barcelona on the 14th. It appears that some Spanish vessels of war are to join her in a cruise on the southern coast of Spain.

PORTUGAL.—Our advices from Lisbon are to the 18th inst. The Chambers were occupied by the usual preliminary proceedings, verifying returns and diplomas, electing committees, &c. Count Lavradio had moved a vote of censure against the Home Minister for irregularity in summoning the new peers to the Royal session before their diplomas had been presented to the Chamber; and had also attacked the nominations themselves, as an abuse of the Royal prerogative, but his motions were rejected by about 2 to 1. The Chamber had decided in favour of admitting the sons of former peers without any fresh nomination, but a question had arisen with respect to the sons of Miguelite peers, which was still undecided. The Miguelite peers forfeited their own rights, by the decree of Don Pedro, afterwards confirmed by the Cortes; but the question had arisen, in the case of the Conde de S. Lourenço, son of the late Miguelite Marquis of Sabugosa, whose claims to sit as a peer had been urged by Conde da Taipa. The matter had been referred to a special committee. The Tariff commission (Portuguese) had presented another report. The papers were in the hands of Baron Tojal, who was thought likely, in case the Duke of Palmella continued his refusal of office, to leave the Finance for the Foreign department. The Duke of Palmella had been sent for by the Queen to Cintra, and went there with his Duchess; but though it was believed he was urged to take office, he still refused to do so, mainly, it was thought, owing to the influence of the Duchess. The army was to be increased by 4,295 men, to make up the legal number voted in 1840. —A decree had appeared for the immediate and effectual enforcement of a tax of 10 per cent. upon every description of property.—It appears that 2,755 pipes of wine were exported from Oporto in June, of which 2,291 were to England and its dependencies. In the last six months 13,713 pipes have been exported, of which 11,186 went to Great Britain and British colonies.

GERMANY.—Letters from all the great capitals of Germany mention the deep impression produced by the death of the Duke of Orleans. The funds, both in Vienna and Berlin, fell on the receipt of the news, and did not recover for some time. Accounts from Berlin state that the works for the fortifications of Ulm and Rastadt are to be advanced with the greatest speed.—A letter from Dresden, of the 18th instant, represents the Elbe to have become so shallow, that the water in general is not more than four feet ten inches in depth, and in many parts is fordable, so that for the time the river is unnavigable—a state without example in the memory of man.—Accounts from Baden-Baden state that great numbers of persons are flocking to the Rhine and to Baden-Baden, which will be this year the rendezvous of the high society of Europe. The papers estimate at 7,289 the number who have arrived since the 1st of April; and it is almost certain that this number will be doubled before the month of August. It is supposed that at the end of the season 25,000 persons will have visited this fashionable watering-place. The Rhenish journals mention that in preparing the ground for the railroad along the left bank of the Rhine, discoveries interesting to geologists have been made. Near Offenburg, about 30 feet below the surface, in a bed of marl, were found portions of the skeleton of a mammoth. They consist chiefly of a masticator, nearly perfect, and of two molar teeth, larger than any that have hitherto been found in the valley of the Rhine. Each of these is 13 inches in length, and weighs nearly 11lbs.—The German papers report that the inhabitants of the Black Forest, living principally by the manufacture of wooden clocks and articles of wood and straw, which are exported in great quantities into France, are greatly alarmed at the new tariff made known by the French Government, which is from 1f. 40c. to 2f. 10c. upon all clocks from the Black Forest. The French Government is said to desire the transference of this branch of industry into Alsace, and wish the inhabitants of the Black Forest to establish themselves in France.—A letter from Munich states that the Walhalla, or Temple of Fame, which the King of Bavaria has constructed on the Danube, has just been terminated, and already 200 busts of illustrious Germans, for whom his Majesty has composed the inscriptions, have been placed there. The Walhalla is, without doubt, the greatest edifice in Germany. It is situated on a steep rock, 304 feet high, close to the left bank of the Danube, in the neighbourhood of the town of Donaushaufen, two hours' journey from Ratisbon, and opposite the picturesque ruins of the fortress of Hauff, which are on the other bank of the river. The temple is raised on three terraces, formed one above the other, of immense blocks of unhewn stone, joined together without cement. The form of the building is nearly the same as that of the Parthenon at Athens, being of the Doric style, with its frieze ornamented with triglyphs. 52 columns, 5ft. 9in. in diameter, form the porticoes, in front and in the rear. The two pediments contain representations of the battle in which Arminius (Hermann) conquered Varus, and delivered Germany from the Roman yoke. These representations are composed of more than 40 figures in alto relievo, 14 feet high, and the pediments are the only modern ones in which figures are formed in full relief, or entirely isolated. From the foot of the rock runs a wide flight of white marble steps, conducting to the portico of the principal front. Around the interior of the building is a frieze, 292 feet long, ornamented with sculptures representing the most remarkable actions of ancient German history, from the heroic times to the epoch of St. Boniface, who first preached Christianity in the country. The Walhalla is 228 feet in length, 108 in width, and 59 in height, exclusive of the pediment. It was built after plans given by the King, under the superintendence of the celebrated architect, Von Klentze, to whom Munich is indebted for its finest modern monuments. The sculptures on the pediments were executed by M. Stigelmayer, and the great frieze in the interior was modelled by M. Wagner, at Rome. The King intends inaugurating the Walhalla himself, towards the end of August or the beginning of September.

BELGIUM.—The railway from Liege to Ans was opened last week with great festivities; but these ceremonies were surpassed by the spectacles in honour of the inauguration of the statue of the musician Grétry, which took place at Liege on the 18th. The heart of the composer, which had been brought from Paris for the purpose, was deposited in an urn in the pedestal of the statue, and a chorus in honour of the occasion was executed by 500 musicians. The town was illuminated in the evening, and the presence of a large number of visitors added to the gaiety of the scene.

ITALY.—Letters from Naples state that the French fleet, under Vice-Admiral Hugon, composed of three three-deckers, five two-deckers, four large frigates, and a war-steamer, have unexpectedly arrived at Naples. His Majesty lost no time in announcing to the Admiral, that according to existing treaties, the force must be reduced, or rather spread; and suggested the sending one division to Castellamare, and a second to Baiæ, whilst a third could remain at Naples; whereupon the Admiral gave him to understand that it purposed shortly weighing and proceeding to do honour to the festivities of Santa Rosalia at Palermo. The King remarked that, that being the capital of Sicily, the treaty extended to it likewise. A hint was also thrown out that the appearance of so large a force at Palermo would attract the English fleet, which was not at all desirable. It is said that the Royal Family intend to proceed to Palermo, to be present at the fêtes of Santa Rosalia.

MALTA.—A public meeting of the British inhabitants was held on the 1st inst. at Valletta, for the purpose of aiding the endowment of the bishopric of Gibraltar; the Governor, Sir H. F. Bouverie, in the chair. Resolutions expressing the satisfaction of the meeting at the appointment of a bishop, whose chief residence will be in Malta, were unanimously carried, and subscriptions were entered into for the purpose of promoting the endowment. —The Admiral, Sir Edward Owen, in the Queen, accompanied by Rear-Admiral Sir F. Mason, in the Howe, and the Impregnable, Rodney, and Indus, ships of the line, attended by the Devastation war steamer, had left the harbour, but their destination was unknown. By some it was supposed that they were going to Palermo and other ports of Sicily, where the usual festivities are about to commence in honour of the patron saints of the respective ports, but this would appear to be contradicted by the fact of the ships having provided themselves with quarantine grounds, so as to entitle them to free pratique on their return from any place subject to quarantine, provided they do not communicate with the shore. The general impression is, that they are about to join the French fleet now in the Sicilian waters, in order to repair and make a demonstration on the coast of Syria.

HAMBURGH.—The Hamburgh papers contain an account of a vessel having been raised near a place called Oro, and taken into Mallmo, which is supposed to be the Magnet, sloop of war, commanded during the war of 1809, by Capt. Morris. She mounted two 9-pounders and sixteen 32lb. carronades. From her appearance it is surmised that she has been many years under water. A number of cases, containing spike nails, and a quantity of clothes, have been saved. Of the latter the linen portion are rotten, but the woollen, on the contrary, particularly the blue cloth, is in good preservation. The most curious circumstance is the excellent state of the works of three silver watches found in the cabin, which, it appears, after the inspection of a watchmaker, are capable of being repaired. The remains of a man's body were discovered in the hold, but its condition is not stated. Her bowsprit is gone, and from the damage to the bows it is supposed she must have been run into by a large vessel. She is built of oak, and copper fastened, and is represented to be worth the expense of raising.

Turkey and Syria.—The Levant mail has brought few particulars of interest. Sir Stratford Canning had addressed a note to the Porte, accompanied with a report of the cruelties recently perpetrated by Askar Pacha at Tripoli. The murder of the Arab chiefs, who, with forty other prisoners, had been betrayed into his hands, and whom he had gone into the interior to seize upon in person, is mentioned as the least revolting feature of the tragedy. The Arabs, who under promise of reward had given up the chieftains, and the children of the latter, mere infants, shared their fate, having been massacred and their bodies thrown into wells. Sir Stratford Canning had made an earnest appeal, in order to prevent the Porte from compromising itself, or inadvertently assuming the responsibility of these crimes, by leaving the author of them unpunished; and in order that the chances of retribution may be the more certain, he had particularly requested that the report be laid before the Sultan. Accounts had been received of a victory gained by the Turkish army over the Persians at Bayazid. The loss of the Persians is said to have amounted to more than four thousand men. The intervention of Russia, which had been previously invoked, has thus been rendered superfluous.—Letters from Beyrout of the 1st inst. announce that there had not been any fresh disturbances in the Lebanon. The Druses, who had been carried off, still remained in the prisons at Beyrout. The Emir Abdallah, of Gazir, had quitted the British frigate on board which he had sought protection. He had received a formal promise from the Turkish authorities that he would not be further molested, on condition that he should not return to his district for some time.

Greece.—Accounts from Athens of the 10th instant state that the Greek Ministry, finding the treasury nearly empty, were about to apply to the French Government for a fresh loan. They had, moreover, adopted extreme measures of severity against such persons as were in arrear of their Government taxes. It was said that at Messena alone 3,000 individuals had been arrested. The Ministry, who were entirely devoted to French interests, were becoming every day more unpopular. An observatory was on the point of being built on the summit of the Pnyx. The famous Theocaris, accused of the murder of Signor Crokidas, and whose trial has lasted three years, has been condemned to death by the Criminal Court of Athens.

Egypt.—Our intelligence from Alexandria of the 6th inst. states that Said Pacha, the son of Mehemet Ali, a youth of 22 years of age, had been appointed Admiral-in-Chief of the Egyptian fleet. The Pacha had suffered a serious loss by the death of Selim Bay, one of the most distinguished officers in the Egyptian army, and General-in-Chief of the Artillery, who died of a *coup de soleil*, in the 33d year of his age. The plague continued to rage at Alexandria. A report was current that Mehemet Ali had assured the French engineer Mongel that he wished to realise the dream of his life—the junction of the Red Sea and the Mediterranean by means of a canal. It was even stated that the Pacha had written to Mr. Brunel, proposing to him to undertake this work.

United States.—The Acadia steamer arrived at Liverpool on Thursday night from Boston and Halifax. Some impediment has occurred in the progress of Lord Ashburton's mission, and a reference to an independent sovereign is talked of. The rejection of the Tariff Bill still gives rise to much discussion. Two steamboat accidents are mentioned in the papers, one being the explosion of the Edna at the mouth of the Missouri, whereby 63 persons were nearly scalded to death and 28 killed; the other was the explosion of the Shamrock, near Montreal, by which 62 emigrants from Great Britain were killed and 20 seriously injured. Lord Morpeth had arrived at Montreal. Among the passengers by the Acadia are Lord Glamis and Fanny Elsler.

West Indies.—The Royal Mail Steamer, Tweed, reached Falmouth on Tuesday from the West Indies, having sailed from Turks' Island on the 30th June, from Nassau on the 4th, from Bermuda on the 10th, and from Fayal on the 19th inst., and bringing about 40 passengers, 90 serons of cochineal, and 200,000 dollars on freight. The scarlet fever was raging at St. Jago de Cuba. The Jamaica papers announce that Lady Elgin was safely delivered of a daughter on the 18th ult. A severe shock of an earthquake was felt at Ponce, Port Royal, on the 7th ult. It lasted for three minutes. The inhabitants ran out of their houses, and knelt down in the streets praying. Several hogsheads of sugar and molasses on the beach were destroyed. Occasional shocks of earthquake were felt throughout the Islands, though without any serious results. The parliamentary committee to inquire into the state of the colonies, had made considerable progress. Trinidad and Barbadoes had first engaged their attention; and as soon as Antigua and St. Kitts are disposed of, the case of Demerara will be taken up, then Grenada, and afterwards Jamaica.—The republic of Hayti is said to be completely upset, both by the late earthquake and the tyranny of the President Boyer, who had not been assassinated as reported in recent advices from New York, but is, however, approaching his last moments.

Parliament.

HOUSE OF LORDS.

Saturday.—The Earl of Shaftesbury sat as Speaker.—Mr. M. Sutton and others from the House of Commons brought up the Irish Fisheries Regulation Bill, the Poor-law Amendment Continuance Bill, and some private bills, which were read a first time.

Monday.—A conversation took place between the Bishop of London and Lord Wharncliffe on the subject of national education, at the conclusion of which the Lord President explained that in his speech some days since, upon the subject of education, he had desired only to express his intention, in apportioning the grant between Churchmen and Dissenters, to abide by the rule which had been laid down, and hitherto acted upon by the Committee of Privy Council. He denied the inference that because elementary instruction on other subjects was afforded, the religious education of the classes was to be neglected, and declared that Government would support no schools in which religious culture did not form a part of the system.

On the motion for the recommittal of the Mines and Collieries Bill, Lord Brougham inculcated great caution in the application of the principle of interfering with the rights of labour. He admitted that the Legislature might interfere with the employment of children in occupations injurious to their constitutions, but was jealous of interference with the occupation of adults, as the principle adopted in the present bill might be extended to other occupations, such as that of pin and needle-making, &c.—The Marquis of Londonderry hailed the support of Lord Brougham in opposition to the bill, as otherwise he had stood alone, having been thrown overboard by Lord Hatherton. He moved that the bill be referred to a select committee. After a short discussion, the recommittal of the bill was carried by 49 to 3. The bill was then recommitted, and Lord Skelmersdale moved that women above 40 years of age at present working in collieries should still be permitted to do so. After considerable discussion, this was rejected by 29 to 15.—The Earl of Mountcashel proposed to raise the limitation age of children from 10 to 12 years. This was negatived without a division. The bill, after some further discussion, went through committee.

Tuesday.—The Duke of Wellington, in moving the second reading of the Poor-law Amendment Bill, expressed the satisfaction which, as one of those who had originally approved the measure, he felt at its general operation. In many cases it had certainly been carried too far—buildings, which had acquired the nickname of bastiles, had been unnecessarily erected, and these had been so constructed as to inflict uncalled-for deprivation upon the inmates. He had seen much of the practical working of the system, however, and was satisfied with its general management. The noble Duke then proceeded to enumerate the alterations and deficiencies in the present bill, and concluded by promising that whatever additions might be required to render it complete should be introduced early next session.

Earl Stanhope spoke at considerable length, and with great warmth, against the bill, which, he contended, would so disgust the working classes as to lead to a revolution. He moved that the bill be read a second time that day six months.—Lord Brougham censured Earl Stanhope for his declamatory appeals to the passions of the people, and his prophecies of rebellion. The working of the New Poor-law was a sufficient test of its value.—Earl Stanhope's amendment was negatived without a division, the bill being then read a second time; and after some other business the House adjourned.

Thursday.—On the third reading of the Customs Acts Amendment Bill, Lord Monteagle asked questions relative to the progress made in the commercial treaty with Portugal, the present state of our negotiations with the Brazils, and what steps the Government had taken with respect to the French ordonnance affecting our linen yarns.—The Earl of Ripon replied, that it was fully expected that the treaty with Portugal would soon be brought to a satisfactory conclusion, that we were carrying on negotiations with the Brazilian Government respecting the treaty shortly to expire, and that representations had been made to the French Government on the subject of its ordonnance.

The Poor-law Amendment Bill went through committee; to be read a third time on Friday.

Lord Campbell brought on a motion that a standing order be established, prohibiting any Member of the House of Commons from pleading at the bar of the House of Lords on any bill which might be under its discussion. He reviewed the practice of the House on the subject, stating that he could only find three instances in which Members of the House of Commons had pleaded at the bar on a bill, one of these instances being the celebrated Bill of Pains and Penalties against Queen Caroline. He did not question the right of any Member of the House of Commons appearing at the bar of the Lords on any judicial proceedings, but contended that great inconvenience might arise from that permission in legislative matters, as there might be a clashing of the two functions of zealous advocate and independent legislator.—The Lord Chancellor opposed the motion. The House could act in any particular case as it might think proper, and it was better to leave the matter in that way, than to adopt any absolute rule. No doubt possible inconvenience might arise, but in practice there had been none. If the House should think proper to interfere, it should be done with great deliberation, by means of a select committee next session.—Lord Brougham strongly censured Lord Campbell for want of delicate consideration, and a deficient sense of the gravity and importance of the subject, in bringing forward this motion. Supposing that in any case a Member of the House of Commons, by accepting a retainer to appear and plead on any particular bill, should have his judgment and independence as a legislator warped and destroyed, that was for the House of Commons to consider, and not the House of Lords.—After some observations from the Marquis of Clanricarde, and a reply from Lord Campbell, the motion was negatived without a division.

Friday.—The Poor Law Amendment and Commission Continuance Bill was read a third time and passed.

The Marquis of Clanricarde withdrew the Sudbury Disfranchisement Bill for the present session, in consequence of the state of public business.

The Earl of Glengall called the attention of the House to the excessive allowance for travelling expenses made to the assistant Poor-law commissioners in Ireland.—The Duke of Wellington said that those expenses, if too high, would be reduced by the Treasury.

HOUSE OF COMMONS.

Saturday.—Mr. Gladstone moved the order of the day for a committee of the whole House on the Copyright of Designs Bill.—Mr. M. Philips opposed the motion, and declared his intention of doing all in his power to defeat the bill. He protested against proceeding with a measure of such importance on a Saturday, after a week of unexampled Parliamentary toil and exertion. He moved as an amendment that the bill be committed that day three months, but the motion was negatived without a division. The bill then went through committee.

On the order of the day for a committee on the Government of Newfoundland, Mr. O'Connell presented a petition from a delegate of the House of Assembly against the bill. He said he did not intend to offer any factious opposition to the bill, but having received the important petition he had presented only about ten minutes before he entered the House, he hoped the noble Lord would allow the committee to be postponed to that day week.—After some conversation, Lord Stanley consented to postpone the committee to Wednesday next.—The Lunacy Bill was read a second time. The Grand Jury Presentments (Ireland Bill was reported.—The Manchester, Birmingham, and Bolton Police Bill was read a third time and passed.

Monday.—Mr. Colquhoun took the oaths and his seat for Newcastle-under-Lyme.

In reply to a question asked on Friday night by Lord Palmerston, it was intimated by Sir R. Peel that a supplementary grant of 10,000*l*. is to be proposed, in addition to the usual education grant of 30,000*l*.

Sir J. Graham, in reply to Mr. Ewart, said that Government were not prepared to substitute another punishment for that of transportation.

On the motion for going into committee of supply, Mr. T. Duncombe called the attention of the House to the case of John Mason, a Chartist lecturer, and others, committed for trial at the late Midsummer Assizes of the county of Stafford, moving for copies of the indictments, &c. The man had been apprehended and tried on the interference of a constable, who had interfered with what he considered to be an unlawful meeting.—Mr. Hume seconded the motion.—Sir J. Graham vindicated the conduct of the parties concerned in the apprehension and prosecution of the prisoners, and who had carried on the case without any communication with Government. He objected to the motion, being indisposed to convert the House into a court of review of trial by jury.—Mr. Aglionby and Mr. Hawes expressed alarm at the doctrine which they understood Sir J. Graham to have advanced, that a constable can make himself a judge of the tendency of oratorical addresses to produce a breach of the peace.—The Attorney-General corrected their misapprehension of Sir J. Graham's meaning, and stated the law to be as Sir J. Graham had really put it, that a constable is not only justified, but bound, to interpose as soon as he perceives any act done, or any language used, the immediate tendency of which is to produce a breach of the peace—such interposition being at his own peril, if groundless or premature.—Mr. O'Connell contended that the constable had himself commenced the riot which was alleged to have taken place at the meeting, for participation in which the prisoners were tried and convicted. He thought it unwise, in the present condition of the country, to strain the letter of the law with respect to what might be considered unlawful assemblies.—Sir R. Inglis was assured that this motion, if carried, was calculated to impeach trial by jury.—The Solicitor-General, looking at the motion as a censure on judge and jury, objected to it. To grant it would lead to perpetual and unseemly discussions on verdicts obtained through the usual tribunals of the country.—Mr. Sheil said that at this rate any meeting whatever might be dispersed by an ignorant constable taking upon himself to decide some nice point of law, whereon the highest authorities might be divided.—Sir R. Peel, without denying the right of the House to review a trial in an extreme case, protested against its interference by way of appeal under any ordinary circumstances. If this were allowed, there would hardly be a night without some such appeals from parties unsuccessful in the courts below.—Lord Palmerston, while admitting the perfect propriety of abstaining from unnecessary interference, was nevertheless not disposed to admit that certain functionaries should act on their own interpretation of what was the law, and thereby involve the personal liberty of individuals. The motion furnished *primâ facie* grounds for inquiry.—After a few remarks from Mr. Villiers, Mr. Ewart, and Mr. M. Philips, a division took place, when the motion was rejected by 116 to 32.

On the motion for going into committee of supply, Mr. S. Crawford called the attention of the House to the present distressed condition of the poor of Ireland. He was convinced that the corn-laws had been productive of much injury to Ireland; and as an Irish proprietor, was quite willing to bear his share in any imposed burden for the relief of the distress, which was so severe, that many of the poor might perish of starvation during the recess, if not by some means rescued before Parliament was prorogued.—Mr. Fielden seconded the motion.—Lord Eliot admitted the unquestioned sincerity of Mr. Crawford, who, as an Irish proprietor, had done much for the welfare of his humbler fellow-countrymen. But there was nothing in the general condition of Ireland to inspire despondency—rather the reverse. The present distress was of that usual and unfortunately annual nature, arising from the condition of a merely potatoe-consuming population, and to remedy which the Government had taken measures of relief. Otherwise the country was steadily progressing in improvement, and the people actuated by a spirit of enterprise hitherto unknown.—After a few observations from Major Bryan and Mr. French, Mr. O'Connell, while thanking Mr. Crawford for his motion, and Mr. Fielden for seconding it, thought that it might be better withdrawn, as at this late period of the session no practical result could come from it. He was used to these glowing prophecies about the improved and improving condition of Ireland; and the present distress was as severe as he had ever known, not so much in absolute famine, as in a general want of employment, and therefore wages. He admitted, however, that the Irish government and individuals were taking steps to alleviate the distress, though he contended that the present condition of the country indicated something essentially wrong.—Mr. Crawford yielded to Mr. O'Connell's suggestion, and withdrew his motion.

Mr. Hume then, before the Speaker left the chair, mentioned the condition of his own constituents, he having been called on to do so by them at a public meeting, with their chief magistrate presiding. When he had concluded, the House resolved itself into a Committee of Supply, commencing with the remaining Irish Estimates.—A conversation respecting the Lord Lieutenant ensued, when Sir R. Peel stated that, so far from there being any truth in the rumoured recall of Lord De Grey, the Government had the highest confidence in his administration of Ireland, and that he was leaving Dublin in order to recruit his health by a short journey on the Continent.

Tuesday.—Sir R. Peel intimated, in reply to Sir F. Burdett, that the Government mean to carry out a declared intention of the late Government, of causing monuments to be erected to the memories of Sir Sydney Smith, Lord Exmouth, and Admiral De Saumarez.—Mr. Brotherton regretted the disposition to promote and glorify the art of war, in opposition to those of peace.—Mr. Hawes also intimated his intention of meeting the proposal, when it should be made, with an amendment for a monument to the memory of Watt and other men of science.

Mr. Kemble made some observations, vindicatory of the Rev. Henry Melvill, whose character he considered to have been attacked by the mode in which a quotation from a sermon, published without his sanction, had been adduced and commented on by Mr. M. Gibson, in his speech on Friday last.—Mr. M. Gibson had not intended any personal reflection on Mr. Melvill, whom he respected; but thought, at the same time, when clergymen undertook to teach political economy from the pulpit, the Church should lay down a standard to guide them in the discharge of their new functions. The system of which he complained was too commonly practised by the clergy.—Sir R. Inglis could not agree to the proposition that clergymen should be reponsible to Parliament for their sermons, or that the Church should construct articles of political economy.

The first order of the day was the third reading of the Colonial Passengers' Bill. Mr. Hawes, objecting to a clause in it, raised a discussion on the subject of the transportation of Hill Coolies from India to the Mauritius. Several Members joined in the debate.—Mr. Mangles argued in favour of the permission of the immigration of Indian labourers; and Mr. Hogg strongly censured Lord Stanley for not having pursued a fair and straight-forward course in the matter, first in his opposition to the late Government, and his present adoption of that which he had formerly condemned. He also contended that Lord Stanley had not adopted a respectful course towards the House, inasmuch as by an order in council he had initiated this very practice of the exportation of labourers, and afterwards called on the legislature to sanction it. Mr. Hogg was not opposed to a voluntary emigration under regulations which would effectually secure that the Indian labourer knew before he quitted his home where he was going to, and under what conditions.—Lord Stanley, after giving a brief history of the legislation by which the exportation of labourers from India to the Mauritius had been at first admitted, then regulated, and at last entirely prohibited, contended that it was for the advantage as well of the natives of India as for the planters of the Mauritius, that this last measure should be repealed. He enumerated all the abuses of the former system, and every system and species of fraud and oppression to which the emigrant could be liable, with the view of showing that the provisions of the present bill were amply sufficient for his protection; and called upon the House, not in a spirit of indolent humanity, to affirm the mere fact that there were abuses, and deny to the Mauritius the means of improvement, and to India a means of employment for her starving population.—Sir R. Inglis was not convinced by Lord Stanley that this measure would be beneficial to the ignorant and defenceless natives of India.—Mr. Hume, on the contrary, thought it was as absurd to restrict the natives of India from emigration, as it would be to confine Irishmen and Scotchmen to their native countries.—After some observations from other Members, the House divided, when the clause was retained by 118 to 24. The bill was then passed.

The report of the committee on the Parish Constables Bill, after some discussion, was received, and the bill ordered to be read a third time on Wednesday. The Bonded Corn Bill was read a third time and passed; and the orders of the day were disposed of.

Wednesday.—Mr. Roebuck gave notice that he should, on Thursday, move the three following resolutions:—

"That the compromises of election petitions, as brought to the knowledge of this House, by the report of the committee on election proceedings, must, if for the future they be allowed to pass without punishment or censure, tend to bring this House into contempt with the people, and thereby seriously to diminish its power and authority.

"That all such practices are hereby declared to be a violation of the liberties of the people, and a breach of the privileges of this House; which it will in all future cases strictly inquire into, and severely punish.

"That whereas in the late elections for Harwich, Nottingham, Lewes, Reading, Falmouth and Penryn, and Bridport, the present laws have been found insufficient to protect the voters from the mischievous temptations of bribery, it be ordered that Mr. Speaker do issue no writ for any election of members for the said towns, till further legislative enactments have been adopted to protect the purity of elections."

Mr. C. Buller moved the order of the day for the committee on Lord John Russell's Bribery at Elections Bill.—Mr. Mackinnon opposed the Bill as contrary to the principles of the law of the land, and as it invested the Executive Government with powers inimical to the independence and the privileges of the House. He should move that the Bill be committed that day six months. Considerable discussion arose on the first two clauses; a proper definition of what constituted "corrupt treating" being one of the subjects of debate.—Sir R. Peel expressed his anxiety that something should be done to discourage the practice, which was not only pernicious in its influence on the constituency, but gave the rich candidate a wholly unfair advantage over his poorer competitor. The proper method of procedure in discovering cases of bribery was also another topic of debate; objection being taken to compelling confidential and professional agents to disclose what they might know, without reference to what is commonly considered as "privileged communications." This was ultimately settled by an amendment permitting such agents to be examined "according to the ordinary rules of evidence." During the discussion an attempt was made to get rid of the proceeding by counting out the House, which was defeated by the arrival of a sufficient number of members.—Several hours having passed, and very little progress having been made with the Bill, Sir R. Inglis suggested that, as the prorogation of Parliament was not far distant, the probability of carrying the measure during the present session was small, and that it might be therefore postponed. Sir R. Peel urged its importance, both with reference to the public generally, and to elections which might occur during the recess; and the discussion proceeded.

Clause 5 provided, that in cases where a petition against an election was presented, its merits should be tried at the public expense, except when the petition should be declared frivolous and vexatious in which cases the party presenting it should be liable to the costs.—Mr. Darby opposed the clause, on the ground that it would produce an immense increase in the number of petitions.—Several other members took different views of the subject; and, on a division, the clause was carried by 62 to 15.

The next clauses, constituting a mixed commission of members of both houses, to hear evidence with reference to alleged bribery, gave rise to considerable discussion. Mr. Escott and Mr. Mackinnon contended that the House was thereby parting with one of its most valuable privileges, that of exclusively judging of matters relating to its own members.—Mr. O'Connell and Mr. Roebuck also opposed the clause, the latter arguing for a court which would be beyond the reach of the influence of that party spirit to which a mixed commission of members of both Houses would be exposed.—Sir R. Peel could not see that any surrender of the privileges of the House was involved by the creation of this mixed commission. The House of Commons retained the exclusive power of issuing writs, but it had no exclusive power to disfranchise a borough; and much inconvenience had been repeatedly the result of the rejection of a disfranchisement bill by the Lords, on account of the late period of the session at which it had reached them. This would be avoided in future, by making the Lords parties to the preliminary investigation of cases of bribery, on which a disfranchisement bill might be based; and thus the Lords would be in possession of the materials for legislation before the bill reached them from the Commons.—After several other members had expressed their opinions, Mr. C. Buller agreed to abandon the clauses, which were then negatived without a division.

To clause 26 the Attorney-General strongly objected. He was decidedly opposed to any prospective indemnity to persons enabling them to reveal that which might criminate themselves. He objected to the clause as breaking in on some of the great maxims of the law. After considerable discussion the committee divided, when there appeared, for the clause, 39; against it, 80; majority against the clause, 41.

Mr. C. Buller proposed to withdraw the 27th and 28th clauses, which were described by the Solicitor-General and Sir R. Peel as appendages merely to clause 26.—Mr. Crawford, in support of the two clauses, insisted on a division, when the clause was negatived by a majority of 42.—The enactments for throwing the costs of petitions under this bill upon the counties, cities, or boroughs where the bribery had been practised, were all struck out.—The clause abolishing the bribery oath was opposed by Mr. Escott and Mr. Sheil, and withdrawn by Mr. Buller; the bill then passed through committee.

The Coroners (Warwick and Lancaster) Bill was read a second time, after a motion of Dr. Bowring for again adjourning the debate had been negatived by 51 to 19.—On the motion of Sir J. Graham, the Lords Amendments to the Tithes Commutation Bill were agreed to. The Slave-Trade Suppression Act was considered in committee, and a resolution passed thereon, authorising the Lords Commissioners of her Majesty's Treasury to apply a portion of the proceeds of slave-vessels captured among the captors.—The other orders of the day were then disposed of.

Thursday.—Mr. Divett stated the case of the English merchants on whose claims for serious injuries to their ships and property by the French authorities in the Bay of Portendic a mixed French and English commission has been adjudicating.—Sir R. Peel, in reply, expressed a confident hope that the French Government, feeling the justice of the claims made on them, would act in the matter as became a great nation. The death of the Duke of Orleans had caused a delay in the progress of the negotiations.

In reply to a question from Mr. Fielden, Sir J. Graham, and afterwards Sir R. Peel, complained of the character of the published reports of the interviews of the deputies of the manufacturing districts with the Members of the Cabinet. These reports were not only calculated to destroy all confidential communication, but they gave a distorted account of the actual facts.

Captain Fitzroy obtained leave to bring in a bill to require and regulate the examination of all persons wishing to become the masters or chief mates of merchant vessels.

Mr. Roebuck then moved the resolutions given in our report of Wednesday, the purport of which was, that the compromises, brought to light by the Election Compromises Committee, were calculated, if passed without punishment, to bring the House into contempt, and that no writ be issued for the boroughs convicted of bribery until legislative proceedings have taken place to protect the purity of elections. He acknowledged that it was owing to the aid of Sir R. Peel that he had been enabled to conduct the committee to a satisfactory conclusion with its proceedings: and, after commenting on the evidence adduced, and lamenting the practices which that evidence revealed, he concluded by moving the first of his three resolutions.—Mr. C. Russell contended that the inquiry had done no good, and entered his protest against proceedings which he regarded as unprecedented and unjust.—Major Beresford denied any participation in bribery, nor could he find anything in the report to implicate him.—Mr. H. Fitzroy complained of some errors in the report, but admitted that Mr. Roebuck had conducted the proceedings with great courtesy.—Capt. Plumridge would have asked Sir Robert Peel had he been in his place, whether or not he, Capt. Plumridge, should now accept the Chiltern Hundreds, and thereby carry into effect that corrupt compromise in his case to which he was no party.—Mr. Lascelles and Viscount Chelsea bore testimony to the impartial conduct and courteous bearing of Mr. Roebuck.—Mr. Hawes had considerable doubt about the second resolution, and should decidedly oppose the third, because, as a member of the committee, he considered that its duty was only to lay the facts before the house. But he would support legislative measures to put down these corrupt practices.—The Solicitor-General considering that the committee had been appointed to investigate these proceedings with a view to future legislative measures, and not to punish individuals, opposed the resolutions, more especially as the Bribery at Elections Bill, which had gone through committee on the previous evening, was calculated to meet all the required circumstances. He would, therefore, meet the resolutions by moving the previous question, and hoped that in doing so he would not be exposed to the unfair charge of wishing to screen bribery and corruption.—Sir R. Inglis would have been better pleased had the Solicitor-General met the resolutions with a direct negative, because he did not consider that they were borne out by facts, or justified by circumstances.—Mr. Hume said that the Solicitor-General, by moving the previous question, had placed the House in an awkward position, because it was thereby precluded from expressing a decision on the practices revealed in the report, and which it was desirable should have been done. Mr. T. Duncombe wished to know if the Government meant to give, on application, the Chiltern Hundreds to Major Beresford, Captain Plumridge, and one of the two of the Members for Reading, and thereby to make themselves parties to the compromises?—The Chancellor of the Exchequer said that the stewardship of the Chiltern Hundreds was in his gift, and that he would decide on the subject when the applications were made.—Capt. Plumridge thereupon, amidst considerable laughter, applied for the office, and wished to know the Chancellor's decision, denying that he was any party either to bribery or compromise.—After a few words from Mr. Cochrane, Sir R. Peel said he had supported the appointment of the committee in order to reform the system, and not to brand individuals for pursuing practices well known, and even tolerated. Compromises were bad, for they tended to conceal the truth; but the House had, in some measure, been a party to encouraging compromises, by saddling parties with costs in cases of frivolous or vexatious defences. He would prevent these practices in future, not by a resolution, but by law. But while he supported the necessity of a legislative enactment, he could be no party to the suspension of the writs of the boroughs named in the third resolution, not considering the grounds sufficient for a proceeding affecting the rights of so many constituencies. After some remarks from Mr. V. Smith, Mr. Aglionby, Mr. S. Crawford, and Mr. Turner, Mr. Roebuck replied; and on a division the "previous question" was carried by 136 to 47.

Mr. Hume then asked if the Government were prepared to complete the corrupt compromises, by granting the Chiltern Hundreds.—The Chancellor of the Exchequer said, if Mr. Hume would apply on his own behalf, he would be happy to grant his request. Mr. Roebuck's resolutions were then put, and negatived without a division. Some routine business was then transacted, and the House adjourned.

Friday.—The Nottingham writ was postponed until Monday.

On the motion for going into committee of supply, Mr. Hutt moved as an amendment, that an address in favour of the Danish claimants be presented to her Majesty.—Mr. Hume seconded the motion, which was opposed by the Chancellor of the Exchequer, and withdrawn.

After some conversation on the subject of the importation of American flour, the House went into committee. A division took place on the vote for South Australia; the other votes were grants supplementary to the education grant, and to the service of the war in India and China. When the House had resumed, Mr. S. Crawford moved the issue of a new writ for Nottingham.—Sir R. Inglis seconded the motion.—Some discussion took place, in the course of which Sir R. Peel supported the motion, which was carried without a division.

On the report of the Canada Loan Bill, Mr. Hume divided the House against the measure, when the resolution was carried by 89 to 9.

CITY.

Money Market, Friday.—Consols for money and the account closed at 91⅛ to ¼; Bank Stock, 167 to 169; Exchequer Bills, 2d. issue, 49s. to 51s. prem.; do., 2¼d. issue, 51s. to 53s. prem.; India Stock, 249 to 251; Three per Cents. Reduced, 91¾; Three-and-a-Half per Cents. Reduced, 100¾; New Three-and-a-Half per Cents., 100 to ⅛; India Bonds, 30s. to 33s. prem.; and Long Annuities, 12⅛.

Metropolis and its Vicinity.

Thunder Storm.—During Wednesday night, and early on Thursday morning, the Metropolis and neighbourhood for several miles round were visited by the most severe storm of thunder and lightning that can be recollected for years past. It was attended, we regret to say, with very disastrous consequences. Between four and six o'clock the fury of the storm was terrific—the flashes of the forked lightning succeeding each other in rapid succession, accompanied with loud peals of thunder. The storm was most violent at the western suburbs, particularly about Battersea, Wandsworth, Putney, Roehampton, and Barnes. In the two latter villages a number of houses were unroofed, and several haystacks destroyed. A number of barges on the river between Vauxhall and Putney bridges were sunk. Stacks of chimneys and roofs of houses were thrown down; great damage was sustained among the craft in the Pool, and many had their masts and rigging shattered. The steeple of St. Martin's-in-the-fields, in Trafalgar-square, was struck by the lightning shortly before six o'clock; the church received considerable damage, large portions of the stone work of the steeple being thrown down, and all the glass of the southern window being shattered. In Vincent-square, Westminster, the lightning struck one of the houses, throwing a stack of chimneys through the roof and setting fire to the furniture in the rooms. The tower of the Fishmongers' Almshouses, at Newington, was struck, and the clock and windows shattered to pieces. In the Hampstead-road several houses received considerable damage, and many buildings were injured on the Surrey side of the water, particularly near the river. At Hammersmith, a labouring man who was proceeding along on the high road to his work was struck dead. At Vauxhall, the lightning struck a house in Clarence Place, and forced its way into several apartments, shattering the glass and furniture, and even the beds in which the family were sleeping, but they fortunately escaped unhurt. In the New Road, Woolwich, it struck one of the houses and traversed the rooms in a similar manner; the inmates of which were equally fortunate in escaping without injury. In the villages around town great damage was done, and further accounts of fatal accidents will doubtless be received.

The Conservancy of the River.—The Lord Mayor's Septennial Survey of the Thames and Medway, as Conservator of both rivers, took place on Thursday, Friday, and Saturday last; the present Lord Mayor having consented to take the survey, at the particular request of the Court of Aldermen. The Duke of Wellington had transmitted a letter to the Lord Mayor inviting his Lordship to take his embarkation at the Tower, in consequence of which his Lordship embarked there in the Mercury steamer on Thursday morning, accompanied by the Lady Mayoress and several of the aldermen and their ladies, the members of the Navigation Committee, the principal city officers, and a number of Members of Parliament and private friends. The Chief Magistrate was loudly cheered by the crowds assembled on both sides of the river, and at Blackwall the Mercury stopped, in order that the launch of the East Indiaman, built by Messrs. Wigram and Co., might be witnessed by them. Immediately after the launch the Mercury went down the river, occasionally stopping for the purpose of taking on board additional visitors. On Friday the Conservator was received by the Admiral of the Fleet. When the Mercury arrived at Sheerness, Capt. Brace, the flag-officer, accompanied by his first Lieutenant, came alongside, and his Lordship and Lady Pirie, with several of their guests, proceeded to the Camperdown, the Admiral's ship. The yards of the ship were manned, and all her signals flying as the visitors approached, and the Lord Mayor was received by Admiral Sir E. Brace, Commander-in-Chief at Sheerness, and a numerous party. Upon leaving the Camperdown, the Lord Mayor proceeded up the Medway to Upnor, and landed there, in order to inspect the boundary-stone of his jurisdiction in the eastern district, at Cockham-wood. The party formed a circle round the stone, upon which the colours of the city were flying; the Lord Mayor proposed the toast, "God preserve the city of London," and distributed wine and new coins amongst the assembled multitude. The party then returned to Rochester, where they were received by the mayor and corporation of that town with the usual formalities. The Crown Hotel was the place selected for the residence of the Conservator during his stay at Rochester, and the first part of the survey concluded there. In the evening his Lordship gave an entertainment to which the nobility and gentry of the neighbourhood were invited. On Saturday the Lord Mayor received his guests at nine o'clock at breakfast, and at ten the party embarked on board the Mercury for the purpose of proceeding to Southend, and thence to Leigh, the boundary of his jurisdiction in Essex. As the steamer passed the Camperdown, the crew of the flag-ship manned the yards and saluted the Conservator with three cheers. The Admiral and several other men of naval rank followed the Mercury in a yacht to Southend, where a *déjeûner* was provided at the Royal Hotel. His Lordship, attended by the Aldermen and the principal city officers, then proceeded in boats to Leigh, where the Court of Conservancy was opened. The Lord Mayor exercised his right of jurisdiction, proceeded three times round the stone, on the top of which was hoisted the city colours, drank "Prosperity to the City of London," directed the usual inscription to be cut, and distributed coin and wine to the populace, who had assembled in considerable numbers to witness the ceremony. The Court was then dissolved, and the party returned to town in the course of the evening.

Public Meetings.—On Friday the Middlesex magistrates assembled for the purpose of electing a chairman of the sessions for the ensuing year. The circumstances that gave rise to the present meeting arose out of the intention of Government to appoint an assessor to act as judge of the Quarter and General Sessions. The proposition was opposed by Mr. Witham on the county day, and in order that the sense of the magistracy might be taken on the propriety of such a proceeding, that gentleman nominated himself in opposition to Mr. Sergeant Adams, the ordinary chairman. The candidates for the chair were Mr. Serg. Adams and Mr. Witham; and at the close of the ballot the scrutineers declared the numbers to be, for Mr. Serg. Adams, 20; Mr. Witham, 2; majority for Mr. Sergeant Adams, 18.—The half-yearly general meeting of the proprietors of the Australian Trust Company was held on Saturday, J. Abel Smith, Esq., M.P., in the chair. The report stated that the company had commenced business in Sydney, on the 2d August, 1841, and was proceeding under peculiarly favourable circumstances; the investments had proceeded regularly, and without any prospect of early interruption, on the scale authorised by them of 25,000*l.* a month, and the advances did not exceed one-half of the saleable value of the property mortgaged to the company. The state of the company to the 1st of July, 1842, was as follows:—Sums received on calls, 158,310*l.*; deposits and promissory notes, 61,249*l.*; interest received, 6,000*l.*; other receipts, 21,257*l.*—making a total of 247,000*l.* The whole of the interest due in Australia to the 1st of January last had been received; and the directors did not doubt that they would be enabled to propose to the proprietors, at the meeting to be held in Jan. next, a dividend of 4 per cent. for the half year, being at the rate of 8 per cent. for the whole year upon the paid-up capital of the company, and have a large surplus for a reserved fund. The accounts of the company had been audited by N. W. Senior, Esq., one of the Masters in Chancery, and the Lord Mayor. The report was adopted.

The "Times" Scholarship.—Our readers will remember that a subscription was lately entered into by many influential members of the mercantile world in this and other countries, with a view of acknowledging, and in some degree compensating, the exertions and expenditure of the proprietors of the "Times" in the exposure of the conspiracy developed in the trial of "Bogle *v.* Lawson." The proprietors having declined, with every feeling of respect to the subscribers, to avail themselves of any portion of the sum contributed, it was appropriated partly to the erection of tablets commemorative of the circumstances in the New Royal Exchange, and in the "Times" office, but chiefly to the foundation of two Scholarships in perpetuity for the encouragement of learning at the Universities of Oxford and Cambridge, one of which was assigned to the pupils of Christ's Hospital, and the other to the City of London School. The first election to the Scholarship at the latter institution took place on Friday, when it was gained by Mr. W. Emery, who is proceeding to the University of Cambridge. The first election at Christ's Hospital took place on Tuesday last, when the successful competitor was Mr. W. Romanis, also proceeding to Cambridge. The value of the exhibition is 30*l.* a year.

River Navigation.—The daily papers have published some curious statistical accounts of the rapid increase in the steam navigation of the Thames. They state that the number carried by the Iron Steamboat Company, on Sunday last, to and from the various stations between London-bridge and Chelsea, was 30,000; the wooden boats of the Westminster Company carried upwards of 20,000 on the same stations; the seven steamers of the Watermen's Company conveyed to Greenwich, Woolwich, Blackwall, and Charlton, 10,000 passengers, and brought back about the same number. The old Greenwich and Woolwich steamers conveyed to and from those places 30,000 persons. The earnings of the Railway Company's steamers, between the terminus and Gravesend, exceeded 300*l.* The other Gravesend packets were well filled, and the number of visitors who landed at Gravesend and Northfleet was about 35,000; the various steamers making about 80 trips to and from those places. The steamers which carried down passengers to the Rosherville-pier at Northfleet for 6*d.* each, were so crowded that more than 1,500 persons were left behind. The City of Canterbury and the Red Rover took down 1,000 persons on Sunday on an excursion to Herne Bay and Margate; and, notwithstanding the fares have been lately raised, those two vessels are daily crowded. Every village between Richmond and Gravesend has now its steam-boat piers for the accommodation of passengers; and the banks of the Thames, above and below bridge, have become the outlet for a vast portion of the people of the metropolis every Sunday during the summer season. Wandsworth, Putney, and Richmond received 12,000 visitors on Sunday and Monday, and the villages of Erith, Greenhithe, Purfleet, and Grays, on the Kent and Essex shores, are beginning to be visited by the citizens. There are now 140 steam-vessels navigating the Thames, in addition to the General Steam Navigation Company's fleet, and the Irish, Scotch, and foreign steamers. There will be at least 30 more next season, and the Watermen's Steam-packet Company have just determined on building five more, to be ready by the spring of 1843.

Police.—A further investigation into the affairs of the Westminster Loan Society took place on Wednesday at Guildhall. The justice-room was crowded with persons who had invested their money either as shareholders or as depositors. Sir P. Laurie read a letter he had received, respecting the parties concerned in "getting up" the company. Several statements were made by persons who had been ruined by the loss of their deposits; and a long conversation took place between both parties, which ended in the magistrate advising that the sufferers should attend at the next sessions of the Central Criminal Court, prefer a bill before the Grand Jury, and prosecute all the parties.—On Thursday, a labouring man, named James Wyatt, was brought before the magistrate at Queen-square, charged with throwing a stone at Lord Sandon, as his Lordship was leaving the House of Commons on Wednesday evening. The prisoner stated that he had intended to throw it at Sir R. Peel, and would intercept every carriage until he struck him. The magistrate said that it was his impression that the man was insane, and he should, therefore, commit him, in default of bail, for three months, in the course of which time two of the visiting justices at the prison might, if they saw cause, on the certificate of the medical attendant, place him under restraint for the future.

Boat Race.—The match between the Westminster scholars and those of Eton College, which has been for some time talked of, came off on Tuesday evening. The distance rowed was nearly five miles and a half, and was in that part of the river which lies between Barker's-rails and Putney-bridge, the start being from the first-mentioned place, and the winning-point the bridge. The river was crowded with steamers and the boats of the different clubs, and presented an animated appearance; the bridges and those parts of the banks from which a view of the match could be commanded were covered with spectators. The boats were both built on the recently improved system, but the Etonians had the advantage of weight. The start took place at five minutes past seven, and both crews went to their work in gallant style. The lead was taken by the Westminster boat almost immediately, and off Barnes-terrace she began to show her superiority; she gradually got away, and before the distance of two miles had been rowed was three boats' length in advance. The pace was very good, assisted by the running down of the tide; the boats cut through the water with great rapidity, and at 27 minutes to eight the Westminster boat reached Putney-bridge, the Etonians being about 120 yards behind her. The winners were greeted with loud cheering from the steamers, the shores of the river, and the people on the bridge. Both boats rowed in beautiful style, and the match was altogether one of the best of the present season.

Marylebone.—On Friday the ratepayers of Marylebone forming the committee appointed to maintain the public "right of way" over Primrose-hill, in the direction of Kilburn, which has recently been obstructed, viewed the ground, in company with Sir B. Hall and Sir C. Napier. Mr. Wilson produced a sketch taken from Roque's map of Marylebone, dated 1745; which clearly defined the line in dispute, and was corroborated by those subsequently published by Bowles and Eaden. The committee, after carefully tracing the path, discovered by their sketch that another and an important right of way had been infringed on, leading from the estate of the Duke of Portland over Barrow or Blood-hill, and communicating with Primrose-hill, on the south side from the outer circle of the Regent's-park, and which has been blocked up by gates. The borough members were satisfied that the public had a "right of way," which had been infringed on, and it was agreed that the vestry be called upon to direct their surveyor to make a survey of the boundaries of the parish at Primrose-hill, and define it and the footpath by a course of stones, and that the borough members and the committee should then request the Commissioners of Woods and Forests, who have purchased Primrose-hill for the use and recreation of the public, to assist in preserving the means of gaining free access to it.

Southwark.—In consequence of the death of Mr. Holmes, the High Bailiff of this borough, an active canvass has commenced for the vacant office. The following gentlemen are mentioned as candidates:—Mr. D. W. Harvey, Mr. Pritchard, Mr. Payne the coroner, Mr. Ledger, Mr. Jupp, Alderman Brown, and Alderman Sir W. Heygate. The situation is said to be worth 3,000*l.* a year. The Court of Common Council on Thursday appointed Mr. Pearson, the City Solicitor, to act as High Bailiff until the election should occur.

Peckham.—The inquest on the body of James White, who died in St. Thomas's Hospital, on the 18th inst., from the injuries inflicted on him on the 13th while sleeping in a barn on the premises of his employers, Messrs. Noble and Mee, at Peckham-rye, was resumed on Tuesday. It will be remembered that the first inquiry, which took place last week, was adjourned in order to collect further evidence against William Webb, a fellow-workman of the deceased, who was taken into custody on suspicion. As no additional evidence had been adduced, the jury returned a verdict of "Wilful murder against some person or persons, but there was not sufficient evidence to prove who that person was."

Chelsea.—Considerable alterations are contemplated in the management of the Royal Hospitals of Greenwich and Chelsea, which will prove a great saving to the public, and an accommodation to the retired solders and sailors enjoying the benefits of these magnificent institutions. It is proposed to join both establishments under one board, the members of which will hold their sittings at Somerset-house, an examination having already been made to ascertain if there are suitable offices in that building for the purpose. When the arrangements are completed, it is intended to pay retired sailors in districts, by officers, as has already been adopted with retired soldiers in Scotland.

Deptford.—This town on Tuesday evening was thrown into a state of excitement by a Chartist riot. A large assemblage of persons had met at the meeting-house in High-street, for the purpose of hearing a lecture by Mr. G. Thompson, on the distress of the country. The chair was to be taken at seven o'clock, by which time the meeting-house, which is capable of accommodating about two thousand people, was crowded to excess. The Minister having taken the chair, announced the unavoidable absence of the lecturer, who was compelled to attend a meeting at which considerable opposition was expected. A person in the gallery then proposed that a general discussion should take place; this excited an uproar, in the midst of which a body of Chartists proposed that the chair should be filled by a working man. Several Chartists attempted to get possession of the table, and a general fight and scuffle ensued. The entrance of a body of police, accompanied by an inspector, served to increase the riot, and their attempt to secure the principal parties induced their friends and partisans to join the fray, and prevent their being captured. After several ineffectual attempts to restore order, during which some violent speeches were delivered, a repetition of the violence ensued, which at length assumed such an alarming appearance that another body of police was sent for; and, in the midst of the confusion, the meeting was declared to be dissolved. The Chartists then proposed an adjournment to the Broadway, which was agreed to. Hundreds who had been unable to gain admittance, followed to the Broadway, and in a few minutes the large open space was filled, and the highway blocked up. Dr. M'Dowell began to harangue the multitude, but his address was cut short by the arrival of the police. The meeting was ordered to disperse; which was met with determined opposition, upon which Dr. M'Dowell was apprehended, and conveyed, with several of the Chartist leaders, in custody to the station-house. He has been examined before the magistrates, and bound over in heavy sureties to keep the peace.

Woolwich.—On Monday night an incendiary fire was discovered in the stackyard of Mr. Johnstone, at Park Farm, near Plumstead old church, in this neighbourhood. The engines of the Royal Artillery and of the Brigade were promptly on the spot, and the fire was extinguished before it had spread to the dwelling-house. The stacks were completely consumed, and some damage done to the outhouses that adjoined. From inquiries made by the police, no doubt is entertained that the fire was the work of an incendiary, who has hitherto escaped detection.

Chatham.—On Monday her Majesty's ship Goliath, 80 guns, and the steam frigate Virago, of 1,059 tons, were launched at this dockyard, in the presence of a great number of spectators, who had come down from town to witness the spectacle. The Goliath was named by the Duchess of Buccleuch, and the Virago by the Hon. Mrs. Grey. Both vessels went off the slips in gallant style, and a finer launch was never seen. The festivities, however, were greatly checked by a lamentable accident, which occurred in the morning to the gig of her Majesty's steamer Shearwater. The boat had left the steamer at Sheerness, with Lieut. Cudlip, Dr. Corral (the surgeon), and six of the crew, for the purpose of seeing the launch, and was proceeding up the Mersey under sail, when it was suddenly capsized near Gillingham, and instantly went down. All on board perished, with the exception of Lieut. Cudlip, who contrived to lay hold of the back-board of the boat, and thus prevent himself from sinking. After floating for three-quarters of an hour, he was picked up by one of the City steamers, proceeding with a party to the launch, and conveyed on board the Shearwater in a very dangerous condition; but he is now doing well.

Provincial News.

Brighton.—The new steam-packet wharf erected by the Railway Company at their terminus at Kingston was opened on Monday. The Dieppe packet conveyed a large party there on that day to celebrate the occasion. The wharf is fitted up with a place for the examination of passengers' luggage, so that, within the shortest possible time after the arrival of the packets, passengers will proceed by a special train, which will be sent on the packet's arrival to convey them to the Brighton station; and those who proceed to London may do so by the first train after the packet's arrival. Passengers from London may also place themselves in the railway train at London-bridge, and, in less than three hours after, embark at the wharf in smooth water. The improvements in Shoreham harbour, and the accommodation afforded by this branch railway, will add materially to the convenience of passengers.

Birkenhead.—On Tuesday evening, the 19th, the inhabitants of this town were alarmed by a whirlwind, similar to that recorded in our Lancashire news of last week. Not a breath of wind was felt at the time, when suddenly a loud noise was heard, resembling the falling of waters, which continued about two minutes, when the wind came from the south-east, apparently embracing only about eight yards in breadth; its force was so powerful that it bent down everything before it, shaking the houses it passed to their foundations, and throwing up the water in the pits to a height of three or four yards. No other injury was done than the breaking of some windows, and throwing down bricks, slates, &c. The passengers by the Chester train were coming up Jay-street at the time, and many of them were thrown upon the ground by the wind. The effect of the whirlwind was not felt more than three minutes.

Cardiff.—On Saturday last, Richard Edwards, or Tamar, convicted at the late assizes for the murder of his mother, underwent the last sentence of the law in front of the county gaol in this town. There were not less than 10,000 persons present. The criminal was only 28 years of age, but had become notorious from being associated with many of the worst transactions which have occurred in these parts for some years past.

Cheltenham.—On Friday last, the county coroner and a jury assembled to inquire into the cause of the death of Mr. T. Sollis, a farmer of Bishop's Cleeve, near this town, who was accidentally drowned in a stone-trough, in a field at some distance from his house. On their proceeding to view the body, the floor of the room gave way, and the whole party, including the jury, surgeon, and police, were precipitated into the cellar, together with the body of the deceased farmer. No serious injury was sustained, although a large quantity of broken timber and rubbish fell upon them; and after a brief interval they were able to resume the business of the inquest.

Crediton.—A fire broke out on Monday night in this town, by which from 30 to 40 houses were entirely consumed. Our readers are probably aware that no provincial town in England has suffered so greatly from fire as this place. Since its total destruction in 1742 and 1796, extensive fires have occurred almost annually, and the losses have chiefly fallen upon the insurance-offices. The present fire commenced at about 6 o'clock on Monday night, in a dwelling-house opposite the old cathedral. The supply of water was very scanty, and the flames rapidly spread. Before assistance could be procured from Exeter 20 houses were consumed, and it became necessary to pull down several buildings, in order to arrest the progress of the fire, which was not extinguished before nearly 40 houses were destroyed. Several accidents occurred, but none of a serious character are mentioned.

Deal.—It will be remembered that the efforts of Mr. Bush last year to construct the lighthouse on the Goodwin Sands, to be called the "Light of all Nations," were impeded by repeated failures. His caisson has since been reconstructed; and about three weeks ago he succeeded in getting it afloat. It was however doubtful whether success would crown his efforts during the present season; but these doubts were resolved on Wednesday, when the caisson was towed to its station; it soon settled down, and the other works will commence immediately.

Macclesfield.—The Staffordshire colliers have been endeavouring to excite the colliers of this county to join them in their strike for wages. On Thursday the 21st, a large body of them marched into Congleton. Their numbers were estimated at from 800 to 1000, and they were most of them armed with formidable bludgeons. In several instances, it is stated, they entered shops, and demanded provisions or money; and, of course, their demands were at once complied with. After committing some acts of violence, they proceeded to this town. Information of their movements had already been forwarded to Manchester, and a squadron of 1st Dragoons was despatched towards Poynton, which the colliers were expected to visit. Two companies of the 60th Rifles and a company of the 72nd Highlanders speedily followed in the same direction. The Tatton troop of the Cheshire Yeomanry were also ordered to assemble at Congleton, to guard against the return of the disaffected workmen to that town. On Friday the colliers proceeded towards Poynton; not, however, in one large compact body, as at Congleton, but in small scattered groups, and apparently as if reconnoitring the place. Finding a strong body of military there, it is supposed that they had thus separated; they showed no hostile intentions whatever, but some of them distributed hand-bills, containing a copy of the resolutions passed a few days before at a meeting of the Staffordshire colliers. It is said that the terms which those resolutions prescribe are less advantageous to the men than the wages now given to the colliers in the pits of Lord Vernon, at Poynton. It is also stated that it was their intention, if they had not been checked by the presence of the troops, to have turned out the Poynton colliers, and closed the pits there, and then proceeded to the collieries in the neighbourhood of Stockport, Hyde, Dukinfield, Ashton, and Oldham. They despatched emissaries in that direction, but their intentions as to the Poynton collieries being frustrated, they appear to have abandoned their intention of proceeding further north, and set out on their return to the Potteries. With the exception of what occurred at Congleton, the parts of Cheshire visited by the rioters have not suffered from any violence, which is attributed, in a great measure, to the prompt arrival of the military.

Manchester.—On Friday, the 23rd, a case was brought on for hearing before the stipendiary magistrate, at Salford, which, on account of the respectability of one of the parties, excited much interest in the town. The party accused was Mr. D. Hardie, who carried on business as a share-broker; and Mrs. Wilding, a widow, who attended to prefer the complaint. It appeared from the evidence, that Mrs. Wilding, who could not read or write, had a sum of money in her possession, which she gave at various times to the prisoner, in order that he might purchase shares in the Liverpool Plate Glass Company, with the understanding that she was to receive a large profit. She advanced altogether 450*l.*, but the prisoner would never give up the scrip for her shares, telling her that she knew nothing of such matters, and that he would keep them for her until Christmas, when the interest would have accumulated to several hundred pounds, and that he would pay her in one sum. After various unsuccessful attempts to obtain a settlement, the prisoner became embarrassed and was arrested, when he admitted that he had never bought a single share with the money. The magistrate said that the only evidence wanting to prove the case, was that of the Plate Glass Company, and he, therefore, should commit him for trial as soon as the necessary witness was forthcoming.

Newcastle-under-Lyne.—The colliers at Hanley are beginning to return to their work, but some still continue out. On Monday there was a numerous meeting of colliers; but nothing definite was arranged as to future operations. The markets on that day were deserted, only about 15 butchers out of 70 or 80 having appeared. The poorhouses of Burslem and Wollaston union, situated in Chill, are filled with paupers; and distress, such as never before existed in this part of the country, now prevails. All however is quite peaceable, owing, no doubt, to the appearance of the military stationed at this place. In the southern districts of Staffordshire the turn-out assumed a more serious aspect. On Tuesday the colliers, to the number of some hundreds, marched out of Bilston to Walsall, where a large meeting was to be held. They also turned out in large numbers and surrounded the poorhouse, and commenced levying contributions on the inhabitants. They compelled the men employed in the lime and other works to leave off, and great alarm was excited. The 3rd Dragoon Guards and the Yeomanry were called out, and stationed in different parts of Walsall, and the magistrates assembled in order to preserve the peace. The mob ducked in the canals several men who had refused to join them, and then proceeded towards Bloxwich to stop the works there. The latest accounts, however, state that these extreme measures were prevented, and that a compromise with the masters has been effected.

Northampton.—It is announced that in the month of September her Majesty, accompanied by Prince Albert and the royal suite, will honour the Marquis of Exeter with her presence at Burghley House, in this county, where preparations have already commenced for her Majesty's reception. The mansion is already known in connexion with the "progresses" of English Queens. It was founded in 1585, by the celebrated statesman Cecil, first Lord Burghley, Lord High Treasurer to Queen Elizabeth, who honoured it with Royal visits on twelve several occasions, and was in the habit of sojourning there for more than a week at a time. There are many antique relics of historical interest preserved there. Among other treasures, the jewel-closet contains a gold basin and spoon, used at the coronation of Queen Elizabeth; and a rosary worn and used by Mary Queen of Scots.

Portsmouth.—The operations against the wreck of the Royal George are still continued. Five or six divers descend at every tide, and a large stock of timber, shot, ballast, &c., has been recovered during the present season. An accident occurred on the 11th to one of the divers, a private of the Sappers and Miners, by the bursting of the air-pipe; and although the greatest alertness was displayed in hauling him on board and relieving him of the dress, he sustained considerable injury, his face and neck having become black, and his eyes so seriously affected as to deprive him of sight for some time. The accident arose from the iron wires which bound the pipe having corroded and burst the India-rubber coating.—The new Governor of the Mauritius, Sir W. Gomm, and suite, embarked for his destination on Sunday, under the usual salutes, in H.M.S. Cleopatra. Rear-Admiral the Hon. D. P. Bouverie resigned his command as superintendent of the dockyard and the ships in ordinary at this port on Thursday, and was succeeded by Rear-Admiral Hyde Parker. Admiral Sir E. Codrington will also retire from his command as Port Admiral here in a few weeks, when his time for holding the appointment will expire. It is believed that he will be succeeded either by the Hon. Sir J. Talbot or Sir Byam Martin.

Rugby.—A meeting of the trustees of Rugby School took place on Thursday for the election of a Head-Master in the room of the late Dr. Arnold. There were present the Earls of Denbigh, Aylesford, and Howe; Sir G. Skipwith, Sir F. Lawley, Sir H. Halford, Sir G. Crewe, Mr. W. S. Dugdale, M.P., Mr. E. J. Shirley, M.P., and Mr. Holbeche. The trustees proceeded to the business of the day, when the Rev. Archibald Campbell Tait, Fellow and Tutor of Balliol-college, Oxford, was elected Head Master of the school.

Windsor and Eton.—On Saturday afternoon, her Majesty the Queen, accompanied by Prince Albert, and the Hereditary Prince and Princess of Saxe Coburg Gotha, with a numerous suite, left Buckingham Palace, and proceeded by the Great Western Railway, to Windsor Castle. The terminus was crowded with persons, by whom her Majesty was loudly cheered. The train consisted of the royal saloon carriage, two first-class carriages, and an open carriage. This was the first occasion on which her Majesty has travelled by the railroad from London to this town.—The annual celebration of Eton election commenced on Saturday. The cloister speech was delivered by Mr. Tarver, son of the French Master; it alluded as usual to the principal events of the year, particularly dwelling on the birth of the Prince of Wales and the visit of the King of Prussia to the College. The election regatta took place in the evening, and the festivities closed with a display of fire-works. On Monday, the annual speeches were delivered before the Provost and a distinguished party, after which the examination and election of scholars on the foundation commenced. In the evening, the Provost gave an entertainment to 100 visitors, among whom was the American Minister, who addressed the company in a very happy speech. The election was concluded in the evening, when twenty-three foundation scholars or collegers were admitted. The number of scholars upon the election list was 649, being an increase of twenty-four since last year, and upwards of 300 since the commencement of the present century, when the numbers were only 357. The following, showing the gradual increase of the pupils during the last seven years, will interest all old Etonians:—in 1836, there were 444 boys at the College; in 1837, 472; in 1838, 522; in 1839, 560; in 1840, 593; in 1841, 635; and this year, 659.

Railways.—The following are the returns of the principal railways for the past week: Blackwall 1,361*l.*, Greenwich 935*l.*, South-Western 7,933*l.*, Eastern Counties 1,183*l.*, Northern and Eastern 1,700*l.*, Great Western 20,627*l.*, London and Birmingham 17,763*l.*, Birmingham and Derby 1,386*l.*, Birmingham and Gloucester 2,149*l.*, Manchester and Leeds 4,645*l.*, Hull and Selby 1,032*l.*, Midland Counties 2,849*l.*, North Midland 4,291*l.*, York and North Midland 1,746*l.*, Great North of England 1,349*l.*, Edinburgh and Glasgow 2,214*l.*—The half-yearly meeting of the shareholders of the North Union Railway Company took place last week. The report stated that the usual half-yearly dividend of 2*l.* 10*s.* per share would be paid out of the surplus of profit of 16,588*l.* 10*s.* 7*d.*, leaving a balance of 741*l.* to the credit of the profit and loss account of the next half-year. The general depression in trade was alluded to as the reason for the decline in traffic; but to meet this depreciation, the directors had exercised great vigilance and economy, and thereby preserved the former rate of dividend to the proprietors. A negotiation, which appears likely to be brought to a favourable issue, has commenced between this company and the Lancaster and Preston Company.—A special meeting of the Manchester and Birmingham Company has been held for the purpose of considering what course the Directors, under the advice of the shareholders, should pursue, effectually to conclude the negotiation long since opened with the Grand Junction Railway for the settlement of the line of road. After some discussion a committee was appointed to co-operate with the directors in the matter.—A meeting of the Chester and Birkenhead Company has been held, to receive the balance-sheet and report of the Directors. It appeared that the accounts were so obscure, that the assistance of two experienced persons had been found necessary to unravel them; but the Directors stated that they had reason to believe that the accounts laid before the meeting were correct. From the report it appeared that the total amount of traffic for the year 1841-42 was 30,784*l.* 6*s.* 8*d.*, while the expenditure was 25,247*l.* 4*s.* 9*d.* The directors acknowledged that this was a high charge for the working of the railway, and attributed it chiefly to the shortness of the line. A dividend of 20*s.* per share was announced, the balance of the traffic account with the surplus previously on hand being 8,852*l.* 1*s.* 3*d.*, the whole of which was stated to be available for division.—On Sunday evening a fatal accident occurred on the Croydon Railway. While the train was proceeding over Croydon-common, a gentleman got out of the third-class carriage, and, after walking over the tops of two carriages at the imminent danger of his life, the train going at a rapid rate at the time, sat himself on the roof of a first-class carriage. The guard, Joseph Clutterbuck, immediately left his seat for the purpose of going to the passenger; and while in the act of walking across the carriage, his head struck one of the bridges, dashing him on the coupling chains. The screams of the passengers who witnessed the occurrence induced the engine-driver to stop the train, and the guard was placed in a carriage, and conveyed to London, when it was discovered that the injury must have caused instant death, the head being completely shattered. The passenger made his way out upon the arrival of the train at New-cross, but he was instantly followed and given into custody. He gave his name and address, Mr. Cramer, Devonshire-street, Queen-square, and stated that he was a civil engineer. An inquest has been held on the body of the guard, and a verdict of "Accidental death" returned. Mr. Cramer, on Tuesday, was brought before the magistrates, under the provisions of the General Railway Act, to answer for the misdemeanour. The magistrate refused to settle the case summarily, and sent it for trial at the assizes at Guildford: it came on yesterday. Mr. Cramer pleaded guilty, but the Judge thought the indictment could not be sustained, and discharged the prisoner on payment of a nominal fine of 40*s.*—On Monday morning, a fatal accident occurred on the South-Western Railway; the luggage-train from Southampton having passed over a man, who was asleep and lying across the rails on Woking-common. The obstruction created by the body gave intimation to the engine-driver that all was not right, and he stopped the train within a few yards of the spot where the accident had occurred. The guard and stoker proceeded to search for deceased, whom they found groaning dreadfully, the right leg having been torn off. The man was carried to the train as carefully as possible, and conveyed to Nine Elms; but he ceased to live before he had arrived at Esher. When taken up he said his name was John Mitchell, but he had not power of speech sufficient to state anything further. When the train arrived at the terminus at Nine Elms, the guard, hoping that the deceased might be only in a state of syncope, sent for a surgeon, who declared the man to have been dead some time, and attributed his death to excessive hemorrhage. The evidence at the inquest showed that he was probably intoxicated, and the jury returned a verdict of "Accidental death."—On Monday an accident, resulting in the death of a farmer named Leak, occurred on the line of the Manchester and Birmingham Railway. Deceased resided near Cheadle Hulme, Cheshire, and on Monday forenoon went towards the railway to overlook some men, whom he had set to mow on the slopes of the line. While he stood watching them, the train from Manchester to Sandbach was seen advancing. At this moment a dog, which had accompanied him, lay basking on the line, and did not heed his call. He ran to it, and had taken hold of it, but before he could get out of the way, the engine struck him on the head, and several of the wheels passed over his body and killed him on the spot.

IRELAND.

Dublin.—His Excellency the Lord Lieutenant left the Viceregal Lodge on Sunday evening, for Kingstown, and immediately embarked on board H.M.'s packet Merlin for Liverpool, on his way to London.—The papers publish the decision of the Government upon the report of Mr. Smith, the commissioner appointed by the Lord Lieutenant to inquire into the conduct of the magistrates and police who had been on duty upon the night of the fatal conflict in Ennis. Mr. L. C. Smith, the stipendiary magistrate stationed at Ennis, who had been in command of the force, is retained in the service of the Government; but his Excellency deems it expedient to remove him to another station, and accordingly he will at once proceed to Borrisokane, County Tipperary, in place of Captain Duff, who proceeds to Ennis. Mr. Fitzsimon, the sub-inspector, proceeds to another station. The decision of his Excellency regarding Mr. Browne, the county inspector, is not yet made known. All the police party, who had been on duty on the night of the riot, amounting in number to 37, are ordered to this city, where they are to undergo an examination before Col. M'Gregor, the inspector-general of the constabulary.—Accounts have been received in town of the death of the Very Rev. Peter Brown, Dean of Ferns and Incumbent of Gorey for upwards of 50 years, who died at Gorey on the 21st inst.—The papers continue to report unfavourably of the state of the Bishop of Cashel's health. No amendment appears to be taking place; and the venerable prelate is yet unable to comply with the recommendation of his physicians to try the effects of a change of climate.—The inquest on Mr. Byrne is still continued and the proceedings are reported at great length, but they present as yet little public interest.

Cork.—The meeting of the Royal Agricultural Society of Ireland has just taken place in this town. The local papers are filled with details of the proceedings, which seem to have drawn together large numbers of the nobility and gentry from all parts of the country. The grand banquet took place on Thursday, the 21st. The company amounted to about 1,000. The chair was taken by the Marquis of Downshire, and the vice-chair was filled by the Earl of Shannon. Of the exhibition, the papers say that on the whole it went off well. There was less stock than seems to have been expected, but many breeders were deterred from sending cattle in consequence of the fatal distemper prevalent in some parts of Ireland. This affection appears to be of a very malignant character, and to present the ordinary symptoms of pulmonary disease. It commences with a short continuous cough, and the lungs on examination after death are found to be completely decayed. Hundreds of cattle are said to have been carried off by it within a very short period.

Armagh.—Another Ribbon trial under the recent statute was held at Armagh on Friday, the 22d, before Mr. Justice Crampton. The Attorney-General attended in person to prosecute. The parties tried were four in number, all of whom, along with a fifth, who had forfeited his recognisance and absconded, had been tried at a former assizes; but in consequence of the jury not agreeing, they were held over for a second trial on this occasion. There was a sixth who had never been made amenable to justice. The jury found all the parties guilty. The Court, in forcible terms, urged all members of the illegal confederation of Ribbonmen to take warning by the example about to be made of their five associates, and sentenced each to transportation for seven years. All the convicts were of the better class of farmers.

SCOTLAND.

Edinburgh.—The General Assembly having appointed Thursday, the 21st, to be observed as a day of solemn humiliation, public worship took place in the churches of the Establishment. There was a good attendance on the part of the different congregations. The Dissenters having declined the invitation made to them through the Moderator of the General Assembly to co-operate with the Church of Scotland on this occasion, the observance of the day was almost entirely confined to the latter. The shops were shut as generally as on ordinary fast days; and, as the weather was beautiful, great numbers availed themselves of the opportunity to take a trip to the most interesting localities in the neighbourhood. The number of passengers entered at the Edinburgh station of the Glasgow railway amounted to 5,600, being more than three times the number booked on the occasion of the sacramental fast in April last. The number who travelled on the various branches of the Edinburgh and Dalkeith railway, including children, was above 7,000. The number who paid was 6,861; and it is stated that these were chiefly of the respectable classes in middle and lower life, and that not a drunken or disorderly person was seen on any part of the lines.—Mr. James Miller has been elected Professor of Surgery to this University, in the place of the late Sir Charles Bell. The other candidate, Mr. Lizars, was not even proposed. The election to the Chair of Pathology, vacant by the resignation of Dr. Thomson, will take place on the 9th of next month. The candidates are Dr. Craigie, Dr. Henderson, Dr. John Davy, Dr. Handyside, and Dr. Bennett.

Harris.—The island and parish of Harris, constituting a middle link in the great chain of the Hebrides, called the Long Island, has presented a scene of considerable commotion for the last three weeks, in consequence of nearly 400 of the population having resolved to emigrate to North America. It is said that the proprietor, the Earl of Dunmore, has given about 700*l.* to assist these destitute people to defray the expenses of their emigration. About 500 persons from Loch Boisdale are also destined for America.

SPORTING.

GOODWOOD RACES.—*Tuesday.*—These popular races commenced this day, and were very numerously attended. The proceedings begin with

The Craven Stakes of 10 sovs. each. Mile and a quarter. 9 subs. Won by Mr. Etwall's Discord (Melody colt), (J. Day, Junior), beating Lord Jersey's f. by Bay Middleton out of Trampoline, Col. Anson's Elopement, Duke of Richmond's The Currier, and Mr. Forth's Paul Potter. Won by two lengths.

The Lavant Stakes of 50 sovs. each, 30 ft., for two-yr.-olds. Half a mile. 17 subs. Won by Lord Maidstone's The Castor (Scott), beating Mr. Treen's Bastile, Lord Exeter's c. by Beiram, d. by Emilius, Lord G. Bentinck's Bramble, and Mr. Gratwicke's Hopeful. Won cleverly by a length.

The Drawing-room Stakes of 25 sovs. each, with a bonus of 10 sovs. each. 41 subs. to the stakes, and 30 to the bonus. Won by Duke of Bedford's Envoy (Robinson), beating Col. Peel's Seahorse, Col. Anson's Attila, Duke of Richmond's Eaglesfield, Mr. Grevill's Gunter, Mr. Goodman's Rover, Lord G. Bentinck's Misdeal, and Lord Exeter's Albion. Won by half a length, Seahorse beating Attila by a neck. The others were tailed off an immense distance.

Sweepstakes of 300 sovs. each, h. ft., for four-yr-olds. 12 subs. Won by Lord G. Bentinck's Mustapha (Rogers), beating Lord Westminster's Van Amburgh, and Lord Chesterfield's Mehemet Ali. Won by 20 lengths.

The Gratwicke Stakes of 100 sovs. each, h.ft., for three-yr-olds. 67 subs. Won by Lord Verulam's Robert de Gorham (Cotton), beating Mr. Wreford's Wiseacre, Lord G. Bentinck's Firebrand, Duke of Richmond's f. by Elis out of Baleine, and Mr. Bowes's The Lady of Silverkeld Well. The favourite jumped off with a lead of about 20 lengths, and kept it to the end; such a tailing race for the distance has seldom, if ever, been seen.

The Goodwood Club Stakes of 10 sovs. each, for three-yr-olds and upwards, ridden by members of the Goodwood Club. 18 subs. Won by Mr. Tollett's The Tiger (General Gilbert), beating Lord Eglinton's The Young'un, Lord G. Bentinck's Proof Print, Count Bathyany's Nicholas, Sir C. Cockerell, named Man Friday, Lord G. Bentinck's Flytrap, and Lord G. Bentinck's The Yorkshire Lady. Won by a head, after a fine race.

Match, 1,000 sovs., h.ft. Cup course. Won by Mr. Johnstone's Charles XII. (Marson), beating Mr. Lichtwald's Hyllus. Won by a neck.

The Welter Stakes of 20 sovs., for three-yr-olds. Gent. riders, &c. 7 subs. Won by Duke of Richmond's The Currier (Lord March), beating Mr. Holmes's Vulcan. A dead heat; after which both horses divided the stakes, and The Currier walked over.

The Ham Stakes of 100 sovs. each, h.ft., for two-yrs-old colts. T.Y.C. 32 subs. Won by Lord Eglinton's Aristides, by Bay Middleton (Lye), beating Col. Peel's Murat, by Slane, and six others. A good race; won by two lengths.

The Innkeepers' Plate of 50 sovs., added to a sweepstakes of 5 sovs. each. T.Y.C. 4 subs. Won by Lord G. Bentinck's African (W. Howlett), beating Mr. King's Sultana, Lord Rosslyn's Cornuto, and Mr. Greville's Pickwick. Won easy. This day's sport was not over till seven o'clock, making nearly seven hours' racing.

Wednesday.—The Queen's Plate of 100 gs. Won by Mr. Forth's Vibration (Bell), beating Mr. Holmes' Vulcan, Mr. Wreford's Warden, Mr. Bignold's c. by Emilius out of Memima, and Lord G. Bentinck's Tripoli. Won very cleverly by a length. A fine race for second.

The Stewards' Cup, added to a handicap of 5 sovs. each. T.Y.C. 30 sovs. Won by Lord Jersey's f. by Touchstone out of Adela (Chapple), beating Lord G. Bentinck's Misdeal, and Col. Peel's Garry Owen. Several others started, but were not placed. Won by a head; Misdeal beating Garry Owen by half a length.

The Goodwood Stakes of 25 sovs. each, 15 ft. Cup course. 151 subs., of whom 101 declared, &c. Won by Major Hay's Retriever (Murphy), beating Lord Kilmore's c. by Muley Moloch, d. by Actæon, and Mr. Shelley's Daddy Longlegs. Several others started, but were not placed. Retriever made all the running, was never caught, and won by six lengths.

The Handicap Plate of 50 sovs., added to a sweepstakes of 5 sovs. each. Mile heats. Won by Duke of Richmond's The Currier (Rogers), beating Mr. Theobald's Pocahontas, Mr. Ley's c. by Elis out of Partiality, and Lord Rosslyn's Gilbert. Won in a canter.

The Cowdray Stakes of 25 sovs. each. T.Y.C. Won by Sir W. Stanley's Cecil (Butler), beating Lord Chesterfield's f. by Muley Moloch, and Lord G. Bentinck's Tiptoe. Won by a length cleverly.

The Members' Plate of 50*l.* with 50*l.* added by the Ladies, and 10*l.* from the fund for the second horse. Heats, once round. Won by Lord Eglinton's The Young 'un (Lye), beating Mr. Gregory's Fitzroy, Lord G. Bentinck's f. Stop-awhile-says-Slow, and Lord Verulam's Concertina. Each heat won easy. Fitzroy broke down in the second heat.

Thursday.—This being the Cup day, the stand was crowded, and an immense assemblage of spectators had collected at an early hour.

A Sweepstakes of 25 sovs. each, for 2-yrs-old colts. T. Y. C. 12 subs. Won by Lord Chesterfield's Peter the Hermit (Natt), beating Mr. Sadler's Decisive, Mr. Wreford's c. by Sultan, jun., f. out of Victoria, and Lord G. Bentinck's Gaper. A dead heat between the two first; the stakes were divided, and the Hermit walked over.

The Molecomb Stakes, of 50 sovs. each, h. ft. T.Y.C. Won by Lord Maidstone's The Caster (Scott), beating Mr. Wreford's Victoria colt, and Lord G. Bentinck's Bramble. Won cleverly by a length.

The Duke of Richmond's Plate of 100*l.* New Mile. Won by Lord Rosslyn's Catmelino (F. Butler), beating Mr. Forth's Vibration, and several others. Won cleverly by a neck,

The Racking Stakes, of 50 sovs. each, p.p., for 3-yr-olds. New Mile. 26 Subs. Won by Lord G. Bentinck's Misdeal (W. Howlett), beating Lord Westminster's Candahar, and several others which were not placed. Won by a length.

The Goodwood Cup, value 300 gs., by subscription of 20 sovs. each, with 100 added. Cup Course. 50 subs. Won by Mr. Johnston's Charles XII. (Robinson), beating Mr. Forth's Policy, Mr. Ferguson's Fireaway, Mr. Ettwall's Thistle Whipper, Lord Westminster's Sleight-of-Hand, Mr. Bell's The Squire, Mr. Allen's Belcœur, Lord G. Bentinck's Yorkshire Lady, and Mr. Higgins's h. by Priam, out of Seamew. Thistle Whipper was in front at starting, but in a few strides contented himself with the second place, the lead being taken at a good pace by Policy, Thistle Whipper and Fireaway lying next, Yorkshire Lady and Belcœur fifth and sixth, Charles, The Squire, and Seamew horse bringing up the rear. There was no alteration of the slightest moment in the leading horses until they reached the last turn, where Charles and the Squire moved towards the front. At the distance the race was over—Charles went by his horses, made the rest of the running, and won in a canter by two lengths. Fireaway was beaten two lengths from the second. The Seamew horse pulled up a mile from home, and Sleight of-Hand, the Yorkshire Lady, and Belcœur, were tailed off two distances. The pace was good.

The Anglesey Stakes, of 15 sovs. each, for 3-yr-olds, &c. Gentlemen riders. The new mile. 13 Subs. Won by Mr. F. Clarke's Currycomb (Mr. P. Williams), beating Lord G. Bentinck's Proof Print, Mr. Graydon's Helpmate, and Sir W. Stanley's Cecil. After the first quarter of a mile, Currycomb made the running, which he kept up to the end, and won in a canter by two lengths.

Law.

ROLLS COURT.—*Clarke* v. *Yonge.*—Lord Langdale gave judgment in this cause, reported to the Court in May last. The suit was by the trustees of the will of the Rev. Thos. Young, formerly rector of Necton, Norfolk, as impropriator of a portion of lay tithes in Necton, consisting of a moiety of the tithes of corn, which, upon the dissolution of the monastery of Westacre, came to the Crown, and was granted as a lay fee and vested in the testator, Thos. Young, who devised it to his brother, the Rev. W. Young, now dead, for life, with remainder to his children, and was brought against the present rector, the Rev. Wm. Yonge. In April, 1839, there was a commutation of the tithe for an annual rent-charge of 905*l.*, to be paid to the defendant, as rector, and his successors. In consequence of the unsoundness of mind of Young, the brother and devisee for life, the registrar of the diocese of Norwich was appointed his substitute; but no notice was taken of the existence of the portion of lay tithes. After the devisee Young's death, the plaintiffs filed the bill for a reasonable proportion of the annual rent-charge of 905*l.*, and for an apportionment of it, according to the values of the lay moiety of the corn tithes, and of the tithes belonging to the rectory.—Lord Langdale said, the first question was, whether the testator, Thos. Young, was entitled to the moiety of the corn tithes. His Lordship went through the title from the time of Henry VIII., and was of opinion that the title to the portion of tithes was made out. The testator was rector of Necton from 1791 to 1837. It could not be expected to find, under such circumstances, the relative rights of the rector and of the portionist. From the circumstances it was improbable that there should have been a separate possession of the tithes by the rector and the portioner. For 28 years before his death the testator was both rector and portioner. It was called "about a moiety." The writings lead to a conclusion that there was an equality of value. He was of opinion it could be reasonably construed only as a description of a moiety of the rectorial tithes; and, therefore, that the testator in his lifetime, and the plaintiffs as trustees under his will, were entitled to a moiety of the corn tithes in the parish. Under the Tithes Commutation Act, the lands had been discharged from future payment of tithes. The act provided that persons having interest in tithes should have the same right over the rent-charge as they had over the tithes. The plaintiffs were not excluded from seeking to establish their claim to a portion of the rent-charge commensurate with the portion they had in the tithes. He should declare the plaintiffs had been entitled to one moiety of the corn tithes, and were now entitled to such a proportion of the rent-charge (905*l.* a year) as the one moiety of the corn tithes bore to the whole of the tithes; and there must be a reference to the Master to settle the proportion. The plaintiffs were not entitled to any further account. There was no foundation for concluding that the defendant had notice of the plaintiff's right until the claim was made. The defendant was justified in requiring the claim to be made out by legal proceedings; and although it might have been wished that some of the defences had not been resorted to, he was of opinion that plaintiffs must pay the costs of the suit.

ASSIZE INTELLIGENCE.—WESTERN CIRCUIT, EXETER.—*Elizabeth Small* was indicted for stealing from the person of William Harding the sum of 28*l.* This case presented an instance of extraordinary superstition on the part of the prosecutor; and, to persons unacquainted with the ignorance that still spreads over many parts of our agricultural districts, would seem to belong to the history of many centuries past. It appeared by the evidence that the prosecutor, who kept a beer-shop at Sandford, in this county, was, in the month of April last, in a feeble state of health. He happened upon some occasion to see the prisoner, who is an old gipsy woman. He fell into conversation with her on the nature of his complaint, and she was enabled to persuade him that one of his neighbours had looked upon him with the *evil eye*, which was alone the cause of his malady, and that until the baneful influence of this *evil eye* could be counteracted it was impossible that he should get well. The prosecutor was induced to give her first half-a-crown, with which she crossed her hand, and performed other absurdities. It is hardly necessary to add that the *evil eye* was not removed. The parties met again, and the prisoner at this time succeeded in obtaining double the sum he had before given to her. Still the *evil eye* glared on him with all its malignant influence, and none of its consequences were removed. He saw her again, and again gave her 5*s.*; which, no doubt, convincing her of the extreme credulity of the man, she ventured to test it yet still further. She now informed him that it was necessary that he should get together all the money he could possibly command; that he should bring that money with him to a place on a neighbouring common which she indicated; and that he must then kiss her hand and show the money; and having done this, she promised she would bring before him the person by whose *evil eye* he was then suffering, and cure him of his complaint. After this conversation he went to a person for whom he occasionally worked, and borrowed of him 25*l.*, which this person immediately lent him, on his saying that he wanted it for some private purpose. Having borrowed the money, he went to the spot indicated, and there, as he stated, saw the prisoner. She desired him to produce the money, which he did in his hand, when she said that he must for a short time give it into her possession. This seems to have alarmed him, and he somewhat demurred at the proposal. On hearing this the prisoner made a snatch at the money, succeeded in getting it, and set off at full speed across the common. The prosecutor stated that he was too feeble to follow, and that she escaped with the booty. He did not see her for some time after, and when he did he gave her into custody. To this evidence was added the testimony of the policeman by whom the prisoner was apprehended, and who deposed to her having immediately recognised the prosecutor when she was taken, and admitted, in answer to an interrogatory put to her by him, that she remembered his kissing her hand. Another witness also deposed to the fact of having seen her near the place where the prosecutor stated that he had met her. For the defence two witnesses were called to prove an *alibi*. They differed, however, in several particulars on their cross-examination, though it did not appear, from anything elicited from them, that they had any interest in giving the testimony they did, they not being related to the prisoner, nor yet of the gipsy tribe, but simple peasants of this county. Mr. Justice Cresswell summed up, pointing out the perfect agreement of the evidence for the prosecution, and the discrepancies in that for the prisoner. The jury immediately found her guilty, and she was sentenced by the court to a year's imprisonment.

MARK LANE, FRIDAY, JULY 29.—The little English Wheat left over from Monday was held at that day's prices. The business transacted in Foreign has been to a limited extent, but the weather being unsettled has created rather more confidence in the trade; there are but few buyers of cargoes afloat. Barley, Peas, and Beans, remain unaltered in value, but the supply of each article is small. The Oat trade continues in a very dull state.

GAZETTE OF THE WEEK.

INSOLVENTS.—R. Byers, Pitfield-street, Hoxton, laceman—J. Till, Nine Elms, Brewer.

BANKRUPTCY SUPERSEDED.—F. E. Turner, Holywell, druggist.

BANKRUPTS.—G. Chapman, Pullin's-place, Islington, cowkeeper—T. H. Munday, Fore-street, Cripplegate, bookseller—J. and T. Metcalfe, Cambridge, upholsterers—J. Cotton, Nottingham, and Sheepshand, Leicestershire, hosier—A. Leighton, Liverpool, merchant—J. Scott, Birmingham, gun maker—D. Hodgson, Sandwich, Kent, banker—J. Lang, S. Armitage, R. Redfearn, and J. Sykes, Liversedge, Yorkshire, blanket manufacturers—F. F. Richardson, Manchester, publican—J. Dickins, Northampton, upholsterer—E. Wilkins, Swansea, Glamorganshire, linen-draper—R. C. Gray and H. T. Gray, Upper Stamford-street, Blackfriars—H. Westwood, Wolverhampton, steelyard maker—S. Sedgley, Dudley, grocer—T. Clarke, Rugby, Warwickshire, mercer—W. Stone and R. Blake, Bristol, tailors—J. Watson the elder and J. Watson the younger, Wath-upon-Dearne, York, brewers—J. Skelton, Gainsborough, Lincolnshire, miller—T. H. Wood, Ranelagh-road, Pimlico, engineer—W. Wood, Pickett-street Chambers, Strand, bill-broker—T. Chapman, Tottenham-court-road, Middlesex, dairyman—C. King, J. Sandell, and D. H. King, Berners-street, Oxford-street, Middlesex, paper-stainers—J. Fitton, Bolton-le-Moors, Small-ware dealers—C. L. Wrenshall, Liverpool, music dealer—F. Arthur and E. Arthur, Birmingham coach makers.

SCOTCH SEQUESTRATIONS.—J. Benton, Huntly, Aberdeen, grain, merchant—J. C. Henderson and G. C. Balfour, wine merchants, Leith—G. Marshall, Jedburgh, grocer—R. Wilson, Kirkcudbright, spirit dealer—W. Forest, Greenock, draper—A. Corstorphine, Kingsbarns, Fifeshire, banker—R. Jackson, Glasgow, bookseller—T. Kinnon, Rutherglen, merchant—J. and J. Craig, Partick, builders.

BIRTHS.—On the 25th inst., in Grafton-street, the lady of E. Jekyll, Esq., of a son—On the 26th inst., in Westbourne-street, Hyde-park-gardens, the lady of F. W. Russell, Esq., of a son—On the 25th inst., at Coombe Lodge, the lady of R. Allfrey, Esq., of a son—On the 25th inst., at 10, Carlton House-terrace, Lady Ridley, of a son—On the 26th inst., at Peckham, Mrs. J. S. Hardy, of a son—On the 26th inst., in Albany-street, Regent's park, the lady of D. Geddes, Esq., surgeon, R.N., of a daughter—On the 27th inst., in Eccleston-street, Chester-square, the wife of J. Scott, Esq., of a son—On the 27th inst., at Merton-cottage, Surrey, the wife of W. Adams, Esq., of a son—On the 28th inst., at Clapham-common, Mrs. Hudson, of a daughter.

MARRIED.—On the 23rd inst., at Broadwater Church, Worthing, the Hon. J. C. Westenra, M.P., second son of Lord Rossmore, to Ann, daughter of the late L. C. Daubuz, Esq., of Truro, Cornwall—On the 26th inst., at St. Mary's, Bryanstone-square, Robert John, only son of J. Bagshaw, Esq., of Gloucester-place, to Georgiana, youngest daughter of the late R. Baker, Esq., of Bath-house, Elstree—On the 26th inst., at St. Mary's, Wanstead, Francis Lawrence, youngest son of M. Bland, Esq., of St. Leonard-on-Sea, to Agatha Elizabeth, second daughter of J. Chapman, Esq., of Wanstead—On the 25th inst., at St. George's Church, Hanover-square, T. I. Smith, Esq., of Oporto, to Mary, widow of the late G. Sandeman, Esq., St. Swithin's-lane, London.

DIED.—On the 26th inst., at his residence, in the Retreat, South Lambeth, J. Holmes, Esq., aged 78, who held the office of high bailiff of the borough of Southwark for nearly 20 years—On the 26th inst., Hannah, youngest daughter of W. Fox, Esq., Chester-terrace, Regent's-park—On the 17th inst., at Millhill, near Blackburn, aged 66, W. Turner, Esq., member in several Parliaments for the borough of Blackburn—On the 28th inst., at Lindsey-place, Chelsea, Jane, youngest daughter of the late J. Beech, Esq.—On the 27th inst., at Haverstock-hill, Clara, daughter of Mr. E. Robins, of the Piazza, Covent-garden.

Printed by Messrs. BRADBURY and EVANS, Lombard-street, Fleet-street, in the Precinct of Whitefriars, in the City of London, and Published by them at the OFFICE, 3, CHARLES-STREET, COVENT GARDEN, in the County of Middlesex, where all Advertisements and Communications are to be addressed to the Editor.—Saturday, July 30, 1842.

HORTICULTURAL SOCIETY OF LONDON.
EXHIBITIONS AT THE GARDEN.

All persons interested in these Exhibitions are invited to suggest such improvements as may occur to them. The desire of the Society is to do everything that is calculated to attain the great object for which the Exhibitions were instituted, namely, the promotion of Horticulture; and any suggestions that may be made by letter, addressed to the Vice Secretary, 21, Regent-street, will be laid before the Exhibition Committee for consideration. The following were the regulations observed during the past season :—

Subjects of Exhibition.—These will be divided into Classes, as explained further on. No articles not of horticultural produce will be allowed to be placed upon the tables. Exhibitors will do well to make themselves acquainted with the arrangements described in the following list, as they will in all cases be required to sign a declaration stating under what letter their plants are to be shown; and they are particularly requested to take notice, that if errors in the awards of the judges should occur, in consequence of mistakes on the part of exhibitors in filling up such declarations, the Society cannot undertake to rectify such errors afterwards. To enable the officers of the Society to attach names to the objects exhibited, it is requested that correct lists may be delivered to the clerk as soon as the exhibitor reaches the Garden.

Class I.—Flowers for which Nurserymen and Private Growers exhibit independently of each other.

A. Greenhouse Azaleas, to be shown in numbers not exceeding 12, GB, LS, SK.
B. Carnations, in pans of 24 blooms, LS, SK, SB.
C. Picotees, in pans of 24 blooms, LS, SK, SB.
D. Pinks, in pans of 24 blooms, SK, SB.
E. Cape Heaths, in collections of 20 species, GK, SG, LS, SK.
F. Cape Heaths, in collections of six species, GB, LS, SK.—*N.B.* No person who shows in E will be allowed to exhibit also in F.
G. Exotic Orchidaceæ, in collections of not fewer than six species, GB, LS, SK.
H. Exotic Orchidaceæ, in single specimens, LS, SK, SB.
I. Pelargoniums, in collections of 12 varieties, in pots, not exceeding 12 to a cast, GB, LS, SK, SB.
K. Pelargoniums, in collections of six varieties, in pots, not exceeding eight to a cast, SG, LS, SB.
L. Rhododendrons, in pots, not fewer than 12 plants, in 12 varieties, LS, SK, SB.
M. Moss Roses, SK, SB.
N. Common Garden Roses, exclusive of all Chinese or Chinese Hybrids, LS, SB, SK.
O. Chinese or Hybrid Roses, such as Bourbon, Noisette, Tea-scented, and similar varieties, LS, SB, SK.—*N.B.* No exhibitor of Roses can be allowed to occupy more than 15 ft. run of tables for all his Roses, which, being double, is equal to 30 ft. of boxes. If any Exhibitor gains the first medals both in M, N, and in O, he will be entitled to a Gold Banksian medal instead of the three Silver ones.
P. Stove or Greenhouse Plants, in collections of from 50 to 60 plants, GK, GB, SG, LS.
Q. Stove or Greenhouse Plants, in collections of from 15 to 20 plants, GB, LS, SK.
R. Stove or Greenhouse Plants, in collections of six distinct species, LS, SK.—*N.B.* Persons exhibiting in P and Q will not be allowed to compete in R also.
S. Herbaceous Calceolarias, in sixes, LS, SK, SB.
T. Shrubby Calceolarias, in sixes, LS, SK, SB.

Class II.—Flowers, for which all persons are admitted to equal competition :—

U. Collections of Stove or Greenhouse Climbers, GK, GB, LS, SK.—*N.B.* The Gold Knightian medal is not to be awarded for fewer than 12 distinct kinds.
V. Tall Cacti in flower, LS, SK.
W. Single specimens of Ornamental Plants, LS, SK, SB, C.
X. Miscellaneous Flowers, SK, SB, C.—*N.B.* Cockscombs, Hydrangeas, and cut flowers, are altogether excluded from prizes.
Y. Seedling Florists' Flowers, SK, SB, C.—*N.B.* Every seedling must be shown singly, and must be marked with the name it is to bear. The same seedling cannot gain a prize more than once in the season. Pelargoniums are to be shown in single trusses, with a single leaf, so far below the flowers as not to support them; and they are not to be dressed with cotton or wool, or any similar substance, but must be shown exactly as they grow on the bush.

Class III.—Fruit, for which market-gardeners, or persons in the habit of regularly supplying the market, and private growers, exhibit independently of each other.—*N.B.* All Fruit must be ripe and well-coloured; if the contrary, it will be disqualified.

Z. Miscellaneous collections of Fruit, consisting of at least three different kinds, Peaches and Nectarines being considered as only one kind, GK, GB, LS.—*N.B.* Cucumbers Tomatoes, Gourds, and similar kitchen-garden produce, are excluded from this letter.
AA. Grapes, SG, LS, SK, SB.
BB. Pine-apples, SG, LS, SK, SB.
CC. Peaches or Nectarines, in dishes of six specimens, SK, SB.
DD. Miscellaneous Fruit, SK, SB, C.

Judges.—The Judges have the power of increasing or diminishing the number and value of the Silver Medals offered by the Society for particular objects, and also of conferring Silver Medals or Certificates in cases not contemplated in these regulations, if they think it necessary to do so.

The judges are also required to bear in mind that the Society's medals are offered, less for new and curious objects, than for fine specimens of Horticultural skill, the design of the council in instituting these meetings being not so much to encourage the collector as to reward the skilful gardener; they are also not to make any award in cases where the objects exhibited do not appear worthy of a medal; otherwise a bad single exhibition might obtain a prize, merely because there is no better exhibition of the same class to oppose it.

THE FLORICULTURAL SOCIETY OF LONDON beg to remind the raisers of Seedling DAHLIAS, that their days of meeting are the First and Third Tuesdays in each Month; and that parties wishing for their opinion must strictly comply with the Regulations of the Society, by sending not less than Six Blooms of Seedlings raised in 1841, and one of the present year, addressed to the Secretary (carriage free), and accompanied with the name of the raiser, and, *most particularly*, the name intended to be given to the flower—neglect in the latter respect having led upon several occasions to the unavoidable rejection of specimens sent for judgment.

T. C. Wildman, Hon. Sec.

P.S.—The Dahlia Show is fixed for 20th Sept.

EAST NORFOLK GRAND SHOW OF CARNATIONS, PICOTEES, AND FUCHSIAS.

Florists to Her Majesty the Queen Dowager.

MESSRS. YOUELL have much pleasure in announcing that the Show of their unequalled collection of the above Flowers is now in full bloom, and will continue a week. Upwards of 2,000 Pots will be staged this season; and they beg to state, that having spared no expense in obtaining every new variety attainable, possessing superior merits, it will be found one of the most splendid exhibitions of the kind in the kingdom.

The communication between London and Yarmoth as under :—

Steam.—"Ramona," from London Bridge Wharf, every Saturday evening at six o'clock. "Ailsa Craig," St. Katharine's Wharf, every Tuesday evening.

Coaches.—"Star," Spread Eagle, Gracechurch-street, every Morning at half-past six o'clock. "Telegraph," White Horse, Fetter-lane, every evening at six o'clock.

Great Yarmouth Nursery, Aug. 4, 1842.

DAHLIAS.

THE GRAND ANNUAL DAHLIA EXHIBITION ON SALISBURY PLAIN will take place on Wednesday, August 31st, at STONEHENGE, under the immediate patronage of Lady Antrobus. Full particulars may be had on application to J. Keynes, Hon. Sec., Salisbury.

Salisbury, July 26, 1842.

STONEHENGE is Six Miles from Salisbury and Two from Amesbury. There will be accommodation at both places for conveying Exhibitors and their boxes to the Stones.

LILIUM LANCIFOLIUM.

H. GROOM, Clapham Rise, near London, (Removed from Walworth,) by Appointment Florist to Her Majesty, respectfully informs the Nobility, Gentry, and Public, that he has a fine stock of Lilium lancifolium, album, and punctatum, which he can supply at very moderate prices.

He begs to say his Catalogue of Geraniums is ready for delivery, and can be had on application.

MYATT'S BRITISH QUEEN STRAWBERRY, after two years' competition, still maintains its pre-eminence; and, in returning thanks to their numerous patrons and friends, J. and W. Myatt beg to say they can with confidence recommend it as the most superb fruit yet known.

Also their new Seedling Strawberry Prince Albert, which for productiveness and size cannot be equalled. Price per 100, each, 50*s.*; and their Eliza, 20*s.* Runners are now ready, and may be had on application to them at Manor Farm, Deptford.

Myatt's famed Victoria Rhubarb, 50*s.* per 100 sets, or 1*s.* 6*d.* per root, will be ready in October.

GREAT BERKHAMPSTEAD, HERTS.

H. LANE & SON beg to call the attention of the Public to their stock of Black-seeded Bath COS LETTUCE SEED, the qualities of which are superior to any other; withstanding the severity of Winter, and remaining a long time on the ground before running to seed. It is also an excellent Summer Lettuce, and is well known and appreciated by the practical gardeners in the neighbourhood.

Packets, from 1*s.* to 5*s.* each, sent free of postage for a post-office order or postage-stamps.

Their splendid new Seedling FUCHSIA LANEII will be sent out in April next, at 7*s.* 6*d.* each, in succession as ordered.

No allowance to the trade unless six plants are taken.

Aug. 2, 1842.

FLOWER SEEDS for AUTUMN SOWING. The undersigned begs leave to recommend the following Flower Seeds for present and Autumn sowing :—

⁂ A new and extensive Catalogue of Flower-Bulbs, comprising several rare Exotics, exclusively in his possession, will be forwarded, free of all expense, on application to James Carter, Seedsman and Florist, 238, High Holborn, London.

FULLER'S NEW HYBRID WINTER RADISH.—The entire STOCK of SEED of this delicious Esculent is in the hands of the Subscriber, and is now ready to be sent out in packets, post free, on receipt of a Post-office order for 5*s.* A certificate of merit was awarded to the raiser of this Radish at one of the Winter Exhibitions of the London Horticultural Society in 1841. See Dr. Lindley's encomiums upon it. One or two small sowings may be made during the present month, which will suffice for the season.—Address, William May, Hope Nursery, Leeming Lane, near Bedale, Yorkshire.

UNION ROAD NURSERIES, PLYMOUTH.

WILLIAM E. RENDLE, Nurseryman, Seedsman, and Florist, has the pleasure of offering to the Nobility, Amateurs, and the Trade, the following new varieties of

Pelargoniums,

raised by P. E. Lyne, Esq., of Sepson, the entire stock of which he has succeeded in obtaining :—

	£	s.	d.	
Lyne's Sunrise	3	3	0	each
,, Duke of Cornwall	3	3	0	,,
,, Lord Ebrington	2	2	0	,,
,, Princess Royal	2	2	0	,,
,, Cynthia	1	10	0	,,
,, Modesty	1	10	0	,,
,, Hamlet	1	10	0	,,
Bassett's Glory of the West	2	2	0	,,

The usual Discounts to the Trade.

Strong Plants of Princess Royal and Glory of the West are now ready for delivery. The other sorts will be sent out in October.

Agents in London—Messrs. Warner, Seedsmen, Cornhill, and Mr. Wm. Bristowe, Seedsman, Knightsbridge; from whom Plants and descriptions can be procured, and where drawings of some of the sorts may be seen. Descriptions of the Seedling can also be had on application at the Union Road Nursery, Plymouth; or by reference to the *Gardeners' Chronicle* of August 6, 1842.

Union Road Nursery, Plymouth, August 3, 1842.

SPIRÆA LINDLEYANA.

ATKINS & JEYES beg to announce they have a fine stock of the above beautiful New Spiræa (raised by them from Himalayan seeds), and now blooming for the second season in their nursery. The racemes of flowers, of a beautiful creamy white, are upwards of two feet in length, and leaves eighteen inches, forming one of the most graceful *hardy* shrubs yet introduced. Good plants, well established in pots, 7*s.* 6*d.* each; a few extra strong, 10*s.* 6*d.* Northampton, 8 mo., 4th, 1842.

VALUABLE ORCHIDACEOUS PLANTS.

MESSRS. THOMAS WINSTANLEY AND SONS (of Liverpool) announce to the Admirers of curious and rare plants, that they are instructed to sell by Auction on the Premises, Aighurth, near Liverpool, on Monday, the 29th of August next, and following days, at 12 o'clock precisely each day,

THE UNIQUE, WELL-KNOWN, AND JUSTLY-CELEBRATED COLLECTION OF ORCHIDACEOUS PLANTS,

The Property of Richard Harrison, Esq.

In the collection will be found large and rare specimens of the Angræcum Eburnium; Cattleyas, including Skinneri, Perrini (fine), Labiata (very fine), Crispa (very large), Mossii, Loddigesi, Guttata, Citrina, Superba, &c. &c. Epidendrums, all fine; named and several unnamed Maxillarias, Oncidiums, Dendrobiums; Ae'rides Brookii, cornutum, and odoratum; Odontoglossum grande, maculatum, &c.; with about four hundred other varieties of choice Parasitical Plants, including Fernandesia, Grobya, Gongora, Heterotaxis, Hillia, Lissochilus, Leptotes, Cyrtopodium, Calanthes, Cypripedium, Coryanthes, Cirrhæa, Catasetum, Cœlogyne, Cyrtochilum, Cycnoches, Cymbidium, Neottia, Brassavola, Vanda, Rodriguezia, Myanthus, Mormodes, Miltonia, Phaius, Brassia, Burlingtonia, Bifrenaria, Batemannia, Stanhopea, &c. &c.: Lælia anceps, autumnale, and others. Together with a general assortment of Hothouse Plants of an important character, and highly interesting to the lover of Botany.

The above Collection, for its extent, is allowed to be one of the finest in Europe, and is the result of twenty years' formation, by Mr. Harrison, regarding only variety and perfection.

The Plants having been attended to by a skilful gardener, are in excellent condition, and will be sold without reservation.

The whole may be viewed on Friday 26th, Saturday 27th August, and on the mornings of Sale, and Catalogues, which will be ready in a few days, had at the following places :—The Offices of the *Gardeners' Chronicle* and the "Gardeners' Magazine;" Messrs. Winstanleys, Paternoster Row, London; at the place of Sale, and of Thos. Winstanley and Sons, Liverpool.

HEATING BY HOT WATER.

JOHN WALKER, 46, St. John's Square, Clerkenwell, London, having been for many years extensively engaged in Warming Churches, Manufactories, Hospitals, Hothouses, Conservatories, and Private Houses, by means of Hot Water, either in Pipes or Pedestals, can confidently recommend this mode of heating in preference to any other. Numerous references can be given both in town and country, where he has successfully and satisfactorily applied it. Baths fitted up and heated in a superior manner. Orders executed in all parts of the Country with punctuality and despatch.

HOT-WATER APPARATUS FOR HEATING HORTICULTURAL BUILDINGS, DWELLING-HOUSES, CHURCHES, and MANUFACTORIES, upon improved principles, and at very moderate charges, erected by DANIEL and EDWARD BAILEY, 272, HOLBORN.

D. and E. Bailey having devoted much time to the consideration of this subject, and had much experience in the erection of apparatus for the above-mentioned purposes, have, by improvements suggested in their practice, rendered their mode of heating not only very efficient, but very simple, and have combined durability in the apparatus with economy in the charge. They have erected apparatus in England, Scotland, and Ireland, for many noblemen and gentlemen, and have had the honour to be employed by the Horticultural Society of London, in executing the works of their splendid Conservatory, lately erected at Chiswick.

D. and E. Bailey also construct in metal all descriptions of Horticultural Buildings and Sashes, and invite noblemen, gentlemen, and the public to an inspection of their various drawings and models, at 272, Holborn, where they have the opportunity of exhibiting, amongst other metal works, an extremely complete and convenient kitchen apparatus, or range, adapted for the continued supply of hot water, and an arrangement of the oven more complete than has hitherto been brought before the public.

D. and E. Bailey were the first to introduce metallic curvilinear houses to horticulturists, and can refer to the Conservatory attached to the Pantheon as one of their works, besides many others in this country and on the Continent.

D. and E. Bailey have prepared a quantity of the Galvanic Plant Protectors, which are now ready for immediate delivery: they beg to introduce to public notice a new Trough Pipe, for Orchidaceous or other Houses where vapour is constantly, or at intervals, required, and which may be seen at their manufactory.

HOT-WATER APPARATUS, for Horticultural and other Buildings.—STEPHENSON and Co., Agents for the Old Park Iron-works, and Manufacturers, 61, Gracechurch-street, London, solicit an inspection of their improved Conical Boiler. (See Editor's description, *Gardeners' Chronicle*, March 12, p. 175.) To Amateurs these Boilers will be found invaluable. They are complete without furnaces or setting in brickwork, moveable at pleasure, very ornamental in appearance, and require attention only once in 14 or 15 hours, price 5*l.* 5*s.* and upwards. Further particulars, with plans and estimates for heating any description of building, may be obtained as above; where also may be seen the improved Wrought-iron Boiler, as applied with Chanter's Smoke-consuming Furnaces at Chatsworth, and many other of the Nobility's Seats. Iron Fencing, Hurdles, Bedsteads, Ornamental Wire-work, Garden Implements, &c. &c. The trade supplied with Hot-water Socket-pipes.

N.B.—Wayte's New Patent Land-pressers and Drills.

HEATING BY HOT WATER.

HOTHOUSES, and every description of Horticultural Buildings, Churches, Chapels, Public Buildings, Mansions and large Rooms, fitted up with the above apparatus on the most improved and scientific methods.

W. WALKER and Co. (late of Mosley-street, Manchester) beg to announce that they continue to execute works of the above description, in which they have introduced a variety of important improvements of a satisfactory nature, especially to Horticulturists. They have applied this principle on a more extensive scale than has ever been hitherto adopted at the stupendous Conservatory and Hothouses of his Grace the Duke of Devonshire, and in numerous other extensive establishments, with the most complete success.

They have also successfully applied C. W. Williams' Patent Argand Furnace to their boilers, and have made arrangements with the Patentee for its general adoption. It economises fuel, and removes the nuisance and disfigurement of smoke, so much complained of by Gardeners, and is a new and valuable feature in these Apparatus.

Works executed in every part of the United Kingdom with punctuality and despatch.—33, Brown-street, Manchester.

THE CONICAL HOT-WATER BOILERS invented by J. ROGERS, Esq., may be obtained of any size from JOHN SHEWEN, Ironmonger, &c., Sevenoaks, Kent.

J. SHEWEN having had every opportunity afforded him by an extensive practice to bring this apparatus to perfection, begs to offer it as most efficient and economical: it may be seen at Messrs. Chandler & Sons' Nursery, Vauxhall; Messrs. Loddiges', Hackney; Messrs. Henderson's, Pineapple-place; Mr. Knight's, King's road, Chelsea; Messrs. Veitch and Son's, Exeter; and at the Gardens of the Horticultural Society of London.

HOTHOUSES, CONSERVATORIES, &c., Made and Fixed complete in all parts of the Kingdom. One, two, and three-light Cucumber and Melon Boxes and Lights of all sizes kept ready for immediate use, packed and sent to all parts of the Kingdom; warranted best material. Two-light Boxes and Lights complete, from £1 8s. Garden-lights made and glazed, 1*s.* per foot, at JAS. WATT'S SASH MANUFACTORY, CLAREMONT-PLACE, Old Kent-road. REFERENCE GIVEN.

EDWARD BECK, MANUFACTURER IN SLATE, Isleworth, Middlesex, respectfully informs Horticulturists, that his IMPROVED SLATE TUBS for Orange Trees and Conservatory Plants, mounted upon rollers, Slate Cisterns, Shelves, and Edgings for garden paths, may be seen in use at his house upon application to the gardener.

TO FLORISTS, HORTICULTURISTS, AMATEUR GARDENERS, &c.—CLARKE'S AIMATIC COMPOST, for the Flower and Kitchen Garden, Greenhouse Plants, Pineries, &c.: the application of this COMPOST will add greatly to the beauty of the Flower and produce of the Kitchen Garden. In making new Gardens it will be found invaluable; it has long been in use in the Royal Gardens at Kew. Price One Guinea per bag, containing two cwt., sufficient for a good-sized garden for one year.

Also, Prepared HAIR DUST. This Preparation will effectually preserve Flowers, Plants, Bulb-roots especially, from the ravages of worms, grubs, and all kinds of crawling insects. From its imperishable nature, its effect will be lasting. Price One Guinea per bag. Address, Stanbridge Clarke, St. Pancras Wharf, King's Cross; or Henry Clarke, seedsman, 86, High-street, Borough.

ORNAMENTAL WIRE-WORK, &c., FOR THE GARDEN.
390, OXFORD STREET, LONDON.

G. B. THOMPSON having added to his General Stock of FURNISHING IRONMONGERY a large assortment of WIRE-WORK,

Suited to the Flower-Garden and Greenhouse, begs to submit for the inspection of the Nobility and Gentry who patronise Horticultural pursuits his numerous patterns of FLOWER BASKETS, TRAINERS, BORDERS and STANDS, with GARDEN ARCHES, SEATS, and VASES, which for variety, elegance, and utility stand unrivalled.

Also his Improved GARDEN and HOTHOUSE ENGINES, FUMIGATORS, SYRINGES, and PATENT WATER-POT, with every other Implement.

GAME and CATTLE FENCING in variety.

HORTICULTURE.

Saturday, Sept. 3d, will be published, price 3*d.*, 16 pages royal 8vo, illustrated with Wood Engravings, to be continued Weekly,

THE GARDENER & PRACTICAL FLORIST, No. 1. —A new Work, comprising Original Papers by distinguished Writers on the Culture, Properties, and best Modes of Exhibiting Plants, Fruits, and Flowers; Critical Notices of New Books, Flowers, Plants, Implements, and other subjects connected with Horticulture; Observations on the Proceedings of Public Societies, and the Management of Public Gardens; and the spirit of all valuable Works on the various branches of the Science: forming a TEXT-BOOK FOR THE FLORIST, a Guide to the Amateur, a Library for the Gardener, and a useful Book for the Million.

London: Richard Groombridge, Paternoster-row, where Advertisements, Books, Plants, Communications, &c. for the Editor may be forwarded.

Now Publishing, in Weekly Numbers, 6*d.* each,

MR. MURRAY'S CHEAP and POPULAR EDITION of LORD BYRON'S DRAMAS.

1. MANFRED. A Dramatic Poem.
2. MARINO FALIERO. An Historical Tragedy.
3. HEAVEN and EARTH. A Mystery.
4. SARDANAPALUS. A Tragedy.
5. TWO FOSCARI. An Historical Tragedy.
6. DEFORMED TRANSFORMED. A Drama.
7. CAIN. A Mystery.
8. WERNER. A Tragedy.

Each Number forms a complete Poem.

⁂ Lately published, "LORD BYRON'S TALES," in 10 Numbers, and "CHILDE HAROLD'S PILGRIMAGE," in 5 Numbers, at 6*d.* each.—John Murray, Albemarle Street. Sold also by Tilt and Bogue, Fleet Street.

Publishing Monthly, price 6*d.*, in 8vo, 24 pages,

THE FLORICULTURAL CABINET AND FLORISTS' MAGAZINE; conducted by JOSEPH HARRISON.

Each Number contains finely-coloured Figures of TWO or MORE of the NEWEST and MOST RARE and SHOWY PLANTS, selected for their beauty and utility, with particulars of their history, Mode of Treatment, &c. In addition to which there are in each Number several Articles on the Culture of other Flowers and Subjects connected with Floriculture; Descriptions of all the new and rare plants as introduced; Queries on Floricultural subjects, and answers to; Monthly Calendar, with Notices of, and Remarks upon, whatever is known to be of use in Floriculture.

The AUGUST NUMBER contains coloured Figures of FUCHSIA ENCHANTRESS, and VENUS VICTRIX.

This Publication has been honoured for nine years with the support of a Floral Public to an unprecedented degree—its monthly circulation far exceeding that of any other Floricultural Publication. This unequivocal testimony of public patronage in its favour has been bestowed in consequence of the number, variety, and practical value of those communications with which the Work has been enriched. No. 7, of Vol. 10, was published on July 1st. That, or the previously-published Numbers, or Volumes in cloth, may be obtained through the order of any Bookseller, or of the Publishers, Messrs. Whittaker and Co., Ave-Maria Lane, London.

Also, by the same Conductor, and published by Messrs. Whittaker and Co.,

THE GARDENER AND FORESTER'S RECORD.

Each Number contains 24 pages of Letter-press, with coloured Figures of one or more of the newest and best kinds of Fruits, price 6*d.* Three Volumes are now published, bound, 7*s.* each.

ILLUSTRATIONS OF BRITISH GRASSES.

On Thursday, August 4, was published, Quarto, with 118 Plates, beautifully coloured, 3*l.* 16*s.* cloth,

GRAMINA BRITANNICA; or, Representations of the British Grasses; with Remarks and occasional Descriptions. By I. L. KNAPP, Esq., F.L.S. & A.S. 2d Edition.

London: Longman, Brown, and Co. Bristol: W. Strong.

Early in September will be published,
The price not to exceed 20*s.*

THE GRASSES OF SCOTLAND; containing a SCIENTIFIC DESCRIPTION OF EACH SPECIES,
Remarks on their Use in Agriculture, &c.
By RICHARD PARNELL, M.D., F.R.S.E.
ILLUSTRATED WITH
A Figure of each Species and several Varieties, amounting to One Hundred and Thirty;
Drawn and Engraved by the Author.
William Blackwood and Sons, Edinburgh; and 22, Pall-Mall, London.

In Monthly Nos., 8vo, with Four beautifully-coloured Plates.
Price 2*s.* 6*d.*

PAXTON'S MAGAZINE OF BOTANY.

The Number for August, 1842, contains highly-finished drawings of *Aérides Broókii, Mímulus Maclainiànus, Oxylòbium Pulteneæ'a*, and *Achimènes longiflòra*; likewise Papers on Gardening as a science; on the Arrangement of Plants in Groups; and Culture of Chorozema cordatum. Floricultural Notices of new and beautiful Plants figured in the leading Botanical Periodicals for July, and of those in flower at the principal Suburban Nurseries and Gardens; together with a complete Calendar of Monthly Operations for the Garden.

This work comprises, monthly, four admirably-coloured plates, and twenty-four pages of interesting and useful letter-press. The admirers of flowers are requested to observe—

1. That all the drawings are taken from nature, and are consequently made from plants which have flowered in Britain.

2. That, with few exceptions, they are all done by one artist, whose abilities are of the highest order, and who travels himself to the places where the plants are in flower.

3. That they are lithographed by the same individual, and, being coloured in a superior manner, have all the spirit and elegance, and much of the finish, of the original drawing.

4. That about one-half of the drawings are from plants which have never before been figured in this country, the rest representing the most popular novelties, as well as the more neglected, though sometimes far handsomer, old species; the majority being such as can be cultivated by every one possessing a flower-border and a greenhouse or frame.

It may, in conclusion, be safely asserted that, both for the beauty of its embellishments, and the utility of its contents, this work is well adapted to the wants of all who delight in gardening; and as the improved system of having the plates lithographed commenced with the present year, and as it is intended that each volume shall now be perfect in itself, the present is a desirable opportunity for those who wish to become subscribers.

London: W. S. Orr and Co., Paternoster-row.

DARLEY'S SCIENTIFIC LIBRARY, for the Use of Schools, Private Students, Artists, and Mechanics. It is the purpose of this Work to furnish a Series of Elementary Treatises on Mathematical Science, adapted to the wants of the Public at large. To youth of either sex at public and private schools, to persons whose education has been neglected, or whose attention has not been directed in early life to such studies, and to Artists and Mechanics, these little Works will be found particularly suited. The principles of the various Sciences are rendered as familiar and brought as near to our commonest ideas as possible; the demonstrations of propositions are made plain for the mind, and brief for the memory; and the Elements of each Science are reduced, not only to their simplest, but to their shortest form.

1. A. SYSTEM OF POPULAR GEOMETRY. Containing in a few Lessons so much of the Elements of Euclid as is necessary and sufficient for a right understanding of every Art and Science in its leading Truths and general Principles. By GEORGE DARLEY, A.B. Fourth Edition, 4*s.* 6*d.* cloth.

2. COMPANION TO THE POPULAR GEOMETRY, in which the Elements of Abstract Science are familiarised, illustrated, and rendered practically useful to the various purposes of Life, with numerous Cuts. (A Second Edition is now ready.) 4*s.* 6*d.* cloth.

3. A SYSTEM OF POPULAR ALGEBRA, with a Section on Proportions and Progressions. Third Edition. 4*s.* 6*d.* cloth.

4. A SYSTEM OF POPULAR TRIGONOMETRY, both Plane and Spherical, with Popular Treatises on Logarithms, and the application of Algebra to Geometry. Second Edition, 3*s.* 6*d.* cl.

"For students who only seek this limited knowledge of these sciences, there are perhaps no treatises which can be read with more advantage than Darley's Popular Geometry and Algebra." —*Library of Useful Knowledge, Article "Mechanics."*

Taylor and Walton, Booksellers and Publishers to University College, 28, Upper Gower-street.

Just published, in 2 vols. 8vo. cloth, price 24*s.*

HISTORICAL MEMOIRS of the QUEENS of ENGLAND. By HANNAH LAWRANCE.

"These laborious and interesting memoirs."—*Athenæum.*

"This very industrious and interesting work."—*Examiner.*

"One of the most pleasing and valuable contributions which English history has received for many years."—*British Mag.*

"Narratives of as much interest as if they were pure dramas." —*Atlas.* Edward Moxon, Dover-street.

WANTS a SITUATION as GARDENER out of the House, a man aged 41; can have an unexceptionable character from his last place, in which he lived 14 years.—Apply prepaid to J. D., at Messrs. Cormack & Co.'s, New Cross, Surrey; or at Mr. Fielder's, Gardener, Wadhurst, Sussex.

WANTS a SITUATION as GARDENER, a respectable Single Man, aged 27. He has lived in some of the first establishments in the country; has a good knowledge of the management of forcing Pines, Peaches, and Grapes; also the management of Flowers, their propagation, and the laying out of Flower Gardens. Can have a good recommendation.—Direct Y.Z., Mr. Fryer's, Nurseryman, Camberwell, Surrey.

In one small volume, price 15*s.*

PAXTON'S POCKET BOTANICAL DICTIONARY.

In what may be called an age of Cyclopædias, when the compression of a great variety of information into one volume, in order to bring it within the means of persons of all ranks, is so universally sought, it is evidently desirable that the Gardener, and those connected with his profession, should be as well accommodated as other classes in this particular. No such work existing, however, prior to the issue of the present publication, its value will be at once apparent; since it combines the more essential features of a Botanical Catalogue, a Horticultural Guide, and a Technical Glossary.

Besides being of this comprehensive description, it is especially adapted for the Amateur and Floriculturist; who may, by carrying it in his pocket, examine all the plants that are at any time submitted to his inspection, and immediately derive every intelligence respecting the peculiarities or affinities of particular species which could reasonably be wished for. This is an advantage that can only be sufficiently estimated by those who have felt the want of such an assistant; and to all such individuals, as well as to every agent or friend of horticulture, the Pocket Botanical Dictionary is decidedly indispensable.

London: J. Andrews, Bond-street; Orr and Co., Paternoster-row.

Handsomely bound in cloth, with Ninety-three Wood-Engravings,
Price 6s. 6d.

ILLUSTRATIONS OF THE BIBLE, AND CONFIRMATIONS OF SACRED HISTORY, from the Monuments of Egypt. By W. C. TAYLOR, LL.D.

From the British Magazine.—"This is an elegant and well-executed little book, on a most interesting subject."

From the Birmingham Herald.—"A valuable and indispensable accession to the library of every Biblical student."

From the Rev. Thomas Hartwell Horne's Introduction to the Critical Study of the Scriptures.—"Nearly three hundred texts of Scripture are more or less explained in this elegantly-executed volume, and in a manner equally curious and interesting."

Tilt and Bogue, Fleet-street.

FAMILIAR ASTRONOMY. By GEORGE DARLEY, A.B., Author of a System of Popular Geometry,—Companion to the Popular Geometry,—a System of Popular Algebra,—and a System of Popular Trigonometry. 12mo, with Engravings, 5s. cloth, lettered.

"There is a vast deal of astronomical information conveyed in a most winning and unassuming manner in this delightful little volume, which, not less for the novelty of its plan than the extent of its intelligence, reflects infinite credit on the taste and talents of its projector and editor, Mr. Darley."—*Sun.*

Taylor and Walton, Booksellers and Publishers to University College, 28, Upper Gower-street.

One Volume, price 7*s.* 6*d.*,

THE LIFE AND TIMES OF RIENZI.

"Not less interesting than Sir E. Lytton Bulwer's eloquent Romance, and scarcely less romantic, is this historical record of the Conspiracy of Gabrini."—*Monthly Repository.*

"To all who have read Sir E. Lytton Bulwer's 'Rienzi,' its perusal is, in a measure, a duty."—*Spectator.*

"A curious and pleasing volume, and full of matter of historical character and illustration."—*Literary Gazette.*

"The publication of this work is well timed . . . . The Life of Rienzi is to us full of interest."—*Athenæum.*

"Those that wish to become acquainted with the true history of a man who was, in some sort, the *Napoleon* of his own age and country, would do well to consult the extraordinary narrative of the 'Life and Times of Rienzi.'"—*Tait's Magazine.*

London: Whittaker and Co.

SECOND-HAND GREENHOUSE FOR SALE, part New within Three Years, glazed with small glass, well painted, &c.; complete 25 ft. 6in. by 13 ft., 2 ft. 6 in. high in front, two glass ends. To save trouble, lowest price 36*l.* At JAS. WATTS' Sash Manufactory, 8, Claremont-place, Old Kent-road.

HODGSON and ABBOTT'S PALE ALE.—The above celebrated Beer, so strongly recommended by the Faculty, is to be procured only from E. ABBOTT, Brewery, Bow, Middlesex. The Trade not being supplied, the Pale Ale cannot be genuine if procured elsewhere.

City Office, 98, Gracechurch-street.

THE "ROYAL ESSENCE OF EGLANTINE" for the Handkerchief is prepared only by Mr. WHITE, Chemist, 24, Cornhill, London, in bottles at 2*s.* 6*d.*, 4*s.* 6*d.*, and 8*s.* each. Where also may be obtained the "AROMATIC PUNGENT ESSENCE" so useful in Headaches, Fainting, &c., at 3*s.* each.

N.B. Public Offices and Merchants can be supplied with Postage Stamps and Envelopes in any quantity at Government Prices.

SHIPS FOR NEW ZEALAND, under Charter to the New Zealand Company, to sail as undermentioned, viz.—

FOR NELSON AND WELLINGTON:
PRINCE OF WALES, A 1, 516 tons, from London, 1st Sept.
FOR WELLINGTON AND NEW PLYMOUTH:
ESSEX, A 1, 300 tons, from Plymouth, 1st Sept.

For further particulars, apply at the New Zealand House, Broad-street Buildings.

COPY of a Communication addressed to Messrs. Rowland and Son, No. 20, Hatton Garden, London.—

GENTLEMEN,—Being called upon to attend a Lady who had had a complaint in her head about a year before, and in consequence had lost nearly all her hair; I found very few hairs remaining, and those just like down, with no appearance of any fresh roots. She stated her desire to use your Macassar Oil, but I felt I could not conscientiously recommend anything for its recovery, as I considered it too far gone. She however determined to try one bottle, which was used in about a month, and then sent to my shop for another, stating her hair to be much improved; she has now used eight bottles in as many months, during which time I have frequently pointed it, and have now the pleasure to inform you that it is quite thick and long; and she is so much pleased with the change, that she says the expense is nothing, and she will never be without it. If you think this statement of facts worth publishing, you are at liberty to do so; and I remain, yours respectfully, JOHN LICKLEY, Hair-cutter.

Middle-street, Ripon, April 19, 1842.

⁂ On purchasing, ask for "ROWLAND'S MACASSAR OIL."

HORTICULTURAL SOCIETY OF LONDON.

NOTICE IS HEREBY GIVEN, that the MEETINGS OF THE SOCIETY in Regent-Street are DISCONTINUED till Tuesday, October the 4th, in consequence of the Meeting-room being under repair.

The Gardeners' Chronicle.

SATURDAY, AUGUST 6, 1842.

We rejoice to find that the New Zealand settlements continue to prosper. We mean those under the New Zealand Company, and not Auckland, the seat of Government, the establishment of which appears to have been a most unfortunate error of judgment. Wellington, in Port Nicholson, seems on the whole to have the advantage over New Plymouth, on account of the latter station being bounded by a dangerous coast; but there is another town, called Nelson, rising fast into importance, to which emigrants should also turn their attention. Seated at the bottom of Tasman's Gulf, it has the advantage of a fine harbour, capable of being much improved at small expense; and there is an excellent anchorage, in 7 fathoms, not three-quarters of a mile from the Custom House. In a letter from this place now before us, dated March 8th, the population is stated to exceed 800, all in excellent spirits; about 70 houses were built or building; 9 ships were in the harbour; and, what was most important, COAL and LIMESTONE had been discovered in Coal Bay, about 6 hours' sail from the town, at a place called Tata. This cannot fail to be an element of speedy prosperity. Labour was so very scarce, that no more than 20 men could be procured for the construction of a road of indispensable necessity to the town.

We have on a former occasion alluded to the establishment of a Horticultural Society at Wellington; no bad sign of all being well. We now learn from the "New Zealand Gazette" that the first show had taken place. Among the vegetables were Cabbages of 21½ lbs.; Turnips 21 inches round, and weighing 3 lbs.; Potatoes, from native seed, 9 inches long; Apples, from trees taken out from England; Dahlias, seedling Pelargoniums, &c. In short, "vegetables may be purchased in Wellington much finer *and cheaper* than in London," produced, too, in gardens in and round the town, on spots described as *barren hills* by the enemies of the settlement. Much of the prosperity of the gardening operations is to be ascribed to the success with which seeds had been sent out; the directions given in our columns of Oct. 30, 1841, having been followed. Large quantities of seed so prepared had been transmitted for distribution among the settlers by James Robert Gowen, Esq., one of the Directors of the New Zealand Company, and, with few exceptions, had arrived, after a five months' voyage, in excellent condition. These seeds had been gathered in the garden of the Horticultural Society of London, and consisted of all sorts of European fruits, vegetables, and garden flowers. Besides these, the New Zealand Company had despatched to the Colony a large quantity of other seeds, purchased of Mr. Charlwood in Covent Garden. Those of our readers who are desirous of further information that can be relied upon as to the state of the colony should consult the columns of the "New Zealand Gazette," in the 66th Number of which is a fund of authentic information. Among other things is the following statement made by Mr. D. Sinclair, one of the settlers, to his uncle, the Hon. A. G. Tollemache; it is contained in a letter dated Wellington, Port Nicholson, Feb. 9, 1842: "Valuable stock will always pay to bring out; I think a fine jackass for breeding mules as well as anything. Mules will be peculiarly adapted to this hilly country. You know I sold my bull for 105*l*., and refused 70*l*. for the cow. Breeding stock will, no doubt, be the most profitable business here for years, and now is the time to get it from New South Wales, where things are so low."

The observations made some time since (p. 363) upon forest-tree pruning have, as we expected, brought forth their fruit. *Prune not at all*, was a maxim which we did not suppose would find favour in the eyes of woodmen, with their axes, and saws, and knives, and all the amputating apparatus of a timber-surgeon; and yet there is no great reason for objecting to our advice. Othello's occupation is not gone; there are plenty of trees all over the country on which mutilation may still be practised, and there will be for ages to come. People will neither begin their plantations in the right way, nor manage them properly in early youth; and the consequence will continue to be, what it now is, that the axe and the saw will still be called for to remedy evils produced by previous neglect. It should also be remarked, that what we said was—Prune not at all, *if you can help it.*

The reason why we gave this advice was principally because the destruction of branches and leaves is the destruction of that timber for the acquisition of which trees are planted. The objections to our advice that we perceive have been taken amount to this—that trees, if not pruned, will never make clean trunks; and that leaves are not necessary to the production of timber, as is supposed. Let us examine the value of these assertions.

"Trees must be pruned, if they are to have a clean trunk; if left to themselves, they will be feathered to the ground, and produce a knotty, unsound log." This is, we think, the first line of argument. But let us ask whether the finest trees that have been found are not those growing wild in new countries, where the mischief of pruners has never been committed? Where shall we now see in England such sticks of Oak as form the beams of the oldest buildings of this country? and yet they were grown without the aid of knife or axe. Who was it that trimmed up the prodigious forest-trees of the United States? The size and quality of our home-grown timber are evidently on the decrease; is it because the pruner is everywhere at work?

It is not true that unpruned trees will necessarily feather to the ground; if a good strong leader gets the start of the lower branches, their growth will soon be arrested—by degrees they will die back, and eventually will disappear, or remain as mere brushwood; and in this way nature prunes trees much better than we can. But suppose a vigorous tree is feathered to the ground—what then? It does not follow that the timber will be knotty or weak in consequence. Knots are produced by dead branches buried in timber which forms above them, and eventually encloses them; weakness results from large wounds made by the pruner and also hidden in the timber. The timber of well-grown trees feathered to the ground may, indeed, be cross-grained and troublesome to work, but is not necessarily knotty.

But it is said that the "finest and most valuable boles of timber are such as have grown rather closely together, so that the lower branches are consecutively destroyed by the want of light and air." Now we apprehend that the finest and most valuable boles that are known, are those of the Kaurie Pine. They are of immense length, and perfectly clean, without a knot or blemish. But they grow *singly, on the open plains* of New Zealand, and have not been drawn up at all. On the other hand, the knotty deals that are in common use, with dead plugs many inches long, which, when driven out of them, leave the wood pierced with so many auger-holes, are what *have* "been growing rather closely together;" and "the lower branches consecutively destroyed" are exactly what cause the knots with which such deals are blemished.

The second statement was hardly to be anticipated from an intelligent writer of the present day. If a man can bring himself to believe that leaves are not necessary to the production of timber, he may as well persuade himself that a stomach is not necessary to the change of food into the elements of his own organisation. Good news that would be for dyspeptic people.

Roots, it is alleged, are produced without leaves—so are bulbs and tubers; *ergo*, leaves are not necessary to the production of those organs. We do not deny the statement; but the inference is wrong. An extreme case will illustrate the fallacy of such a conclusion. Garlic bulbs produce cloves or young bulbs, which feed upon the nutritive matter contained in the mother-bulb; but how long will this go on in the absence of leaves? Exactly as long as the organisable matter collected in the mother-bulb by the former leaves shall be unexhausted. Destroy the young leaves as they appear, and there will soon be an end to the self-production of cloves by the garlic. The Potato affords another instance. The tuber of a Potato is a fleshy underground stem, filled with organisable matter produced by the agency of leaves; it is a large magazine of such materials. Under fitting circumstances, it produces young tubers without leaves, and it will go on doing so for a certain length of time; but it is merely because of the ample supply of organisable matter contained in the old tuber. Leave the young Potatoes to themselves, and they will soon be found struggling into the light and air for the purpose of forming their leaves:—prevent this, and they will perish from suffocation. Such instances, then, instead of showing that leaves are unimportant, prove exactly the reverse.

One of the advocates of digestion without a stomach relies chiefly upon some well-known cases, cited by Dutrochet, a French physiologist of eminence, of Silver Fir roots which continued to grow in diameter and to form wood for many years, although the stems had been felled, and nothing was left except the roots. He mentions two instances of this—one of a root that grew for 45 years, and the other for 92; during all which time successive annual layers were produced; and one of the roots was still full of life when it was taken up. But M. Dutrochet draws from this fact no such absurd conclusion as, that leaves are not the origin of timber; on the contrary, what he says is this: "Where a tree is felled, and the stock does not shoot again, the stock and the roots that fix it to the ground generally die. This phenomenon depends upon *the well-known law of vegetation*, that from the leaves is derived that elaborated sap which is so necessary to the life and *growth* of a tree, both in the parts exposed to air and in those which are buried." He then goes on to recite those singular facts connected with the root of the Silver Fir, which we have just mentioned; but instead of inferring from such evidence that the leaves are unnecessary to the production of timber, he gives the following philosophical explanation of the phenomenon:—

"This case of the Silver Fir may seem *at first sight* to weaken the theory, that from the leaves or aërial parts of a plant is derived the elaborated sap which furnishes the materials of growth. But, on the contrary, the *extreme slowness* of increase in the stock of the Silver Fir *confirms the theory*; for this stock, which remains alive so many years, only grows thus slowly *because it is destitute of leaves, which are especially the organs that produce organisable sap.* It appears that in this tree roots possess the property of elaborating a minute quantity of crude sap, and of transforming it into organisable sap sufficient to maintain the life of the roots and stock, and to furnish them with a trifling amount of increase for a great many years."

We have only one more remark to make upon this subject. The necessity of pruning is thought to be proved by the Spanish Chesnut. "We should be glad," says the writer to whom we have been alluding, "to know from the non-prunists what sort of form the Spanish Chesnut would assume without pruning in its youth—an elegant tree, or a vast bush?" Allusion is here made, we presume, to the practice of heading down the Spanish Chesnut and the Oak a few years after they are planted, in order to give them a straight single stem. It is the universal practice of nurserymen, and, *under the circumstances*, is necessary; but why? All foresters know that the Spanish Chesnut and the Oak form a strong tap-root when young. When they are removed from the seed-beds and quartered out, this tap-root is necessarily broken, and is afterwards further shortened in replanting. The effect of this is to paralyse the young plant, and to stop its growth straight upwards—whereupon the lateral buds start, the terminal bud scarcely stirs, and the plant is stunted. Here the mischief is done by *pruning* the roots; and that mischief must be repaired by subsequent heading down. But no such heading down is wanted if the tap-root is not destroyed. Look at a seedling Oak or Spanish Chesnut—how they push up their vigorous leader; and, if it is not meddled with, how they continue to do so year after year, forming a stem as straight as a ramrod! No heading down is required in that case, for there is no disposition to become bushy-headed. It is the taking them up—it is the mutilation of their roots, that original evil, which renders severe pruning necessary at a later period.

We are clearly of opinion that neither Oaks nor Spanish Chesnuts should be transplanted at all. It is far better to sow them where they are to grow. As for the mice, and other vermin that attack them, a man must have little ingenuity who cannot devise some effectual means of keeping them under. But that is another question, upon which we have at present no space to enter.

A short time since a correspondent made some inquiry of us concerning a plant called Glycine Harrisonii. We answered that we knew of no such species. A friend having since pointed out to us a figure of it in Harrison's Floricultural Cabinet, we find that this *new* Glycine Harrisonii, sent out, as we hear, at half-a-guinea a plant, *is nothing more than the common Snail-flower, Phaseolus Caracalla, introduced from the East Indies in the year* 1690, and as well known as a Kidney Bean to everybody who knows anything of plants. So much for novelty!

ROAD-MAKING.

In the Prospectus of the *Gardeners' Chronicle* it was, I think, stated that "road-making" would form one of its objects; and if so, wooden roads seem to fall particularly within its province, although I do not recollect to have seen any notice on these or any subjects connected with them.

It appears to me that the art of making wooden roads has not advanced as it ought to have done, from the experience of the last few years; an effect which is perhaps attributable to the rage for taking patents; each successive projector having aimed, not so much at making a perfect road, as at introducing some novelty good or bad, which should form the subject of a monopoly. The consequence has been, that the Metropolis has been the victim of innumerable crude experiments, while the art has remained nearly stationary; little or no progress having been made since it was first brought before the public by the volumes of the Society of Arts in the year 1832.

If it will not occupy too much space, it would be useful and interesting to publish the very sensible business-like communication of Mr. Heard, who first introduced the matter to the notice of the Society of Arts, and whose early labours and sagacity deserve to be better known; for he seems to have anticipated all that is yet ascertained in reference to the applicability of this plan to the streets of London. I will, on a future occasion, endeavour to explain *why*, in my judgment, the good effects anticipated by Mr. Heard have not yet been realised, and describe a mode of making wooden roads, which is common property, and superior, I consider, to any or all the patents.—*A.*

The communications here alluded to are the following:—

Oct. 6, 1832.—"It is the duty of every traveller in foreign lands to observe attentively the improvements that have been made in useful arts in the various places through which he may pass; and when he perceives anything conducive to the happiness, comfort, or prosperity of a people, unknown at home, to communicate the same, for the general benefit of his fellow-countrymen.

"Under this impression, I take the liberty of soliciting that you will lay before the Society of Arts, &c., the following account of a mode of constructing roads in cities, hitherto totally unknown in England, and by far the most perfect that has ever come under my notice. I think no person will deny that it is desirable to have the streets of towns so paved, that in dry weather there should be no dust, and in wet weather no mud, and as little noise as possible from the passing of carriages. All these advantages are combined in the kind of road I allude to, besides being smoother than a macadamised road, even when the latter is in its most perfect state.

"In countries abounding in wood, various schemes have been adopted for the formation of roads of that material; but hitherto they have always been made by laying logs or planks parallel to, or at right angles with, the sides of the way; these logs were easily displaced and soon cut up by the horses' hoofs, and when once out of order, no road can possibly be worse. The improved road, on the contrary, will last five or six years without repair, and were it not for the high price of timber in this country, might be adopted with the greatest advantage; and being a plan of considerable national utility, possibly the government might be induced to allow the importation of timber for this purpose duty free.

"The following instructions will be found sufficiently practical and explicit as a guide to the construction of roads on this principle:—

"1. Prepare a hard and level bed of gravel or broken stone, covered with sand and well rolled, about nine inches lower than the intended surface of the road.

"2. Take logs of timber of sufficient diameter, and, by means of equidistant circular saws, cut them into equal lengths of one foot each.

"3. These round logs must now be passed under a sexangular steel stamp, which cuts off the outside of the log, and leaves little more than the heart of the tree, in the form of a sexangular block.

"4. Two sides of this block must now be bored three inches deep with an inch borer, for the reception of a wooden pin six inches long, which is to be driven into the hole already prepared in the log; the three inches of the pin which project being inserted in the next log. The operation of laying the blocks of wood and driving the pins proceeds rapidly, and the surface of the road soon assumes a beautiful chequered appearance, somewhat resembling an inlaid floor; and the fibres of the wood standing vertically and not horizontally, there is not a possibility of splintering. The whole is held compactly together by a narrow strip of stone pavement; and nothing now remains to be done but to cover it with a thin coat of boiling tar, and on the tar a fine layer of sand, by which means every interstice is completely filled up and moisture excluded.

"In addition to the advantages already mentioned of never being either dusty or muddy, this road is little inferior to a rail-road in point of smoothness; so that it may be safely asserted that one horse will easily draw on it the burden of two.

"If at the end of five or six years (where the traffic is great) the road should be so injured as to require repairing, it may be done by taking up the logs, sawing a new face, and replacing them, when the road will be again equal to new.

"The one which I saw constructed in the above-mentioned manner was in one of the most frequented streets of a populous city; and, when I left that country, had stood between three and four years unimpaired.

Oct. 13, 1832.—"I hasten to supply the omission in my paper on the construction of a wooden road upon new principles, by informing you that the first experiment was made in St. Petersburg, before the house of the governor-general, in the street called the Great Morskoi. After this piece of road had stood several years unimpaired, the plan was tried on a larger scale in the street called the Maloi Millionne; and this trial only served to confirm the good opinion the public had already conceived of this mode of pavement; and consequently, in the course of last summer (1832), the Nevsky Perspective, from the Admiralty to the Anitchkin palace, was paved in a similar way—not, however, from one side to the other (this street being of an extraordinary width), but two strips, each sufficiently wide for two carriages to drive abreast, the original stone pavement being left in the intermediate spaces.

"I neglected also to state, in my communication, that a road constructed in this manner should not be bound together so tight by the side pavement as to prevent the possibility of a slight expansion of the wood, from the absorption of moisture. I was led to make this remark by the swelling up of a small piece of foot pavement on a cast-iron bridge, where the iron sides preventing the least expansion, the natural consequence of the absorption of moisture was the swelling up of the pavement; but this never occurred where the log pavement was held together by a strip of common stone pavement.

"I think it also necessary to observe, that although the above-mentioned streets, in which the experiments have been made, are places of so great traffic that roads constructed upon the macadam principle were found of insufficient durability, yet no excessively heavy loads comparable to the wagons and heavy carts used in England ever passed over them; I therefore would not pledge myself that such a road (however desirable for the west end of London) would bear uninjured the enormous burdens continually passing through the streets of the city."

ON ORGANIC MINERAL MANURES.—No. II.

By **Professor Charles Sprengel** (translated from the German).

(Continued from page 508.)

2. *Mud of Ponds and Ditches.*—The mud of ponds and ditches never contains so much humus as mould, and generally does not possess so many manuring substances as the latter, because the saline substances, easily soluble in water, will always flow off with it. But if the pond or ditch has no escape, and is situated in a locality where, along with the water, excrementitious materials can be conveyed to it, then it is obvious that such mud will be of much better quality. To determine, however, whether the mud of ponds is worth having—an operation mostly requiring much labour—it will be always best to subject it to chemical analysis. I subjoin, in the first instance, the analysis of mud from a pond without escape, situated near a farm, and used as manure with great success.

100,000 parts of it consisted of—

75,802	,,	silica and quartz.
2,652	,,	alumina.
3,360	,,	peroxide and protoxide of iron.
5,548	,,	lime.
0,430	,,	magnesia.
0,280	,,	oxide of manganese.
0,150	,,	potassa.
0,058	,,	common salt.
0,625	,,	sulphuric acid, combined with lime.
0,897	,,	phosphoric acid, combined with lime and iron.
0,490	,,	humic acid, combined with potassa, lime, and magnesia.
5,000	,,	coal of humus.
0,548	,,	organic remains, containing nitrogen.
3,160	,,	carbonic acid, combined with lime.

100,000 parts.

Of this mud, about 50,000 lbs. were spread upon one Magdeburg acre of sandy soil; consequently this area of land obtained thereby 1,300 lbs. alumina, 2,774 lbs. lime, 215 lbs. magnesia, 75 lbs. potassa, 29 lbs. common salt, 308 lbs. sulphuric acid, 448 lbs. phosphoric acid, 745 lbs. humic acid, 2,500 lbs. coal of humus, and 274 lbs. of organic remains, containing nitrogen; all which substances produced a very good effect, for the soil was not deficient in humus, and they rendered the ground for many years very productive.

Another sort of pond mud, the water of which flowed away, contained, on the other hand, in 100,000 parts—

88,000	parts of	silica and quartz sand.
0,480	"	alumina.
0,133	"	peroxide and protoxide of iron.
0,358	"	lime, mostly combined with silica.
0,120	"	magnesia, also combined with silica.
0,260	"	gypsum.
0,070	"	potassa, combined with silica.
traces of		common salt.
traces of		phosphate of lime.
10,579	parts of	humic acid and coal of humus.

100,000 parts.

Those who ascribe all fertility of the soil to humus, might have asserted that this sort of mud would manure better than the former; but in reality it produced little effect. The action of even 100,000 lbs. per acre was scarcely remarked.

At times, the mud of ponds contains a great quantity of protoxide of iron, in which case the same process is to be resorted to as has been stated in regard of mould. Such mud also contains, very generally, much coal of humus, on which account it should be dried, and placed for a year and a half in high heaps, and to be well worked up several times before it is used. To facilitate the decomposition of the coal of humus, it is also useful to mix it with lime, dung, or ashes; in other words, to make compost of it. The more seeds of weeds the mud contains, the longer it should lie in heaps; in fact, all which has been stated previously with regard to mould, may be also applied to mud.

How much thereof is to be used on every acre of land, and how long its effects will continue, depend on the proportion of its manuring substances. The mud or scourings accumulated in the ditches of fields or meadows should never be neglected; if it is put in heaps and allowed to rot, it yields at times a very valuable manure, more especially if much grass or other plants had grown in such ditches.

3. *Sea-Mud.*—This sort of mud, which accumulates at the mouths of rivers, is very often carried away during low tides, and conveyed to fields, meadows, and pastures. As its manuring powers are quite astonishing, I have subjected it to chemical analysis, and found that 100,000 parts are thus composed:

60,140	parts of very	fine quartzose sand and silica.
7,405	,,	alumina.
3,300	,,	peroxide and protoxide of iron.
0,200	,,	oxide of manganese.
6,210	,,	lime.
2,900	,,	magnesia.
0,187	,,	potassa, mostly combined with silica.
0,032	,,	common salt.
0,610	,,	phosphate of lime, and a little phosphate of iron.
0,390	,,	gypsum.
9,200	,,	humic acid, combined with alumina, iron, lime, and magnesia.
3,000	,,	organic substances, composed of nitrogen.
6,426	,,	carbonic acid, combined with lime and magnesia.

100,000 parts.

This mud contained a great quantity of fragments of marine shells, whence the great proportion of carbonate of lime. The organic remains, composed of nitrogen, may owe their origin to marine animals; whilst the humic acid has been carried into the sea from the adjacent heaths, moors, ravines, and forests; and has formed humates of lime and magnesia by the decomposition of gypsum and chloride of magnesia. After sea-mud has been kept for a long time in heaps, about 40-50,000 lbs. are used upon one Magdeburg acre of land; consequently the soil of this surface is enriched by 3,105 lbs. of lime, 1,950 lbs. of magnesia, 93 lbs. of potassa, 16 lbs. common salt, 305 lbs. of phosphate of lime, 195 lbs. of gypsum, 4,600 lbs. of humic acid, and 1,500 lbs. of organic remains containing nitrogen. This explains the cause of the great manuring power of sea-mud. The most striking effects are always observed on meadows and pastures composed of peaty and marshy soils. In cases where such land yielded nothing but coarse grasses and rushes, immediately after the application of sea-mud sweet grasses and trefoil will make their appearance. When applied to fields, very fine wheat will be grown, which is said not to be subject to mildew.

4. *Mud of ditches enclosing Fields or Highways.*—In many countries it is usual to collect the water from the ditches of sloping fields, or which flows down from much-frequented roads into deep reservoirs, for the sake of its depositing there its manuring substances. As soon as these reservoirs have been filled, the contents are thrown into large heaps, with which the fields are afterwards manured. This mud is the better the more fertile the fields are whence it has been derived—or the more frequented the roads are, as in these cases it will contain much animal excrements. It is best adapted for light soils, as it is of very fine grain, and very clayey. The mud derived from roads is most valuable when they are paved with basalt or limestone, as in that case the mud is rich in lime, potash, and soda. But although in this case the mud scraped from high-roads is a very valuable manure, it is of little or no value if the road is made with quartz or gravel. It is always advisable to collect the mud of roads into heaps, and to work them over several times; for it always contains much protoxide of iron (derived from wheels and horse-shoes). If this is neglected, a field may be poisoned by its application.

5. *Mud from streets in towns.*—In the neighbourhood of large towns, the mud or sweepings of streets afford a kind of manure of great value, as is well understood in Belgium. There the mud scraped from the streets of a town, containing 60,000 inhabitants, is often sold for 20,000 dollars; whilst in many towns in Germany, thousands are paid every year for getting rid of it. The mud of streets is composed of animal excrements, soil, filth, house-sweepings, soapsuds, urine, vegetable remains, the rubbish of buildings, ashes, &c.; it must therefore be necessarily an efficacious manure. On account of the great diversity of its constituent parts, it is advisable to prepare it properly before being used—viz. to put it in large heaps; to moisten it, if it be too dry, with water, urine, or dung-water; to work it up after a few weeks, and to take out all broken earthenware, stones, &c. The heap, after standing for some time, will be completely rotten, and fit to be conveyed on the land, where it is best adapted for top-dressing.

The best street mould is always obtained in towns where an active traffic and many trades are carried on, and where the paving is either basalt or limestone. Great care must, however, be taken, that such mould does not convey noxious substances upon the land, which may very well be the case if it contains much refuse of dyers' manufactories, &c., in which there are often mixed mineral substances, noxious to vegetation.

6. *Rubbish of Farm-yards, &c.*—In the yards of farm-houses, where carts and wagons draw up, earth is always to be found which consists of animal excrements, vegetable remains, and similar substances. This may be scraped up at intervals, and either used as a top-dressing on meadow land, or may be added to the heap of compost; it usually contains seeds of weeds.

(To be continued.)

ON CHRYSANTHEMUMS.

The great improvement which has been effected within the last few years in this tribe of plants, is a sure indication of their having become general favourites; and as they bloom naturally at that season of the year when there is little else to enliven the Conservatory or Greenhouse, they cannot fail in maintaining that high place in the public favour which they have already acquired.

The principal requisites towards growing Chrysanthemums to perfection are:—to allow them plenty of pot-room, and to shift them as often as the pots become filled with roots; to give them a rich and rather strong soil; to water them freely, and grow them in a situation where there is a free circulation of air, but where they will be sheltered from boisterous winds. Neglect in watering the plants, and growing them where they are shaded by trees or surrounded by sheds, cause them to become drawn—their lower leaves wither and become unsightly, and their bushiness is totally destroyed.

The time is fast approaching when the plants will be shifted into those pots in which they will remain to flower. The soil for potting them in should be composed of two-fourths good turfy loam, one-fourth kitchen-garden soil, one-fourth cowdung and a small portion of night-soil; to every barrowful of which a handful of saltpetre may be added. This will prevent the soil in the pots from becoming so soon dry, and consequently lessen the labour of watering them, at the same time that it will impart a more verdant tint to the plants.

At this season of the year Chrysanthemums are extremely liable to become infected with mildew. Those plants upon which it makes its appearance should be immediately separated from the rest, and well dusted with flowers of sulphur. This should be allowed to remain on them at least a day or two, and may afterwards be washed off with a syringe or garden engine.

Let the plants be placed in a situation where they are fully exposed to the sun; and water them two or three times a week with diluted liquid manure. Each of the advancing shoots should be neatly tied to a separate stick. On strong plants it may be well to leave about five leading stems; but on weaker ones not more than two or three should be allowed to remain. When the flower-buds are distinctly discernible, pinch out the smallest of them, so as not to leave more than three upon each shoot; and as the blooms begin to expand, let the plants be removed to a cool frame or greenhouse, where they will be protected from wet. The early varieties will sometimes flower in the open border in warm situations, and in favourable seasons; but where there is a scarcity of room it is hardly worth while to run the risk, when Dahlias, Salvias, and so many other more certain plants can be obtained. The latter will continue to bloom until destroyed by the autumnal frosts; whereas the Chrysanthemum is only then showing signs of flowering, and is destroyed at the moment when the amateur is anxiously looking forward to be rewarded for the trouble which he has taken in its cultivation.—*T. R.*

AMATEUR'S GARDEN.—No. XXXII.

The Hydrangea has always been a favourate in gardens since its introduction into England; and although individuals, who profess to have a refined taste for flowers, may sneer at it, and call it common, yet it is one of those things which will always retain a corner in the greenhouse or garden of the amateur. As most of the plants are now in good condition for taking off cuttings, I will explain the method by which a very large head of flowers may be produced upon a small plant, and in a small pot. Many amateurs have been astonished at the large flowers which they have seen at exhibitions, and have naturally attributed the effects to something in the soil, or to manure water of some kind. This, however, is not the cause. It depends upon a law which is almost universal in nature—namely, the younger and more vigorous a plant is which flowers freely, and the fewer flowering branches that plant is allowed to produce at one time, the larger will be those which are permitted to come to maturity. This is taken advantage of by the gardener, in the case of those plants which I have just mentioned; they are struck from cuttings about this season of the year, and potted off as soon as they are rooted. The point of the shoot is not pinched out, as is the case with plants which are wanted to form a quantity of branches; but it is carefully trained to one stem, and if any laterals make their appearance on the sides, they are removed. After being kept in a cold frame or greenhouse during the winter, they are shifted into 48 or 32 sized pots in spring, and liberally supplied with water when they commence their growth. If these points are attended to, the most common treatment in other respects, and any light rich soil, will be sufficient to enable the plants to produce very large bunches of flowers. When the flowering season is past, a number of lateral shoots will be produced; the plant will acquire a bushy habit, and if allowed to grow on until another season, many heads of flower will be produced, but individually they will be small; and therefore if small plants with large heads are preferred, these must be struck from cuttings every year. Where a number of these plants are grown, it is very interesting to have the flowers of different colours. They may be brought out blue, as well as pink or rose, which is their natural colour, by growing them in certain kinds of loam, such, for example, as that of Norwood, near London; some kinds of peat are also said to produce the same effect. The particular substance contained in soil which produces this change is, I believe, at present unknown. Alum is said to do so.

The Hydrangea makes a beautiful autumn-flowering plant, when growing in some corner of the flower-garden, and will stand with a slight protection even in the neighbourhood of London. Where the sub-soil is cold and wet, two or three barrowfuls of brick-bats or other drainage should be put in the bottom of the hole, and the Hydrangea planted above them. When growing and flowering, it requires a large supply of water, and in winter a little dry litter should be laid over the roots and among the stems, the whole being afterwards protected with stakes and mats in the usual way.

That part of the garden in which Strawberries are to be planted, ought now to be got ready, and I will shortly furnish a list of those particular varieties which are most approved.—*R. F.*

HOME CORRESPONDENCE.

Country Shows.—As a constant reader of your paper I beg to suggest that it would be highly useful if you each week gave a list of all the forthcoming shows, with their dates. This used to be practised in the defunct Horticultural Journal, and, I believe, in one or two other works. It is, in my opinion, a valuable plan for ready reference, and saves persons the trouble of noting down the shows, or referring to the back numbers for the advertisements.—*Sunburnt.* [Whether we do, or do not, insert the dates of country shows the week previous to their taking place, must depend entirely upon whether we are furnished with the necessary information. If the Secretaries of the different Societies do not think proper to forward to us a list of their exhibitions, it is impossible for us to insert them.]

Myatt's Pine Strawberry.—I can state from experience that Myatt's Pine Strawberry is one that will not succeed for *early* forcing, as the flowers will nearly all go blind, however well the plants may be prepared; but it may be forced late. Forced Strawberries generally lose their flavour when conveyed to any distance; and I determined to try Myatt's Pine, although it had failed with me the previous season, as I judged, from being too early excited. From its peculiarly high aroma, I made no doubt, if I could succeed in obtaining a crop, that it would carry its deserving merits with it to any reasonable distance. I had discovered that it would not be safe to attempt forcing it till towards the middle of March; as I could then nearly expose them in the middle of the day to the direct rays of the sun, and abundance of atmospheric air, by pushing down the lights, and leaving on a portion of it through the night; keeping the temperature up by artificial means to between 55 and 60 deg. By pursuing this method, I had an excellent crop; and after their journey to London, they were pronounced excellent. Small low pits are best, where there are such, for forcing them; and the best situation for them is in the top angle, where they are near the intercepted light, close to the reflection of the whitened back wall, and at an acute angle with the glass, which is of great importance to them, with a good ventilation, convenient for all necessary operations. As they become securely set, they can safely be removed to a higher temperature, and give place to others for succession. If they are a cross from the Hautbois, it is probable that they may carry along with them some of their other habits, and be subject to run off, or to be overrun by males, or imperfect blossoms; and it would be safest for those who are desirous to grow them successfully, to procure their plants from the most successful cultivators of them.—*John Mearns, F.H.S., Leeds Botanic Garden.*

Myatt's Pine Strawberry.—In the *Chronicle* of the 23rd, I observed with regret that there are few who cultivate this Strawberry with success, at which I am rather surprised. I have known it for the last four years successfully grown in the north of Scotland, under the same treatment as the Keen's Seedling, Elton Pine, and the Roseberry, without even hearing of any symptoms of its failure. I will, therefore, lay before you the method adopted in cultivating it. The piece of ground intended for the plantation is trenched two spits deep in November, and in the process of trenching, a good coat of dung is given, the surface soil being left rough during the winter. In the beginning of March it is dug over, and the rows marked out twenty inches apart from each other. Holes are made with a large dibble in the rows six inches apart, which are filled up with a mixture of rotten leaves and bone-dust; the plants are then taken from their nursing situation, and transplanted in the holes; by this means they grow luxuriantly, and produce an abundant crop the second season. Afterwards, they are treated in the same way as the kinds above mentioned.—*Cicero.*——There are many instances where Myatt's Pine Strawberry has produced partial crops, when cultivated in the ordinary manner stated by Mr. Mearns, and your other correspondent. At the same time we are well aware that this same method has failed times innumerable, and where every care has been taken of it. It is, therefore, evident that it requires peculiar treatment, being of a very weakly habit; consequently, the way to give it all the vigour it is capable of receiving, is to make it produce a crop of runners annually, rooted in richly-manured soil. When treated in this way, it never fails to produce an immense crop. I would strongly advise every one to adopt the above plan, and they will be richly rewarded for their pains. Having no fear of your friend "Stump," or the "Club," making any improvement on this plan, I shall therefore call it the "Model Plan" for growing Myatt's Pine Strawberry. To produce a crop of the stronger-growing kinds in the highest perfection, the same system ought to be adopted; or an equally good plan is to allow the runners to strike in pots, on pieces of turf, cut square, and a stone laid upon the runner till rooted, which would be in eight or ten days. Move them afterwards into a well-prepared bed, a foot apart each way. When planted in this manner, they will produce a finer crop of superior fruit the following summer than they will do in the second year if planted in the usual manner.—*Robert Reid, Noble Thorpe.*——After all that has been said about Myatt's Pine Strawberry, I believe the true principle of growing it has not been fully pointed out. By some it has been grown successfully in almost all soils and composts; and in other cases, although various soils have been tried, it has been a complete failure. Mr. Redding, gr. to Mrs. Marryatt, grows it in good rich loam on a slope; these words are deserving of repetition, *on a slope.* It would not grow planted like other varieties on level ground, in the garden of the Horticultural Society, but is now doing very well since planted on a sloping border, as practised by Mr. Redding.—*R. T.*

Newsome's Princess Royal Strawberry.—I was surprised at seeing in your Paper last week an attempt by Mr. Brooke to prove that the Princess Royal Strawberry was a new variety, and to vindicate Mr. Newsome's conduct in sending out an old sort for a new one, merely because it was a seedling. What proof does Mr. B. bring forward that the Princess Royal is a new variety? Simply this—that Mr. Newsome said such was the case. Mr. B. does not seem to understand the culture of the Strawberry, or he would not lecture Mr. Morris on his unreasonable expectation as regards the size of the fruit borne the first year after planting. The fact is, the largest fruit is obtained from the same year's planting. I have gathered fruit this summer from runners, planted in the spring, weighing each above an ounce. I fully concur with Mr. Morris that the Princess Royal and the Elton Pine are one and the same thing. I should not have arrived at this positive conclusion had I not planted them both this spring; I have watched and tasted them, as have several other persons, in their different stages, and as to the darker colour of the Princess Royal, which Mr. B. urges as peculiar to it, that is impossible, as every one knows that the Elton when quite ripe is nearly black. I have seen Mr. Sheppard, of Deptford, one of the largest and most successful growers of Strawberries, who fully agrees with me in declaring that the Princess Royal and the Elton are the same. He, like myself, was unfortunately a purchaser of the former, as a new variety. I do not dispute the possibility of his seedling producing fruit, twelve of which may weigh one pound. The Elton, in a good rich loam, will do the same. In making the above remarks I do not mean to insinuate that Mr. N. intentionally wished to deceive the public, but I say that he ought not to send out a seedling for a distinct sort, without being acquainted with the varieties already in cultivation, before he pronounced his seedling a new sort, and charged the public 5*l.* per 100 for it, under the high-sounding title of the "Princess Royal."—*G. Imms, Woolwich.*——You will, I am sure, allow me (in corroboration of Mr. Brooke's remarks) to say that I consider Newsome's Princess Royal Strawberry to be as distinct a variety as any in cultivation. I have this year grown the Elton Pine, the Swainstone Seedling, the Victoria, the Eliza, the British Queen, Roseberry, &c., and last, but not least, Newsome's Princess Royal. It is the largest fruit I have ever seen, and from the sample that Mr. Newsome sent me last year, I can readily believe what Mr. Brooke states, that he grew them twelve to the pound. How this Strawberry can be confused with the Elton Pine I cannot imagine. The Princess Royal is of an oblong form; the Elton, for the most part, is pointed, of a perfectly conical shape. But the flavour is as different as the form, and I should give the preference to the Elton Pine in that respect. The growth, again, makes a decided distinction, and I do not hesitate to say, if we recognise distinctions at all, that the Princess Royal has as much pretension to the distinction given it by Mr. Newsome as any other Strawberry.—*H. B., Essex.* [We must now put an end to this discussion. Mr. Newsome has himself sent us fruit of his Princess Royal Strawberry, and they are *not distinguishable from the Elton.*]

Bees.—In answer to the inquiries of a cottager in the *Chronicle* of Saturday last, I beg to refer him to my treatise on the "Honey-Bee;" in which he will find that I have cautioned my readers against supering swarms of the current year, and have also adverted to the occasional aversion of bees to accept a super when so given to them. My reason for the caution is this. Bees have always a disposition to carry their stores upward, and if supered the first year of their establishment in a hive or box, may, if they accept such supering, carry that disposition so far as to impoverish the box in which they are to be supported during the winter, and thus be reduced to the alternative of being either fed or famished. Whereas if an eke or a full-sized nadir were made use of, no such danger would be incurred, nor would any indisposition be shown for carrying on their operations. In all future years, supering should be preferred to nadiring, as greatly lessening the risk of having brood intermingled with the honey-combs.—*Edward Bevan, Llanferry.*

Bees.—If your correspondent will hold the bell-glass under the bees which hang out of his hive, and get as many of them into it by sweeping them off the hive, or whereon else they cluster, with a goose wing or anything else, so as to prevent injuring them, and covering a tin or thick paper over the bottom of the glass, place it on the top of the hive, by removing the tin or paper, the bees will work into the bell-glass and thank him for his trouble. If he pursues any peculiar method by which he obtains a swarm early in April, and two more, from the same stock, early in May, most bee-keepers would feel obliged for information on the subject.—*M. H. G.*

Bees.—Will your correspondent "A. Thaxter, Norwich," have the kindness to inform me if there is any way to save the Bees after leaving the hive, which had been placed in the dark shed, as stated in the last week's *Chronicle*?—*E. M.*

On the Vitality of Seeds.—If in the experiments at Oxford it is intended to try what method will best preserve seeds, and not to test the merits of the particular plan pointed out, I am afraid the plan itself is faulty. From long practice among seeds, I am of opinion that if they are once properly prepared for keeping, vitality is sooner injured by excessive drying than by any of the ordinary accidents they are subject to, perhaps from losing the fixed water, which De Saussure calculates at 10 in 198; or from one of the most necessary agents in germination, heat, being present without its necessary accompaniment of moisture. From whatever cause, however, it may arise, excessive drying is the most prejudicial of any of the accidents that can attend seeds. All dealers in seeds, especially Grass seeds, have to complain of this; when damp they will not keep, and are generally put on the top of a kiln to dry off the external moisture; but if the process be suffered to go beyond this, and if the natural moisture of the seed is much trenched on, it will be as white, and fair, and full of farina as before, but will not grow. I have frequently observed that small quantities of Onion and other seeds, kept over year loose in the drawers or in paper parcels, would not grow; when the same seed in a quantity, in a damp bag, or double-bagged for safety, grew well. I have seen parcels of Onion seed weighed and put up in paper parcels, and which had been kept for a few weeks in that state, owing to a change of weather not permitting their being sown, that on weighing were found to have lost more than an ounce in the pound. It is familiar to seedsmen the in-drink in weight of such as Carrot seeds when long kept. Most practical men also must have noticed that when dry weather is long continued after sowing, especially if warm, the best of seed will either not germinate at all, or do so very weakly. All these are proofs that seeds are much injured by the drying action of air; and when set aside for preservation in our cool climate, they should be as much excluded from the air as possible, and not exposed in jars pierced with holes for ventilation. In sending across the equator ventilation is best, because heat is the greatest drying agent there, and requires most to be guarded against; and as no coverings will exclude the heat, there is least risk in ventilation. The above principle of excess in drying has been often applied to the keeping of Potatoes by drying on a kiln, when there is no loss from sprouting in the ensuing spring; but it does not seem to be generally known.—*R. Lymburn.*

Vitality of Seeds.—Your correspondent, Mr. C. Penny, gives an account of the growth of the Charlock (Sinapis arvensis), after a recent opening of the soil on the Birkenhead and Chester Railway. Many instances of this kind are related, and the inference is made that the seeds have been buried in the soil, and brought to the surface by the cuttings, as in this case of Mr. Penny's; but if we consider that such an inference would give to seeds a power of retaining their vitality for periods, compared with which the two or three thousand years that seeds from Egyptian tombs are said to retain their vitality would fall into insignificance, the greatest care should be taken that the fact is correct. If Mr. Penny, or any other person in the neighbourhood of the cuttings of railways, canals, &c., would take care to procure some of the soil from those spots, and ascertain that there are seeds of plants present in it, and, by preventing all sources of accidental introduction, thus prove that they had been deposited with the stratum in which they are found, they would, I am sure, greatly oblige the committee of the British Association appointed to investigate this subject. There seems a good deal of evidence to prove that seeds may be buried in the earth for ages, and then grow when placed in favourable circumstances; and there is really nothing *à priori* improbable with regard to the fact; but still the *experimentum crucis* is wanted.—*E. L.*

Budding.—In the last leading article on budding, the generally-received opinion that the piece of wood connecting the bud with the alburnum, when jerked out, produces a blind bud in the spring, has been adopted. I was also bred up in the same opinion, and continued to hold it for some years; but having observed that in practice the best buds were most apt to have that fault, and cause their rejection—and being also of opinion that the piece of wood jerked out formed no part of the bud, as it appeared quite sound without it, and trusting to its being again renewed by the cambium, I determined to give it a fair trial. For several years I selected a portion of these buds, and marked them with a tally, and in spring they generally all started away at the growing period. There were much fewer failures among these than the others, and I now never reject any of them. Blind buds appear to owe their origin to the bud itself being diseased. A very excellent method of budding was taught me some years ago, by Mr. Fairbairn, long of the Mile-end Nurseries. I think he called it Sweet's mode. In the ordinary way of budding, when the piece of wood and bark both are cut from the shoot and the wood pulled out afterwards, the edge of the bark is apt to get rough, especially if there is much work to be done, which is against the success. A better way, and more easily performed, especially with such as Cherries and Plums, is to mark out the size of the shield of the bud all round with the point of the knife, cutting into the alburnum; then applying the thumb to the bark at the side of the bud, and squeezing it gently out, the bark will rise as smooth on the edges as if cast in a mould, if the sap has been running freely; without which it is in vain to try budding.—*R. Lymburn.*

Pruning Forest Trees.—Your excellent directions on pruning forest trees, by stopping the leader in time, will save a vast deal of trouble if properly attended to. It is possible to err in planting too thin as well as too thick. The standards to be left ultimately for timber should all be selected of the most vigorous, healthy plants; and for this purpose there should be sufficient to choose from. They also help to improve one another when young. The leaves they shed are, perhaps, as much as they rob; and the thinnings, if good, are excellent for other plantations. It surely may be possible also to grow trees quicker than they will solidify; the slowest-grown Oak may not be always the best: but we see the growth of other trees spongy and unripened at the ends when grown more luxuriantly than the ordinary state of the climate will ripen; may it not be the same with the Oak also?—*R. Lymburn.* [Certainly. All we mean by advocating fast-grown timber is, to recommend that it should be enabled to grow as fast as is suited to the climate. We shall soon return to the subject.]

Araucaria Braziliensis.—I observed in the *Chronicle* of the 16th instant, that you published my remarks of having planted in the open air an Araucaria Braziliensis; and that it stood the whole of last winter, &c. But you have added, "We apprehend some mistake here. All the Brazilian Araucarias that we have known to be exposed to the winter have invariably perished." I now reply that what I then asserted is a positive fact, and in order to be certain of my plant being the Araucaria Braziliensis, one of several which I raised from seed was, about 18 months ago, submitted to Dr. Lindley, who pronounced it to be of that species.—*J. S., Balham.* [We are not convinced.]

Fuchsia fulgens.—I beg to inform "A Subscriber," that Fuchsia fulgens flowers well with me in the open garden without shading. I have been in the habit of making a bed of it for these last four years; the plants flower beautifully, and the blooms are much brighter than those in the greenhouse. I may add, that I find a small quantity of bone-dust mixed with the mould, a sandy loam, to be an excellent manure; as it tends to produce flowers, without a great increase of foliage, which is oftentimes the case when too highly manured.—*J. N., Dorset.*——Fuchsia fulgens will bloom beautifully, in the open ground, either in plunged pots or planted out. The cause of the blooms dropping off is from the roots being allowed to become dry; and if F. fulgens is exposed in a pot, without being placed in a saucer or plunged in the ground, the sun will heat the sides of the pot to such a degree as will invariably cause the flowers to fall off.—*J. R., Woolwich.*——I have been successful in flowering Fuchsia fulgens both in the open ground and in pots plunged in the borders, without dropping its flowers. I have also made a group of them in the flower-garden, by turning them out of the pots, and they have grown very luxuriantly, without even a flower falling prematurely. The soil they were planted in was composed of loam, sand, and leaf-mould.—*D. Gelletely.*

New Plan to preserve Gooseberries.—I observe in the *Chronicle* of the 23d ult., that Mr. Whiting recommends Gooseberry-trees to be covered with mats, in order to preserve the fruit for a lengthened period. I therefore propose to lay before your readers a method which I have seen practised with success, and at very little expense—preferable, in my opinion, to the one just mentioned; as the fruit continues longer in a state of maturity, and with the flavour unimpaired; which is far from being the case with those covered with mats, owing to their being excluded from light and air, which causes the fruit to shrivel, lose its flavour, and ultimately fall off.—Procure boxes (made of any dimensions to answer the size of the bushes which they are intended to cover) open on three sides; the other side, which is intended to face the south, being closed with boards, and the roof formed of the same material, at a slight angle, to carry off the rain. The sides which are left open may be covered with thin canvas, to exclude wasps and other pests, so troublesome to the gardener; which will admit light and a free circulation of air—both very beneficial in keeping the fruit dry, and in preserving the foliage from decay. It is requisite to take off all the superfluous shoots before covering, in order that the fruit may have the advantages of light and air. I have seen excellent Warringtons preserved in this manner, gathered in the end of November. —*A Journeyman Gardener.* [We are afraid this plan will be too expensive to be generally adopted.]

Destruction of the Gooseberry Caterpillar.—Much has been said of late in the *Chronicle* about Hellebore powder and Gooseberry caterpillars: I will therefore tell you and the public what I was told by a late relative, of the old school, and what I did in consequence. My Gooseberry-bushes being one year much infested with these voracious consumers of foliage, I was complaining of them to my friend, when he said—"Oh, you may easily get rid of them." How so? "Go out to the roads, and get some dust, and powder them well early in the morning; I warrant you they will all die." Accordingly, the remedy being simple, I did *not* go to the road, but took some dry clods, and having pounded them to powder, I applied it as directed. The result was (whether that killed the creeping things or not, I will not vouch), that they very soon disappeared, and my bushes were clean. I at first objected that the fruit would be spoiled; the answer was —"Oh, the first shower will put all that to rights," and so it was.—*Grossularia.*

Triple Dahlia.—From a neighbouring garden I have received a purple double Dahlia, with three quite perfect flowers, formed into one, which I take to be a rarity, never having seen more than two united before. The flower-stalk is much flattened, and deeply reeded, so as to look exactly as if three stalks had been stuck together; and the flowers are placed triangularly, back to back, with a crown at the top, which is composed of some petals from each of the blooms.—*L. W. D., Sketty Hall.*

Lílium lancifólium.—Will Mr. Groom be kind enough to inform me, through the medium of your columns, at what season of the year, and at what period of the growth of the plant, he was successful in obtaining bulbs at the axils of the leaves by surrounding the stem with peat and sand as detailed in a Number of last year's *Chronicle*, and whether in the operation the leaves were allowed to project through the surrounding mould, or whether they were completely covered?—*A. Whittaker.*

Mildew on Peas.—I beg to differ from your correspondent, "P. Mackenzie," as to the cause of mildew on Peas. He seems to think it is caused by an over-supply of moisture; while I think, or, I may say, I am convinced of the contrary. I am ready enough to admit "that mildew in canvas and in damp cellars is caused by damp;" but I consider mildew on plants and the same in damp cellars to be different species. In this part of the country we have had scarcely any rain all the summer; to use a gardener's phrase, "we are completely dried up;" and my Peas, Roses, and Wall-trees are completely covered with mildew. I think this proves, that it is in this case over-dryness that causes the mildew.—*E. M.*

White Swallow.—At Pegglesworth Farm, near Cheltenham, a snow-white swallow has been hatched during the present month, and has been seen flying by several persons. There were two other young birds in the nest, but they were of the usual colour. A man, who has lived on the farm for the last eighteen years, informed me that in July, 1837 (the year his late master died), the following remarkable instances of change of colour were observed upon the same farm, viz., a white hare, a white rat, and a white *black*-bird.—*R. A., Charlton Kings, July 30th.*

PROCEEDINGS OF SOCIETIES.

HORTICULTURAL SOCIETY.

August 2nd.—R. W. Barchard, Esq. in the chair. R. W. Gaussen, S. Ram, and H. Russell, Esqrs., were elected Fellows. Mrs. Lawrence exhibited a very handsome new Papilionaceous plant, of a partly climbing habit, with racemes of broad dark purple flowers; Besléria pulchra, with bright orange blossoms, streaked with dark red; Clerodendrum squamatum, with panicles of bright scarlet; C. paniculatum, with a much larger panicle than the former species, and smaller flowers, of a brick red colour; a well-grown plant of Státice arborea; exceedingly fine specimens of Erica retorta; E. infundibuliformis, a most elegant species, with blossoms of the brightest pink, and E. inflata alba, quite a bush, completely enveloped with swollen tubular flowers of the purest white. A Banksian medal was awarded for the three Heaths, and another for the Papilionaceous plant. From Sigismund Rucker, Esq., Jun., was a remarkably beautiful plant of Miltónia spectábilis, with no less than 19 flowers expanded at the same time, the pure white of the perianth forming a striking contrast with the deep purple of the labellum; also Oncidium Lanceanum, a highly ornamental species, no less deserving of notice than the preceding; and Cycnoches chlorochilum, with large green flowers, not remarkable for the beauty which they possess, but as exhibiting an extraordinary instance of the various forms which this tribe of plants assume: a Knightian medal was awarded for the Miltónia. Mr. Jackson, of Kingston, sent a large collection of Heaths, amongst which were a gigantic specimen of E. ventricosa purpúrea, 5ft. high, covered with dense heads of rosy purple; the highly beautiful E. Savilleana, with nearly globular flowers of purplish rose; E. jasminiflora alba, an elegant variety, with long inflated white blossoms; and E. vestita coccínea, with tubes of the brightest crimson: for the two former a Banksian medal was awarded. Messrs. Veitch exhibited a cut specimen of a new species of Echites, from the Organ mountains, in Brazil; the flowers are of a dark maroon colour, and the plant is said to possess a climbing habit, to be a free grower, and an abundant bloomer; it flourishes best in a temperature intermediate between that of a stove and a greenhouse: a Banksian medal was awarded for it. From Mr. Mountjoy, of Ealing, was a particularly handsome Seedling Phlox, named Picta, with small white flowers, beautifully shaded towards the centre with rosy purple; the blossoms are produced in dense heads, with great profusion, and, in fact, bear more resemblance to those of a Leptosiphon than any species of Phlox at present cultivated; this variety is a hardy Herbaceous plant, growing to the height of about two feet, and will prove a valuable addition to the many ornamental kinds which this genus already contains. Mr. Mountjoy also exhibited an interesting little Herbaceous plant under the name of Pentstemon Mexicanus, but evidently not belonging to that genus; a plant of the same kind was exhibited by Mrs. Lawrence, at a previous meeting a few weeks since; in addition to these were a well-grown specimen of Achimenes longiflora and a handsome Seedling Dahlia, named Virgil. Certificates were awarded for the Phlox and the Pentstemon? From Mr. Watts, gr. to R. Marshall, Esq., a beautiful specimen of Lisianthus Russellianus, with flowers of an unusually large size and of a rich violet colour; the plant was raised from seed in 1840, and has since then received alternate greenhouse and vinery treatment, being grown in the latter during the spring months; the soil in which it is potted being composed of equal portions of leaf mould, peat and loam, with a little silver sand: a certificate was awarded for it. From Mr. Cuthill, of Camberwell, was also a plant of Lisianthus Russellianus, with better shaped but not such highly coloured flowers; accompanied with a cutting in a phial of water, the same as was exhibited at the last meeting. From Messrs. Lane and Son, of Berkhampstead, a Nérium, called Reyanot, semi-double, with crimson blossoms striped with white; it closely resembles the old variety in general habits, but is much handsomer on account of its variegated flowers. From J. Schrouder, Esq., of Brixton, a noble plant of Lílium lancifólium punctatum, with showy white blossoms, curiously dotted with pink; for which a certificate was given. Mr. Todd, gr. to J. G. Monypenny, Esq., sent a rather handsome seedling Fúchsia, called Gibboniana, but not sufficiently distinct from other varieties. From Messrs. F. A. Smith, of Hackney, were two showy seedling Dahlias, named Sir R. Sale and Rainbow. From Mrs. Morris, a variety of the very variable Stanhŏpea oculata. From Mr. Hamp, gr. to J. Thorn, Esq., a pretty species of Chirónia, supposed to be new, with pretty rose-coloured flowers; the plant is of compact habit, and blooms freely. W. Leveson Gower, Esq., exhibited a stand of Picotees, principally seedlings, containing many beautiful heavy-edged and light varieties; the ground colour of some of the flowers was remarkably pure, and the colour nicely distributed along the margins. From Mr. Ivery, of Peckham, were two seedling Fúchsias, named Gem and F. Iveryana. Mr. Sellers, gr. to L. V. Watkins, Esq., exhibited six remarkably well swelled Queen Pine-apples: two, weighing respectively 4lb. 10oz. and 3lb. 15oz., cut from plants grown in open soil, heated by hot water; two others, of 3lb. 4oz. and 3lb. 5oz., from plants grown in pots, plunged in tan up to the rims, according to the general method; and two of less weight, from plants plunged in coal-ashes: showing that much larger fruit may be produced by plants grown in open soil than upon those whose roots are confined in pots, although the latter may possibly bear fruit of richer flavour: a Knightian Medal was awarded for the two former. From Mr. J. Spencer, gr. to the Marquis of Lansdowne, were two handsome specimens of a new French Pine, called the Cayenne épineux, which is stated sometimes to attain the extraordinary weight of 20lb.; the fruit exhibited weighed 4lb. 12oz. and 4lb. 6oz., being of a perfectly cylindrical form, with large flat pips; the spines upon the leaves rather large and irregular: a Banksian Medal was awarded for them. From Mr. Errington, gr. to Sir P. Egerton, Bart., a well-swelled Enville and two Black Jamaica Pine-apples. From Mr. Saul, gr. to Earl Fortescue, three remarkably handsome Queen Pine-apples, the heaviest weighing 4lb. 1oz., and a dish of good Bellegarde Peaches: a Banksian Medal was awarded for the Pines. From Mr. Henderson, gr. to Sir G. Beaumont, were well-formed specimens of the Brown-leaved Sugar-loaf, and what was supposed to be the Antigua Pine-apple. Mr. Roberts, gr. to M. Wilson, Esq., exhibited some very fine Black Hamburgh and Muscat of Alexandria Grapes, for which a Banksian Medal was awarded. Mr. Elliott, gr. to Sir W. Ingleby, sent some fruit of the Carica Papaya, or Papaw tree, the blossoms of which merely require to be impregnated during their expansion to ensure an abundant crop. It is stated that tough meat hung upon the branches of this plant is rendered tender in a few hours, and that this singular effect is produced by some peculiar exhalation from the tree. A variety of Melons was sent by Mr. Robertson, gr. to J. Currie, Esq., but without names attached to them. From the Garden of the Society was a large collection of Orchidaceous and other plants, including the lovely Cattleya crispa, with flowers of the most delicate pinky white, finely contrasting with the violet colour of the curiously-fringed labellum; the handsome Oncídium Lanceanum, with six spikes of brown and purple blossoms; the pretty drooping Pháius albus; a large box of the showy Achimenes longiflora, found to succeed best in a moderately warm and humid atmosphere; Achimenes rósea, closely allied to the well-known Trevirana coccínea, but much exceeding it in point of beauty; Tropæolum Moritzianum, which is far from being the handsome plant at first imagined, its large leaves almost concealing the small inconspicuous flowers; and Aloe xanthacantha, or the yellow-spined Aloe, an elegant species, producing its pretty tubular scarlet and yellow blossoms in gracefully drooping clusters, and not singly upon erect stalks, as is the general habit of the tribe.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

H. Handley, Esq., in the chair. The Earl of Powis, W. H. H. Hartley, and N. V. E. Vaughan, Esqrs., have been elected governors during the month of July, and 217 gentlemen members. Dr. Lyon Playfair, Mr. Edward Solly, and his Excellency the Hon. H. Everett, have been elected honorary members. A communication was received from the Rev. W. H. Fisher, concerning the Dyock Oat; who states that, having seen, in the Transactions of the Agricultural Society of Scotland, a report of a series of trials made with this Oat by Mr. J. Watson, he was induced to apply for a small quantity of the seed; and that so far as the return of one year and the appearance of his crops can be condsidered as bearing testimony to the value and probable utility of this Oat, he is enabled to confirm the favourable opinion expressed by Mr. Watson. The land on which he sowed the half-quarter of seed is a poor red soil, resting upon a clayey subsoil, at an altitude of from 400 to 500 ft. above the level of the sea, and was enclosed from a common about 20 years ago. A poor crop of Turnips had been grown upon it the year preceding, with 20 bushels of bones to the acre, one-half of which was drawn, and the other eaten off with sheep. The alleged qualities of the Oat in question, which induced him to make trial of it, were early maturation and an abundant return. As a test of the former, he selected the Potato-oat to sow with it in the same field, upon land of the same texture. The early part of the season of 1841 was remarkably fine, and the Potato-oats were sown on the 18th of March, the ground being in beautiful order. On the following morning the Dyock Oats were sown; rain having interrupted the sowing and rendered the soil less favourable for harrowing in the seed. In both instances the seed was sown broadcast at the rate of 5 bushels to the acre. The crop was better than was anticipated, growing rather vigorously, but with a perceptible advantage, as regards forwardness, in favour of the new variety; though, when reaped, the straw of the Potato-oats was a little longer. These were reaped on the 20th of Sept.; the Dyock Oats having been cut on the 31st of Aug. The returns were, from the Potato-oats 6 9-20 times the seed; from the Dyock Oats 8¾ times. The former weighed 36 3-5 lbs. per bushel, and yielded of Oatmeal 17 3-20 lbs. per bushel; the latter weighed 40 lbs. per bushel, and yielded of Oatmeal 21 7-9 lbs. per bushel. The straw is of excellent quality, well adapted for fodder. This Oat takes its name from a Mr. Dyock, who first raised the variety in Aberdeenshire. If, after a further test, its good properties be maintained, there is little doubt of its proving a highly valuable acquisition, especially upon the cold elevated lands of the northern part of the kingdom. Mr. Watson states that it usually arrives at maturity from 12 to 16 days before Potato-oats; and the higher the altitude, the greater is the disparity in this respect. It is rather small in the grain, but is distinguished from other early varieties of Oat by the thinness of its husk.

FLORICULTURAL SOCIETY.

Aug. 2.—Mr. D. Shears, jun., in the chair. Several seedling Carnations, Dahlias, and Calceolarias were sent for the opinion of the Society. From Mr. Dover were five blooms of a crimson bizarre Carnation, raised in 1841, which was adjudged to be "a small flower, with the white very pure, and colour good; but generally deficient in crimson." Mr. Oakley sent six blooms of a Dahlia, raised in 1841; colour, crimson tipped with white: "the best tipped Dahlia seen by the Society, and in shape second-rate, but not quite perfect in the centre." From Mr. Mountjoy, were six blooms of a crimson Dahlia, called Virgil, of 1841: "a first-class flower." From Mr. W. Pipe, of Hampstead, a Dahlia, of 1842, named Firebrand, crimson scarlet: "a very promising flower, a little sunk in the centre, but not much." From Mr. S. Hodges, an extensive collection of Calceolarias: "not sufficiently fresh to allow of their being properly judged; some of the herbaceous ones, such as Nos. 6, 11, 16, and 19, pretty, but much too small; the shrubby ones not worth cultivating." Mr. Smith, of Hackney, sent a bloom of a Dahlia, called Sir R. Sale, and another of Rainbow; Mr. R. Aldridge, five blooms of his Hoxton Rival; and Mr. Whale, of Elcot, a bloom of a dark Dahlia. These being all flowers raised in 1841, were set aside; the rules of the Society requiring six blooms of that year to be exhibited before passing their opinion. Mr. Barnes, of Evesham, also sent two Picotees and two Carnations, without names or any other particulars attached to them, as required by the Society, and as stated in our advertising columns of to-day; they were, therefore, not judged.

COUNTRY SHOWS.

Wingham Horticultural and Floral Society, July 28th.—The following is the award of prizes:—Pelargoniums: 1, Matilda, Beauty of Ware, and Joan of Arc; 2, Jewess, Alexandrina, and Beauty of Ware; Rev. C. Baylay. Balsams: Lady Bridges. Cockscombs: D. Denne, Esq. Perennials: Commelina cælestis, Linária dalmática, and a new-striped Antirrhinum, Mr. Sankey. Annuals: Phlox Drummondi, Salpiglossis picta, and Martýnia proboscídea, Mr. Sankey. Best Climbing Plant: Clemátis Sieboldi, Miss Montresor. Fuchsias: 1, Fulgens, Youelli, and Stándishi, D. Denne, Esq.; 2, Fulgens multiflora, Moneypénnyi, and racemiflora, J. Godfrey, Esq. Best Fuchsia: Formosa élegans, J. P. Plumptre, Esq., M.P. Greenhouse Plants: Mimulus glutinosus, Tristánia neriifólia, Clethra arbórea, Jasminum odoratíssimum, Crássula coccínea, and Bæ'ckia virgata, J. Godfrey, Bsq. Best 3 Do.: Siphocámpilus bícolor, Bæ'ckia virgata, and Petúnia picta, Mr. Sankey. Best single Plant: Lady Bridges. Roses: 1, Theresa, Florida, Maria Leonida, Minette, Luxembourg, and Acidalie; 2, Theresa, Leda, Crimson Moss, Acidalie, Le Pactole, and Florida; J. Godfrey, Esq. Dahlias: 1, Beauty of the Plain, Grace Darling, President of the West, Duchess of Richmond, Hope, and Argo; 2, Pickwick, Argo, Duchess of Richmond, Hope, Metella, and Lady Mill; Rev. C. Oxenden. Carnations: Hale's Prince Albert, Lady Chetwynd, Wilson's Harriet, Puxley's Prince Albert, Holmes's Mary Ann, Jacques, and Gloriana, Rev. J. G. Hodgson. Picotees: Gidden's Teaser, Wilson's Julia, Gidden's Diana, Queen of England, Anacreon, and Burroughs' Sylph, Rev. J. G. Hodgson. Heartsease: 1, Grand Duke of Russia, Imogene, Black Knight, Hope, Amulet, Lord Glamis, Arethusa, Alpha, Countess de Grey, Lord Durham, Chameleon, and Conservative, Mr. Keeler; 2, Cook's Perfection, Robin Adair, Dr. Johnson, Seedling, Stubbs' Purple Perfection, Maid of Honour, Cook's Ovid, Great Western, Jehu, Victory, Cook's Prince Albert, and Ultraflora, Rev. J. G. Hodgson. German Stocks: 1, J. P. Plumptre, Esq.; 2, Mr. Dadds. Best 12 Perennials: Mr. Sankey. Best 12 Annuals: R. Brooke, Esq. Best Tender Bouquet: Lady Bridges. Best Hardy Bouquet: Mrs. Brooke. Best Floral Device: 1, *crown*, Mrs. Plumptre; 2, *basket*, Mrs. Brooke. Fruit.—Melon: 1, *Cote's Green Flesh*, Sir B. W. Bridges, Bart.; 2, *Green Flesh*, G. C. Oxenden, Esq. Purple Grapes: 1 and 2, *Black Hamburgh*, J. P. Plumptre, Esq. White Do. 1 and 2, *Muscat of Alexandria*, J. P. Plumptre, Esq. Apricots: *Brussels*, J. Godfrey, Esq. Plums: *Early Lawrence*, Mr. Cozens. Wall Cherries: *White Turkey Heart*, Mr. Cozens. Standard Do.: 1, *Tradescant*, Mr. Dadds; 2, *Bigarreau*, J. Elgar. Red Gooseberries: *Crown Bob*, Mr. Dadds. Green ditto: *Ploughboy*, J. Godfrey, Esq. Yellow do.: *Tupper's Seedling*, Mrs. Hudson. White do.: *Victoria*, Mrs. Hudson. Red Currants: *Dutch*, Mrs. Hudson. White do.: *Grape*, Mr. Harrison. Black ditto: *Naples*, Mr. Cozens. Red Raspberries: Mr. J. Elgar. White do.: R. Brooke, Esq. Strawberries: *Downton*, D. Denne, Esq. Dessert Apples, 1841: *Sharpe's Russet*, Mr. Dadds. Do., 1842: *Primitive*, Mr. Harrison. Kitchen Apples, 1841: *Lady's Fame*, Mr. Dadds. Ditto, 1842: *Hawthornden*, Mr. Cozens. Pears: *Green Chisell*, Mr. Cozens. Peas: 1, *Wrinkled Marrow*, Mr. Sankey; 2, *Knight's Marrow*, Mr. G. Denne. Broad Beans: *Windsor*, Mr. Fostall. Cauliflower: J. Godfrey, Esq. Cabbage: *Wellington*, Mr. D. Deverson. Lettuce: *Paris Cos*, Rev. J. G. Hodgson. Cucumbers: 1 and 2, *Snow's Seedling*, D. Denne, Esq. Onions: *Tripoli*, Mr. Dadds. Basket of Vegetables: Mr. Sankey.—Extra Prize: *Brown Ischia Figs*, Lady Montresor.—The Cottagers' Prizes, 45 in number, were competed for by 70 cottagers; 33 of whom obtained prizes, and to each, in addition to the money, was presented a copy of Paxton's "Cottager's Calendar." The sum of 5*l*. was also distributed, in sums varying from 15*s*. to 2*s*. 6*d*., to the 15 best cultivated Cottage Gardens in the district, according to their respective merits, with a copy of Paxton's "Cottager's Calendar" to each. From Mr. Masters' nursery, Canterbury, there were some rare and curious plants, which were greatly admired, particularly the following Orchidáceæ: Stanhópea insignis, with the flowers protruding from beneath the plant; Oncídium papílio, with flowers like a butterfly; Oncídium flexuosum and Cattleya Forbesii, both very curious; with Portulacca Thellusoni, Verbena Burleyana, Besléria pulchella, Passíflora Loudoni, Achimenes longiflora, Lílium lancifólium punctatum (very elegant), and Larochea falcata. From Miller's, Ramsgate, were fine plants of several varieties of Fúchsia, as Globosa variegata, Dalstónia Chandleri, Fulgens superba conspícua, racemiflora, and magnífica; and from Johnson's, Dover, Fúchsia Venus victrix, a new and curious variety, and some other rare plants.

NOTICES OF NEW PLANTS WHICH ARE EITHER USEFUL OR ORNAMENTAL.

Stylídium pilosum. Hairy Stylewort. (*Greenhouse Perennial.*) Stylidiáceæ. Gynándria Diándria.—The plants of this Stylewort now in cultivation have been principally raised from Swan River seeds; the species being not uncommon in that colony. It has the largest flowers of any yet introduced, and when in good health has rather a handsome appearance. It is sometimes met with under the name of Stylídium Dicksoni. The natural situation of such plants is said to be sandy plains, dry on the surface, but wet and springy underneath, by which, notwithstanding the hot sun which shines upon them, they are able to maintain a healthy state. Art will, however, render them much handsomer than they are when wild, if we are to judge from what has recently been done with St. fasciculatum; and we do not despair of seeing the very species now before us with a large panicle of flowers. It is a neat little greenhouse perennial, requiring a soil composed of sandy peat, mixed with a small portion of loam. It should be kept in small pots, and treated as a subaquatic during the growing season in summer, but must be kept rather dry during the winter, and in a cool part of the greenhouse, where there is plenty of light and air. It is easily increased from seeds.—*Bot. Reg.*

Stylídium ciliatum. Ciliated-leaved Stylídium. (*Greenhouse Perennial.*) Stylidiáceæ. Gynándria Diándria.—This species, from the Swan River colony, is now in the cultivation of Mr. Lowe, of Clapton; and is extremely different, especially in the colour of its flowers, from any species yet introduced into our greenhouses. The leaves are rosulate, densely imbricated, and springing from the top of the root; the stem, as well as the calyx and outside of the corolla (which is yellow), being clothed with long spreading hairs, tipped with a viscid gland.—*Curtis's Bot. Mag.*

Philadelphus mexicanus. Mexican Syringa. (*Half Hardy Shrub.*) Icosándria Monogýnia. Philadelpháceæ.—This new half-hardy, or perhaps hardy shrub, has been introduced by the Horticultural Society from Mexico, by the assistance of Mr. Hartweg. It forms a small bush, with weak branches, and has the merit of being an excellent plant for forcing. It is cultivated at Jalapa, and grows wild in the hedges there; also at Oaxaca, and the city of Mexico, according to Schlechtendahl. Hartweg found it at the Hacienda del Carmen, which is mentioned in the Linnæa as the locality of Philadelphus affinis, a species with 5-flowered racemes, and therefore very different from this.—*Bot. Reg.*

Epidendrum Grahami. Dr. Graham's Epidendrum. (*Stove Epiphyte.*) Orchidáceæ. Gynándria Monándria.—This pretty species of Epidendrum, belonging to the group Encýclium, was received at the Edinburgh Botanic Garden, from Mexico, and well deserves a place in every collection. The pseudo-bulbs are smooth, of a pale green, about the size of a pigeon's egg, bearing two somewhat obtuse coriaceous leaves. The scape, which is about 1½ ft. high, produces from eight to ten rather large flowers, of a yellowish green tinged with brown. The labellum is deeply lobed, with two white prominent lamellæ at the base; the side lobes yellow, almost convolute, so as to embrace the column; the middle one large, orbicular, waved at the margin, white, beautifully streaked with red.—*Curtis's Bot. Mag.*

MISCELLANEOUS.

To prepare Dried Specimens of Plants.—The modes of preparing dried specimens are various, depending very much upon the circumstances under which they are to be procured. To explain, therefore, the general principles upon which they should be prepared will, perhaps, answer every necessary purpose, and enable those who may have been previously unacquainted with the mode of drying specimens, to apply general directions to their own particular case. First, as to selecting the specimens for drying. They should be chosen when in flower, or when in fruit, or in both those states; and they should be reduced, if very large, to such a size, that they may be conveniently laid between the two leaves of a sheet of common brown paper; but they should be in all respects in as perfect a state as possible. Generally, no other preparation before commencing the operation of drying is necessary; but there are certain plants, such as Pinuses, Heaths, and fleshy-leaved plants in general, which, if placed in paper in the state in which they have been gathered, will either part with their vitality so irregularly as to fall in pieces in drying, or so slowly as to render the operation very long and tedious. If such plants are plunged for an instant in boiling water, the inconveniences I have mentioned are entirely removed, and the process of drying will go on as rapidly and uniformly as in other plants; or if the papers in which they are first laid be made very hot, the same end will be attained. When the specimens have been properly prepared, the second operation is to place them between sheets of paper, under a gentle pressure, and, by successively shifting them from the paper which becomes damp to dry paper, to extract from them all their humidity, till they become in a fit state for laying by in the herbarium. For this purpose common brown paper is generally employed, and perhaps it is altogether the best; soft absorbent paper, such as blotting paper, loses its texture and becomes rotten so soon, as to be both too expensive and too perishable. The following is as little troublesome a method of drying plants as any with which I am acquainted. Take separate sheets of small-sized common stout brown paper; between the leaves of each sheet place your specimens compactly, so as to get them in as small a space as possible, without their pressing too much on each other; having filled a convenient number of sheets in this manner, place them between two stout pieces of brown paper boards, or what are called millboards, of the same size as the sheets, and tie the whole together tightly by means of leathern straps, or a strong cord. After the specimens have been thus pressed for a few hours, till the paper may be supposed to have absorbed a considerable portion of humidity from the plants, uncord the package, and strew the sheets over the floor of a room till the paper begins to become dried; then tie them together again as first directed, and repeat the operation of unpacking and repacking till the specimens are perfectly deprived of their moisture, when they may be placed in fresh paper, and laid by. It will be found, that in the process of drying, as thus directed, some kinds of plants will be fit for laying by much sooner than others; the parcels should therefore be examined from time to time, and the specimens selected as they become ready. If, as upon journeys in a wild country, there should be no convenience for spreading the sheets of paper upon a floor, the specimens should be packed as closely as possible in a bundle, which may be carried on the back, and they may be laid not only between the leaves of single sheets of paper, but between the sheets themselves. The nightly fires which are made upon such a journey will serve for drying the sheets of paper, in which the specimens may be immediately replaced. By transferring into a single spare sheet of dry paper the plants in the first sheet of damp paper, and then drying the damp sheet, and so on, a large collection of fresh specimens may be quickly shifted, and daily receive all requisite attention without difficulty or inconvenience. Specimens, when finally prepared, are usually of a uniform, more or less dark brown, colour; they should be quite flat, and will often become brittle, and to the eye of inexperienced persons very unlike what they were when fresh. I mention this in order to guard against the very common mistake of supposing that unless specimens retain their colours, or at least some portion of their beauty, they are useless. Even European plants, prepared by the most experienced collectors, can rarely be brought to preserve their colours; with tropical plants no such effect can possibly be anticipated. The object in preparing them is, by pressure, to make them capable of being retained between the leaves of a book, and, by drying, to arrive at a state in which they are no longer affected by the humidity of the atmosphere. In many cases both leaves and flowers become perfectly black; it frequently happens that the specimens fall in pieces at every joint; large fleshy flowers will shrivel into a third of their size, and the gayest variations of brilliant colouring will be converted into a uniform dull black or brown colour. But these alterations are of no importance; because, in whatever state the specimens may be, maceration in boiling water will restore their original forms; if they should have fallen in pieces, the scars upon the branches will indicate whence the parts have separated, and loss of colour does not interfere with subsequent investigation for the purposes of science. In sending specimens to England, it is necessary that very great care be taken to keep the case containing them in as dry a part of the ship as possible; and that the paper in which they are finally laid be not only dry, but either new, or at least not deprived of its texture by previous use. A single sheet of rotten paper will infect a whole bundle of fresh paper. If the collection is small, common wooden boxes answer every purpose for packing. But if it is so extensive as to render the stowing it in a good part of the ship inconvenient, the specimens, well secured in external coverings of paper, should be placed closely in casks, cased over with wood, some dry material being rammed in tightly between the cask and its case.

Orchidaceous Plants.—We perceive that another large collection of these fashionable flowers is announced for sale by auction. It is the property of Richard Harrison, Esq., of Liverpool, who is removing to London, and discontinuing their cultivation. Here will be found some of the oldest and finest specimens in the kingdom, especially of Cattleyas.

To Force the Chinese Chrysanthemum.—Mr. J. B. Garber, of Columbia, Pa., has succeeded in flowering the Chinese Chrysanthemum in the month of May. The plan which he pursues, is simply to detach the sprouts or suckers in the autumn, when the plants are in full bloom, and place them in small pots, keeping them in a temperature of not less than 50° Fahrenheit, with occasional shifting as they advance in growth, not neglecting to keep the soil at all times moist; from which experiment, he is led to believe that there would be no difficulty in forcing the Chinese Chrysanthemum so as to have it in flower the whole year.—*Hovey's Magazine.*

Phlox Drummondii, as a Greenhouse Plant.—We have so often alluded to this beautiful plant, that we fear our readers will think that we are giving it more importance than it can truly claim, as an object of ornament for the garden. To this opinion, however, we cannot give our consent. It may be said that we are prejudiced in its favour. If admiration of its exquisite flowers may be called prejudice, we are decidedly so; for we never look upon it, or cut one of its clusters of flowers, but we are involuntarily led into exclamations of its great elegance. As a summer ornament of the border, and as a winter inmate of the greenhouse, it is equally to be admired. Now that the season is at hand when it is to be seen in its full splendour and when its seeds should be planted to produce plants for blooming in the greenhouse in the spring months, we are induced to make a few observations upon its cultivation in the latter place. The seeds, to produce good plants, should be sown the latter part of August, or, at the latest, by the middle of September. Collect them from the plants now growing, if such can be had, or procure them from the seedsman. Select a shady situation in the garden, where the sun only shines in the morning or afternoon, and plant the seeds, after having well pulverised and prepared the soil. In the course of a week or two they will be up. Keep the young plants free from weeds, and in the latter part of September if the seeds were sown in Aug., or in Oct. if they were sown in Sept., take up the young plants into pots, placing one on each in a No. 1. Any common soil of the garden will answer for potting them. The pots should then be removed to a frame, where they may remain until November or December, giving occasional waterings, though they will need but a very small quantity at this season of the year. At the end of this time the plants may be removed to the greenhouse, placing them on an airy shelf, as near the glass as is convenient, watering them very sparingly. About the 1st of Feb., the strongest of the plants may be removed into No. 2 pots, using about half loam and leaf-mould, or peat and a small quantity of sand, giving at the same time a good drainage to the pots. The weaker plants need not be repotted until March. When the flower-stems appear, they should be tied to neat sticks, painted green, to give them a handsome form. If allowed to trail over the sides of the pot, they do not look well, from the half-erect habit of the plants. We have trained them to small delicately-made trellises, of a fan shape, and found the plants to present a very showy appearance; this, however, is unnecessary, unless the amateur has leisure time, and wishes to indulge in such fancy work: to look well, it must be done neatly, and the plants often looked over, and the stems tied up with fine bass or grass matting. In this manner the plants are rendered the gayest objects of the greenhouse or parlour, blooming abundantly from March to June. The plants might be then turned out into the border, where they will continue to flower all summer.—*Hovey's Mag. of Horticulture.*

Celery.—The method of cultivating Celery in the garden of Mr. Douglas, of Washington, is quite different from the usual plan of growing it in single trenches. The system is, to prepare a bed about four feet wide, and of any length the ground will admit. In this bed the plants are set out, in rows about six inches apart, and six inches from plant to plant. This takes place the latter part of July or first of August. As soon as the plants get well rooted and begin to grow, the operation of branching commences, and the earth is filled in between the plants every fortnight, until they complete their growth. The object of this mode is principally to counteract the effects of dryness. When the earth is thrown up in single ridges, evaporation, under a hot sun, takes place much more rapidly than if there was a large body of earth, as in beds four feet wide. The consequence is, that the plants have a constant supply of moisture, and as ridges are formed between the beds, where the earth is thrown out, in all heavy rains the plants receive all the benefit of the rain; while, by the method of growing the plants in single rows, all the water is carried away from them into the hollows which are formed, as soon as the plants are earthed up above the surface of the soil.—*Hovey's Magazine.*

On the Cultivation of Salsafy.—The seeds should be sown in April, in rows about ten inches apart, in good light rich soil, dug very deep, so that the roots may penetrate the earth, and meet with no obstruction to make them crooked. Thin out the plants to the distance of four or six inches; give due attention during the season, and keep the beds clean by occasional hoeings between the rows and by hand-weeding, and the plants will make a good growth. In October, or early in November, the roots should be taken up, and housed in the cellar, precisely in the same manner as the Parsnep, and may be used from time to time as needed. We have left them out all winter, as they are as hardy as the Parsnep; and where there is a plentiful stock, one or two rows might remain until March or April, when the roots should be dug. There are various methods of cooking the roots; but one of the most simple is to boil them, then mash and form them into cakes, and fry them in batter. Served in this way, they resemble a real "native" oyster, challenging even the palate of a *grand gourmand* to detect the substitute, and are an excellent accompaniment to many dishes, particularly in the country, where oysters are a rare article at all times.—*Hovey's Magazine.*

Liebig.—On the 4th of last month this great chemist was elected a Correspondent of the Academy of Sciences of Paris. He is expected shortly in this country.

GARDEN MEMORANDA.

Royal Botanic Gardens, Kew.—Numerous improvements have taken place in these gardens within the last few months. The lawn has been increased in size; fresh walks have been formed, and the Orangery has been undergoing extensive repairs. The hardy plants had been arranged in their natural orders as far as practicable before the season was too far advanced for their removal; and one portion of the garden has been exclusively devoted to the collection of native plants, which are also arranged according to their natural orders. In one of the stoves Pothos coriácea and several more of the same genus are growing luxuriantly upon blocks of wood, with their roots enveloped in moss; Allamanda cathártica is blooming freely, and Lissochilus streptopétalus, a handsome Orchidaceous plant, continues to expand its singular twisted flowers of brown and yellow. Amongst the aquatics in bloom are Nymphæa cærulea, blue with well-contrasted yellow stamens; Saururus cérnuus, with curious tail-like spikes of white blossoms, and Valisnéria spiralis, whose inconspicuous white flowers rise from the bottom of the basin on a slender spiral stalk of great length to the surface of the water. Here, too, are Jatropha multifida, with handsome fan-like leaves, producing cymes of bright scarlet; Gesnéria lanata, a strong-growing species, flowering in whorls of red and orange; and a fine plant of the Dámmara orientalis or Amboyna Pitch-tree. The Palm-stove contains two large specimens of Sabal Blackburniana, some of whose gigantic flabelliform leaves measure 11 or 12 feet in diameter, and a branching plant of the Pandanus or Screw Pine. In the Conservatory Chamærops húmilis and Córypha australis are growing luxuriantly, and a noble plant of Araucária excelsa has already reached the roof. The Banksias, of which there is an extensive collection, are in excellent health, and many of them are remarkable for their large size; Banksia speciosa is in flower, with Dryandra plumosa, Anadénia Manglésii, several Grevilleas, Leucospermum hypophyllum, and Tristánia conferta. In the same house with these are straight-growing plants of the rare and graceful Dacrýdium cupressinum and Dammara australis. In the Orchidaceous-house we observed in flower, Cattleya Forbesii; Pleurothallis Gróbyi, a delicate little plant, with spikes of yellow glume-like flowers; Zygopétalon Mackáii, dark brown, having the labellum beautifully marked with blue and white; Griffinia hyacinthina, a handsome bulbous plant, with light blue flowers, the two upper petals being margined with a deeper colour; and Nelúmbium speciosum, a splendid aquatic, with petals of deep rose, gradually changing to white towards the centre of the flower; the stamens are yellow, and the top of the ovarium, which bears some resemblance to that of a Poppy, appears to be studded with numerous distinct stigmas. Amongst the Cactáceæ in flower, are Echinocactus erináceus, yellow; E. centetérius, dull red; Mammillária quadrispina, scarlet; and Opúntia Dillénii, bright yellow; the singular Euphórbia meloniformis is also producing its inconspicuous green flowers; and many new species of Echinocacti and Mammilláriæ from Mexico will shortly be in blossom. The noble plant of Araucária Dombeyi on the lawn is rapidly increasing in size, and is producing four globular cones upon its uppermost branches. In front of the Orangery are magnificent specimens of Araucária excelsa, A. Braziliensis, and A. Cunninghami, in tubs, the former of which is at least 20 feet in height. The Kitchen-garden contains a great extent of glass, devoted to the forcing of Pines, Grapes, aad Peaches; and the healthy appearance of these is very creditable to the gardener who has the management of them. One Vinery in particular has a crop of the finest possible fruit: the Vines have been planted only three years, and are spurred close to the main stem every year; the shoots are invariably stopped two eyes above the bunch, and certainly the present appearance of the Vines argues little in favour of allowing them to ramble about the house at will. The quantity of Pines in different stages of growth is very great; one pit contains some remarkably strong plants of the Providence, and one of the Trinidad,' the latter in fruit. It does not, however, answer to the description given of this Pine in the Hort. Soc. Transactions, being rather broader at the top of the fruit than at the bottom; whereas it is there stated that the fruit is of an elongated conical form. The Peach-trees look very healthy, and are well cropped. —*R. A., July* 25.

Standish's Nursery, Bagshot.—Within the last two or three years several plants have been raised in this Nursery of great merit: such as Fúchsia corymbiflora, F. Standíshii, and Calceolaria Standíshii. There are now in flower some excellent Hybrids raised from F. formosa élegans (Thompson's), crossed with F. corymbiflora. The petals are of the richest purplish crimson, and the sepals are finely reflexed. The habits of the different plants vary, but the whole seem to be very free bloomers, some of them sending bunches of flowers from the axil of every leaf. We observed some excellent pits built of turf at a trifling expense, which are particularly well adapted for keeping half-hardy plants during winter; for they are much warmer and drier than those which are built of brick or stone. These pits are now filled with many thousands of hybrid Azáleas, raised from seeds saved from A. variegata, crossed with the best of the other varieties. They seem to grow as freely as Willows, and will probably be more easily kept alive than those which are struck from cuttings.—*R. F.*

CALENDAR OF OPERATIONS *for the ensuing week.*

THE remarks lately made by "A Tyro" on the stopping of Vines appear to have provoked a discussion on the subject, as though the propriety of the practice admitted of a reasonable doubt. Experience is in all cases the safest guide to practice; and that the system which we have recommended in this Calendar is correct, is abundantly proved by its adoption by almost all Grape-growers, in preference to any other method of summer management. The arguments of "A Tyro" are founded upon the assumption, that much of the true sap generated by all the leaves above a bunch is expended upon the fruit—when, as a matter of course, the greater the extent of digesting surface or leaf, the greater would be the amount of food afforded to the Grapes; but this assumption is certainly erroneous. Unquestionably the fruit is fed through the agency of the foliage (not, however, by the foliage only, which extraordinary doctrine has been promulgated by some modern chemists); yet if two perfect leaves are capable of assimilating all the nutriment a bunch of Grapes requires to bring it to perfection, as is proved by every-day experience, it may be questioned whether a single particle of the assimilated matter furnished by the superior leaves goes to increase the size of the berries. After supplying the bud in its axil, each leaf contributes a portion to the general system of the plant, thus adding to its bulk and solidity; therefore, the more leaves, or rather, the greater available superficies of leaf, a tree carries, the greater will be its general increase in size. As, however, Vines are cultivated, not for timber, but for Grapes, the object of the cultivator should be to cause the vigour of the plant to be expended in the production of fruit, and not in the growth of a great quantity of wood, which cannot be turned to any useful purpose. A little observation and reflection will convince "A Tyro" that increasing the wood of a Vine to the greatest possible extent will not increase the fruit in the same ratio; besides, the system he advocates would incur a great loss of space, because two yards of young wood would be laid in and require room to grow, instead of about as many feet. Respecting the syringing of Vines, we will merely observe, that the practice can only be defended on the plea of necessity; and if old Vines in old houses can be kept free from red spider by a better method, syringing may be dispensed with.

I.—KITCHEN-GARDEN AND ORCHARD.

In-door Department.

PINERY.—Proceed with the repotting of the plants, beginning with those intended to fruit next spring. If the soil in the pots is at all dry, let it be watered the day previous to potting. As the roots will now be placed in a large mass of earth, sufficient drainage should be used to insure the free egress of water; a little moss, spread over the crocks, will prevent the soil from trickling among them and choking the passage. In potting, place the ball deep in the pot, which need not be quite filled up with soil, unless embryo roots are formed in the axils of the lower leaves; a few of which should then be pulled off, and the young roots moulded up. Almost every Pine-grower has his favourite soil, differing from each other as widely as possible in composition: some choosing pure loam, without manure; while others give the preference to the richest and most stimulating mixtures. As plants are found to thrive in all these soils, it follows that this matter is of less importance than is generally supposed: the soil should, however, be rough and fibrous, that the water may percolate freely through it. Raise the surface of the bed, that the plants may stand near the glass; and if a large quantity of fresh bark is required for that purpose, bury it in trenching below the depth of the pots, that the roots may be surrounded by bark which is partly spent. In replunging, give the plants an increase of room, and take pains to set the pots level; and, as a strong heat may be expected, the trenches should not be filled up at present, but an open space left round each pot. Mr. Paxton recommends each pot to be set upon an inverted empty one, which, no doubt, is a good precaution. After untying and regulating the leaves, the plants should be syringed overhead, but not watered at the root. Keep the house close and damp, till the heat rises in the bed.

VINERY.—Remove laterals, and regulate the leaves, so that every bunch of ripening fruit may receive the benefit of sunlight. Deficiency of colour in Grapes is, perhaps, as often caused by over-cropping, or by an unhealthy state of the plant, as it is by the want of free air and light.

PEACH-HOUSE.—Direct exposure to the sun's rays appears to be beneficial to the young wood of Peach-trees, probably by exhaling its watery particles, and thus making the wood more firm. When, therefore, the leaves of the early-forced trees are found to come off with a touch, which is a sign that they are no longer necessary, all that are loose had better be removed, by brushing the trees lightly over with a besom; but if the leaves are still in vigour, continue to wash them and to water the roots as before.

CUCUMBERS AND MELONS.—If, in spite of all the precautions hitherto taken, the red spider increases in the frames, the steaming process described in a former Number should be repeated as a last resource. The safest course will be to put a thermometer in the frame, and when this rises above 100°, to shade the lights with mats; the frame need not be opened again till the following morning. This process is inapplicable when the fruit is nearly ripe, as upon these the vapour would have the same effect as water, causing them to crack. Water Cucumber plants liberally.

Out-door Department.

RAIN has fallen so partially this summer, that while in some parts of the country there has been a superabundance, others are so parched by extreme drought, that garden produce can only be kept alive by continual waterings. In the latter places, watering is now the chief occupation. Where a sufficient supply of water for everything that requires it cannot be obtained, the preference should be given to such standard crops as Celery, Cape and Grange's Broccoli, autumn Cauliflowers, &c., because the want of these at the proper season would be less easily remedied than a deficiency of a particular crop at the present time.

CABBAGES.—Water the seed-beds regularly, and unless a change of weather soon occurs, they had better be shaded, if fully exposed to the sun.

ENDIVE.—Make a sowing to stand late in spring.

SUCCORY.—Thin the young plants, and water them occasionally.

TURNIPS.—At the end of the week, sow the Stone for use in spring.

ORCHARD.—Wasps will most likely soon be getting numerous; their nests should therefore be sought out and destroyed, before they do much mischief. Most kinds of insects which are injurious to plants abound this season; and constant attention will be requisite to keep them under. If earwigs are troublesome to wall-fruit, they can be caught by cutting the hollow stalks of Beans in pieces, and placing them among the branches. Let Peach-trees be washed with the engine as often as practicable. Should the hot weather continue, Cherries, Gooseberries, and Currants against walls will keep better if covered with mats instead of nets. See to the watering of Strawberry plants for forcing.

II.—FLOWER-GARDEN AND SHRUBBERY.

In-door Department.

STOVE.—Where there are flues in the house, they should now be cleaned and repaired; hot-water apparatus should also be examined and put in order. If any alterations which were intended are not yet done, this is an excellent time to do them; the house may be painted within and without, the walls washed, and the wires for creepers throughly cleaned.

GREENHOUSE AND CONSERVATORY.—Particular attention must be paid to the watering of all pot plants, while such hot and drying weather prevails. Delicate plants are sometimes irreparably injured by the sun striking directly against the sides of the pots, and drying up the tender roots. To prevent this mishap, the pots which contain very choice plants might be placed in empty ones of a larger size, and the interstices filled with moss. The Conservatory borders will need a liberal supply of water, and such plants as are not in blossom should sometimes be syringed. Let all necessary repairs be made before the time arrives for housing the plants.

PITS AND FRAMES.—Put in cuttings of scarlet Pelargoniums for bedding out next spring. If potted singly, they will not need shifting again. When offsets of Calceolarias show a disposition to protrude roots, let them be taken off and potted in small pots of light sandy soil. Some cultivators lay a little soil round the base of the shoots, into which they strike roots before being taken off the old plants. Pot Hydrangea cuttings.

Out-door Department.

Watering and cleaning is now the chief work in this department; if the replanting of any vacant beds is indispensable, they had better be shaded afterwards. Cuttings of the finest Pentstemons, Snapdragons, and many other showy herbaceous plants, may still be put in under hand-glasses. The double varieties of the various kinds of Lychnis and its kindred genera are much less cultivated than they deserve.

NURSERY AND FOREST DEPARTMENT.

NURSERY.—When time can be spared, prepare ground by trenching or digging, for the reception of cuttings of evergreens, which will succeed well if planted in moist weather towards the end of this month, or the beginning of next. Clean the ground thoroughly between the rows of young plants, likewise all seed-beds; or when rain comes, the whole will soon be a wilderness of weeds.

FOREST AND COPPICE WOODS.—If not already done, young trees and the bottoms of hedges should be cleared of grass and weeds before rainy weather sets in. A man with a mattock could clean round the stems of a great many young trees in a little time, and the rubbish might be left upon the ground as a mulching.—*J. B. Whiting, The Deepdene.*

State of the Weather near London for the Week ending August 4, 1842, as observed at the Horticultural Garden, Chiswick.

REPORT ON COVENT GARDEN MARKET,

For the week ending August 5, 1842.

The Market has been well supplied during the past week, and the long-continued fine weather has greatly accelerated the ripening of Plums and other late fruits; trade has, however, been rather on the decline. *Fruit.*—Amongst the Pines, we observed some fine Providences. Black Grapes remain steady at the former prices; Muscats are a trifle cheaper. English Melons are from 2*s.* to 3*s.* 6*d.* each; the Dutch from 1*s.* to 2*s.* 6*d.* Peaches and Nectarines are remarkably fine, from 10*s.* to 18*s.* per dozen. The best Apricots are fetching from 2*s.* to 2*s.* 6*d.* per dozen; Green Gage Plums from 2*s.* to 3*s.* 6*d.* per punnet, and other good dessert Plums 1*s.* 6*d.* per punnet: early Orleans and Violet Plums are plentifully supplied, the former from 2*s.* 6*d.* to 4*s.* per half sieve, the latter from 1*s.* 6*d.* to 2*s.* per half sieve. The supply of Cherries has diminished greatly; and Strawberries are quite over. The dessert Apples consist principally of White and Red Juneatings, the Duchess of Oldenburg, the Astrachan and Manks Codling, from 3*s.* to 5*s.* per bushel; and culinary Apples are from 2*s.* 6*d.* to 4*s.* per bushel. Jargonelle and Windsor Pears are very fine, and fetch from 4*s.* 6*d.* to 7*s.* per bushel. Nuts have appeared during the week at 9*d.* per lb. Frame Cucumbers are from 3*s.* to 7*s.* per doz., and Girkins for pickling, from 8*s.* to 9*s.* per 1000.—*Vegetables*: Cauliflowers still continue to fetch a high price. Coleworts may be obtained from 2*s.* to 3*s.* per dozen bunches. Peas are somewhat cheaper than they were last week; so likewise are Windsor and Kidney Beans. Good Lettuces are to be procured from 6*d.* to 1*s.* 6*d.* per score. Artichokes are plentiful from 2*s.* to 4*s.* per doz. Vegetable Marrows are very abundant, and are selling from 4*d.* to 9*d.* per doz. Mushrooms are not so scarce as they have been during several previous weeks; they fetch from 1*s.* to 2*s.* per pottle.—*Flowers*: We observed in pots some well-flowered plants of Campanula pyramidalis, and Oleander splendens; with Hydrángeas, Fuchsias, and Balsams. The cut flowers consist of Dahlias, Stocks, Picotees, and Carnations, with a few blooms of Hoya carnosa, Bouvárdia triphylla, Gardénias, Ericas, and Bignónia venusta.

PRICES, Saturday, August 6, 1842.—FRUITS:—

Pine Apple, per lb. 4*s* to 7*s*
Grapes, per pound, 1*s* 6*d* to 4*s*
— Muscats, per pound, 5*s*
Melons, English, each, 2*s* to 3*s* 6*d*
— Dutch, 1*s* to 2*s* 6*d*
Peaches, per doz. 10*s* to 18*s*
Nectarines, per doz., 10*s* to 18*s*
Apricots, per doz., 1*s* to 2*s* 6*d*
Plums, dessert, per punnet, 1*s* to 2*s*
Greengages, per punnet, 1*s* 6*d* to 2*s* 6*d*
— Baking, per hf.-sv., 2*s* 6*d* to 5*s*
Apples, dessert, per bush., 3*s* to 8*s*
Pears, dessert, per hf. sieve, 3*s* to 6*s*
Raspberries, per gall. 10*d* to 1*s* 2*d*
Cherries, wall, per lb. 1*s* 6*d* to 2*s* 6*d*
— standard, per doz. lbs., 3*s* 6*d* to 5*s*
Gooseberries, per hf. sve., 2*s* 6*d* to 5*s*

Currants, White, per hf. sv. 4*s* to 5*s*
— Black, per hf. sv., 3*s* 6*d* to 7*s*
— Red, for wine, 3*s* to 3*s* 6*d*
— for dessert, 4*s* to 6*s*
Cucumbers, per doz., 3*s* to 7*s*
— for pickling, per 1000, 8*s* to 9*s*
Oranges, per doz., 1*s* to 2*s*
— per 100, 6*s* to 14*s*
Lemons, per doz. 1*s* to 2*s*
— per 100, 6*s* to 14*s*
Almonds, per peck, 7*s*
Sweet Almonds, per pound, 3*s*
Filberts, English, per 100 lbs. 75*s* to 100*s*
Hazel Nuts, per lb. 9*d*
Nuts, per bushel—
— Brazil, 20*s*
— Barcelona, 20*s* to 24*s*

VEGETABLES.

Cabbage, per doz. 6*d* to 1*s* 6*d*
— plants, or Colewort, per doz. 2*s* to 3*s*
Cauliflowers, per doz., 2*s* to 6*s*
Peas, per sieve, 2*s* to 5*s*
— per half sieve, 1*s* 3*d* to 2*s* 6*d*
— per sack, 5*s* to 10*s*
Beans, Kidney, per hf. sv., 1*s* to 2*s*
— Broad, per sieve, 1*s* 6*d* to 2*s* 6*d*
Potatoes, per ton, 40*s* to 60*s*
— per cwt. 2*s* to 3*s* 6*d*
— per bushel, 1*s* 6*d* to 2*s* 6*d*
— Kidney, per bush., 3*s* to 4*s*
Artichokes, per doz., 2*s* to 4*s*
Turnips, per doz. bun., 2*s* to 3*s* 6*d*
Carrots, per doz. bunch, 3*s* to 5*s*
Red Beet, new, per dozen, 9*d* to 1*s*
Radish, per doz. hands (24 to 30 each) 1*s* to 1*s* 6*d*
— Turnip, p. doz. bch., 1*s* to 1*s* 6*d*

Horse Radish, per bundle, 1*s* 6*d* to 5*s*
Spinach, per sieve, 2*s* to 3*s*
Onions, Green, per doz. bun. 1*s* 6*d* to 3*s* 6*d*
— Cooking, per doz. bch., 2*s* to 4*s*
Chives, per bun., 3*d*
Leeks, per doz. bun., 3*s* to 4*s*
Garlic, per lb. 4*d* to 6*d*
Shallots, per lb., 10*d* to 1*s*
Lettuce, Cabbage, p. score, 9*d* to 1*s* 6*d*
— Cos, 6*d* to 1*s* 6*d*
Celery, per bund., (12 to 15), 9*d* to 2*s*
Small Salads, per punnet, 2*d* to 3*d*
Parsley, per half sieve, 1*s*
Tarragon, per doz. bun., 2*s* to 3*s*
Mint, per doz. bunches, 3*s*
Vegetable Marrow, per doz., 6*d* to 9*d*
Capsicums, green, per 100, 1*s* 6*d* to 2*s*
— Ripe, per doz., 9*d* to 1*s* 6*d*
Chilies, per 100, 1*s* 6*d* to 3*s* 6*d*
Mushrooms, per pottle, 1*s* to 2*s*

Notices to Correspondents.

Mr. PAXTON'S COTTAGER'S CALENDAR is now reprinted in the form of a small volume, for general distribution, price 3*d.* each copy; it may be ordered of all Booksellers. Gentlemen wishing to distribute copies among their cottage tenantry may have them *delivered in any part of London* by remitting a Post-office order to this Office, at the rate of 5*s.* for every 25 copies required.

B. B. B.—The charge for your Advertisement should have been 5*s.* You had better in future send direct to the office.

R. M. K.—In packing Cacti in foreign countries, two things only have to be observed. The first is to take them up when they are not growing, and on no account to injure their roots; the other is to pack them in the driest material that can be procured—very dry sawdust is as good as anything. They must be packed perfectly tight, so that they may not afterwards become loose and be bruised by knocking about in the box.

J. A. D.—One of your plants is Linária bipartita; the other, a Mathiola, probably tristis.

Amicus.—The best method of propagating Camellias is by inarching them: the best time of performing that operation is in the month of April. They may, however, be inarched in September, keeping them in rather a shady part of the house, with a temperature of between 55° and 60°. It is impossible for your Camellia glauca to be in even *apparent* excellent health, if the leaves and blossom-buds keep dropping off. Probably it has suffered from want of water.

A. B. C.—There are many freaks of nature which we cannot understand or explain. Among them is the unusual circumstance of an Apple-tree (with Apples on) blossoming again at this season of the year.

Wills 'plants are:—1, Equisetum sylváticum; 2, O'robus sylváticus; 3, Vícia cracca; 4, Ervum hirsutum; 5, Euphórbia Peplus; 6, Euphórbia Láthyris; 7, Hypéricum perforatum; 10, Pulicária dysentérica; 11, Hypéricum quadrangulare; 12, Mentha arvensis; 13, Stachys sylvática; 14, Mentha hirsuta; 16, Prunella vulgaris; 17, Betónica officinalis; 18, Arum maculatum; 19, Torilis anthriscus; 20, Gálium palustre; 21, Lotus corniculatus; 22, Sedum acre; 23, Láthyrus pratensis; 25, Fumária officinalis; 26, Verónica Anagallis; 28, Silene Arméria var. rubra; 29, Penthorum sedoides; 30, Dianthus superbus.

Messrs. Maule.—Your Clematis is new. It is near C. viorna and cylindrica, and looks as if it were a cross between them. It is very sweet-scented, and a good addition to the collections.

An Amateur, Farringdon.—No. 1 is the best of your seedling Pansies; the eye and general form are good, but the undecided nature of the blue colour throughout the flower we consider to be a great defect; 2 is pretty, but surpassed by many in the same way; the eye in 3 renders it of no value.—*

R. O., Southampton.—The Crimson Dahlia, tipped with white, is a flower of good general form; the centre is well up, and it has considerable depth of petals; it is also very regularly tipped. As it is of a pleasing colour, should it prove constant, it will form a very desirable addition to this class of flowers.—*

E. S. C.—The general form of your seedling Pelargonium, No. 1, is very good; the petals are well formed, with clean edges; the spot is good, and the colour, though common, clear and pleasing; the petals are rather thin. No. 2 is not worth preserving; the form of the flower is bad, and the texture of the petals thin and flimsy.—*

S. Hodges, Cheltenham.—Your seedling Calceolarias do not keep pace with the present improved state of these beautiful flowers. So much has lately been effected as regards size and marking, that your blooms are poor, compared with the varieties now cultivated in the neighbourhood of London.—*

An Amateur.—Your question respecting Chrysanthemums is fully answered in another part of the Paper. The duty now levied on foreign seeds is stated in the Tariff at p. 479. We know nothing of those you mentioned beyond what you find in the advertisement. Such manure as you describe will be of excellent quality. The party who advertises Carnations we believe to be respectable. There is no necessity for taking *any* bulbs out of the ground for the winter, except for the purpose of ripening them; many ripen well enough of themselves, even in this cold country. Tulips and Hyacinths, with tender species of Gladiolus, and similar plants, require it.

X. Y. Z.—The Pea sent is the Purple-podded.

An Inquirer will find his question fully answered amongst this week's Miscellaneous matter.

A Churchwarden.—As far as we can judge from the appearance of the leaf and flower sent, your plant is the Tília parvifólia, or small-leaved Lime.

R. W.—The insect sent is the Humming-bird Hawk-moth, remarkable for the rapidity with which it darts from flower to flower, in order to extract the nectar which they contain. You may rest assured that the caterpillar which destroyed the leaves of your Ipomœa Learii was not the larva of this insect; as it feeds entirely upon the different species of Gálium. In some parts of the country it is rather common. The annual which you had sent from London under the name of Brachycome iberidifólia is decidedly incorrect; the flower sent is Callichroa platyglossa.

A. W.—Your flower is Gesnera Douglásii.

I. shall be attended to shortly.

J. R.—The seeds of the Bermuda Cedar will require to be sown in pots in a frame: the sooner the better. This is the kind of which the Cedar ships are built in the Bermudas; but it is too tender for this climate.

C. E. G.—You are right. The plant which was sent you from London, as a new pink Verbena, is nothing more than the Crucianella stylosa.

A Constant Reader.—Your plants are, 1, Inula ensifólia; 2, Spiræa filipéndula; 3, Dracocéphalum Moldávicum; 4, Lysimáchia nummulária; 5, Campánula púmila alba.

Zaccheus.—The word sepal signifies a division of the calyx, just as petal means a division of the corolla. You are mistaken in supposing the word sepal to be new.

An Observer.—We are not acquainted with any Moth-trap, except the gauze forceps used by entomologists. You may easily collect these insects in abundance by such means. But, for heaven's sake, don't send your acquisitions to us! What would become of the questions of polyonymous correspondents if the Editor of *G. C.* were Moth-eaten? We recommend you to apply to a florist to supply you with Picotees and Carnations for forming a bed, and leave the selection to him; in addition to this, as you want them for nosegays only, it would be advisable to have a bed of seedlings, as they blossom most abundantly, and remain a much longer time in flower.—*

Gamma.—Your seedling Picotees with yellow grounds are both good varieties—the Duke of Orleans is the better of the two; the yellow ground being very clean and bright, and the heavy edging of a good colour. Princess Helen being a light-edged variety, with a delicate yellow ground, the beauty of the flower is much impaired by having the under side of the petals much spotted, which, curling up at the ends, make the ground appear discoloured. The pods of both are good.—*

P. R. W.—The plants sent are, Poa aquática, Rumex crispus, Lepídium ruderale, and Scolopéndrium vulgare. Those numbered are:—1, Aspídium filix mas.; 2, Aspidium aculeatum; 3, Asplénium filix fœmina; 4, Polypódium vulgare.

Paul Pry.—You will find a list of the plants best adapted for forcing at p. 144 of last year's *Chronicle.*

Lomax.—Your plants of Salvia patens in the open ground are more likely to have withered from the attacks of some grub or insect at the roots, than from having received too much water.

A. B. next week.

Contagio.—When you tell us that your Vines, until lately, have been in excellent health, and that they are now covered either with *mildew* or *dirt*, you speak of two things so entirely different, that, without you are more explicit, it will be impossible for us to prescribe a remedy, since what would be the cure for one, would infallibly increase the other. You furthermore state, that you can trace a small insect upon them; if so, it is undoubtedly the brown scale, which can only be subdued by peeling the rough loose bark from every branch in winter, and brushing or scraping off all the insects discernible: afterwards coating the whole Vine over with soapsuds and sulphur, of the consistence of paint. We can recommend nothing better for your Gooseberry bushes, which are infested with the green fly, than to dust all the infected shoots with Scotch snuff. The Cape Jasmine requires to be kept in a moist heat after flowering, to perfect its growth, and form blossom-buds for next year.

S. S.—Mr. Sandys's Treatise on Forest Pruning forms a part of Mr. Withers's book.

An Amateur.—We will attend to your request next week.

Dr. M. says, "In a late Number of the *Chronicle*, p. 422, I observed that Bees can be stupified and removed from their combs by means of puff-balls or rags soaked in nitre. As I cannot easily get the puff-balls, and nitre is always at hand, I will feel obliged if you can direct me how to use the latter. I used to cut out the combs from the hives, and then join the Bees to the neighbouring hive; but this is troublesome, and I would much prefer keeping the honey in the hive when it has been made, if I could depend on merely stupifying my pets for a little while." [Mr. Cotton recommends a pointed tin box, with holes in the top, and a sharpened point on the under side, to fasten into the under empty hive. The holes being small, and the form of the top conical, the Bees are not burned or injured by their fall. He prefers the puff-balls, but says that linen rags soaked in nitre will do. Of course they are burned in the tin box in the same way as the puff-ball.

Culshaw.—A young gardener, who wishes to know the best work on plan-drawing, should first of all make himself perfect in practical geometry, and then he will find "Clark's Drawing," in "Chambers' Educational Course," of great use in enabling him to draw greenhouses, &c., correctly. In so far as the mere ground-plans are concerned, practice and a few lessons are what he most requires.

A Limerick Subscriber.—Cirrhopetalum sinense has not yet been figured in any of the periodicals, but will appear shortly in the "Botanical Register." Myatt's Pine Strawberry was sent out in the spring, at 5*l.* per 100 plants. Lelieur is a good crimson Noisette Rose.

T. Savoy.—The seeds of Clintonia pulchella may be sown in pots as soon as they are ripe, and the young plants as soon as they have obtained a sufficient size may be pricked out, three or four together, into small 48-sized pots. These plants, if protected from the frost during winter, will bloom well when planted out in beds towards the middle of May. The soil should consist of equal portions of sandy loam and peat, with a small quantity of manure. The seed sent is not the Flanders, but the New Zealand, Spinach. The plants are, Stenactis speciosa, Digitalis ferruginea, Tróximon glaucum, and Geropogon glaber.

A Subscriber's plants are—1, Camássia esculenta; 2, Helianthus multiflorus; 3, Stenactis speciosa; 4, Lobélia Begoniæfólia; 5, Coronilla várium; 6, Geránium prostratum; 8, Monarda fistulosa; 10, Justícia speciosa; 11, Lantana salviæfólia; 12, Francoa ramosa.

Cr, Whitehaven, says, "that a gardener in his neighbourhood grows what he calls Myatt's Pine Strawberry, and has from it most abundant crops, on a soil little better than rubbish from a freestone quarry—but it is manured well. His fruit ripens the earliest in the neighbourhood—and the berries are of a bright red colour: do these agree with the Myatt's Pine? if they do, he intends adopting the plan recommended by Mr. Reid in this week's *Chronicle*, and plant some runners this autumn. He asks if we can give him any other character peculiar to them, that he may not be deceived?"—[The fruit of Myatt's Pine Strawberry is ovate or conical, rather pale red, with yellowish grains, which are prominent, or but slightly embedded. The leaves have a yellowish-green hue: the middle leaflet is regularly oval, the side leaflets are obliquely ovate. The leaf stalks are hoary, with silky reflexed hairs: on the petioles the hairs are erect, and along the midrib they at last become closely adpressed; the upper surfaces of the leaves have also scattered hairs, less silky than those on the under side.]

G. J. P.—Your plant of Fuchsia corymbiflora, which has 8 leading shoots branching from the bottom, to the height of 8 or 9 feet, and which does not show the least indication to flower, has probably been over-potted, and grown too freely. We therefore recommend you not to shift it, and try whether starving it will not cause it to blossom.

An Original Subscriber.—The Pear you sent is the Citron des Carmes.

Glazed Flower Pots again next week.

A Tyro.—The Linária is L. repens; the other specimen is nothing more than a slender growing plant of Thymus serpyllum.

Rosamond.—The seeds of the Horse-Chesnut which you have sent us are dead; therefore it will be of no use for you to plant them. You must procure some fresh nuts, as soon as they drop naturally from the trees, and preserve them in sand through the winter. These may be sown in March, in rows about two or three inches deep, and about six inches apart. After standing in the seed-beds for one year, the plants will be fit for removing.

J. Youell.—Your Elm from the neighbourhood of Holt, which you suppose produces Oak leaves on its laterals, is, we suspect, no Elm at all, but a Hornbeam. At all events, the so-called Oak leaves are nothing more than a natural sport to that kind of cut-leaf which gives their name to the fern-leaved Beech, the Gooseberry-leaved Alder, and the Fern-leaved Hornbeam.

Hortulanus.—On no account place hot-water pipes amongst the roots of Vines in the border in front of your Vinery, unless they are inclosed in a hollow chamber; and it is much better not to do so at all.

As usual, many letters have arrived too late for answers this week.

NEWS OF THE WEEK.

The arrival of the Overland Mail has supplied us with recent intelligence from India and China. The news from Jellalabad comes down to the 29th of May: the troops had remained inactive since the arrival of reinforcements, and had suffered much from heat and from the want of supplies. Some contradictory accounts have been received relating to the evacuation of Affghanistan. An order appears to have been issued by the Adjutant-General for the troops serving west of the Indus to retire within the British provinces, and some excitement had been produced in the different Presidencies at the supposed withdrawal of the army under existing circumstances. It is said, however, that the instructions were misunderstood, and that the order for the withdrawal of troops applied only to Jellalabad. Notwithstanding this explanation, other circumstances are mentioned which are considered to indicate the intention of the Governor-General to evacuate the country beyond the Indus at no very distant period. No arrangement has been effected for the release of the British captives. Akhbar Khan had demanded, as the price of their ransom, an exorbitant sum of money, and secure possession of the throne of Cabul; these terms were of course rejected, and in the mean time the prisoners have been removed to some place nearer the hills, with little prospect of an immediate release. General Sale's victory had struck terror into the minds of the people; and it was thought that the army might have marched on the capital without resistance, if it had been furnished with the indispensable supplies. An attack had been made by Akhbar Khan on the Bala Hissar, which had signally failed; but the Khyber Pass is said to be re-occupied by the mountain tribes, and the whole road to Cabul stockaded.—In China some fighting has taken place in the neighbourhood of Ningpo, in which 1,100 British routed 6,000 Chinese, with the loss of some hundreds on the part of the enemy; Sir H. Pottinger remains at Hong Kong, waiting the arrival of reinforcements, before he undertakes any operations to the northward. A rumour was current at Macao that an Imperial Commissioner was on his way to offer 40,000,000 dollars as compensation for the expenses of the war, and the surrendered opium, with the cession of Hong Kong, as the price of peace; it was also said that the Chinese are preparing to rebuild the Bogue Forts: but both rumours are considered to require confirmation.—Our European news also increases in importance; in France the contests of parties have begun with more than their usual animosity, and the proceedings in the Chambers indicate a spirit of opposition to the Ministry which is likely to lead to the retirement of M. Guizot. The disclosures relative to the recent elections afford some startling proofs of intrigues between men of extreme political opinions, who have united to effect the overthrow of the Ministry; and so determined is the hostility of the Opposition, that they have resolved in the approaching contest for the Presidency to oppose one of their own members, because he is favoured by the Cabinet. The funeral procession for transferring the remains of the Duke of Orleans to Notre Dame took place on Saturday; the church ceremonies were performed on Wednesday, and the body was removed on the following day for interment in the Royal vault at Dreux. The people assembled in great numbers, and their demeanour evinced a respectful sympathy for the melancholy event.—In Spain the journals are beginning to protest against the cruelties committed by Gen. Zurbano in his mission against the Carlists of Catalonia; it is believed that the late Cortes will not be again assembled, and that a general election will take place in the course of the autumn.—Our Portuguese news mentions the recognition of Donna Maria by the Emperor of Russia, and states that the Duke of Palmella has positively declined joining an administration in which the present Prime Minister holds office.—By the Levant mail we learn that the affairs of the Ottoman Empire are daily becoming more embarrassed, and that the foreign relations of the Sultan have assumed a serious aspect. War with Persia is on the eve of declaration; a Persian army is preparing to march against Bagdad, and another against Erzeroum; while a fresh outbreak has occurred on the Servian frontier, and the whole of Bulgaria is in open revolt against the Porte.

At home it is announced that Parliament will be prorogued on Thursday next by the Queen in person. Both Houses during the week have been occupied with the completion of various measures preparatory to the close of the Session, and several bills which had given rise to much discussion in their earlier stages have been passed. The progress and prospects of the harvest are highly favourable; the accounts from all parts of the United Kingdom show that the country was never blessed with a finer season; and even where the supply is likely to be deficient, the quality of the corn promises to be better than has been known for many years.

Home News.

Court.— The Queen, Prince Albert, the Prince of Wales, and the Princess Royal remain at Windsor, and are in excellent health. Her Majesty is expected in town early in the week, for the purpose of proroguing Parliament in person; after which the Court will immediately return to Windsor. On Monday the Duke of Cambridge and the Princesses Augusta and Mary of Cambridge arrived at the Castle on a visit to her Majesty, and returned to town on Wednesday. The Queen Dowager arrived on Wednesday on a visit to her Majesty, and returned to Marlborough-house yesterday, in order to proceed this day to Gopsall Hall, on a visit to Earl Howe. Preparations are making at the Castle to celebrate the birthday of Prince Albert on the 26th inst., when his Royal Highness will enter his 24th year. The Duchess of Kent is about to proceed to Wiesbaden for the benefit of the baths, and will make a short stay at Brussels, in passing through that city. Lord Sydney has been succeeded by the Marquis of Ormonde as the Lord in Waiting on her Majesty; and the Hon. Col. Grey has been succeeded by Col. Buckley as Equerry in Waiting on the Queen. Col. Wylde has relieved Col. Bouverie as Equerry in Waiting on Prince Albert.

Parliamentary Movements.—It has been announced that Parliament will be prorogued on Thursday next by the Queen in person. The new writ having been issued for Southampton, Mr. St. John Mildmay, and Mr. Hope, Under Secretary for the Colonies, have addressed the electors on the Conservative interest; Lord Nugent and Mr. G. Thompson, the Anti-Corn Law Delegate, are the opposition candidates. At Nottingham Mr. Walter the Conservative candidate was opposed by Mr. Sturge, who was actively supported by the Chartists; at the nomination on Wednesday the show of hands was in favour of Mr. Sturge; a poll was demanded on behalf of Mr. Walter, who was returned by a majority of 81.

Election Compromises.—A letter from the Chancellor of the Exchequer to Lord Chelsea, one of the members for Reading, has been published, in which the Chancellor refuses his Lordship the Stewardship of the Chiltern Hundreds, and states his intention to withhold the office in all cases where compromises have been entered into.

Gazette Announcements.—Official notice was given in the Gazette of Tuesday, that Lord Monteagle, as Controller-General of the Exchequer, and Mr. Arthur Eden, the Assistant Controller, have full authority, under the new act passed in the present Session, to sign Exchequer Bills in their own names respectively. The Queen has appointed Mr. C. G. Young to the office of Garter Principal King of Arms; and Mr. E. H. Gibbon to the office of York Herald, vacant by the promotion of Mr. Young.

Foreign.

France.—*The Chambers.*—The state of the Ministerial and Parliamentary question becomes more and more complicated, and the contests of parties have commenced with more than their usual acrimony. The Chambers have been engaged in discussing the validity of disputed returns, and some startling disclosures have been made of electoral intrigues in which several members of the Cabinet suffer as much in estimation as the Opposition leaders, whether Republican or Royalist. The first case brought on was the election of M. De Larochejaquelin, the Royalist deputy for Ploermet. M. Billaut read a letter from the Sub-Prefect of the district, stating that he had at first observed neutrality in the election, but that when he saw the Prefect, his superior, lean to the Legitimist candidate, he, the Sub-Prefect, rallied round him all the friends of the Revolution of July, and supported the candidate of liberal opposition against the Legitimist. Here was proof, exclaimed M. Billaut, from the mouth of a Government officer, that Government favoured a Legitimist against a candidate of dynastic opposition. M. Larochejaquelin declared that he had not been supported by the Government, and retorted on the opposition by quoting letters from M. Thiers and M. Odillon Barrot in support of various Royalist candidates. M. Larochejaquelin then took his seat, but the Government have dismissed the Sub-Prefect for writing the letter in question, on the ground that such a document is contrary to all the rules of administrative service when permitted to be read publicly. The next case was that of M. Pauwels, Ministerial deputy for Langres, whose election was opposed on the score of bribery and corruption. After a warm debate, on the admission or non-admission of M. Pauwels, the Chambers divided, giving 191 for his admission, and 205 for the adjournment. Until the question is finally settled, M. Pauwels is allowed to retain his seat, but the division is considered by the Opposition as a blow to Ministers. Another angry discussion has taken place on the validity of M. Baude's election, and the Opposition have made a fierce attack on the interference of Government in the elections. M. Duchatel on the part of Ministers alleged in their defence, that the Opposition intrigued and interfered too; but his speech was received with shouts of derisive laughter, and with cries that the conduct of the Ministry was immoral, as it had not only patronage and power at its disposal, but the secret funds as well. M. de Beaumont was the chief speaker against M. Baude. After an angry speech from M. Barrot, the election was declared valid. The election of M. Emile de Girardin, editor of the "Presse," who has acquired some notoriety from having killed M. Armand Carrel, of the "National," in a duel, then occupied attention; an objection had been raised to his nationality, and some informality having been discovered in his qualification, it was considered doubtful whether he would be allowed to take his seat for either of the places for which he has been returned. The commission had proposed his election by 25 votes to 3, but the question was adjourned. In regard to the election of President a warm and angry contest may be expected; as soon as the Ministerial organs announced that the Conservatives would vote for the Presidency of M. Sauzet, the party of MM. Dufaure and Passy, to which M. Sauzet belongs, resolved not to vote for a candidate, even of their own, who was favoured by the Ministry. They have resolved to bring forward M. Dufaure himself, and the Opposition papers begin to recommend a reconciliation with M. Thiers, who had announced their intention of supporting M. Odillon Barrot. There is a general impression that if these candidates go to the ballot with M. Dupin and M. Salvandy, who are also proposed, they will each have a respectable portion of votes, but none of them sufficient to form an absolute majority and render the election valid. At present nothing is known with certainty, but the fact that the different sections of the Opposition are ready to support any plan which may be most effectual in overthrowing the Ministry. It is generally believed that the election of M. Dufaure will be followed by the immediate retirement of M. Guizot.

Funeral of the Duke of Orleans.—The funeral procession for transferring the remains of the lake Duke from Neuilly to Notre Dame took place with great solemnity on Saturday. The day was fine and cool. The troops of the National Guard and of the garrison were all under arms, and lined the road the whole length of the procession. The clergy, both on foot and in carriages, were far more numerous, and in greater pomp, than at the funeral of Napoleon. The Archbishop of Paris himself was in the procession, whilst many of his clergy were on foot. The heart of the Prince, contained in an urn, covered with crape, was borne in a state mourning coach, with four ecclesiastics. The hearse was drawn by eight horses, and the cords of the pall were borne by six grandees on horseback. Marshal Soult, and three other Marshals, bore four of these cords; the Chancellor and the President of the Chamber of Deputies bore the two others. The Prince's charger, a grey, was covered with a black gauze, studded with silver stars. The Princes, the ministers, the deputations of peers and deputies, followed in a long line of mourning coaches; and the demeanour of the public evinced every sympathy for the melancholy fate of the Prince and the grief of his family. On Wednesday the funeral service was performed in Notre Dame, in the presence of an immense concourse of spectators and the State authorities. The mass was celebrated by the Archbishop of Paris. The body was removed to Dreux on Thursday, where it will be deposited in the Royal sepulchre in the presence of the King, the Princes, and the great Officers of State.

The Capital.—On Friday, the Chamber of Peers presented an address to the King on his recent bereavement. In his reply, the King said, "I am much affected by this address. I find in it the expression of those sentiments with which my own heart is penetrated, and a new pledge for that union of all the powers of the state on which is founded security for the present, and a guarantee for the future against the dangers to which they might have been exposed from the cruel blow which has fallen upon me." The editor of the "Gazette de France" has been prosecuted for alleged seditious libels which appeared in that paper on the 19th and 20th ult., in articles referring to the contemplated Regency, and sentenced by default to two years' imprisonment and a fine of 24,000f.—Accounts have been received in Paris of the death of Baron Larrey, the eminent surgeon whom Napoleon pronounced to be the most honest of men. He died on Monday last, at Lyons, in the arms of his son, who had accompanied him on his inspection of the troops in Africa, from which he was returning. Two days previously, his wife expired at Bièvre. The Baron was 76 years of age. He was a member of the Académie des Sciences and Inspector du Conseil de Santé des Armées. Commencing the career of his professional life in 1787, when he embarked for America as a surgeon-major in the navy, he continued it without interruption up to his last mission to Africa.

Spain.—We learn by the Madrid mail of the 26th ult., that Señor Arguelles, the Queen's guardian, continued to make changes in her Majesty's household. He had appointed Señor Lujan, a deputy to the Cortes, and an intimate friend of S. Gonzales, tutor to the Queen. Madame de Belgida, the friend of the Don Francisco family, had been replaced as Lady of Honour by Señora de Montijo, well known for her opinions in favour of the Carlists. This curious appointment had given rise to much commentary; and a rumour was current that Señor Arguelles had resigned. Great doubts are expressed of the stability of the Rodil Ministry. The Infante Don Francisco and his family had obtained permission to remain in Madrid till the end of the month, when they would leave for St. Sebastian. The Madrid papers, which had been compelled to appear in half-sheets for some days on account of the printers' strike, were expecting compositors from the provinces, and by this mode it was hoped to put down the coalition.—It is stated in private letters that the concentration of Spanish troops on the Portuguese frontiers continued, the object being, it was supposed, to suppress smuggling more effectually, although political motives are assigned in some circles. Accounts from Barcelona mention that Gen. Zurbano had left Girona for Vich. On his arrival in the latter town, he ordered the list of the rebels in prison there to be presented to him. After having perused it, he ordered six of them to be shot on the following day, and the remainder set at liberty. The Madrid journals are filled with complaints of the cruelties committed by Zurbano. They express their astonishment that the Government had not interfered, and hint that the orders had emanated from General Rodil. Private letters state that the late Cortes will not be again assembled, and that the new elections will take place in about 3 months.

Portugal.—No parliamentary business has yet been entered upon by the Chambers. The validity of the returns and other preliminary matters continue to occupy their whole attention. The Commission on the Custom-house Tariff in reference to British goods has made little progress. It is reported that the Duke of Terceira has intimated his intention of retiring from office, and that he will be succeeded by the Baron Campanha. The Duke of Palmella has been strongly urged to take the portfolio of Foreign Affairs, but is said to have positively declined serving in an Administration in which Costa Cabral holds office. The last Russian papers announce, officially, the recognition of Donna Maria by the Emperor of Russia, and the appointment of Count Stroganoff as Russian Ambassador at Lisbon.

Belgium.—A project of law has been presented to the Chamber of Representatives by the Minister for Foreign Affairs, in consequence of the convention just concluded with France relative to the importation of linen and thread. It provides that the King may extend to other states the reductions stipulated by the convention, with such clauses, conditions, and reservations as his Majesty shall judge necessary or advantageous, and that the present law shall be binding the day after the promulgation. The King and Queen will not return from Paris till the end of next week.

Germany.—Letters from Berlin inform us that the collections made for the establishment of an hospital and school at Jerusalem, for German Protestants, amount to 44,035 dollars, without the collections in the Grand Duchy of Posen, which have not yet been received.—Much excitement has been produced at Vienna by the murder of Baron Philibert de Stramitski, Director of Accounts of the Austrian public debt, a nobleman nearly 80 years of age, 55 of which he had passed in office. He was murdered by a young Venetian, whom he had liberally patronised, and appointed to a lucrative place in his office; he was struck down by a stone in a handkerchief, while in the act of taking money from his chest, to hand to the murderer a hundred florins, which he had solicited as a loan. The Baron was greatly respected, and was one of the oldest functionaries in the finance department of the Government.

Italy.—The papers contain an account of an interview with which the Pope recently honoured an English Quaker who had visited Rome. The Quaker, it seems, suggested the interference of his Holiness to prevent the desecration of the Sabbath which prevails in France; when the Pope replied that the time when the person occupying the chair of St. Peter could directly interfere in the affairs of foreign states, and when emperors, kings, and princes attended to the behests of the Vatican, had passed away; he could not now exercise any temporal authority beyond the limits of the Papal States. All that he could do to repress vice and crime in foreign states was by addressing letters of advice and remonstrance to the heads of the church in communion with the Catholic church in those states. He had remonstrated with those in France on the open violation of the Sabbath in that kingdom, and should not omit any opportunity of expressing his strong disapprobation of the anti-Christian practices which there prevailed.—Letters from Naples state that during the sojourn of the French fleet under Admiral Hugon, off that city, several fights took place between the crews and the Neapolitans, and that a fatal duel had been fought in one of the hotels between two naval pupils of the French squadron. The King, however, had ordered the parties concerned to be given up to the Admiral, on condition that they were at once removed to

France; an act of indulgence which was fortunate for the French officers, as duelling is punished with death or the galleys in the Neapolitan dominions.

Greece.—Letters from Athens mention that on the 8th ult., during the eclipse of the sun, the ceremony of laying the foundation-stone of the new Observatory was performed. The building is to be erected on the Nymphæum, to the west of the city, near the Pnyx. His Majesty, with Prince Frederick of Hesse Cassel, the Bavarian and Austrian Ambassadors, and all the civil and military authorities, attended the ceremony. The Bishop of Athens pronounced the benediction on the stone; and Professor Bury delivered in the open air an appropriate address. The Observatory is to be erected at the expense of Baron Von Sina, the Greek Consul-General in Vienna, and is to be furnished with instruments made by the celebrated optician Plössl.

Russia.—Advices received by way of Constantinople confirm the rumour of last week, that the Russian army has sustained severe reverses in Circassia, and the reports of a great victory gained by the mountaineers are said to have spread excitement along the whole coast of the Black Sea. It is said that the Circassians, either in anticipation of the advance into their territory of the Russian army, or while it was actually fighting its way through a distant part of the country, suddenly united their forces, and made an attack upon the fortress of Aboon, which is situated in the interior of the province of Shapsook, and is the grand depôt of Russian stores and provisions. The place was carried by assault, its garrison killed or made prisoners, and all that it contained for the supply of the army during the present campaign has fallen into the hands of the Circassians. It is asserted, indeed, in some quarters, that the catastrophe is complete, and that the invading force, amounting to upwards of 40,000 men, has been dispersed, killed, or captured.—Letters from the Turkish frontier state that a considerable number of Alsacian families, who about thirty-five years ago left their native country on the banks of the Rhine, to emigrate to Russia, had arrived in Wallachia, having given up their settlements in Southern Russia, where they have hitherto resided. Dissatisfaction with some ordonnances of the Russian Government, and with their whole position, seems to have induced them to this new emigration.

Turkey and Persia.—Letters just received by the Levant mail represent the affairs of the Ottoman empire to have assumed a serious aspect. Complications and embarassments of various kinds menace the Porte on every side. War with Persia is reported to have been declared, or to be on the eve of declaration: the Schah is making preparations for an immediate war against Turkey; a Persian army is to march against Bagdad, and another against Erzeroum; and troops have already marched from Teheran to Amedan on their way to Bagdad. It appears that the cause of quarrel is a disputed boundary line, and that the Schah had forwarded an *ultimatum* to the Porte, signifying his intention to take possession of the territory in dispute if it were not ceded to him by the 5th of October. In the mean time the Turkish Pasha of Erzeroum, the contiguous frontier, was preparing for defence. A body of 3,000 regular troops was collected, and the militia were being armed. The Schah's demand had created considerable uneasiness at Constantinople, the treasury being quite empty, and but few troops disposable. It is said that there is every probability that the Schah will penetrate into Turkey, giving the war a religious character; in which case he is likely to be joined by all the Shiah sect of the holy cities and Bagdad—while the Arab and Kurdish tribes are all of them more or less disaffected to the Turkish government. In the mean time the Schah has appointed the Russian minister at Constantinople his *chargé d'affaires*. To add to those embarrassments, there is another outbreak at Nissa, on the Servian frontiers, the Bulgarians being again in open revolt against the Porte, excited, it was supposed, by Greek emissaries. The Bulgarians invite the whole Christian population in Turkey to proclaim their independence, and shake off the Mussulman rule. The energetic measures adopted by the Ottoman government were expected to put down this outbreak; which, however, cannot fail to leave its fruits behind in the moral effect on European Turkey. Prince Mavrocordato has at length been able to open the negotiations with the Turkish Minister for Foreign Affairs for the commercial treaty between Turkey and Greece.—Accounts received through Vienna mention that the Austrian and Russian Commissioners had come to an understanding with the Porte to settle the Bucharest disputes. Prince Ghika was to be secured from personal responsibility.—Accounts from Moldavia state that the plan of a railway, to traverse Moldavia from north to south, so that the southern terminus would be at the harbour of Galacz, on the Danube, seems to be in a fair way of being realised. It is proposed to execute, in the first instance, only a line of 60 or 70 German miles, and to employ only horses. This scheme has been well received; and as soon as an iron railway traverses Galicia and the Buckowina, the shortest communication between the North Sea and the Baltic with the Euxine will be established.—Letters from Tripoli mention the arrival of Mehemet Pacha, and the departure of his predecessor, Askar Ali, who has become so notorious by his cruelties.

Egypt.—The arrival of the India steamer from Calcutta at Suez, on the 25th ult., after making the passage from the Bengal Pilot to Suez in 46 days, of which she was 9 in port, is regarded as a satisfactory proof that the communication may be calculated on with certainty, even in the most unfavourable season of the year. She had to contend against the monsoon, and was only 37 days at sea from port to port. There is nothing of importance in the news from Egypt, except the slow rise of the Nile this season. Fears are entertained of a deficient inundation. There is still some talk of the fleet going out under the command of Said Pacha.

India.—The Berenice, with the Bombay mail of the 18th of June, arrived at Suez on the 18th ult. Her mail reached Alexandria on the 22nd at 3 A.M., Malta on the 27th, and Marseilles, by the Polyphemus, on the 31st, at 6 A.M. In Affghanistan matters remain nearly in the same state as at the date of our last advices; a report was current that Lord Ellenborough had ordered the immediate evacuation of the country beyond the Indus; but it seems to have arisen from some misapprehension of instructions for the withdrawal of the troops from Jellalabad. In other respects the accounts on this point are very contradictory. There appears to have been little done in the shape of active measures since the arrival of General Pollock at Jellalabad. Akhbar Khan had become more tyrannical than ever; and had demanded as conditions for the liberation of his prisoners, personal indemnity, eight lacs of rupees, and his being placed and supported on the musnud of Cabul as Ameer, with a gift of two lacs per annum by the British! The first and third conditions being inadmissible, he had removed almost all his prisoners into the mountains to the north-west of Cabul, while with some of his adherents he was carrying on a conflict of murders and intrigues from Cabul against the partisans of one of Schah Soojah's sons, who was in possession of the Bala Hissar, which he had attacked without success. Major Pottinger was forced to attend him in these movements. The mission of Capt. Mackenzie to Jellalabad, to treat for the liberation of the prisoners, had proved ineffectual; a report had been got up that Akhbar Khan had given liberty to Capt. Mackenzie, in consequence of his having so honourably fulfilled his promise by returning twice into his power, but the report had not proved correct; on the contrary, Lady M'Naghten had been plundered of her jewels. During this lull at Jellalabad, Gen. England had succeeded in joining Gen. Nott at Candahar. A system of combined movements was, therefore, expected by the retreat of Nott's division within the Bolan Pass to the borders of the Indus, and of Gen. Pollock's troops to the eastward of the Khyber Pass towards Peshawur.—The "Delhi Gazette," of the 8th of June, which contains the same intelligence, asserts that General Pollock had received positive orders to retire in the direction of Peshawur, and that he had even made preparations for removing the heavy baggage by rafts down the river, and that the advance towards Cabul was but a *ruse* to keep the army in good spirits. From all these circumstances, it would appear that there were negotiations on foot which might lead to their withdrawal.—From Candahar there is news of a victory gained on the 21st of May over the Affghans under the command of Sufter Jung. They attacked the fortified post of Khelat-e-Ghilzee, and even placed scaling ladders against the walls, but were repulsed and routed, with upwards of 100 men killed, besides the prisoners, who, having attempted to escape, were cut up by the garrison. The idea of the British retiring from before the Affghans, has excited the indignation of many, who did not hesitate to declare that such a retreat would become the signal for numerous revolts of the Mahomedans in the provinces of the interior, and that it would serve hereafter as an encouragement to the Affghans themselves to make an invasion of this country. Judging from several facts, it would appear that Lord Ellenborough had not made up his mind to effect the withdrawal instantaneously. Some accounts state that orders had been issued for rendering Jellalabad a strong position; and it was further asserted that it had been determined to send forward towards Cabul both the divisions simultaneously—viz., from Jellalabad and Candahar, in the first week of June, when the harvest around Cabul will be ripe and provisions plentiful. In addition to these statements, Gen. Sale, who had in October last fought his way from Cabul to Jellalabad, had declared that if Gen. Pollock would give him another brigade in addition to his own, together with a squadron of the 3d Dragoons and four guns, he would march from Jellalabad back to Cabul. The spirited conduct of this general has redeemed the reputation of the British troops among the Affghans. The Indian journals continue to publish details of the unfortunate retreat in January last, which are said to show the incapacity and want of energy of the military chiefs on that occasion. It is also said that Sir W. MacNaghten had engaged in some act of treachery against the Affghan chiefs, which was discovered by them, and led to the fearful retribution by which our army was destroyed. The fate of the prisoners continued to be an object of the most painful interest; it was asserted that they are in the keeping of the high priest of Cabul, and that Col. Palmer, with several other officers, remain in custody at Ghuznee. The Governor-General was at Allahabad, where he intends to assemble an army of observation, and to raise eight new regiments. His Lordship is to come in September, it is said, to Agra. In India tranquillity prevailed. The monsoon had begun, and the people of the country were busy in agricultural pursuits. The only remarkable event was the death of the King of Oude; by the good arrangements of the British resident, the rightful heir succeeded to the throne without any trouble or confusion.—A dreadful hurricane has taken place at Calcutta, destroying numerous houses, and damaging about 50 vessels in the river, with great loss of human life. The loss of boats with produce down the river will be enormous, and of ruinous amount, particularly in sugar, saltpetre, rice, and cotton.—At Bombay two ships have been destroyed by fire within the last fortnight,—the Vansittart, formerly one of the East India Company's China ships, and the Cornwallis, both on the eve of sailing for China with cotton cargoes. The loss of property amounts to above 100,000*l*. These fires were attributed to incendiaries, and large rewards were offered for their detection. A small ship, the Kate, laden with coals for Aden, also caught fire, but by great care its destruction was prevented. The new Governor of Bombay, Sir Geo. Arthur, arrived there by the May steamer, and met with a flattering reception. The Parsees of Bombay were highly delighted with the elevation by her Majesty of one of this body to the dignity of knighthood. The new knight, Sir Jamsetjee Jejeebhoy, had, in commemoration of the event, made to his co-religionists the munificent gift of three lacs of rupees, to be vested in trustees, for the purpose of having instruction disseminated among them. The cholera had considerably abated in its ravages.

China.—The overland mail brings news from China, but only eight days later than that last received. Some new conflicts had taken place in the neighbourhood of Ningpo, in consequence of the Chinese having attempted to obstruct the supply of provisions. A body of their troops having encamped at Tsee-kee, about 11 miles to the westward of Ningpo, the British Commander-in-Chief resolved to dislodge them. A force of about 1,100 men was landed on the 15th of March at a place near the Chinese encampment, to the west of Tsee-kee, where the enemy, amounting to about 6,000, was found posted in rather a strong position. The walls of the town were soon scaled, without any opposition, but considerable resistance was made at the camp. This resistance was strengthened by the nature of the ground over which the British troops had to proceed to the attack, and three men were killed and about forty wounded. The Chinese were, however, soon routed, and from five to seven hundred killed. The Chinese troops were subsequently rallied by some Mandarins, and large reinforcements collected near the city of Shou-hing, to the north of Yu-yaou, whence Sir Hugh Gough expressed his intention to expel them. It was rumoured that the Mandarins, at the head of 30,000 men, had contemplated an attack on Ningpo; but their views were anticipated by the British General, who in return was making preparations for a movement on Hang-chow-fou, the capital of the province of Chekeang. This movement, it was supposed, would produce the abandonment of the position at Ningpo. Several conflicting rumours were circulated at Hongkong and Macao. Some represented the Mandarins at Canton as determined to oppose to the last the attempts of the English to obtain a footing in their country, for which purpose they had even contrived to build a steamer, had strongly fortified the banks of their river, and had also commenced clearing away the ruins of the Bogue forts, as a preparation for rebuilding them, while they had put into practice the most stringent measures for suppressing piracy in the Canton river, having in one day captured 100 offenders, of whom 44 were at once decapitated in Canton. Another rumour stated that the Mandarins in other provinces were much alarmed lest the war should extend to their districts, and had therefore induced the Celestial Government to send an Imperial Commissioner with an offer of 40,000,000 dollars as compensation for the expenses of the British expedition and the surrendered opium, all which, together with full possession of Hongkong, the Emperor was said to be disposed to grant as the price of peace. The reinforcements from England continued to arrive, and, as the season for operations was approaching, it was expected that the decisive measures which would be speedily adopted would oblige the Emperor to propose terms for a lasting peace.

Parliament.

HOUSE OF LORDS.

Saturday.—Lord Shaftesbury sat as Speaker, in the absence of the Lord Chancellor.—The Commons were summoned to hear the Royal assent to the Poor Law Act Continuance Bill, the Customs Duties (Tariff) Amendment Bill, the Preparation of Exchequer Bills Bill, the Perpetuation of Testimony Bill, the Ecclesiastical Jurisdiction Suspension Bill, the Dean Forest Bill, the Prisons Bill, the Tithe Commutation Act Amendment Bill, the Controverted Elections Bill, New South Wales Bill, South Australian Bill, Slave Trade Suppression Treaties Bill, and several others of private or local interest. Several bills were then advanced a stage.

Monday.—The Earl of Ripon moved the second reading of the Bonded Corn Bill. The object of the bill was to allow a certain quantity of bonded corn to be taken out of bond and ground into flour, or made into biscuit, which was again to be returned into bond, and not to be taken out till the duty was paid on the flour, at the rate which might then prevail. The biscuits might be taken out for the purposes of exportation.—Lord Beaumont opposed the bill. He apprehended that it would open the door to numerous evasions of the Corn Law.—Lord Ripon, in reply, said that the noble Lord seemed to forget that vessels could now provision themselves at Hamburgh, the United States, and elsewhere, which, by the operation of this bill, would be enabled to lay in their stock as cheaply at home. It appeared to him that the bill would remedy a great inconvenience, and injure no one.—After a few words from Lord Monteagle in its support, the bill was read a second time.

The Earl of Aberdeen laid on the table copies of treaties relative to the suppression of the slave trade; also a bill for suspending the operation of an Act now in force for suppressing the slave trade, as far as related to Portuguese vessels; which was read a first time.

Lord Redesdale, in the absence of the Earl of Devon, moved the third reading of the Mines and Collieries Bill.—The Marquis of Londonderry opposed the third reading. He said it would show the haste with which it was framed, if he cited the clause enabling a Government inspector to inspect collieries and mines at all times, which was absolutely inoperative. The inspector might come, but there was nothing to compel the coalowner to put him down the pit, or to carry on the work of the pit whilst he was there.—After a discussion, in which Lord Redesdale, Lord Campbell, the Marquis of Londonderry, and Lord Wharncliffe took part, a clause was added, on the motion of Lord Wharncliffe, to remedy the defect which had given rise to the observation of Lord Londonderry, rendering it incumbent upon mine-owners to admit duly-appointed inspectors to visit their operations.

Tuesday.—On the third reading of the Insolvent Debtors Bill, Lord Brougham took the opportunity of expressing his gratitude to the Government and to the Legislature generally, in behalf of a large class of their fellow-subjects, for the passing of a measure which, while insuring to the creditor a fair distribution of the debtor's property, would virtually abolish imprisonment for debt.

On the motion of Lord Aberdeen, a bill to suspend the Slave Trade Suppression Act, the operation of which has excited so much ill-feeling in Portugal, and the necessity for which is superseded by the treaty recently concluded with that Power, was read a second time. Lord Brougham then brought forward a motion, of which he had given notice, for the adoption of more efficient measures for the suppression of the slave trade. He proved by a variety of statistical information that the traffic was, if not on the increase, at least perpetuated in its internal activity throughout Cuba and the Brazils by British enterprise and by the aid of British capital; and after demonstrating the defects of the present law, and how readily its provisions might be evaded, concluded by impressively calling upon the House to cease to protect the slave-monger, and resolutely to apply itself to the extirpation of the traffic. The Duke of Wellington recommended that Lord Brougham should himself propose some measure for the improvement of the existing law, and promised, in the name of the Government, his cordial support. Some discussion followed as to the nature of the amendment necessary, and the notice was ultimately withdrawn, on the understanding that Lord Brougham should introduce a bill early in the ensuing session.

Thursday.—The Earl of Radnor moved the second reading of his bill for repealing the duties on the importation of corn, supporting his motion at some length.—The Earl of Ripon met the motion by an amendment, that the bill be read a second time that day six months.—Lord Kinnaird, in support of the bill, pleaded strongly for a repeal of the Corn-laws, as detrimental to the interests of the country. After a reply from the Earl of Radnor, the motion for the second reading of his bill was negatived without a division.

The Bonded Corn Bill and the Court of Exchequer Bill were read a third time and passed.

Friday.—The Royal Assent was given to several bills, among which were the Assessed Taxes Bill, the Lunacy Bill, Court of Exchequer Bill, Western Australia Bill, &c. Several bills were then advanced a stage. On the motion of Lord Campbell, the Bribery of Elections Bill was read a second time, after some observations from Lord Brougham, who wished it had gone further, and abolished the bribery oath.

HOUSE OF COMMONS.

Saturday.—On the order of the day for the committee on the Newfoundland Bill, Mr. O'Connell moved that the committee should be postponed for three months, in order to afford time for a communication from the parties to be affected. He had no objection to the increase of qualification for the members, but he would leave that change to be made by the local legislature itself; and as to the proposed increase of qualification for the electors, he protested against it altogether. To require, as this bill did, a 5*l.* occupation in the towns, and a two years' occupation of a 40*s.* freehold in the country, would disfranchise a large proportion of those inhabitants whom the Governor, Sir John Harvey, had described as the most valuable part of the population. He denounced the fusion of the Legislature into one assembly—the conversion of it into a divan. Rather re-establish the old despotism in the colony than insult it with this mockery of a coustition. He felt a persuasion that the colonists were thus persecuted only because the majority of them were Roman Catholics. At the present period of the session it was impossible that the bill could be fairly discussed.—Lord Stanley denied that it was the aim of this bill to extinguish the constitution of Newfoundland. The late Government had determined, in consequence of the violences committed at the last elections, to discontinue the House of Assembly; and this bill was intended to replace it by a modified representation. He wished to avoid religious topics; but though he would throw no blame on the Roman Catholics as a body, he must say a considerable number of their priesthood had evinced a description of activity at the elections which greatly scandalised many respectable colonists of their own faith. The Government, in the introduction of this bill, had no view to any religious distinctions at all. Their object, in the consolidation of the two legislative bodies, was merely to preclude a repetition of those collisions between them which had lately suspended the whole business and revenue of the colony. The change of the electoral qualification would not affect Roman Catholics peculiarly, but it would limit the franchise to those who had a permanent interest in the soil. The actual state of business in Newfoundland was such that the greatest embarrassment to its affairs must be the consequence of postponing the present bill. —Mr. Hume contended that Newfoundland was entitled to be heard by counsel, as Jamaica and Canada had been. The effect of the bill would be to transfer the representation from the inhabitants of Newfoundland to the merchants of London, Liverpool, Bristol, and Dartmouth. The members of Assembly in Newfoundland have been paid by wages, and he wished the same course was pursued in England. He had been accused of stinginess, but he would have real service paid; gratuitous service was bad service.—On the motion of Mr. Pakington, the debate was then adjourned.

Mr. P. M. Stewart brought up the report of the Ipswich election committee, declaring that the Earl of Desart and Thomas Gladstone, Esq., were not duly returned to serve in Parliament for that borough, and that the last election was a void election; and, further, that the late members had, by their agents, been guilty of bribery and treating.

Monday.—On the motion of Mr. P. M. Stewart, it was ordered that no new writ be issued for the borough of Ipswich until the report of the committee on the last election, and the evidence, be printed.—On the motion of Mr. Mackinnon, the Southampton writ was ordered to issue. In the discussion of this motion, Sir R. Peel assured the House that it was the intention of her Majesty's Government to give their general support to the bill then in progress for the suppression of bribery and treating.

Mr. T. Duncombe brought on a motion for a select committee to inquire into the circumstances under which a Dr. M'Douall was taken into custody in the act of addressing a body of people, at Deptford, on Tuesday last. The particulars of this case were given in our Paper of last week, under our Metropolitan news. Mr. Duncombe now contended that there was no pretence for the arrest.—Sir J. Graham resisted the motion, contending that the conduct of the parties justified the interference of the police, and that the case had been impartially and fully investigated before the police magistrate.—Mr. O'Connell, Mr. Hawes, Mr. Sheil, and Lord Palmerston, contended that there were sufficient grounds for referring the matter to a select committee; the noble Lord, in particular, arguing that if the shield of authority were thrown over constables interfering with public meetings, on their own view of what constituted an illegal assemblage, great danger might result, not only to public liberty, but to the public peace.—The Attorney and the Solicitor General recapitulated the facts, and argued that no ground whatever was shown for the interference of the House.—Sir R. Peel argued that the law was open, if the parties deemed themselves aggrieved by the interference of the police; and that, with little cost, a decision of the ordinary tribunals of justice might be obtained, which would be more satisfactory than an inquiry by any committee of the House. This Deptford meeting had been from the beginning a tumultuous assembly; the seats had been torn up in the chapel, and bludgeons called for; and now it was termed a squabble or a scuffle. Perhaps Mr. O'Connell remembered the man in Ireland who called the rebellion of 1793 "*a hurry*,"—or the other Irishman who, speaking of the Dublin riots in 1803, in which death was inflicted, described it as "the *dispute* in Thomas-street." He exhorted the House to abstain from condemning a policeman who, under such circumstances as these, had felt it his duty, as the evening advanced, to interfere for the prevention of further mischief.—Mr. T. Duncombe replied, after which the House divided, rejecting the motion by 89 to 30.

The House then went into a Committee of Ways and Means; and votes for Exchequer Bills, &c., were agreed to. The Tobacco Regulations Bill created some debate. Mr. T. Duncombe opposed its recommittal, on the ground of its vexatious character and onerous provisions.—The Chancellor of the Exchequer, in supporting the bill, made some statements as to the very general and extensive adulteration of tobacco which was practised. To meet the objections to the bill, he intended to introduce a clause, giving further time to the dealers for disposing of the stock which they might have on hand of adulterated tobacco, and a more extended time for snuff.—After a discussion, Mr. T. Duncombe's amendment for recommitting the bill this day three months was lost by 53 to 9.

Mr. V. Smith opposed the farther progress of the Ecclesiastical Corporations Leasing Bill, stating at length his objections to the measure.—Sir J. Graham said that he intended to introduce some amendments on the third reading. He avowed his conviction that all the available means of the church should be made use of before the state was called upon to contribute to church extension, which this bill was calculated to promote. After a short conversation, Mr. V. Smith withdrew his opposition at the present stage, and the report on the bill was brought up.

The other orders of the day were then disposed of, including the Bribery at Elections Bill, to which some clauses were added, on the motion of Mr. Hawes.—Sir J. Graham obtained leave to bring in a bill to annex the county of the city of Coventry to Warwickshire, and to define the boundary of the city of Coventry. The bill was read a first time.

Tuesday.—Sir J. Easthope, who, on a former occasion, had withdrawn a motion for church-rate returns, at the request of Sir R. Peel now re-produced his motion, having modified it so as to meet the objections of Sir J. Graham. In now moving for these modified returns, he asked whether the Premier intended to take the subject of church-rates into his consideration, with a view to the legislative settlement of the question during the next session; or, if otherwise, he were satisfied with the state of the law relating to it.—Sir R. Peel could give no assurance that he would bring in a bill to settle the question, nor would he say that he was satisfied with the present state of the law.—Sir R. Inglis thought the hon. Baronet would have done better if he had given notice of his motion in the usual manner. He would beg leave to ask Sir J. Graham by what process these returns were to be obtained?—Sir J. Graham said the honourable gentleman had, at his request, withdrawn his former motion, and had submitted the present motion to him, and he certainly could see no objection to it. He admitted that there might be some difficulty in procuring the return, and he did not know that he possessed the power of enforcing it; but he, in obedience to the order of the House, should feel it his duty to apply to the different churchwardens to make the returns in conformity with the orders of the House.—After some conversation, the returns were ordered.

The Bribery at Elections Bill was read a third time and passed.

A long discussion took place on the Copyrights of Design Bill. Mr. Williams moved the recommittal of the bill, and was supported by Mr. Heathcote, Mr. M. Philips, Mr. Ellice, Mr. Hume, and other members.—Mr. Gladstone defended the Bill as a just protection.—Lord Palmerston contended for the exemption of the lace trade from its operation. Sir T. Fremantle desired, on the contrary, that at least the branch of the pillow lace trade might be included in the protection held out by the Bill.—Sir R. Peel observed upon the hardship of allowing a man, who had incurred no hazard or cost of his own, to lie in wait till the patterns of the season were brought out at great expense by others, and then seize upon all the successful ones.—Mr. Williams's motion was then lost by a majority of 73 to 13. After some further discussion, the Bill was ordered to be read a third time on Wednesday.

Sir R. Peel moved that the House would on Friday resolve itself into committee, with a view to an address for defraying the expense of monuments to Lord Exmouth, Lord de Saumarez, and Sir Sidney Smith.—Mr. H. B. Curteis said, that at a time when it was necessary to burden the country with a new load of taxation, they ought not to think of creating new expenditure by voting money for the erection of monuments. He hoped when the motion was brought forward, some hon. member would move as an amendment that no such monuments should be erected until the prevailing distress was alleviated.—Sir C. Napier was much surprised at the speech of the hon. gentleman, and did not think he should be doing his duty if he did not express his cordial support of the proposed address. No men of the age better deserved monuments to their illustrious memories than the gallant officers to whom it was proposed to erect these trophies. He only hoped that their monuments would be worthy of their fame.—The motion was then put and agreed to.

Sir G. Clerk brought in the Exchequer Bills Bill, which was read a first time.

Wednesday.—On the motion of Sir G. Clerk the Slave Trade Suppression Bill and the Canada Loan Bill were reported; the Slavery East Indies Bill was read a third time and passed; and the Consolidated Fund Bill was read a second time.

On the adjourned debate on the Newfoundland Bill, Mr. Pakington and Sir Howard Douglas spoke in support of the bill, as a choice of evils; it was opposed by Mr. C. Buller, Mr. P. Howard, and Mr. Wyse.—Mr. Vernon Smith admitted that the state of the colony required legislation, but suggested that the duration of the bill should be limited, and that an objectionable clause, altering the qualification of electors, should be omitted.—Lord Stanley agreed to these suggestions, with the view of obtaining more extended support for the bill.—Mr. Labouchere admitted that by these concessions the bill was stripped of its most objectionable features.—On a division, the bill was supported by 68 against 13.—On the motion that the Speaker do now leave the chair, Mr. O'Connell expressed his opposition to the bill, contending against the injustice which it would inflict, and protesting against the compromise which he considered to have been entered into with respect to it between the members and friends of the late Government and those of the present.—Some further debate followed, after which another division was taken, when there appeared 82 to 21. The House then went into committee on the bill, and after several divisions, in each of which the Government had the majority, the several clauses of the bill were agreed to, with the exception of the 6th, on which the discussion was adjourned till Friday.

Thursday.—Mr. Mackinnon obtained leave to bring in a bill to improve the health of towns, by preventing the interment of bodies within their precincts.

Sir F. Burdett moved for a select committee to inquire into negotiations of the Government with Mr. Warner respecting his invention.—Sir H. Douglas recounted the various circumstances connected with the commission appointed to examine the merits of the invention; and Sir R. Peel detailed the negotiations with the Government, and showed that both the late and the present Ministry had offered the most ample facilities to Mr. Warner; the right hon. Baronet expressed his decided conviction that the alleged invention, for which a guarantee of 400,000*l.* was demanded, was of a questionable character.—Mr. Brotherton also read letters which showed that Mr. Warner had not so scrupulously kept the offers of his invention exclusively to this country as he claims credit for, but had endeavoured to sell it some years back to Don Pedro. In that instance, as in the present, the negotiation had been broken off by Mr. Warner's demand for preliminary payment.—On a division, the motion of Sir F. Burdett was negatived by 72 to 2.

Lord Ashley obtained the consent of the Government to a motion for procuring a further inquiry, by the mines and collieries commissioners, into the number and ages of children and young persons employed as apprentices in coal and iron mines, with the nature or terms of the indentures or agreements under which tehy serve.

Mr. T. Duncombe moved an address to the Crown, for taking into merciful consideration the case of John Mason and seven working men (the circumstances of which were brought before the House last week), now confined in Stafford Gaol, with a view to their immediate discharge.—Sir J. Graham resisted the motion, which, after a short discussion, was rejected, on a division, by 53 to 30.

Mr. Hume then brought under the consideration of the House the case of the ex-Rajah of Sattara. During his speech the benches became almost deserted; and after some observations from Mr. Baring, the House was counted out.

Friday.—On the adjourned debate on the Newfoundland Bill, the clause for abolishing the Legislative Council gave rise to frequent divisions, in all of which the Ministerial measure was affirmed by large majorities. The Bill then went through committee. Mr. O'Connell moved for copies of correspondence between the Government and the police, respecting the spy-system disclosed at the late trial at Armagh. Lord Eliot resisted the motion, which was negatived by 72 to 24.—In reply to a question on the Income Tax papers, the Chancellor of the Exchequer said that unavoidable delay had occurred in their delivery; but although they are required to be returned within 21 days from the date they bear, the Government will afford every facility and make a due allowance of time in cases where they have not been delivered at the proper time.—The Ecclesiastical Corporations Leasing Bill was read a third time and passed.—The House went into committee on the Bankruptcy Law Amendment Act, after which Mr. Masterman moved that wine merchants be allowed a drawback on their stocks of Portuguese wines proportionate to the late reduction of duty; but the motion was negatived without a division.

CITY.

Money Market, Friday.—The great abundance of money in the market had produced arise in Stock on Thursday, but a reaction took place yesterday of $\frac{3}{8}$ per cent. Consols closed at $91\frac{1}{2}$ for money and account; Bank Stock, 170 to 171; India Stock, 249 to $250\frac{1}{2}$; Exchequer Bills, 2d. issue, 49s. to 51s. prem.; ditto, $2\frac{1}{4}$d. issue, 51s. to 53s. prem.; Three per Cents. Reduced, $91\frac{7}{8}$; Three-and-a-Half per Cents. Reduced, 100 to $\frac{1}{8}$; Long Annuities, $12\frac{5}{8}$; and India Bonds, 32s. to 35s. prem.

Metropolis and its Vicinity.

Mansion House.—The Lord Mayor gave a banquet on Friday in the Egyptian Hall to the Governors and Directors of the Bank of England, the East India Company, the East and West India Dock Companies, the Marine Insurance Company, the New Zealand Company, the Copiapo and Cobre Mining Company, the South Australian Bank, the Peninsular and Oriental Steam Navigation Company, and other public companies. Among the company were His Royal Highness the Duke of Cambridge, the Duke of Buccleuch, Lord and Lady Sandon, Lord D. Stuart, Lord W. Thynne, Sir G. Murray, Dwarkanauth Tajore, and Chunder Mohun Chatterjee, the Indian merchants, several Members of Parliament, and the leading merchants and capitalists of the city. The usual toasts were given, and a variety of speeches were made in connexion with the commercial interests of London. The one which produced the greatest impression was that of the Rev. Mr. Melvill, in responding to the toast of "The Church." "I hope," he said, "to be pardoned if I attach a special worth to the manner in which the present toast is received by this assembly. I am surrounded by the representatives of the wealth, the power, and the majesty of this emporium of the commerce of the world. Is it, then, presumptuous if, when they express warm attachment to the Established Church, I receive it as a pledge that the transactions of commerce shall not only be conducted on the principles, but made conducive to the purposes of Christianity? This were to give permanence as well as to increase the national prosperity; the motto of your City arms, as I see it emblazoned around me, is a prayer for the direction of God, and commerce hallowed to so righteous an intent would be sure to find the prayer abundantly answered." The Duke of Cambridge, Sir George Murray, and the Duke of Buccleuch, also addressed the meeting, which is stated to have been one of the most interesting of the season.

Court of Aldermen.—In consequence of an order from the Vice-Chancellor of England, in a cause now pending in the Court of Chancery, respecting the property of intestate freemen of the city of London, the Court have unanimously agreed to a report, stating, for the information of the Vice-Chancellor, that by the custom of the city, when there are several orphan children of a freeman who dies intestate, the share which any one may take by reason of surviving a child that dies an infant, survives among the other children in case of the death of the party to whom it has come under the age of 21 years; and that if there be an accumulation of interest upon an orphanage share, the accumulation survives in the same manner as the original orphanage share.

Public Meetings.—The Anti Corn-Law Conference, which has been sitting in London for some time past, was brought to a conclusion on Monday. The Chairman in dissolving the meeting stated that they had taken the necessary measures to put the Government in possession of their sentiments, and having failed in obtaining their object, the only course remaining to them was to return to their constituents. An address to the public was afterwards submitted for approval to the meeting, and the Conference was then declared to be dissolved.—A bazaar has been held during several days of the past week, at the Centenary-hall, Bishopsgate-street, for the benefit of the Wesleyan Missionary Society. In addition to the usual display of fancy articles on these occasions, the bazaar was furnished with supplies of useful clothing, arranged in small lots for easy distribution among the poor. The walls of one of the rooms were covered with rare skins, furs, and various other articles, sent over for the purpose by missionaries in connexion with the Wesleyan community in every quarter of the globe. Among the collections were several costly presents from the King of

Ashantee, curiosities from the Celestial Empire, ornaments manufactured at the mission stations in France; entomological and mineral specimens, collected by missionaries in distant countries, and scientifically classified; several manuscript sermons and autograph paraphrases of texts of Scripture by John Wesley and his brother Charles. The sale was numerously attended, the articles appeared to find ready purchasers at good prices, and such was the abundance of the supply, that the managers resolved to keep it open beyond the time originally fixed for the purpose.

Metropolitan Improvements.—In the House of Commons on Wednesday, Mr. Wortley presented a petition from the inhabitants of a portion of St. Giles's, generally known by the name of "the Rookery," stating that within the circumference of 700 yards, upwards of 1,299 families, comprising upwards of 5,000 individuals, resided; that the condition of the place was most unfavourable to the health and morals of the population, and praying the House to render it compulsory on persons building to adopt improvements.—A report of the proceedings of the Metropolitan Improvement Society has just been published. It takes a general review of the transactions of the Society from its formation in January last to the present time, and adverts with satisfaction to the interview with Sir R. Peel, and to the concurrence of the Right Hon. Bart. in the propriety of appointing an efficient board to institute inquiries and take a broad and comprehensive view of the whole subject. The committee state that they have begun to form a collection of maps and plans of the metropolis, and that several valuable suggestions have already been received. The means of abating the nuisance arising from the smoke of furnaces in the great factories and breweries, and in the river steamers, have also occupied their attention. They dwell upon the importance of adopting such steps as may lead to a better legislation on matters connected with building, and to a revision of the existing Building Acts. They desire especially to effect an improvement of the over-crowded and ill-drained neighbourhoods of the poor; to provide a better description of dwellings for the lower classes, and to adopt every other available means of checking the fearful mortality now raging in the poorer districts. They are anxious to impress the public mind with the consequences arising from the burial of the dead in crowded places, and to encourage, as much as possible, cemeteries formed at a distance from the metropolis. The naming and numbering of streets is another subject to which they direct attention, pointing out the great public inconvenience resulting from the total abandonment of this branch of the duties of municipal administration to individual caprice, and illustrating it by the fact that, in the commercial part of the metropolis alone, there are no fewer than 28 King-streets, 20 Queen-streets, 26 Charles-streets, 25 Church-streets, 20 George-streets, and 23 John-streets, with numerous other examples of a corresponding character. The committee also desire to obtain for the metropolis a better supply of water, not only for domestic purposes, but a supply so regulated as to be instantly available in case of fire, without the necessity of pumping, and for the cleansing of the streets and houses. They state that during the last four years the fires in London have been more than 600 per annum. If each fire on the average incurred a loss of 500*l.*, the total loss annually would exceed the total cost of the supplies of water for the whole of the metropolis to the inhabitants, which, according to returns made to Parliament in the year 1834, amounted to 276,200*l.* They conclude by referring to these facts as a proof of the good which may be accomplished by the Society, and appeal upon these grounds to public support in order to render their exertions effective, and institute proper inquiries on the various topics of their report.—The commissioners appointed to carry into effect the City improvements have entered into engagements to complete the line of street leading from Farringdon-street in the direction of Clerkenwell-green; and contracts have been signed for the erection of houses on each side of the new street. They will be second-rate buildings; the frontage of each being about 18 ft., and the depth varying from 50 to 60 ft. They are all to be of a similar elevation, and to be erected according to plans and specifications at Guildhall.—The works for the new Chapel Royal at Buckingham Palace will be commenced about the end of next month, and be completed by next season. The chapel is to be constructed on the site of the conservatory, joining the middle of the building at the southern extremity, and will be on a level with the lower state rooms.—A notice has been posted on the doors of St. Paul's Cathedral, stating that during the cleaning of the church there will be no performance of divine service, but that due notice will be given when it will be resumed. Workmen are at present engaged in repairing the exterior of the dome, but it is understood that very few repairs are required in the interior.—The surveyor appointed by the churchwardens to examine the steeple of St. Martin's-in-the-Fields, which was struck by lightning in the great storm of last week, has reported that the greater part must be pulled down, and that the total cost of rebuilding it will exceed 2,000*l.*—In consequence of the continual accession of members to Lincoln's Inn, the benchers have resolved on building a new hall, and a contract has been entered into for that purpose. The site chosen is nearly the centre of the terrace on the western side of the garden overlooking Lincoln's Inn-fields. A council-chamber and library are to be added to the new erection; the old hall will be reserved for the use of the Lord Chancellor when sitting out of term, as hitherto.—It is said to be in contemplation to convert the rising ground in the vicinity of the Hippodrome into pleasure-grounds, terraces, and villas, to be called Kensington Park. The arrangements are expected to be similar to the Regent's Park.

East India House.—On Friday, a special General Court of the Proprietors of East India Stock was held at the India-house, in compliance with a requisition signed by Sir C. Forbes and seven other proprietors; Sir J. L. Lushington in the chair. The Court was thinly attended. The requisition referred to the circumstances attending the deposition of the Rajah of Sattara, and embodied a resolution affirming that he had been deprived of his property and exiled without having been heard in his defence; and that such proceedings were repugnant to the principles of justice, and subversive of the British interests in India. The business of the meeting having been opened, the chairman moved an adjournment, when Mr. Thompson, in a speech of five hours' duration, spoke in favour of the resolution. Several interruptions took place, and ineffectual attempts were made to adjourn the meeting. At length, after a sitting of thirteen hours and a half, a division was called for, when the motion for an adjournment was carried by a majority of 24 to 1. The Court then adjourned at half-past one on Saturday morning, having sat for a longer time than on any former occasion.

The Thames Tunnel.—This undertaking was opened on Monday, for the first time, on the Wapping side of the river, and upwards of 500 visitors of all nations passed through the tunnel as far as the shaft on the Rotherhithe shore. The High-street, Wapping, was thronged with people, and the vessels on the river were gaily decked with flags of different nations, in celebration of the event. At mid-day there were upwards of 100 visitors promenading in the tunnel; the names and residences of more than 30 Americans from different parts of the United States were entered in the visitors' book, together with those of persons from all parts of Europe, and many from Asia. Indeed, about one-half of the visitors were foreigners. The shaft by which the descent is accomplished, is about 58ft. 9in. in depth, and 42ft. 6in. in diameter; a staircase, consisting of two flights, and supported by strong iron fastenings, passes along the wall of the shaft from the summit to the basement. The staircase is protected by an iron balustrade, while there is a superstructure above the shaft, through which a sufficiency of light is afforded. On the Surrey side a similar shaft will be completed in about two months, when there will be a direct communication through the tunnel for foot passengers, and toll will be received. Several months must yet elapse before the viaduct will be formed for the transit of carriages; as further excavations must be made, for which purpose an inclined plane of from 150 to 200 yards on each side of the river will be formed, unless, as has been proposed, the system of lowering and raising goods and carriages by means of the atmospheric railway be adopted; in which case, it is understood, a large saving would be made in the expenditure necessary to complete the undertaking.

The Model Prison.—The new prison at Pentonville has been so far completed that some of the officers' apartments are now occupied, and it is believed that the prisoners sentenced at the forthcoming sitting of the Central Criminal Court will be sent there. During the past week the Duke of Wellington, Sir R. Peel, and several of the Ministers have visited the establishment, and examined the arrangements for the prisoners.

Southwark.—The several candidates for the vacant office of high bailiff have been busily engaged in their canvass during the week. Unless the law of the corporation be suspended, and the two aldermen candidates are allowed to enter the lists, it is generally supposed that the contest will be between Mr. Daniel Whittle Harvey and Mr. Payne the coroner.—On Monday, a vestry meeting was held at St. Saviour's for the purpose of receiving a variety of reports connected with parochial affairs, and to make a church rate. Mr. H. B. Clark, warden of the great account, was in the chair. After a variety of speeches and statements had been made relative to various items for the repairs of the church, the payment of salaries, disbursements, &c., the Chairman said it would be necessary, to enable him to get rid of the debts, to apply for a rate of 9*d.* in the pound for the ensuing year, as the total expenditure would be 3,755*l.* 3*s.* 8*d.* An amendment was then moved in favour of a sixpenny rate; after a long and stormy discussion, the amendment was carried by 20 to 16, upon which a poll was demanded, and refused by the chairman, who said he would take legal measures to enforce the original motion.

Vauxhall.—The masquerade which has been for some time back announced, and for which most active preparations have been made for some weeks past, came off on Tuesday evening. It was attended by the usual patrons of amusements of this sort and went off well, although few appeared in character. The whole of the gardens were thrown open for the occasion. The entertainments of the evening, in addition to the concert, fireworks, rope-dancing, &c., consisted in the performances of the stud of the late Mr Ducrow and their riders, and in the performances of La Petite Taglioni, a precocious dancer of great promise. The illuminations and the instrumental band were good, and, on the whole, everything was done that could gratify the public taste, and maintain the popularity of this well-known place of amusement.

Woolwich.—Considerable activity prevails in this Dockyard in the preparation and equipment of new steam-ships. An iron steamer, called the Rocket, has recently been built by Messrs. Fairbairn, at their establishment in the Isle of Dogs, for the service of Government, and has arrived here in order to be fitted for service. The Admiralty have ordered Mr. Lang, master-shipwright of this yard, to submit a plan of a steam-vessel of 1650 tons, and suitable for engines of 800 horse-power, with a crew of 300 men. To convey some idea of the magnitude of a vessel of this class, it may be observed that the largest first-class steam-frigates at present in the Navy, the Geyser, Devastation, and others, do not exceed about 1000 tons and 400 horse-power, and that the Penelope, 42 gun-frigate, at present being converted into a steam-vessel, will only be fitted with engines of 650 horse-power. The steam-vessel now ordered is in addition to another of great dimensions, with engines of 800 horse-power, named the Dragon, to be built at Sheerness or Chatham.

Chatham—The adjourned inquest on the bodies of Mr. Corrall, the surgeon, and the 4 seamen of H.M.'s steamer Shearwater, who were drowned in the Medway, while proceeding to the launch at this place, was resumed on Monday. After the usual evidence had been adduced, the Jury returned a verdict of "Found drowned." Mr. Corrall had only been married four months, and three of the seamen have left families.

Provincial News.

The Harvest.—The provincial papers are filled with details of the progress and prospects of the harvest. The report is, almost without exception, highly satisfactory. In Berkshire reaping has commenced under very favourable auspices, and the crop of wheat is generally good in quality, and of a fair average quantity.—Some new wheat was sold in Uxbridge market last week, at 72*s.* per quarter; it weighed 64lb. per bushel.—In Buckinghamshire several fields of wheat have been cut during the past week, the crops of which are said to be excellent.—In Sussex the wheat harvest has become general, but doubts are expressed whether the crop will be an average.—In Hampshire the weather has been most propitious, and by far the greatest portion of the wheat in the neighbourhood of Portsmouth is cut. In the country around Winchester the wheat harvest is nearly completed; the crops are reported to be very fine, ripening with that clear and even colour which indicates the total absence of blight. The burden of straw is said to be not so heavy as on some former years; but the wheat is remarkably fine in the head, free from weeds and grass, and will produce a large yield of grain. The barley is much improved, but the long drought in the spring seriously damaged much of it, and the quality as well as quantity is expected to be below an average.—In Wiltshire the weather has been most favourable, and wheat-cutting has become general. All accounts speak most favourably of the crop.—In Somerset, Devon, and Cornwall, there has been the most brilliant harvest weather, no rain of five minutes' duration having fallen for several days. At Totnes, Bodmin, Exeter, and Taunton, very fine samples of wheat have been brought to market. In the three western counties less corn is beaten down with rain than there has been for many years; the wheat is very fine in quality, and remarkably heavy in the ear.—In Gloucestershire finer weather for ripening the crops could not have prevailed up to the present time. The wheat is remarkably perfect in the ear, and likely to be productive. Reaping has become general, and in the southern districts the sickle is in full operation.—In Oxfordshire the accounts from all parts are very gratifying. In many places reaping has commenced, and the crops are yielding abundantly.—In Worcestershire several days of glorious weather have advanced the crops towards maturity, and enabled the agriculturists to secure their hay, a considerable portion of which was still out. In favoured situations reaping has already commenced, and should the weather continue propitious, it will soon become general.—In Warwickshire there is every prospect of an abundant harvest. The crops of corn are rapidly advancing, and the reapers will soon be actively employed.—In Cambridgeshire the cutting of wheat has commenced in different parts, and will soon become general. Where thinness of plant was complained of in the wheat, great improvement has taken place. The early-sown barley will be a full average in quantity, and the quality promises to be good if there be fine weather to secure it; the later sown must be an uneven and irregular crop, and the quantity in all probability inferior. Oats are much improved, but do not promise to produce an average.—In Norfolk the harvest has become general, with the exception of those places in the vicinity of the sea. The wheat is said to be below an average, though very good on some soils; but the barley is far beyond the wheat.—In Yorkshire the crops are advancing rapidly towards maturity, with the promise of an early and fair average harvest. New wheat has found its way into some of the southern markets, so that the harvest may be said to have commenced under auspicious circumstances. The plant is represented as rather thin upon the ground, owing to the unfavourable seed time; but the ear is generally full and bold, and exhibits a good sample.—In Durham the crops in all parts are favourably reported. The wheat is remarkably forward, and will, in about a week, be ready for the sickle; according to the general opinion, it is healthier and more forward than at this time last year. Oats promise a good crop; and the beans are better than for some years past, being entirely free from insects. Barley is the same as last season, and has already been cut at Chilton.—In Northumberland the crops are fast ripening, under the present delightful weather. In many parts there is a good deal of grass still uncut, and upon the whole the hay is light. The crops are generally in a forward state. Barley was cut last week at Thornley Pit Houses and at Ovingham, and a sample of the produce has been exhibited in Hexham market. The quality is described as excellent, weighing about 56 lbs. per bushel. It seems to be the general opinion among farmers in this county that the crops are upon the whole lighter, though the produce may be expected to be finer, and got in earlier, and under more favourable circumstances, than for some years past.—From Wales, the reports are equally satisfactory. In Pembrokeshire the country for many years past has not exhibited so luxuriant an appearance as it does at the present season. The weather has been very propitious for securing the hay, and although the crops are generally light, the quality will prove excellent. The crops of corn are advancing rapidly, and there is every prospect of an early and abundant harvest. In Carmarthen harvest has already begun. At Pilruath and at Llwndu wheat was cut last week; and other fields have since been cut in other parts of the county. The grain is very good, and should the present fine weather continue, a splendid harvest will follow. In Flintshire and Denbighshire the corn crops all look healthy. In the Vale of Clwyd, wheat barley, and oats, approach an average crop, especially barley, which in general is particularly fine. On good lands the ears of wheat appear to be heavy, though in parts the crop is thin. In Flintshire the crops are lighter, though in some parts the ears are well filled. In several districts oats are quite ready for cutting, and wheat nearly so. To all appearance the harvest will be early, and will closely follow the hay-harvest.

Birmingham.—On Monday morning the populous village of West Bromwich, situated about midway between this town and Wolverhampton, was entered by at least 10,000 persons connected with the coal and iron trades in the neighbouring districts. They met for the purpose of combining against the proposed reduction of wages, notice of which expired on Saturday, although only 5 masters out of 50 had actually carried the proposal into execution. The men came principally from the neighbourhood of Walsall, Bilston, Dudley, and Wednesbury; but after agreeing to a series of resolutions similar to those adopted by the colliers in South Staffordshire, they separated quietly. The military were marched in at 10 o'clock, and the show of strength and preparation had the effect of preserving tranquillity.

Bradfield.—The late storm was severely felt at Bradfield-hall, the seat of Mr. J. P. Fennington. The lightning struck a tower over the entrance gateway, and threw it on the range of buildings immediately adjoining, which are appropriated to domestic offices. The roofs of the buildings were driven in, and two servants who slept in one of the rooms were greatly injured. Seven head of deer were found dead in the park, and several large trees were split and shattered. An immense Norway fir, which grew at the end of an extensive range of conservatories and hothouses, was shivered to pieces, and the splinters falling on the glass-houses below, totally destroyed a collection of exotics, and the produce of the vinery.

Brighton.—A curious announcement was made on Sunday from one of the pulpits of this town, which has been attended with some unpleasant consequences. At the close of his sermon at the Chapel Royal in the morning, the Rev. S. R. Drummond, the officiating minister, addressed his congregation, and stated that although it might be considered a novelty for a clergyman to speak from the pulpit at the close of service, he wished to tell them that two notorious pickpockets were present, and that it would, therefore, be well for them to be careful. Such an announcement coming from the pulpit, and so close upon the races, created great sensation; and, as if by common consent, the eyes of the congregation were turned in the direction of a pew, where sat two gentlemanly-dressed strangers, who had entered the church during the reading of the Litany. The two strangers on leaving the chapel were followed as far as Castle-square by a large portion of the congregation, when they asked the meaning of such an attendance, and were informed by one of the headboroughs that they were suspected to be pickpockets. The gentlemen protested their respectability, which they offered to prove to any gentleman in the crowd who would accompany them. The headborough immediately got into the fly, which was driven to the house of a respectable lady resident in Brighton, who stated that the suspected pickpockets were the Rev. Mr. Moore, curate of Barton-on-Humber, and Mr. Moore, a fellow of St. John's, Cambridge, residing at Blackheath. Mr. Drummond on discovering the error into which he had been led wrote a letter to each gentleman, tendering the most ample apology, and expressing his regret at the consequences which had arisen from his error. At the same time he sent copies of his letter to each of the local papers, to remove any unfavourable impression which might have been created by the circumstances.

Deal.—A paragraph appeared in the Sunday papers, stating that accounts had been received by the new telegraph from Deal that the caisson for the foundation of the intended lighthouse on the Goodwin Sands had burst on Saturday night. It now appears that no such report was received at the telegraph; and that, so far from such an accident having occurred, the utmost advantage is being taken of the present favourable weather, and rapid progress is making with the undertaking. Since the caisson was placed on the Goodwin last week, two additional tiers of plates have been added, and the stone-work has commenced. The caisson is now 42 feet in height, and 18 above high-water mark.—The new telegraph between London Bridge and the Downs, to which we have alluded in former Numbers, was put in full operation on Monday, the line from the Downs and the North Foreland being rendered complete by the erection of a telegraph at Sandown Castle by permission of the Board of Ordnance. The arrival and departure of vessels are now communicated to Lloyd's immediately they are telegraphed.

Exeter.—The local papers mention in reference to the late failure of the Newton and Totnes Banks, that a further dividend of 15*s.* in the pound will be shortly declared payable to the private creditors of Mr. Wise, which, with the 5*s.* paid on Wednesday, will constitute the full sum of 20s. in the pound upon his separate estate.

Falmouth.—The Cornish papers express great pleasure in reporting that there is every prospect of a successful season to the parties engaged in the pilchard fishery. Large shoals have been seen off the coasts, but it is too early at present to find them of full size. The drift boats continually take considerable quantities, which are eagerly purchased. From the importance of these fisheries to the western coasts of Cornwall, it is hoped that the promise of a favourable season will be realised.

Gainsborough.—The question of Church Rates which has so long excited this town was decided on Saturday the 30th, at an adjourned meeting of the vestry, when a rate of 2*d.* in the pound was carried by 482 to 215. The local papers state that few towns in England contain a larger proportion of Dissenters than Gainsborough, the parish containing only one church and 12 Dissenting chapels, yet a church-rate has been invariably carried on a poll of the rate-payers, but never before by so large a majority.

Harwich.—Our readers will not have forgotten the disastrous fate of her Majesty's ship Fairy, in November 1840, engaged in surveying the coast near this port, when Capt. Hewitt, his brother-in-law the Master, Mr. Adam, son of Sir C. Adam, then one of the Lords of the Admiralty, and the whole of the ship's company perished. It was thought that she had sunk near Lowestoft, and the Admiralty desirous of regaining the valuable surveying apparatus, and the charts and memoranda, the results of years of labour of Capt. Hewitt, sent a Government steam-vessel to look for her, and offered large rewards to any person discovering the precise locality of the wreck; but, although continual search was made, nothing more was heard of her until last week, when the fishing-gear of one of the trawling-smacks got entangled with some wreck, which is said to have been proved, by marks upon the timbers hove up, to be the remains of the ill-fated vessel. The wreck lies about 13 miles south-east of Lowestoft in 17 fathoms water.

Lancaster.—For some time past the neighbourhood of this town has been the scene of nearly a dozen robberies and burglaries, all supposed to have been committed by one gang, who, although known to the police, contrived to elude detection until last week. They generally went in a body of nine together, and neither strength of locks, bolts, nor doors, withstood their attacks, their practice being to use a large beam of wood against the door of the house they intended to rob, as a kind of battering-ram, until the door was either broken open or the locks gave way. Several houses at Forton, Wyerdale, Scotforth, &c., were robbed in this manner. On Wednesday, the 27th, the police succeeded in capturing five of the party, and there is said to be little doubt that the remainder will speedily be brought to justice.

Leicester.—The storm which was so severely felt in the Metropolis on Wednesday the 27th, extended to a great part of this country, and was particularly severe in the village of Queniborough and the neighbourhood. The lightning struck the spire of the church, which at the moment presented the appearance of being enveloped in flame. The cap-stone was broken, and some large fragments fell into the bell-chamber. The bells vibrated violently, and, with the immediate crash of the thunder, caused much terror to the inhabitants of the surrounding houses. The lightning did not enter the church, but passed off externally, or much damage might have happened to the fabric, which is well known as one of the finest specimens of church architecture in this county.—About the same time the town of Melton Mowbray was visited by the storm, accompanied by the heaviest fall of rain witnessed for many years. The streets were completely flooded in a few seconds, occasioned by the stoppage of the grates of the culverts; the obstruction lasted for nearly half an hour, but no damage was done to the buildings.

Manchester.—For some days past the mill of Messrs. Gardner and Bazley, cotton-spinners in this town, has been "picketed" by a large body of unemployed operative cotton-spinners, about 200 in number, who parade up and down the street, in front of the mill, while the hands are coming to the mill, or leaving work. They do not appear to have used or threatened violence, or attempted to induce the spinners to leave their employment. It seems that since the turn-out, which occurred in 1829, through the interference of the spinners' union, Messrs. Gardner and Bazley have declined to employ any spinner who is a member of the union; and the object of the picket would seem to be to compel or induce the hands in the employ of the firm, amounting to about 400, to join the union, and help to maintain all the unionists who are unemployed. The assemblage of 200 men in a public thoroughfare for hours together has excited a good deal of curiosity and inquiry, and at times a considerable crowd has been collected. With a view of protecting the hands from any actual violence, five or six policemen have been stationed in the street, where they remain all day, not interfering with the "pickets," but watching their proceedings.—A pamphlet has been published by Mr. Adshead, giving a statistical account of the state of the labouring classes in this town from 1840 to the present year. The details are very voluminous, and make known some startling facts in relation to the existing distress. It appears that the relief fund raised by voluntary subscription, in 1840, 3,732*l.* 7*s.* 6*d.*, was expended in bedding and clothing, with which 10,132 families were relieved in 24 days, and there remained upwards of 2,000 families unrelieved for want of funds. Of the 45,591 individuals, 6,978 were hand-loom weavers; 38,613 of various occupations; 25,792 were English; and the other 19,799 Irish. The number included 16,900 children under, and 9,030 children above 12 years of age. Of the number, 2,040 families, comprising 9,179 persons, upwards of one-fifth of the whole, lived in cellars, mostly damp and without ventilation. Another examination of 2,000 families gave an average total income of 1*s.* 2¼*d.* per head per week for 8,866 persons, or 2,000 families at 5*s.* 3¼*d.* per week; in whose possession were seen 22,417 pawn tickets, more than 22 in a family on the average; the amount of articles pledged being 2,780*l.* 14*s.* 4*d.*, an average value short of 2*s.* 6*d.* per pawn ticket. Another examination of 2,000 families, by the agents of the town mission, gave the average earnings of 1*s.* 6½*d.* per head weekly, or 6*s.* 3¼*d.* per family; the amount of pledges was 2,835*l.* 10*s.* 10*d.* In 1841, a gentleman visited 258 families, mostly weavers, whose aggregate weekly earnings were 32*l.* 5*s.*, or less than 7½*d.* per head per week. In 1842, 8,072 families were relieved with 3,029*l.* 15*s.* 11*d.*, "the Prince of Wales's fund." Besides this, about 2,500*l.* have been contributed to the soup charity, and from 2,000*l.* to 3,000 persons have been daily supplied with soup for the last three or four months. The parochial expenditure on account of the poor in 1838-9, was 28,304*l.*; in 1841-2, 40,777*l.*; the voluntary contributions in 1839-40, were 3,732*l.*; in 1841-2, 5,529*l.*—together, 9,261*l.*; and the poors'-rate and voluntary contributions together exhibit an aggregate increase of relief afforded of 63½ per cent. since 1839—viz. from 28,304*l.* to 46,307*l.* 200 provision dealers, selling on credit, had lost 23,664*l.* in three years; and 50 shopkeepers in Salford had their receipts diminished from 197,700*l.* in 1839, to 130,100*l.* in 1841; a difference of 67,600*l.*, or a decrease of 1,300*l.* per week.

Newcastle—An accident which threatened very serious consequences occurred last week in this town as the south mail was preparing to start from the inn, after having changed horses. It appears that one of the wheelers took fright as the coachman, with the reins in hand, was about to mount, although a boy was holding them at the time. The latter was dragged a short distance, but succeeded in extricating himself; but the coachman hung on by the reins, and succeeded in keeping pace with and directing the course of the horses. The mail at length came in contact with a cart, which it threw over, but immediately afterwards it was stopped by a large waggon. The guard had previously attempted to check the progress of the horses by putting on the screw-drag, but in doing so he was thrown with violence from the coach, but without sustaining any serious injury. One passenger threw himself off, and also escaped danger. The horses having been brought to a stand by the waggon, were instantly secured. The passengers then alighted, and another coach having been procured, the mail proceeded on its route.

Newport.—The Welsh papers give a long account of a melancholy accident which happened on Thursday the 21st ult. to the two daughters of Mr. George Gethin of this town. It appears that the young ladies, accompanied by their mother, went to bathe in Dunraven Bay, but they ventured too far, and being carried by the strong current round the point called Trwyn-y-wWitch, were unfortunately drowned. The eldest being nearest the shore, on perceiving the danger of her sister, rushed to her assistance, and being carried off by the same current, met a similar fate. Their mother, who was also bathing at the time, witnessed the scene, and, although at so short a distance, was unable to render her children any aid, having, in her ineffectual efforts to rescue them, nearly lost her own life. Her shrieks, however, soon collected the few persons who were on the sands, and, among others, Mr. Gethin himself, who arrived at the spot only a few seconds after the disappearance of the last of his two children. The bodies have been found, and the jury, at the coroner's inquest, have returned a verdict of Accidental Death.

Oxford.—Much satisfaction has been caused in this city and the neighbourhood by the announcement that the Archbishop of York has given instructions for the gardens and park of his seat at Nuneham Park to be thrown open for the recreation of all classes three days a week, Tuesdays, Thursdays, and Saturdays.

Plymouth.—Our readers will no doubt remember the loss of an East Indiaman on the coast of China soon after the commencement of the war. The commander, Capt. Noble, and his child were drowned; but his wife and some of the crew fell into the hands of the Chinese. The Plymouth papers, in reference to this subject, mention that among the articles brought home in H.M.S. Wellesley from China, is the identical cage in which the unfortunate lady was confined for six weeks. It resembles the coop in which birds and small animals are sometimes brought to this country. It measures 2 ft. 8 in. in length, 1 ft. 6 in. in breadth, and 2 ft. 4 in. in depth; the top, or cover, has a small hole for the head to pass through. It is roughly made of fir stakes, and will, it is said, be sent to the British Museum, where it may be of interest, as showing the mode of punishment to which prisoners are subjected in the Celestial Empire.—Inquiries have been made by the Admiralty of the authorities of this Dockyard as to how short a period of time will be required to refit ten packets, lately paid off, of the new class 10-gun brigs, for the service of the West India Mails, at present performed by steam-vessels. The irregularity of the steamers is said to have led to this result, and it is supposed that a saving of 50 per cent. will be effected by returning to the sailing-packets.

Portsmouth.—Great alarm was occasioned in the George Hotel in this town on Friday morning last, when the house was filled with visitors for the Goodwood Races, by a loud explosion in the upper part of the hotel. It occurred at 2 a.m., when everything was quiet, and was so violent as to alarm the neighbourhood and even the police establishment in an adjoining street. The explosion took place in a lobby into which four doors open. The doors were forced off the hinges, the windows of the rooms were shattered, the skylight broken; wainscots, ceilings, &c. destroyed; the carpets were set on fire, &c., and numerous fragments of cartridge-paper and cordage were lying about. It is conjectured that a firework of strong paper, repeatedly folded and lashed with cordage, had been placed in a corner, or suspended from a bell-wire, after having been lighted by a slow match. There is not at present any trace of the delinquent; but it is hoped that the remnants of paper and cord of which the firework was composed may yet lead to detection.

Rugby.—Recent letters from Rugby convey the gratifying intelligence that the late Dr. Arnold at the time of his decease had just completed the third vol of his "History of Rome," and that his friend, Archdeacon Hare, has undertaken to superintend its progress through the press.

Shugborough.—For the last fortnight, Shugborough Hall has been visited by large numbers of persons, attracted by the announcement that all the property of the Earl of Lichfield, including this ancient seat of the Anson family, is about to be sold by auction. The house is rich in fine specimens of statuary and painting, most of which were collected by the gallant Commodore Anson, to whom all the valuable portion of the library and other collections is attributed. The sale of the books commenced on Monday. The lots, with one or two trifling exceptions, were evidently added to the family library before the time of the present peer: they realised indifferent prices, and were bought chiefly by the London booksellers, who had assembled in greater number than usual. The sale of wines will follow that of the books, and the other valuables will be brought to the hammer early in the ensuing week.

Windsor.—An extraordinary horse, supposed to be the smallest in the world, arrived at the Royal Mews on Monday, by railway from town, as a present to Her Majesty, from Java, in which island it was foaled. It is only 27½ inches in height—indeed, not as tall as many of the Newfoundland and other dogs belonging to Her Majesty. It is rising five years old, is a dark brown, well formed, and extremely quiet and playful. Shortly after its arrival, it was taken to the Quadrangle, where it was seen by Her Majesty and Prince Albert, the Prince and Princess of Saxe Coburg Gotha, and the visitors at the Castle. On Tuesday, being the anniversary of the battle of Blenheim, fought in 1704, the annual tributary banner from the Duke of Marlborough arrived at the Castle, and was deposited in the Guard Chamber, over the bust of "Queen Anne's hero."

Wolverhampton.—The Staffordshire colliers still give rise to much uneasiness, and on Monday the authorities were not without apprehensions of an outbreak. Close by the side of placards announcing a public meeting to be held at Swan village, at which the Chartists would attend, were posted large bills issued by the magistrates, in which it was declared that any acts of intimidation towards persons, or injury done to machinery, would subject offenders to the punishment of transportation or imprisonment. At Wednesbury the population was considerably excited, and a troop of the 3d Dragoons was quartered in the town, ready to act at a moment's notice. The itinerant Chartist missionaries are said to keep the people in a state of excitement, and the Magistrates have thought it necessary to call out additional troops of Yeomanry. It appears, from all accounts, that the miners are suffering extremely, although, in several instances, they refuse to return to work, even at their old rate of wages.

Railways.—The receipts of the railways for the past week are stated to have been as follows:—South-Western 8,091*l.*; Greenwich 878*l.*; Croydon, Brighton, and South-Eastern returns withheld; Blackwall 1,316*l.*; Eastern Counties 1,182*l.*; Northern and Eastern 1,601*l.*; Great Western 15,507*l.*; London and Birmingham 17,788*l.*; Birmingham and Derby 1,401*l.*; Manchester and Leeds 4,801*l.*; Hull and Selby 1,059*l.*; York and North Midland 1,756*l.*; North Midland 4,760*l.*; Great North of England 1,435*l.*; and Edinburgh and Glasgow 2,464*l.*—A special general meeting of the shareholders in the Liverpool and Manchester Company was held last week in Liverpool, for the purpose of declaring a dividend. The report of the directors referred to the depressed state of business, in consequence of which the gross receipts have diminished in every department, compared with the corresponding period of 1841. The directors are actively availing themselves of the permission granted at the special meeting for constructing an amended line of railway from Ordsall across the lands of the Manchester and Bury Company, for conjunction with the Manchester and Leeds line at Hunt's Bank. The gross income of the company from January to July had been 114,076*l.* 15*s.* 8*d.*; and the net profit 54,496*l.* 2*s.* 10*d.*, which, with the surplus of 8,122*l.* 9*s.* 7*d.* from the preceding half-year, enabled the directors to declare a dividend of 5*l.* per share, being at the rate of ten per cent. per annum. The report was received with satisfaction, and the necessary authority was unanimously accorded to the directors to receive on loan the required sums for the completion of the intended works.—The Manchester, Bolton, and Bury Railway Company, at their recent meeting, declared a dividend of 20*s.* per share, which, out of their net revenue, leaves a surplus of 1,300*l.* 12*s.*—The half-yearly meeting of the proprietors of the London and Greenwich Railway was also held last week. The report stated that the re-laying of the permanent way on wooden sleepers in lieu of stone blocks is now accomplished, and has effected great saving in the expenditure; but the receipts had been diminished through the altered fares, which induced the directors to think of a return to the former prices. There was a balance of 3,201*l.* 17*s.* 3*d.* applicable to the payment of a dividend, which was at the rate of 1*s.* 6*d.* per share on all the unprivileged shares. The result of the traffic from the Brighton, Croydon, and Dover lines for the last six months has produced only 3,402*l.*, making an average of 567*l.* per month; but during the last two months, since the increased toll has been received, the average has been 931*l.* per month, which left a hope of greater prosperity as the traffic of the other lines came into operation. The total cash, to the 30th June, was 1,012,336*l.* 1*s.* 6*d.*, and the balance in hand 15,705*l.* 3*s.* 10*d.* The receipts for the half-year were 27,570*l.* 2*s.* 4*d.*, and the number of passengers was 824,291*l.* After a warm discussion of several hours the report was adopted.—The half-yearly meeting of the proprietors of the Grand Junction Railway was held on Monday in Liverpool. From the report it appeared that the income of the Company had been, from January to July, 207,635*l.* 14*s.* 7*d.* The net profit for the last half-year had been 113,661*l.* 12*s.* 8*d.*; to which must be added the reserve fund, amounting with interest to 8,226*l.* 0*s.* 4*d.*; making a total of 122,487*l.* 13*s.* The report says—"The income-tax, amounting to 1,826*l.* 18*s.* 11*d.*, becoming payable to Government, will first have to be deducted for the three months ending the 30th of June; and the directors, for the reason given by them on the last occasion of their meeting the proprietors, have again to advise that the sum of 5,000*l.* be placed to the fund for the depreciation and renewal of engines and other stock. From the balance they have now to recommend that a dividend of 5*l.* per cent. be declared, amounting to 110,165*l.* leaving, after the above deductions, the sum of 5,495*l.* 14*s.* 1*d.* to be carried to the credit of the reserved fund, and applicable to future dividends. The depreciation fund, with the above appropriation, will, consequently, be with interest 10,040*l.* 7*s.* 6*d.* The net receipt for Sunday travelling is 10*s.* per share of 100*l.*—An entertainment has been given to 236 of the children belonging to the day and Sunday schools connected with the Railway station at Wolverton, on the London and Birmingham Railway. The children were afterwards examined by the chaplain of the station, and numerous reward books given for proficiency. The Episcopal chapel at the station having been found too small, it has been determined that a church and parsonage-house shall be erected there, and about 3,500*l.* have already been subscribed or promised in aid of this object.—A fire broke out last week in the train between Birmingham and Derby, supposed to have been caused by spontaneous combustion among the goods in one of the luggage-waggons. Great alarm was excited among the passengers in a third-class carriage attached to the waggons, and on approaching the Derby station several persons jumped out and were seriously injured. The waggon in which the fire occurred was entirely consumed, and the second was much burnt.

IRELAND.

The Harvest.—The Dublin papers state that nothing can be more propitious than the prospects of the harvest. The markets already afford a sensible indication of the appearance of the crops; and new potatoes, of the very finest quality, have been selling for 9*d.* a stone. They state that the old times and seasons seem to have returned, and that, within the memory of the oldest man living, there has never been a more extraordinary luxuriance and abundance of the crops than there is this year. Not a field of corn is prostrate by wet or storm. In the southern counties not a drop of rain has fallen. The past week was one of almost unclouded sunshine, and the days have had, from morning to night, a degree of warmth such as the country has not known for years. The harvest is fast ripening, and will shortly commence, under favourable auspices. In the north oats have been already cut on the farm of Messrs. Scott, nurserymen, of Belfast; the crop is excellent, and the grain quite ripe, full, and plump. The field, about four acres, was sown on the 16th of March last, and this is the third successive year that it has produced the earliest harvest in this country.

Dublin.—Accounts have been received in town, stating that Dr. Sondes, the Bishop of Cashel, who is now sojourning at Cheltenham, is considerably improved in health.—The Marchioness of Waterford has entirely recovered from her recent accident, and no unfavourable result of any kind is now likely to ensue. At the special meeting of the Dublin and Drogheda Railway Company last week, it was stated that the negotiation with the Government for a loan of 150,000*l.*, at 5 per cent., was progressing in a satisfactory manner. With regard to this railway, it was also stated that the capital of the company is 450,000*l.*, about one-half of which is said to be subscribed by English capitalists. The sum of 132,000*l.* has been paid up by the proprietors, of which 120,000*l.* has already been expended on the undertaking.—The Repeal meeting took place on Monday. Several letters from the United States were read; among others, one said to have been written by President Tyler, expressing warm interest in the object of the Association. After the routine business, Mr. J. O'Connell addressed the meeting on the proceedings of the late trials for Ribbonism in Armagh, and on the alleged employment of spies by the Irish Executive.

Monaghan.—Great interest has been excited throughout Ireland by the third trial of Mr. Sam. Gray, at the recent assizes in this town. The trial lasted two days; the jury were locked up on Friday, and were discharged on Saturday without agreeing to a verdict. It appears that the accused is the person who obtained from a corporate jury of Dublin a heavy verdict against the "Dublin Evening Post," for the publication of an article objecting to his appointment as Sub-Sheriff of Monaghan, and in that capacity the officer intrusted with the impanelling of juries, on the ground that he was an Orangeman who had long taken a leading part in the factious contentions of the district. Lord Normanby, then Lord-Lieutenant, deemed it necessary to cancel the appointment of the High-Sheriff, who had elected Mr. Gray as his deputy; and in consequence he lost the office. The action for libel against the paper was the result; and Mr. Conway, proprietor of that journal, who pleaded a justification, was amerced by the jury in damages and costs to the amount of upwards of 1,000*l.* Some time afterwards Mr. Gray was tried for murder at the assizes of this town, and acquitted. But a new charge growing out of the same occurrence, of shooting with intent to kill, was brought against him at the present assizes. Mr. Brewster, Q.C., attended on the part of the Crown to prosecute. The jury was composed of about an equal number of Protestants and Roman Catholics, and, after having been locked up a considerable time, they were discharged, as stated above, without agreeing to a verdict.

Galway.—The trial of Mr. Owen Lynch, who killed Mr. Kelly in an affair of honour, about a jockeying transaction, near Ballinasloe, last year, has just taken place at these assizes. The seconds were indicted at the summer assizes last year; but all the witnesses produced on the part of the Crown declined, with one consent, to give any account of what they had seen, alleging that they did not choose to criminate themselves. As the court was therefore precluded from entering into any inquiry, the prisoners were discharged, Mr. Lynch, the principal in this affair, has now been arraigned, and, after a similar formality, pronounced not guilty.—At the same assizes two young men named Blake, sons of a gentleman of consideration in the neighbourhood of Tuam, were tried for having cut off the ears of a man who had been a servant in their father's family. They pleaded guilty, and were sentenced to be transported for fifteen years.

SCOTLAND.

The Harvest.—The Edinburgh papers state that great progress has been made towards maturity in the grain crops, so that there is now no doubt of an early harvest; and if the weather prove favourable for gathering it into the stackyard, it will be the best crop of the finest grain with which Scotland has ever been favoured. In the neighbourhood of Glasgow the weather has been exceedingly mild, and the crops are advancing rapidly. In one or two favoured districts the barley harvest has already commenced, and other two or three weeks of equal sunshine will see the wheat and oat crops laid before the sickle. Great numbers of Irish reapers are already making their appearance. At Greenock oats have been produced in the market, and reaping has begun under very advantageous circumstances. In the neighbourhood of Inverness the oat crop is equally fine, and the prospects are very promising. In Dumbartonshire, barley has been cut on various farms, and the crops generally are in a forward state. Indeed from all parts of the country the reports are favourable, and the harvest is daily becoming general.

Edinburgh.—Several paragraphs have lately appeared in the papers relative to the neglected state of the grave of Sir Walter Scott. The Edinburgh papers, in reference to this subject, mention that the iron railing which surrounds the tomb at Dryburgh was put up by Sir Walter Scott's family after the interment, and, by Sir Francis Chantrey's advice, a mass of granite was intended to be put over the grave, for which he was to furnish a design; but a variety of pressing engagements, delicate health, and, finally, his sudden death, combined to deprive the abbey of what might have been expected from him. The accounts add, that it has not yet been decided whose assistance shall be asked to carry out the plan, and that the absence of the present Sir Walter Scott in India has necessarily occasioned delay in the completion of their arrangements.—The Edinburgh papers mention the following circumstance, showing the force of vegetation, which resembles the instance mentioned in our Paper a short time back as having occurred at Cheltenham:—On Thursday last a pavement stone on the road leading through Circus-place, which had been laid down in the month of March, was observed to be raised upwards of an inch from its bed, and, upon examination, was found to be resting upon three large fungi, two of which were each upwards of three feet six inches in circumference, or about 14 inches in diameter. The stone which was thus raised measured three feet nine inches in length, one foot eight in breadth, and four and a half in thickness; and it is said to have been not less than 2½ cwt.

Glasgow.—The local papers of last week contained a statement that the banns of marriage between Count Sartoris and Miss Adelaide Kemble had been published in that city; adding that the lady was already a widow, having two children at Milan. The marriage took place at St. Mary's Chapel on Monday week, but the statement respecting her widowhood is contradicted. It appears that Miss Kemble was engaged to be married to Signor Cartegenova, a bass singer, who appeared at the Italian Opera in London a few years back; but he died a short time prior to their intended marriage.—Some curious accounts of the proceedings of George Wilson, the steeple-climber, who recently repaired Carrickfergus steeple without scaffolding, have been published. It appears that he still continues to follow his occupation, and is ready to make repairs, even in the most dangerous positions, without incurring the expense usual in the erection of scaffolding. During the fair week he repaired the large stalk at Messrs. Muir and Co.'s works, at Anderston. The height of the stalk was 150 feet, and during the late storm it was cracked to the extent of 25 feet from the top. Wilson mounted the stalk in his usual way, by inserting pins of iron in the inside of the building, and using them as a ladder. He then took off 15 feet, to lighten the top of the erection, dropping himself down, as occasion required, by means of a block and tackle, being balanced in his descent by heavy weights. The work is said to have been completed to the company's entire satisfaction. From

Wilson's statement he does not seem to entertain any fear in accomplishing his labours. He says there is little danger of falling, as the needles are driven firmly in, and he attaches himself to one of them at every step by means of a belt.—We regret to state that a strike has taken place among the colliers around Glasgow, which has rendered it necessary to call out the military.

Perth.—Several barrels of American beef have arrived this week in Perth, one of them ordered by several gentlemen anxious to ascertain the quality and exact cost of such meat, and the rest to provision-dealers. The quality was found to be excellent, although not equal to prime pieces of home produce; and, all charges included, stood the importers 2¾*d.* per lb.: it has this week been retailing in the town at 3*d.*

Miscellaneous.

Pigeon Expresses.—The Society of Progress of Brussels sent, some time back, 57 pigeons to Liverpool, with orders to have them let loose on the 4th ult. This was done accordingly, and the following is the result of the trial:—The first pigeon returned on the 11th, and gained the chief prize for M. Camille de Bast, of Ghent, a member of the society; the second came home on the 12th, belonging to the same gentleman; the third on the 14th, the property of M. Jolly, of Brussels; and the fourth later on the same day, belonging to the winner of the first and second prizes. The delay is attributed to the contrary winds which were prevalent on the day they were let off. Of the 57 pigeons, upwards of 30 had returned from London some time before, in another trial, and more than 20 have come back from Orleans, Tours, Vendome, and Lyons. The Morning Papers, which make great use of the pigeon expresses, have received news which left Paris at ten at night, and published it at nine on the following morning in London.

The Earl of Rosse's Telescope.—We recently gave some account of this instrument and its probable effect in facilitating astronomical research. During the past week Sir James South has addressed a letter to the "Times," stating that he has received from the Earl of Rosse the gratifying intelligence that on Saturday last the speculum for his leviathan telescope was safely removed from the annealing oven, where it had lain nearly 16 weeks.

Mortality.—It appears from the official quarterly table of mortality in 114 of the principal districts, including nearly all the large towns of England and Wales, that the total number of deaths in the quarter ending March 31, 1842, was 44,479. The number of deaths in the Metropolis during the same period was 12,396. The total of the average quarterly deaths in the great towns for the past three years was 41,193, and for the past three winters 44,889, of which number 13,062 occurred in the Metropolis. During the three last winters the mortality in the five districts of the Metropolis has been as follows:—West District, 1,947; North District, 2,330; Central District, 2,716; East District, 2,948; South District, 3,121.

SPORTING.

GOODWOOD RACES.—*Friday.*—These interesting races concluded this day with the best possible effect.

The March (Handicap) Stakes of 10 sovs. each, 5 ft. if declared, for all ages, ridden by members of the Goodwood Club; 34 subs. Divided into 2 classes, the winners of each to run for the 5*l.* forfeits. The *first class* won by Lord G. Bentinck's African (Lord March), beating Lord Rosslyn's Cornuto, Mr. S. Herbert's Arctic, Mr. Bell's Man Friday, and Lord G. Bentinck's The Yorkshire Lady. African made all the running and won by a length. The *second class* won by Lord G. Bentinck's Tiptoe (Lord March), beating Count Bathyany's Nicholas, Lord G. Bentinck's Tripoli, Mr. Bell's Sister to Ferneley, and Mr. Graydon's Helpmate. Tripoli made the play throughout, and won easily by 2 lengths; a dead heat for second.

The Nassau Stakes of 50 sovs. each. The new mile; 22 subs.—Won by Lord Chesterfield's Dil-bar (Nat), beating Lord Exeter's Celia, Lord G. Bentinck's Firebrand (6lb. extra), Sir G. Heathcote's Mingrelia, Lord Westminster's Evening Star, and Mr. Bowes's Ladye of Silverkeld Well. Won cleverly by a length.

The Chesterfield Cup, by subs. of 15 sovs. each (handicap). Craven Course; 33 subs.—Won by Major Hay's Retriever (Murphy), beating Colonel Peel's Garryowen and Mr. Payne's Johnny. Eleven others started, but were not placed. Retriever made nearly all the running, and won in a canter by two lengths. A good race for second place.

March Stakes. Challenge for the 5*l.* forfeits.—Won by Lord G. Bentinck's Tiptoe; walked over.

Match. 200*l.* each. Craven course.—Won by Duke of Bedford's Envoy (E. Edwards), beating Lord Eglintoun's Pharold. Won easily by two lengths.

Match. 25 sovs. each. Craven course.—Won by Lord Eglintoun's The Young 'un (Captain Pettet), beating Lord G. Bentinck's Proof Print. Won by a length.

Produce Match. 300 sovs., h. ft.—Won by Lord G. Bentinck's Gaper; received forfeit from Lord Kelburne's Deerslayer.

Match. 200*l.*, h. ft. One mile.—Won by Mr. Theobald's Glenury; received forfeit from Mr. Gregory's Defier.

Match. 100 sovs. T. Y. C.—Won by Lord G. Bentinck's Let-us-stop-awhile-says-Slow (Lord March), beating the Duke of Beaufort's Anspach. Won in a canter.

Sweepstakes of 100 sovs. each. Last three quarters of a mile. 3 subs.—Won by Lord G. Bentinck's Miss Heathcote (Hon. A. Villiers), beating Sir W. Stanley's Cecil and Colonel Anson's Elopement. Won by a neck, after a fast and finely-contested race between the first two. These were two of four races made at Goodwood-house on Thursday evening, and proved an excellent *finale* to a brilliantly successful meeting. The only complaint heard was that the racing was too abundant.

The prospects or next year are very satisfactory; the Earl of Verulam and Lord Maidstone will officiate as stewards, and the stakes are progressing most favourably. There are already nearly 150 subscribers to the Goodwood Stakes, about 40 to the Cup, upwards of 50 to the March Stakes, about 22 to the Goodwood Club Stakes, 13 or 14 to the Anglesey, and 9 or 10 to the Welter Stakes; the last four are for gentlemen riders. The Two-year old and other stakes are filling well.

Law.

HOUSE OF LORDS—APPEALS.—*The Officers of State and the Lord Advocate of Scotland v. Lord Dunglass and another, et e contra.*—These were appeals from a decree of the Court of Session in Scotland, arising out of the following circumstances:—In the year 1827 Lord Dunglass was appointed chamberlain and collector of the rents and revenues of the lordship of Ettrick Forest, part of the hereditary revenues of the Crown. The other defendant was his deputy in office. The Lord Advocate, in 1833, brought a summons for reduction of the grant against Lord Dunglass, for the purpose of setting aside the grant of the office to him, on the ground that the grant was for his life, and that under the provisions of the Civil List Acts the Sovereign had no power to grant such an office for any term beyond his own life, those acts in fact placing the hereditary revenues of the Crown at the disposal of Parliament during the life of each successive Sovereign. Lord Dunglass contested this construction of these acts, and contended that the grant made to him was valid, and he disputed the title of the Lord Advocate to bring the grant into question. By an interlocutor of the 24th of December, 1836, the Court of Session sustained the objection to the Lord Advocate's title to support this summons of reduction, but gave no judgment on the other points of the case. By another interlocutor of the 10th of February, 1837, the court awarded costs to the present appellant. A second summons of reduction was then brought in the name of the Duke of Argyll, "keeper of the great seal, and others our officers of state for Scotland, for our interest; and the Right Honourable J. A. Murray (the Lord Advocate), for and in the name and behalf of the Commissioners of our Woods and Forests and Land Revenue," &c. To this new process for reduction Lord Dunglass put in a defence of *cumulatio actionum*, but the judgment in the first suit having been actually given, the Court of Session held it to be final, and proceeded, therefore, in the second, to adjudicate on the merits, and gave a judgment for the crown, declaring the grant to be void. An appeal was afterwards brought by the officers of state against the decree in the first summons, and the respondent now put in preliminary defences, on the ground that as the appeal related only to a judgment on matter relating to the title of a person to appear as pursuer in the court below, and also to an award of costs, the appeal could not, by the practice of the House, be sustained. Lord Dunglass then brought an appeal against the decree in the second summons. The cases were heard some time since, and the House took time to consider them. Lord Brougham now delivered judgment on the point raised in the second appeal, namely, that which impeached the decree declaring the grant to be void. After stating the facts of the case, and the opinion expressed by the Court of Session upon them, his Lordship said that it was not necessary to go into all the reasons on which the Court of Session had come to a decision on the illegality of the grant. One alone was sufficient. The salary to be paid under the grant to the officer was 120*l.* a-year, while the whole revenue which he collected, and for the collection of which this salary was to be paid him, amounted only to 335*l.* So large a sum to be paid for the collection of one of such small amount, showed sufficiently well that the grant was merely that of a nominal office; that, in fact, it was a mere grant of a pension; the more especially as the salary was to be paid out of the rents and other funds thus collected. If the Sovereign could in this way grant a part of the rents, he could grant the whole of them. It was, therefore, unnecessary to consider what power the Sovereign had to grant an office of this kind under the Civil List Acts, for this was clearly not an office; and, in a similar case, occurring in the reign of George I., a grant of this sort had been the subject of remonstrance to the Lords of the Treasury. Under these circumstances he was of opinion that this grant could not be supported, and that the judgment of the Court of Session, declaring it to be void, must be affirmed. There was an objection taken in the courts below, that the reason of the insufficiency of the grant had not been properly stated in the summons, and could not, therefore, be lawfully adopted and acted on by the court. This had been his chief ground for wishing the case to be postponed for consideration; but, on looking into the summons, he found it there distinctly stated that the pension had been bestowed under the pretence and "disguise of a grant of the office of chamberlain." That allegation was sufficient to get over the objection. He therefore moved to affirm the decree, which declared the grant to be void, and to reverse that other decree, which had declared the process of reduction not to be competent.—Lord Campbell was entirely of the same opinion, and, therefore, should not have added anything to the opinion of his noble and learned friend, but that he could not help taking notice of a mistake in the construction of the Civil List Acts committed by the Judges in the court below. Some of the Judges seemed to suppose that the King, by his speech, surrendered all the land revenues of the Crown for ever, and that the Act of Parliament was only a re-grant of them. This was altogether erroneous. The speech could effect nothing by way of grant or surrender. The surrender was only made by and with the Parliament, and was only made for the life of the individual Sovereign. As to the grant of this supposed office, he considered it a mere shift to grant a pension, which was charged in a way that the Crown had no power to charge it on these revenues. It was, in fact, the grant of an annuity under the name of an office, and that office undoubtedly fell in on the demise of the Sovereign who had made the grant.—Lord Brougham stated that he was authorised to declare that the noble and learned Lord who had likewise heard this case, but did not happen to be present to-day, entirely concurred with his noble and learned Friend and himself in this decision.—Judgment of the court below, declaring the grant to be void, affirmed.

VICE-CHANCELLOR'S COURT.—*De Saulcey v. De Saulcey.*—This was a bill filed by Madame de Saulcey, an English lady, domiciled in France, against her husband, M. de Saulcey, and Mr. Daniell, her trustee, to compel the execution of a decree of the Tribunal at Rouen, which it was alleged entitled the plaintiff to her property for her sole and separate use. Madame de Saulcey was possessed of about 25,000*l.*, which upon her marriage was made the subject of a French settlement. M. de Saulcey having become very extravagant, an *arrêt* of the tribunal at Rouen had been obtained, which directed that gentleman to restore to his wife the possession and the ministration of the whole of her estate. Subsequently, his embarrassments becoming still greater, the tribunal at Rouen directed Madame de Saulcey to allow him a certain sum as alimony. M. de Saulcey, however, had endeavoured to throw obstacles in the way of the proceedings in this suit, and the tribunal at Rouen had suspended the alimony with the view of assisting this court, and bringing him to terms. Mr. Cooper, Q.C., who appeared for Madame de Saulcey, submitted that there should be a transfer of the funds to trustees for her sole and separate use. The French contract of marriage was according to the "régime dotal," and that in effect amounted to the "sole and separate use" of our law. His Honour said that there must be a declaration that M. de Saulcey was not entitled to the property, and the funds must be transferred as the lady desired. This case showed that ladies should pause before they married foreigners without proper settlements. As Madame de Saulcey could make no admissions, there had better be inquiries as to the rights; but M. de Saulcey must not have his costs until he had executed the necessary transfer.

ROLLS COURT.—*Bampton v. Birchall.*—This case, which has frequently been before the Court, came on upon a demurrer to a supplemental bill. This bill, which was filed on the 25th June last, stated that William Blackburn exhibited his original bill against Frank Hall Standish, now dead, stating that Sir Frank Standish, of Duxbury Hall, Lancashire, seized in fee of Duxbury Manor, &c., died on the 15th of May, 1812, unmarried and intestate; that Thomas Standish, otherwise Stanley, weaver, was his heir-at-law; and setting forth a pedigree from Alexander Standish, buried at Chorley, on the 29th of June, 1622, who was stated to be the common ancestor of the late Sir Frank Standish and Thomas Standish, and as such heir he was entitled, on Sir Frank Standish's decease, to the lands as tenant-in-fee. The bill then stated that Thomas Standish, in 1820, took the benefit of the Insolvent Act, and William Blackburn was his assignee; that after Sir Frank Standish's death, Frank Hall Standish entered into possession of his real estates, and had since continued therein without any title thereto; that Blackburn had brought an ejectment, to which Frank Hall Standish had made himself a defendant; that there were outstanding terms of years, and mortgages upon the estates, and the original bill prayed that Blackburn might have a discovery thereof, and that Frank Hall Standish might be restrained from setting them up as a defence to the ejectment, and that all impediments to a fair trial might be removed. Frank Hall Standish demurred to this bill, but the demurrer was never set down, and he died in December 1840, being then in possession, and upon his death the defendants entered as his devisees or representatives. The insolvent Thomas Standish died in July 13, 1836, leaving the defendant, James Standish, his heir, and Blackburn died in March, 1841; and the plaintiff on the 5th of April, 1841, was appointed assignee of the estate of Thomas Standish, and as such was entitled to have the possession of the lands of which Sir Frank Standish died seized delivered to him. The present bill prayed that the suit which had become abated might be revived, that the plaintiff be declared entitled to the benefit of the original suit, and entitled to the estates, or that an issue might be tried, or that the plaintiff might try his title by ejectment, and that the defendants might be restrained from setting up outstanding terms on legal estates. The demurrer was, that the plaintiff had not entitled himself to a discovery, and that the personal representatives of Frank Hall, otherwise Standish, were not parties. Lord Langdale said the question was, whether this was a proper continuance by want of supplement to the original suit. The want of parties was a defect that might be supplied; but if the bill could be altogether demurred to, he hardly ought to give leave to amend. He took time, however, to consider it, and gave judgment on Monday last, allowing the demurrer, and refusing leave to amend.

ASSIZE INTELLIGENCE, GUILDFORD.—*Hunt v. Helps.*—This was an action by the plaintiff to recover the sum of 2,000*l.* from the defendant, who is the secretary to the British Fire-office, upon an assurance to that amount effected upon his property by the plaintiff. The defendant, by his pleas, admitted that the policy had been effected, but he alleged that the plaintiff had made a fraudulent claim upon the office, and also that the premises had been wilfully destroyed either by the hand of the plaintiff or by his connivance. The issue being upon the defendant, his counsel proceeded to address the jury, and said that the plaintiff in this action was proprietor of some paper-mills, situated in the Grange-road, Bermondsey, and upon which he had effected an assurance in the British Fire-office for the sum of 2,000*l.*; and he sought to obtain that sum by means of the present action. Under the circumstances, however, that would be detailed in evidence, the company felt themselves compelled to resist the claim, because they believed it was a fraudulent one, and that the duty they owed to the public and to their own interests left them no other alternative. The jury would have learned from the pleadings that the grounds on which the company resisted the claim were, that the plaintiff had made a fraudulent claim for property which had never been in his possession. The trial lasted two days, and several witnesses were examined for the defendant; but the most important evidence was that of Mr. J. Abbott, surveyor to the company, who stated that he had some conversation with the plaintiff after the fire, in reference to a claim amounting to 140*l.* for some part of the articles alleged to have been destroyed, and told him that he wished to have a detailed account. The plaintiff then valued the paper at 8*l.*, the string at 8*s.*, and the benches, he said, were worth 15*l.* He went through the other articles to make up the sum, and the amount in detail was only 50*l.* The witness asked him why he charged 140*l.* for articles which only came to 50*l.*, and he replied that he thought he would do the best he could for his creditors. Lord Abinger considered this evidence decisive; and the plaintiff's counsel admitted that he felt the difficulty, and undoubtedly if the jury thought the evidence of Mr. Abbott went to establish that the plaintiff had wilfully made a fraudulent claim, it would be useless to go on. Lord Abinger said it appeared to him the only question was, whether the jury believed Mr. Abbott or not? If they did, he thought the defendant must have a verdict upon the counts he had referred to. The jury deliberated for a short time, and they then said they did not think the arson was made out. Lord Abinger said he concurred with them in that opinion; but the question they had to decide was, whether they believed the evidence of Mr. Abbott as to the admission made by the plaintiff. The jury then retired to deliberate for a short time, and on their return they said that they could not disbelieve the evidence given by Mr. Abbott; and upon this a verdict was entered for the defendant upon the two first issues, and for the plaintiff on the third.

MARK LANE, FRIDAY, AUGUST 5.—There has been but little Wheat at Market in addition to Monday's supply, and that could not be sold unless a further decline of 2*s.* was submitted to.—The sale of Foreign continues very limited, and lower rates are taken where sales are effected.—No inquiry for bonded. Barley, Peas, and Beans remain unaltered in value. There is rather more doing in Oats, but at no improvement in prices.

GAZETTE OF THE WEEK.

INSOLVENT.—W. Freeman, Acton-street, Bagnigge Wells-road, builder.

BANKRUPTCY SUPERSEDED.—W. Webb, Northampton-terrace, York-street, City-road, watchmaker.

BANKRUPTCY ANNULLED.—J. Dawson, Huddersfield, woollen cloth merchant.

BANKRUPTS.—J. Ivery, High Wycombe, carpenter—H. J. Watkinson, Birstal, Yorkshire, card maker—C. Bindley and F. Copland, Birmingham, coach makers—H. Hilton, Over Darwen, Lancashire, bleacher—H. Rogers, Dartmouth, wine merchant—T. Collett and J. Smith, Ossett, near Wakefield, cotton spinners—W. Ward, Manchester, plumber—J. M'Gahey, Liverpool, printer—J. Early, Jun., Witney, Oxfordshire, girth-web manufacturer—T. Armstrong, Conduit-street, Paddington, merchant—R. Rollo, Durham-street, Vauxhall-road, merchant—J. Haddock, Warrington, bookseller—R. Loosemore, Tiverton, dealer and chapman—S. Knight, West Heathley, Sussex, cattle dealer—R. Lyon, High Holborn, cabinet maker.

SCOTCH SEQUESTRATIONS.—J. Harley and Co., Glasgow, wholesale warehousemen—J. Gilruth, Dundee, ironmonger—L. Wilson, Midmill, near Dunfermline, mill spinner—J. Naismith, Hamilton, builder—W. Watson, Cromarty, merchant—J. Hamilton, Paisley, writer—R. Menzies, Weem, merchant—J. D. Edgar, Castle Douglas, Kirkcudbright, merchant—T. Adamson, P. Borrie, and W. Esson, Dundee, shipbuilders—A. Broom, Glasgow, draper.

BIRTHS.—On the 29th ult., at Heathfield-house, near Liverpool, the lady of J. Bourne, Esq., of a son—On the 1st inst., at Gibson-square, Islington, Mrs. H. Bradley, of a daughter—On the 1st inst., in Notting-hill-square, the wife of C. K. Murray, Esq., of a son—At Beach-house, Walmer, on the 2nd inst., the lady of Captain Sir Keith Jackson, Bart., of a son—On the 1st inst., in Upper Harley-street, the lady of E. Pepys, Esq., of a son—On the 2nd inst., at 1, Cambridge-square, Hyde-park, the lady of G. Wilde, Esq., of a daughter—On the 3rd inst., in Great James-street, the lady of S. H. T. Hayne, Esq., of a daughter—On the 3rd ult., at Broseley Rectory, Salop, the Hon. Mrs. O. Forester, of a son.

MARRIED.—On the 31st ult., at Hemel Hempstead, Herts, Mr. A. F. Wace, of George street, Portman-square, to Martha Parker, youngest daughter of J. Stephens, Esq., of Rowdown, Boxmoor—On the 1st inst., at St. James's Church, Lieut.-Col. Fitch, to Ellen, relict of the late W. C. Elwyn, Esq., D.C.L., of York-terrace, Regent's-park—On the 3rd inst., at Streatham, F. Scott, Esq., commander, R.N., to Frances Magdalene, second daughter of H. Harvey, Esq., of Hill-house, Streatham—On the 4th inst., by special license, at All Saints, Croydon, the Right Hon. the Earl Cornwallis, to Julia, fourth daughter of T. Bacon, Esq., of Redlands, Berks.

DIED.—On the 1st inst., aged 81, Margaret, relict of the late O. Belfour, Esq., of Lincoln's-inn-fields—On the 2nd inst., suddenly, at East Bourn, aged 39, Frances Jane, wife of the Rev. T. Pitman, vicar of East Bourn—On the 3rd inst., at Tottenham-green, Margaret, wife of B. G. Windus, Esq.—On the 3rd inst., at St. Ives, Huntingdonshire, E. Greene, Esq., aged 74—On the 3rd inst., at his seat, Rufford-hall, Lancashire, aged 65, Sir Thomas Dalrymple Hesketh, Bart.—On the 4th inst., aged 69, Mrs. Taylor, of Highbury-terrace, widow of the late J. Taylor, Esq., of Finsbury-square.

Printed by Messrs. BRADBURY and EVANS, Lombard-street, Fleet-street, in the Precinct of Whitefriars, in the City of London, and Published by them at the OFFICE, 3, CHARLES-STREET, COVENT GARDEN, in the County of Middlesex, where all Advertisements and Communications are to be addressed to the Editor.—Saturday, August 6, 1842.

THE GARDENERS' CHRONICLE.

A STAMPED NEWSPAPER OF RURAL ECONOMY AND GENERAL NEWS.
THE HORTICULTURAL PART EDITED BY PROFESSOR LINDLEY.

No. 33—1842. SATURDAY, AUGUST 13. Price 6d.

INDEX OF THE PRINCIPAL HORTICULTURAL SUBJECTS IN THE LAST NUMBER.

Amateur's Garden . . . 525 a
Araucaria Braziliensis, hardy 526 b
Bees, to hive . . . . 525 c
— to stupify . . . . 529 b
Budding, remarks on . . 526 a
Bulbs, treatment in winter . 529 b
Cacti, to pack . . . . 529 a
Camellias, to propagate . . 529 a
Celery, treatment of . . 528 a
Chrysanthemums, their treatment . . . . . 524 c

Swallow, white . . . . 526 c

ROYAL BOTANIC SOCIETY OF LONDON.—GARDENS, INNER CIRCLE, REGENT'S PARK.
EXHIBITIONS, 1843.

The Council hereby give notice, that in the course of the ensuing year Exhibitions will be held in the Gardens, at which Premiums will be awarded for the best specimens of Ornamental and Interesting Plants and Flowers, and of Paintings, Drawings, Works of Art, and Manufactures in which the representation of Plants and Flowers is introduced.

Full particulars will be announced in future advertisements.

By order of the Council,
Aug. 6th, 1842. James de Carle Sowerby, Sec.

SALT-HILL DAHLIA EXHIBITION will take place on FRIDAY, SEPTEMBER the 16th. Particulars will be given next week.

DAHLIAS.

THE GRAND ANNUAL DAHLIA EXHIBITION ON SALISBURY PLAIN will take place on Wednesday, August 31st, at STONEHENGE, under the immediate patronage of Lady Antrobus. Full particulars may be had on application to J. Keynes, Hon. Sec.,
Salisbury, July 26, 1842. Salisbury.

STONEHENGE is Six Miles from Salisbury and Two from Amesbury. There will be accommodation at both places for conveying Exhibitors and their boxes to the Stones.

SHREWSBURY DAHLIA SOCIETY.—The Fourth Meeting of this Society, being for DAHLIAS, &c. will be held in the Town Hall, Shrewsbury, on Thursday, Sept. 15, when it is proposed that TWO SILVER CUPS be shown for, open to all England: one for 20 Blooms; subscription from Members of the Society 7s. 6d. each, from non-Members 10s. each. The other for 12 Blooms, the property of Amateurs only; subscription from Members 5s. each, from non-Members 7s. 6d. each. Notice to be sent to the Secretary, Mr. Thomas Groves, Frankwell, Shrewsbury, on or before Sept. 1st, who will take care that blooms sent from a distance are properly staged, if they are in the room by 9 o'clock, A.M., on the day of exhibition.

A prize of One Guinea will be given for the best bloom of a Seedling Dahlia of 1842.

No Seedling Dahlia will receive the Premium, unless declared worthy by the Judges.

LILIUM LANCIFOLIUM.

H. GROOM, Clapham Rise, near London, (Removed from Walworth,) by Appointment Florist to Her Majesty, respectfully informs the Nobility, Gentry, and Public, that he has a fine stock of Lilium lancifolium, album, and punctatum, which he can supply at very moderate prices.

He begs to say his Catalogue of Geraniums is ready for delivery, and can be had on application.

MYATT'S BRITISH QUEEN STRAWBERRY, after two years' competition, still maintains its pre-eminence; and, in returning thanks to their numerous patrons and friends, J. and W. Myatt beg to say they can with confidence recommend it as the most superb fruit yet known.

Also their new Seedling Strawberry Prince Albert, which for productiveness and size cannot be equalled. Price per 100, each, 50s.; and their Eliza, 20s. Runners are now ready, and may be had on application to them at Manor Farm, Deptford.

Myatt's famed Victoria Rhubarb, 50s. per 100 sets, or 1s. 6d. per root, will be ready in October.

FLOWER SEEDS for AUTUMN SOWING. The undersigned begs leave to recommend the following Flower Seeds for present and Autumn sowing:—

		£	s.	d.
60	extra fine var. German Stock	0	17	6
	The same in smaller Packets	0	10	0

⁂ A new and extensive Catalogue of Flower-Bulbs, comprising several rare Exotics, exclusively in his possession, will be forwarded, free of all expense, on application to James Carter, Seedsman and Florist, 238, High Holborn, London.

SUPERB SEEDLING DAHLIAS OF 1841.

F. AND A. SMITH and Co. beg to invite Amateurs and the Trade generally to inspect their SEEDLING DAHLIAS, Bianca, Sir R. Sale, Rainbow, &c., whilst in growth; and they flatter themselves that they will (from their Novelty and superior form) well repay the trouble of a visit, and prevent disappointment. Blooms may also be seen at most of the Seedshops in London.—Hackney, London.

GREAT BERKHAMPSTEAD, HERTS.

H. LANE & SON beg to call the attention of the Public to their stock of Black-seeded Bath COS LETTUCE SEED, the qualities of which are superior to any other; withstanding the severity of Winter, and remaining a long time on the ground before running to seed. It is also an excellent Summer Lettuce, and is well known and appreciated by the practical gardeners in the neighbourhood.

Packets, from 1s. to 5s. each, sent free of postage for a post-office order or postage-stamps.

Their splendid new Seedling FUCHSIA LANEII will be sent out in April next, at 7s. 6d. each, in succession as ordered.

No allowance to the trade unless six plants are taken.

Aug. 2, 1842.

STAPLETON ROAD NURSERIES, near BRISTOL. W. MAULE and CO. beg to call the attention of Horticulturists to a new and desirable FUCHSIA, which they intend sending out by the name of "Racemiflora élegans." Its habit is gracefully elegant; the lateral branches are set at every joint with numerous long deep-red flowers, 1½in. to 2in. long, drooping around the main stem of the plant, forming a complete column of beauty. It is allowed by competent judges to be one of the best varieties in cultivation.—Fine strong plants, in bloom, will be sent, if ordered, at 5s. or 7s. 6d. each.

TO GROWERS OF HYACINTHS, AND OTHER DUTCH BULBS.

YARMOUTH approximating so closely to Haarlem, the transit between the two places not occupying more than 10 or 12 hours, has induced Messrs. Youell to pay repeated visits, for the purpose of inspecting not only the Blooms, but of ascertaining the best Growers; and having concluded the objects they had in view in this respect, they have now the pleasure of announcing that this Season they will import a large quantity of Hyacinths, and other Bulbs for which Haarlem is so justly celebrated; and they confidently assert that the many causes of complaint so frequently made, and in most cases not without good grounds, of Bulbs proving unsatisfactory when blooming, will now be obviated. The Bulbs, they beg to add, are remarkably fine; and parties at a distance favouring them with their commands will have Bulbs included, to compensate in some degree for carriage.

Catalogues may be had on application.

Great Yarmouth Nursery, August 11th, 1842.

FULLER'S NEW HYBRID WINTER RADISH.—The entire STOCK of SEED of this delicious Esculent is in the hands of the Subscriber, and is now ready to be sent out in packets, post-free, on receipt of a Post-office order for 5s. A certificate of merit was awarded to the raiser of this Radish at one of the Winter Exhibitions of the London Horticultural Society in 1841. See Dr. Lindley's encomiums upon it. One or two small sowings may be made during the present month, which will suffice for the season.—Address, William May, Hope Nursery, Leeming Lane, near Bedale, Yorkshire.

TWITCHETT'S DON JOHN CARNATION (the finest Scarlet Bizarre in England); HEADLY'S SARAH, a splendid light-edged Red Picotee—each One Guinea per pair. See Wakeling's "Florists' Guide" for Sept. 1841 and June 1842. Also TWITCHETT'S FAIR ROSAMOND, a rich rose-edged Picotee on a snow-white ground, 10s. 6d. per pair. The Trade allowance if six pairs be ordered. Address Mr. Twitchett, Cambridge, or Messrs. Dickson, Acre-lane, Brixton, London.

Mr. Twitchett will show 21 blooms of his Don John against the like number of Martin's Splendid, or any other Scarlet Bizarre, for Two Guineas each bloom, and Twenty Guineas the odd, July 1843, p. p.

SPIRÆA LINDLEYANA.

ATKINS & JEYES beg to announce they have a fine stock of the above beautiful New Spiræa (raised by them from Himalayan seeds), and now blooming for the second season in their nursery. The racemes of flowers, of a beautiful creamy white, are upwards of two feet in length, and leaves eighteen inches, forming one of the most graceful *hardy* shrubs yet introduced. Good plants, well established in pots, 7s. 6d. each; a few extra strong, 10s. 6d. Northampton, 8 mo., 4th, 1842.

TO NURSERYMEN, FLORISTS, BUILDERS, AND OTHERS.
NORWOOD, SURREY.

FREEHOLD RESIDENCE, NURSERY GROUND AND BUILDING LAND. Mr. Henry Brown will Sell by Auction, at the Mart, Bartholomew Lane, on Friday, September 9th, at 12, in two Lots, a valuable Freehold Estate, Land-Tax redeemed, situate at Norwood, near the Beulah Spa, distinguished as the Zion Nursery; comprising a modern detached Dwelling-house and Shop, with extensive ranges of Greenhouses, Forcing Pits, Stabling, Sheds, &c., and upwards of four acres of Garden Ground, planted with fine bearing Trees; also a plot of Building Land of two acres, suitable for the erection of a Villa, and occupying a considerable frontage to the high-road leading from Croydon to the Beulah Spa, and about a mile from the Jolly Sailor Station on the Croydon Railway, one of the most elevated and choice situations in the County of Surrey, with an abundant supply of fine water. May be viewed and particulars had of Mr. Tansley, on the Premises; at the Jolly Sailor and Beulah Spa Hotel, Norwood; the Greyhound, Croydon; of Mr. G. Flight, Solicitor, 1, Adam-street, Adelphi; at the Mart; and of Mr. Henry Brown, Auctioneer and Surveyor, 22, Throgmorton-street.

TO NURSERYMEN, PINE GROWERS AND OTHERS.

MESSRS. PROTHEROE & MORRIS are instructed by the Trustees of Messrs. Adamson and Son, Stoke Newington Common, to submit to public competition, early in Sept. next, the whole of their celebrated Stock of Pine plants, Greenhouses, Hothouses, Graperies, Carts, Waggons, and general Farming and Agricultural Implements, and a considerable quantity of Building Materials. The whole comprise about 35,000 feet of Glass, with Brick and Ironwork and Water Apparatus complete; about 10,000 Pine plants of the first quality, and well-known established Stock; a considerable number of Cucumber, Melon, and other Frames and Lights; the stock of Greenhouse and other Plants. Further particulars will shortly be advertised. The whole of their splendid Nursery and other Stock will be disposed of by public Auction about the third week in October next, of which timely notice and particulars will be given.

American Nursery, Leytonstone.

VALUABLE ORCHIDACEÆ.

MESSRS. J. C. and S. STEVENS beg respectfully to announce they have just received a second importation of valuable Orchidaceæ, collected from the neighbourhood of the source of the River Paleelme, bordering on the State of Quesaltenango: which, although comprising many known species, still, from their character, and the different habitat they have hitherto been received from, may prove varieties, whilst there are a number of them decidedly new. They will be Sold by Auction, at their Great Room, 38, King Street, Covent Garden, on Thursday, 18th August, at Twelve for One o'Clock, and may be seen the day prior and Morning of Sale, and Catalogues had.

VALUABLE ORCHIDACEOUS PLANTS.

MESSRS. THOMAS WINSTANLEY AND SONS (of Liverpool) announce to the Admirers of curious and rare plants, that they are instructed to sell by Auction on the Premises, Aigburth, near Liverpool, on Monday, the 29th of August next, and following days, at 12 o'clock precisely each day,

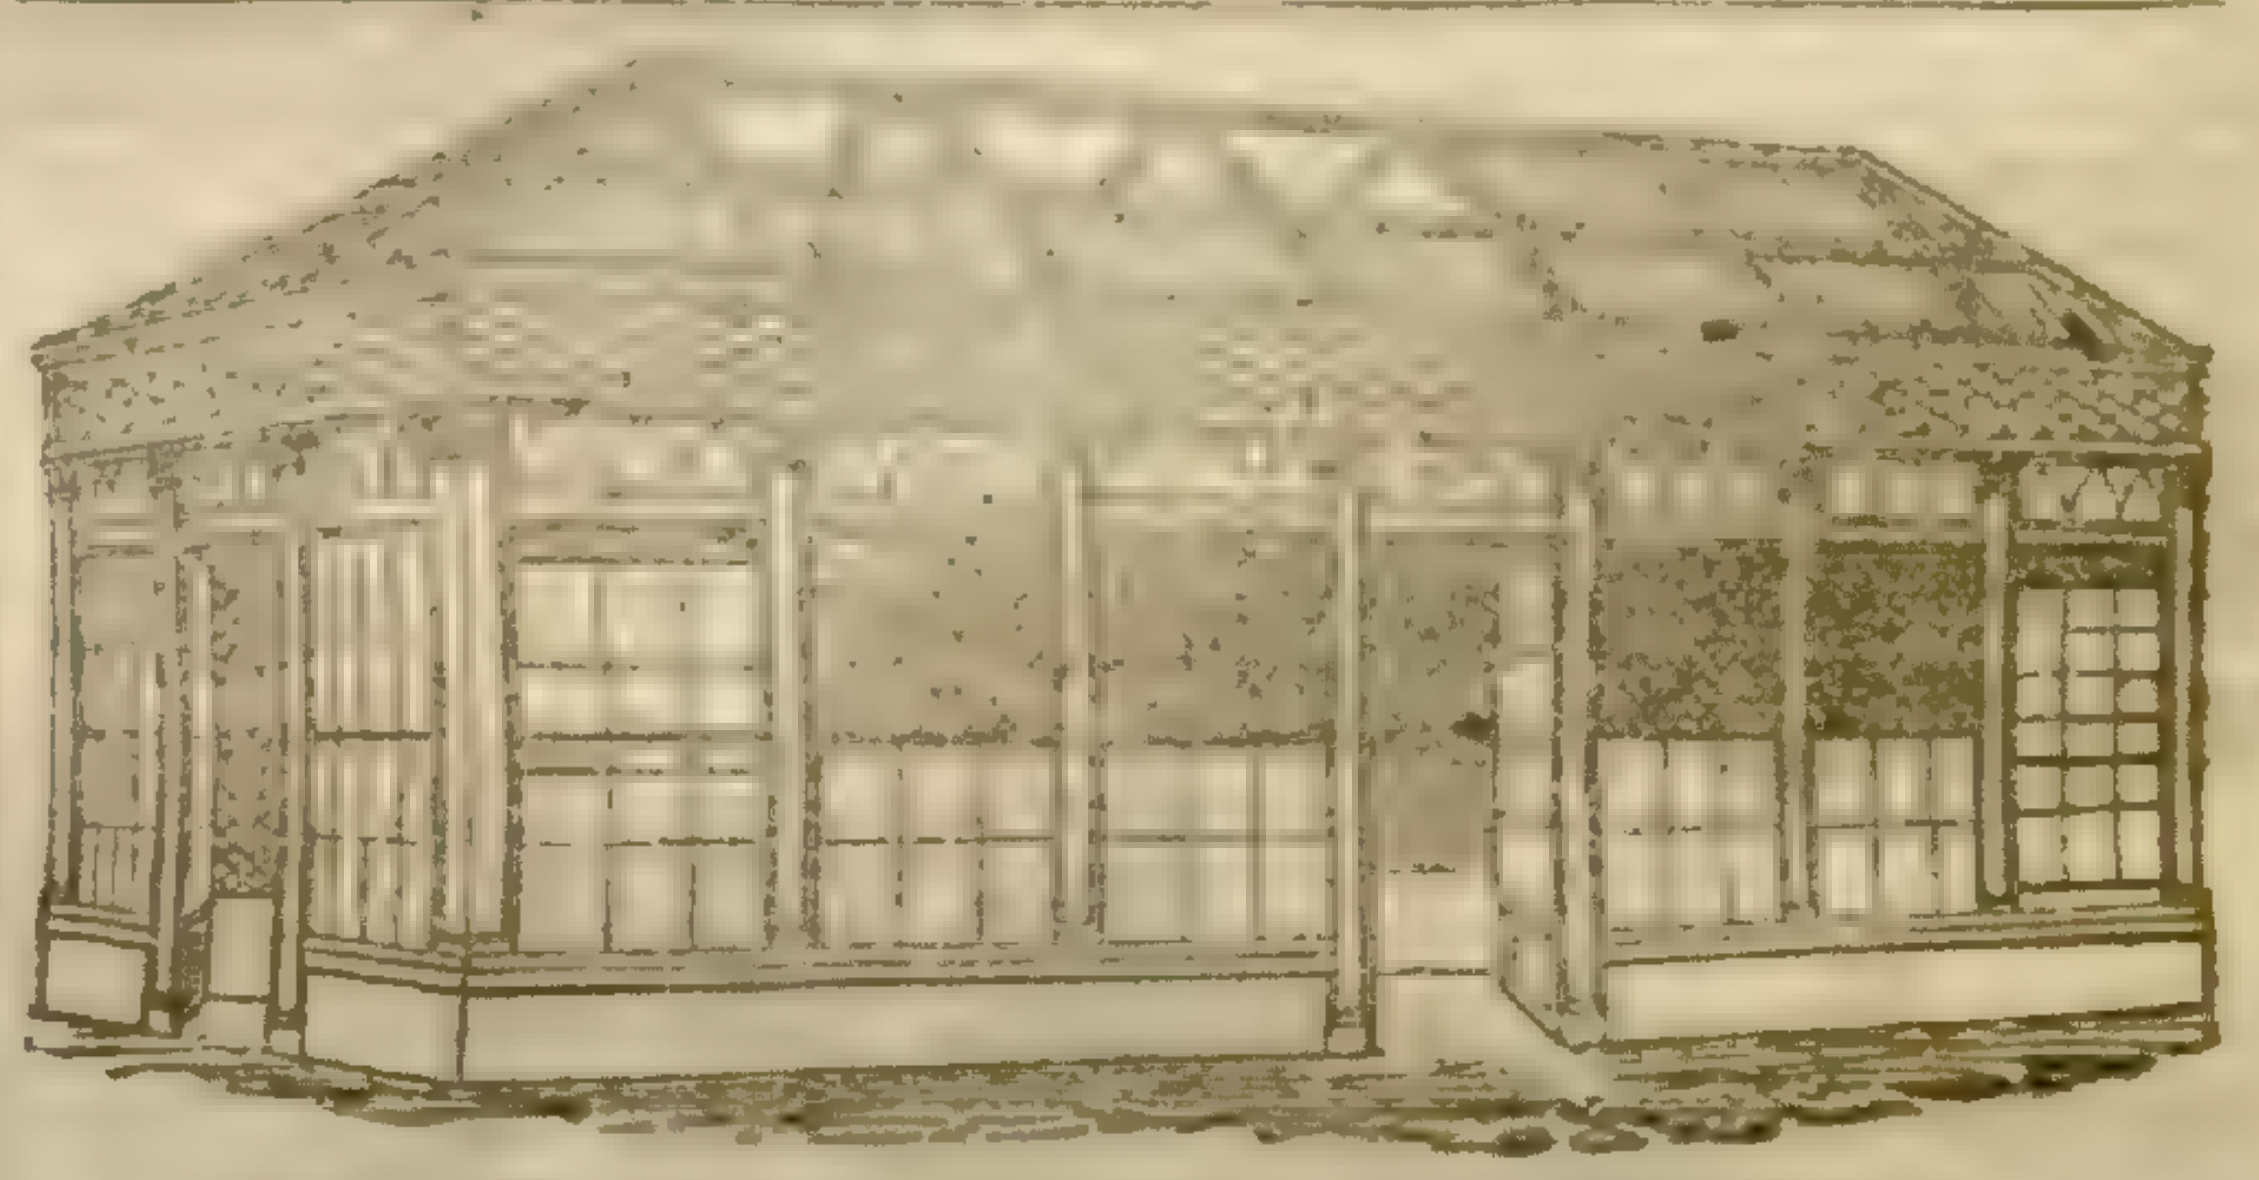
THE UNIQUE, WELL-KNOWN, AND JUSTLY-CELEBRATED COLLECTION OF ORCHIDACEOUS PLANTS,
The Property of Richard Harrison, Esq.

In the collection will be found large and rare specimens of the Angræcum Eburnium; Cattleyas, including Skinneri, Perrini (fine), Labiata (very fine), Crispa (very large), Mossii, Lodgesi, Guttata, Citrina, Superba, &c. &c. Epidendrums, all fine; named and several unnamed Maxillarias, Oncidiums, Dendrobiums; Aerides Brookii, cornutum, and odoratum; Odontoglossum grande, maculatum, &c.; with about four hundred other varieties of choice Parasitical Plants, including Fernandesia, Grobya, Gongora, Heterotaxis, Hillia, Lissochilus, Leptotes, Cyrtopodium, Calanthes, Cypripedium, Coryanthes, Cirrhæa, Catasetum, Cœlogyne, Cyrtochilum, Cycnoches, Cymbidium, Neottia, Brassavola, Vanda, Rodriguezia, Myanthus, Mormodes, Miltonia, Phaius, Brassia, Burlingtonia, Bifrenaria, Batemannia, Stanhopea, &c. &c.: Lælia anceps, autumnale, and others. Together with a general assortment of Hothouse Plants of an important character, and highly interesting to the lover of Botany.

The above Collection, for its extent, is allowed to be one of the finest in Europe, and is the result of twenty years' formation, by Mr. Harrison, regarding only variety and perfection.

The Plants having been attended to by a skilful gardener, are in excellent condition, and will be sold without reservation.

The whole may be viewed on Friday 26th, Saturday 27th August, and on the mornings of Sale, and Catalogues, which will be ready in a few days, had at the following places:—The Offices of the *Gardeners' Chronicle* and the "Gardeners' Magazine;" Messrs. Winstanleys, Paternoster Row, London; at the place of Sale, and of Thos. Winstanley and Sons, Liverpool.



HORTICULTURAL BUILDING AND HEATING BY HOT WATER.

J. WEEKS and Co., Architects, &c., Gloucester-place, King's-road, Chelsea, Hothouse Builders and Hot-water Apparatus Manufacturers, beg leave to inform the Nobility and Gentry that their business, which has been extensive throughout the country for many years, is entirely confined to the BUILDING OF HORTICULTURAL ERECTIONS of every description, and the HEATING of them by HOT WATER.

CONICAL and other BOILERS of all sizes; their largest consumes but a small quantity of fuel, only requiring attention once in 10 hours, and will heat a range of Forcing Houses 300 ft. in length.

Their improved plan of BOTTOM HEAT FOR PITS, by means of an open trough under the bed, is now being universally adopted.

References may be had, and their works seen at most of the Nobility and Gentlemen's Seats in the country, nearly the whole of the London Nurseries, and a great variety of Horticultural Erections and Hot-water Apparatus, Models, Plans, Estimates, &c., at their Horticultural Manufactory, Gloucester-place, Chelsea, near Sloane-square.

HEATING BY HOT WATER.

HOTHOUSES, and every description of Horticultural Buildings, Churches, Chapels, Public Buildings, Mansions and large Rooms, fitted up with the above apparatus on the most improved and scientific methods.

W. WALKER and Co. (late of Mosley-street, Manchester) beg to announce that they continue to execute works of the above description, in which they have introduced a variety of important improvements of a satisfactory nature, especially to Horticulturists. They have applied this principle on a more extensive scale than has ever been hitherto adopted at the stupendous Conservatory and Hothouses of his Grace the Duke of Devonshire, and in numerous other extensive establishments, with the most complete success.

They have also successfully applied C. W. Williams' Patent Argand Furnace to their boilers, and have made arrangements with the Patentee for its general adoption. It economises fuel, and removes the nuisance and disfigurement of smoke, so much complained of by Gardeners, and is a new and valuable feature in these Apparatus.

Works executed in every part of the United Kingdom with punctuality and despatch.—33, Brown-street, Manchester.

HEATING BY HOT WATER.

JOHN WALKER, 46, St. John's Square, Clerkenwell, London, having been for many years extensively engaged in Warming Churches, Manufactories, Hospitals, Hothouses, Conservatories, and Private Houses, by means of Hot Water, either in Pipes or Pedestals, can confidently recommend this mode of heating in preference to any other. Numerous references can be given both in town and country, where he has successfully and satisfactorily applied it. Baths fitted up and heated in a superior manner. Orders executed in all parts of the Country with punctuality and despatch.

HOT-WATER APPARATUS FOR HEATING HORTICULTURAL BUILDINGS, DWELLING-HOUSES, CHURCHES, and MANUFACTORIES, upon improved principles, and at very moderate charges, erected by DANIEL and EDWARD BAILEY, 272, HOLBORN.

D. and E. BAILEY having devoted much time to the consideration of this subject, and had much experience in the erection of apparatus for the above-mentioned purposes, have, by improvements suggested in their practice, rendered their mode of heating not only very efficient, but very simple, and have combined durability in the apparatus with economy in the charge. They have erected apparatus in England, Scotland, and Ireland, for many noblemen and gentlemen, and have had the honour to be employed by the Horticultural Society of London, in executing the works of their splendid Conservatory, lately erected at Chiswick.

D. and E. BAILEY also construct in metal all descriptions of Horticultural Buildings and Sashes, and invite noblemen, gentlemen, and the public to an inspection of their various drawings and models, at 272, Holborn, where they have the opportunity of exhibiting, amongst other metal works, an extremely complete and convenient kitchen apparatus, or range, adapted for the continued supply of hot water, and an arrangement of the oven more complete than has hitherto been brought before the public.

D. and E. BAILEY were the first to introduce metallic curvilinear houses to horticulturists, and can refer to the Conservatory attached to the Pantheon as one of their works, besides many others in this country and on the Continent.

D. and E. BAILEY have prepared a quantity of the Galvanic Plant Protectors, which are now ready for immediate delivery; they beg to introduce to public notice a new Trough Pipe, for Orchidaceous or other Houses where vapour is constantly, or at intervals, required, and which may be seen at their manufactory.

HOTHOUSES, CONSERVATORIES, &c., Made and Fixed complete in all parts of the Kingdom. One, two, and three-light Cucumber and Melon Boxes and Lights of all sizes kept ready for immediate use, packed and sent to all parts of the Kingdom; warranted best material. Two-light Boxes and Lights complete, from £1 8s. Garden-lights made and glazed, 1s. per foot, at JAS. WATT'S SASH MANUFACTORY, CLAREMONT-PLACE, Old Kent-road. REFERENCE GIVEN.

EDWARD BECK, MANUFACTURER IN SLATE, Isleworth, Middlesex, respectfully informs Horticulturists, that his IMPROVED SLATE TUBS for Orange Trees and Conservatory Plants, mounted upon rollers, Slate Cisterns, Shelves, and Edgings for garden paths, may be seen in use at his house upon application to the gardener.

ECONOMIC LIFE ASSURANCE SOCIETY, No. 34, BRIDGE-STREET, BLACKFRIARS, LONDON. Established 1823. Empowered by Act of Parliament, 3 William IV.

LOWER RATES OF PREMIUM THAN THOSE OF ANY OTHER OFFICE, that entitle the assured *to participate in the profits*, as follows:—

Age.	15	20	25	30	35	40	45	50
Annual Premium per cent.	1 10 8	1 14 7	1 19 0	2 4 3	2 10 11	2 19 9	3 11 9	4 8 0

The BONUS declared in 1834 amounted upon an average to 16*l.* per cent. on the premiums then paid; and in 1839 a second BONUS was awarded, amounting on the average to 31*l.* per cent. on the premiums paid during the preceding five years.

No extra charge for residence in any part of Europe, nor for proceeding (in a decked, sailing, or steam vessel) from any one Port thereof to another during peace, to Assurers, not being seafaring men by profession. Licenses are granted to go to any part of the world upon terms proportionate to the risks.

Policies on the lives of persons dying by suicide, duelling, or by the hands of justice, are not void as respects the interests of parties to whom they may have been legally assigned.

Assurances may be effected on any and every day.

By order of the Board of Directors,
CAMPBELL JAMES DOWNER, Secretary.

PAXTON'S BOTANICAL DICTIONARY.—This Volume contains an immense quantity of Useful and Interesting Information, relating to the History, Culture, and Uses of all known Plants. It is, in fact, a Pocket Companion for every one fond of Botany, whether as a Pursuit or Amusement. As a book of reference it will be found indispensable. It may be strongly recommended as the most useful work ever brought before the public.

London: J. Andrews, 167, New Bond-street; and W. S. Orr, Paternoster-row.

ILLUSTRATIONS OF BRITISH GRASSES.
Published this day, quarto, with 118 Plates, beautifully coloured, pp. 250, 3*l.* 16*s.* boards,

GRAMINA BRITANNICA; or, Representations of the British Grasses. with Remarks and occasional Descriptions. By I. L. KNAPP, Esq., F.L.S. and A.S. Second Edition.

London: Longman, Brown, and Co. Bristol: W. Strong.

NEW TRACTS FOR COTTAGERS, BY THE REV. W. C. COTTON.
In 12mo, price 6*d.*, or 5*s.* per doz., (with Woodcuts,)

MARY THOMPSON'S COTTAGE; WALLS.—
By the Rev. W. C. COTTON, M.A.,
Student of Christ Church, Oxford; Chaplain to the Bishop of New Zealand; and author of "My Bee Book."
Rivingtons, St. Paul's Churchyard, and Waterloo-place.

Also just published, by the same Author,
1. The VILLAGE. 2. The VILLAGE SCHOOL, Part I. (To Children.) 3. The VILLAGE SCHOOL, Part II. (To Parents.) 4. The VILLAGE SCHOOL, Part III. (To Schoolmasters and Mistresses.) Price 6*d.* each, or 5*s.* per dozen.

AGRICULTURAL INSTRUCTION.—The opportunity for Young Lads to acquire a knowledge of the THEORY and PRACTICE of FARMING, in combination with the usual routine of an ordinary education, is now offered by the opening of the Agricultural College at Shepscombe, Gloucestershire.—For particulars apply to the principal, addressed (post free) Shepscombe House, near Painswick; or to Mr. Casella, No. 23, Hatton Garden, London.

N.B.—A few Apprentices are taken, vacancies for whom are still existing. Terms for an apprenticeship of three years, 50*l.*, in easy payments; for which every expense of board and clothing is provided. Lads taken on trial for three months for 5*l.*, exclusive of entrance-fee of 2*l.* 2*s.* for tools, &c.

Price 7*s.*, illustrated with Wood-cuts of Birds, Cages, &c.,
A NEW EDITION OF THE

NATURAL HISTORY OF CAGE BIRDS; their Management, Habits, Food, Diseases, Treatment, Breeding, and the Methods of Catching them. By J. M. Bechstein, M.D.

"A very delightful book of its kind. . . . . . It seems to us an indispensable book for the bird-fancier."—*Spectator.*

"It will be welcome to every gentleman's library or drawing-room table. It is superbly got up, with an immense number of vignettes, and, in fact, rivals the beauty of the Annuals."—*Weekly Dispatch.*

London: W. S. Orr and Co.; and W. R. Chambers, Edinburgh.

THE HEALTHIAN.—Published on the 1st of every Month, 1*d.* per Number. The above periodical is devoted to an investigation of the Life and Health Laws, and designed to promote the cause of Temperance.

Published by Strange, Paternoster-row; and may be had of all Booksellers.

In Monthly Nos., 8vo, with Four beautifully-coloured Plates,
Price 2*s.* 6*d.*

PAXTON'S MAGAZINE OF BOTANY.

The Number for August, 1842, contains highly-finished drawings of *Aérides Brookii, Mimulus Maclainiànus, Oxylobium Pulteneæ*, and *Achimenes longiflòra*: likewise Papers on Gardening as a science; on the Arrangement of Plants in Groups; and Culture of Chorozema cordatum. Floricultural Notices of new and beautiful Plants figured in the leading Botanical Periodicals for July, and of those in flower at the principal Suburban Nurseries and Gardens; together with a complete Calendar of Monthly Operations for the Garden.

This work comprises, monthly, four admirably-coloured plates, and twenty-four pages of interesting and useful letter-press. The admirers of flowers are requested to observe—

1. That all the drawings are taken from nature, and are consequently made from plants which have flowered in Britain.
2. That, with few exceptions, they are all done by one artist, whose abilities are of the highest order, and who travels himself to the places where the plants are in flower.
3. That they are lithographed by the same individual, and, being coloured in a superior manner, have all the spirit and elegance, and much of the finish, of the original drawing.
4. That about one-half of the drawings are from plants which have never before been figured in this country, the rest representing the most popular novelties, as well as the more neglected, though sometimes far handsomer, old species; the majority being such as can be cultivated by every one possessing a flower-border and a greenhouse or frame.

It may, in conclusion, be safely asserted that, both for the beauty of its embellishments, and the utility of its contents, this work is well adapted to the wants of all who delight in gardening; and as the improved system of having the plates lithographed commenced with the present year, and as it is intended that each volume shall now be perfect in itself, the present is a desirable opportunity for those who wish to become subscribers.

London: W. S. Orr and Co., Paternoster-row.

DARLEY'S SCIENTIFIC LIBRARY, for the Use of Schools, Private Students, Artists, and Mechanics. It is the purpose of this Work to furnish a Series of Elementary Treatises on Mathematical Science, adapted to the wants of the Public at large. To youth of either sex at public and private schools, to persons whose education has been neglected, or whose attention has not been directed in early life to such studies, and to Artists and Mechanics, these little Works will be found particularly suited. The principles of the various Sciences are rendered as familiar and brought as near to our commonest ideas as possible; the demonstrations of propositions are made plain for the mind, and brief for the memory; and the Elements of each Science are reduced, not only to their simplest, but to their shortest form.

1. A. SYSTEM OF POPULAR GEOMETRY. Containing in a few Lessons so much of the Elements of Euclid as is necessary and sufficient for a right understanding of every Art and Science in its leading Truths and general Principles. By GEORGE DARLEY, A.B. Fourth Edition, 4*s.* 6*d.* cloth.
2. COMPANION TO THE POPULAR GEOMETRY, in which the Elements of Abstract Science are familiarised, illustrated, and rendered practically useful to the various purposes of Life, with numerous Cuts. (A Second Edition is now ready.) 4*s.* 6*d.* cloth.
3. A SYSTEM OF POPULAR ALGEBRA, with a Section on Proportions and Progressions. Third Edition. 4*s.* 6*d.* cloth.
4. A SYSTEM OF POPULAR TRIGONOMETRY, both Plane and Spherical, with Popular Treatises on Logarithms, and the application of Algebra to Geometry. Second Edition, 3*s.* 6*d.* cl.

"For students who only seek this limited knowledge of these sciences, there are perhaps no treatises which can be read with more advantage than Darley's Popular Geometry and Algebra."—*Library of Useful Knowledge, Article "Mechanics."*

Taylor and Walton, Booksellers and Publishers to University College, 28, Upper Gower-street.

HORTICULTURE.

Saturday, Sept. 3d, will be published, price 3*d.*, 16 pages royal 8vo, Illustrated with Wood Engravings, to be continued Weekly,

THE GARDENER & PRACTICAL FLORIST, No. 1.—A new Work, comprising Original Papers by distinguished Writers on the Culture, Properties, and best Modes of Exhibiting Plants, Fruits, and Flowers; Critical Notices of New Books, Flowers, Plants, Implements, and other subjects connected with Horticulture; Observations on the Proceedings of Public Societies, and the Management of Public Gardens; and the spirit of all valuable Works on the various branches of the Science; forming a TEXT-BOOK FOR THE FLORIST, a Guide to the Amateur, a Library for the Gardener, and a useful Book for the Million.

London: Richard Groombridge, Paternoster-row, where Advertisements, Books, Plants, Communications, &c. for the Editor may be forwarded.

Handsomely bound in cloth, with Ninety-three Wood-Engravings, Price 6*s.* 6*d.*

ILLUSTRATIONS OF THE BIBLE, AND CONFIRMATIONS OF SACRED HISTORY, from the Monuments of Egypt. By W. C. TAYLOR, LL.D.

From the British Magazine.—"This is an elegant and well-executed little book, on a most interesting subject."

From the Birmingham Herald.—"A valuable and indispensable accession to the library of every Biblical student."

From the Rev. Thomas Hartwell Horne's Introduction to the Critical Study of the Scriptures.—"Nearly three hundred texts of Scripture are more or less explained in this elegantly-executed volume, and in a manner equally curious and interesting."

Tilt and Bogue, Fleet-street.

FAMILIAR ASTRONOMY. By GEORGE DARLEY, A.B., Author of a System of Popular Geometry,—Companion to the Popular Geometry,—a System of Popular Algebra,—and a System of Popular Trigonometry. 12mo, with Engravings, 5*s.* cloth, lettered.

"There is a vast deal of astronomical information conveyed in a most winning and unassuming manner in this delightful little volume, which, not less for the novelty of its plan than the extent of its intelligence, reflects infinite credit on the taste and talents of its projector and editor, Mr. Darley."—*Sun.*

HISTORICAL MEMOIRS of the QUEENS of ENGLAND. By HANNAH LAWRANCE.

"These laborious and interesting memoirs."—*Athenæum.*

"This very industrious and interesting work."—*Examiner.*

"One of the most pleasing and valuable contributions which English history has received for many years."—*British Mag.*

"Narratives of as much interest as if they were pure dramas."—*Atlas.* Edward Moxon, Dover-street.

WANTS a SITUATION as GARDENER, to board in the House, a Single Man, who has a practical knowledge of Gardening in its various branches, and can have an unexceptionable character. Address, by letter, B. H., Post-office Peterborough.

WANTS a SITUATION as GARDENER and STEWARD, or GARDENER ONLY.—A Married Man, 38 years of age, being now disengaged, begs to offer his services to any Nobleman or Gentleman in want of a thorough practical person in that capacity. He has had great experience in the Erection of Agricultural and Horticultural Buildings, the Draining and Management of Land, and in the Culture and Forcing of Pines, Grapes, Cherries, Orchidaceous Plants, Greenhouse Plants, Heaths, and other Horticultural Productions; his success has been almost unparalleled—as can be testified by the prizes awarded to him by the Horticultural Societies of London, Liverpool, &c. In Landscape Gardening and raising Plantations on exposed situations he has had great experience, having been engaged in that department for many years; and the merits of his system of thinning and pruning Plantations, the management of Wall and Espalier Fruit-trees, only require to be known to be universally adopted.—Address, Mr. Henderson, Pine Apple-place, Edgeware-road, London.

WANTS a SITUATION as GARDENER, a respectable single Man, aged 22, who is competent in the various branches of his business, and can have 3 years' character from the place he has just left. Direct H. Y., 1, Charles-street, Bentinck-terrace, Regent's-park.

FUN FOR THE FIRESIDE!!
Bound in cloth, price 5*s.* 6*d.*,

JOE MILLER'S JEST-BOOK.

A Reprint from the first and genuine edition, such omissions and alterations only having been made as were required by the greater delicacy observed in modern conversation; but, that the volume might have some substance, and be a good table or travelling book, copious additions have been made from other old volumes of Facetiæ.

Extract from the Preface.

"Another strange circumstance connected with this work is, that everybody presumes that he himself and everybody else is perfectly familiar with its contents . . . . . . and yet, if the reader will ask his acquaintance, it will appear that not one in five hundred ever set eyes on a copy. It is in consequence of like questions that this edition is published."

London: Whittaker and Co.

SHIPS FOR NEW ZEALAND, under Charter to the New Zealand Company, to sail as undermentioned, viz.—
FOR NELSON AND WELLINGTON:
PRINCE OF WALES, A 1, 516 tons, from London, 1st Sept.
FOR WELLINGTON AND NEW PLYMOUTH:
ESSEX, A 1, 300 tons, from Plymouth, 1st Sept.

For further particulars apply at the New Zealand House, Broad-street Buildings.

HODGSON and ABBOTT'S PALE ALE.—The above celebrated Beer, so strongly recommended by the Faculty, is to be procured only from E. ABBOTT, Brewery, Bow, Middlesex. The Trade not being supplied, the Pale Ale cannot be genuine if procured elsewhere.

City Office, 98, Gracechurch-street.

THE "ROYAL ESSENCE OF EGLANTINE" for the Handkerchief is prepared only by Mr. WHITE, Chemist, 24, Cornhill, London, in bottles at 2*s.* 6*d.*, 4*s.* 6*d.*, and 8*s.* each. Where also may be obtained the "AROMATIC PUNGENT ESSENCE" so useful in Headaches, Fainting, &c., at 2*s.* each.

N.B. Public Offices and Merchants can be supplied with Postage Stamps and Envelopes in any quantity at Government Prices.

FISHING NETS, SHEEP NETS, WASP NETS.—Fishing Nets, from 4 to 400 yards long, Seines, Flues, Trammels, &c. &c. Sheep-folding Net, 3½ feet high, 4½*d.* per yard—much approved for fences, &c. &c. Wasp and Fly Net, to protect Peaches, Grapes, Plums, &c., 6*d.* and 7½*d.* per yard. Garden Net, 1½*d.* per yard. Long Hare and Rabbit Nets. Tarred Fence Net, 1 yard high, against rabbits, cats, dogs, poultry, &c., 2*d.* per yard. Expanding Tents, for Lawns, (made on a new principle,) 36 feet round, 6 feet high in lowest part, 5*l.* each.—ROBT. RICHARDSON, Net and Tent Maker, 21, Tonbridge-place, New-road, near Euston-square.

PORTRAITS by MR. CLAUDET'S INSTANTANEOUS DAGUERREOTYPE PROCESS, under the Patronage of her Majesty, are taken daily, at the ROYAL ADELAIDE GALLERY, Lowther Arcade, Strand. The sitting generally occupies less than One Second, by which faithful and pleasing Likenesses are obtained. The introduction of Back-grounds, representing landscapes, interiors of apartments, &c., is the invention of Mr. Claudet, for which he has obtained Letters Patent. Considerable alterations have recently been made for the convenience and better accommodation of Mr. Claudet's visitors. Portraits and Groups of Figures are also taken upon plates of an enlarged size.

DESTRUCTIVE ANIMALCULA.—As Summer approaches, the larvæ of DESTRUCTIVE INSECTS are propagated in infinite multitudes, and impregnate with millions of insects the very air we breathe. J. READ begs to inform Nurserymen, Amateur and Practical Gardeners, that he has invented FLEXIBLE DISCHARGE TUBES to all his Machines for destroying these Animalcula which make such deadly havoc on all Fruit-trees and Plants at this season of the year. From thirty-one years' practical experience in gardening in all its branches, J. R. can warrant them the best adapted for the above purposes. The valves being solid metal, they cannot get out of repair.

Manufactured and Sold by the Patentee, 35, Regent Circus, Piccadilly. Sold also by the most respectable Nursery and Seedsmen in the United Kingdom.—N.B. None are genuine except stamped with the words, "Read's Patent." A liberal discount allowed to the trade.

SUN-BURNS, FRECKLES, TAN, and other Disfigurements of the Skin, prevalent at this peculiar season, are pleasingly eradicated by that unique preparation, ROWLAND'S KALYDOR, a balmy odoriferous liquid, and now universally admired for its sovereign virtues in completely removing all cutaneous eruptions, and in rendering the complexion delicately clear and fair. It is invaluable as a renovating and refreshing wash during travelling, or exposure to the sun, dust, or harsh winds, and after the heated atmosphere of crowded assemblies. Gentlemen will find it peculiarly grateful after shaving, in allaying the smarting pain.

CAUTION.—Ask for "ROWLAND'S KALYDOR," and see that these words are on the envelope, with their signature and address in red: "A. ROWLAND & SON, 20, HATTON GARDEN, LONDON;" the same are engraven on the Government Stamp affixed over the cork.

Sold by the Proprietors, and by respectable Chemists & Perfumers.

HORTICULTURAL SOCIETY OF LONDON.

NOTICE IS HEREBY GIVEN, that the MEETINGS OF THE SOCIETY in Regent-Street are DISCONTINUED till Tuesday, October the 4th, in consequence of the Meeting-room being under repair.

The Gardeners' Chronicle.

SATURDAY, AUGUST 13, 1842.

MEETINGS IN THE ENSUING WEEK.

Tuesday . . . . . Floricultural . . . . . 7½ P.M.

AMONG the many steps now taking to improve the education of the yeomanry, one of the most efficient will doubtless be the establishment of schools in which lads can be taught in a formal manner the principles on which the business they will afterwards have to follow are dependent. We have now before us two prospectuses of such institutions, one near Romford, and the other in the neighbourhood of Gloucester; the latter is, we understand, under the direction of Mr. Morison, whose plan for asylum farms, instead of workhouses, we noticed some time ago.

We cannot pretend to form an opinion of the success with which such plans will be carried out, so much depending upon the tact, as well as theoretical and practical knowledge of the directors; but this we can say, with confidence, that they must be a great improvement upon the manner of educating the sons of farmers. In such schools as we remember, the object of the master seemed to be to keep a lad in the greatest possible ignorance for the longest possible time; and when he was sent to learn to farm, he was provided with no kind of elementary knowledge that could bear upon that important subject, to which all his energy and talent and capital were to be devoted during the remainder of his life. A mind untrained to habits of reflection is in the worst possible state to enter upon the great field of accurate observation; and this is one great reason why farming has made such slow progress, and has become so much a mere routine.

What idea is a young man to form of the diseases of cattle, who does not know even the meaning of the term animal physiology? How is he to understand the circumstances that affect his crops, if he is ignorant of the general laws that control the growth of plants? By what method is he to judge of the probable value of manures in an entire ignorance of chemistry? and whence can any improvement in the instruments of husbandry be derived, when the first principles of mechanics are unintelligible?

What! it will be exclaimed, must a farmer be a physician, a botanist, a chemist, and an engineer? Certainly not; it cannot be of any real service to him, as a farmer, to be any of these things; his business is to be a farmer. But it is highly desirable that he should understand the general facts connected with these subjects, so as to understand what he is about. It is the plainest duty of parents to provide their children with such information when it can be procured; and we believe the age is enlightened enough to agree with us.

We have no visionary plans. We have no fancy for Utopian schemes. No one will ever hear us advocating a system of over-education which does infinite mischief, putting men out of that station in life in which it has pleased God to place them. We entirely disclaim all such sentiments; but it does not therefore follow that we approve of under-education; in truth, one is as bad as the other. If a farmer can neither read nor write, he will certainly be cheated; if he does not learn to ride, he is very likely to break his neck; if he knows nothing of the practical business of his farm, he is pretty sure to be imposed upon by every one around him; therefore, he is taught such things. But we also submit that if he is ignorant of the causes which influence his success or failure as a cultivator of the soil, and is compelled to trust exclusively to such usages and practice as he may be taught; if he is driven to work altogether "by rule of thumb," he contends with the elements, and directs his course of husbandry, at just as much disadvantage as he would contend with other things, if he could neither read, write, cypher, ride, sow, plough, nor reap.

What folly it is to bore country boys with Latin, Greek, and French; to annoy them with algebra; and waste their growing energies on mathematical puzzles; at the certain sacrifice of all that time which could be so usefully employed in bringing them acquainted with the material objects that surround them! Depend upon it, there is more practical wisdom to be gained from a block of wood, a horse's hoof, or even a dunghill, than from all the so-called learning of the schools.

Let country boys remain at their ordinary schools till they are fourteen, transfer them to an agricultural school for a couple of years, and then, when they are sixteen, it is early enough to put them to learn to be farmers. Accustomed to correct observation, acquainted with the general nature of the things they have to manage, they will enter upon their first occupation with all the chances in their favour of using wisely the opportunities they may have of applying their knowledge to practice.

While we thus unreservedly express our opinion as to the great national importance of agricultural schools, and our pleasure at seeing them already beginning to arise, we must however add, that it is only by a very judicious system of teaching that they can be made to answer the purpose. It will not do to cram boys. Let them be taught a little, and that well; and let everything be presented to them in an attractive way. Botany and Chemistry are not to be learned at the age of fourteen by the same ingenious processes as are employed to infuse the matter of a Latin grammar into the head of a poor child of seven. By fourteen the servility of the human mind is gone, and the natural independence of man begins to be felt.

But our space forbids our pursuing this subject further for the present.

Two letters upon the subject of glazed flower-pots have reached us. One is the composition of a sensible man; and, as it explains the rationale of pot cultivation in general, we print it entire without other comment than what is found at the end of it. The other letter is very much the reverse, and we do not publish it. It is unfortunate for some men that they should never have learned the art of reasoning correctly; for the moment they trust themselves to an argument, all that practical knowledge which would be so valuable to them in subjects like gardening is only so much waste strength.

The correspondent to whom we allude supposes us to recommend the use of "hard-burnt, glazed, uncrocked pots;" and thereupon turn the whole of his comments. But we have not *recommended* the employment of glazed pots; we have merely insisted upon the *possibility of growing plants in them as well as in unglazed pots*—and that we think we have proved. Whether or not glazed pots should be used is a question of money, and concerns the pockets of cultivators, with which we have nothing to do. As to having recommended the use of glazed pots *uncrocked*, that also is a piece of imagination on the part of our correspondent, as he will discover if he will take the trouble to understand what he reads.

This was by no means a trifling question, inasmuch as it involves the inquiry of how far gardens or drawing-rooms are capable of being decorated by handsomer ware than that in common use. For our own parts, we now consider it settled.

ON THE TRANSMISSION OF FRUIT-TREES, &c., TO FOREIGN COUNTRIES.

YOUR readers are aware that the transmission of seeds to and from India is now regularly carried on through the India-House,—such as are suitable to the different climates and seasons of that extensive empire are sent thence by every mail; and, in return, from the East India Company's Botanic Gardens, are received Pines and various other plants suited to the climate of this country. The success has been so complete, that the Deodar may be mentioned as an instance of a rare plant now become common in every part of the country. As the time employed in the transit is so short, no particular precaution would seem to be required; but as the dawk, or mail, is conveyed in India by men, the letter-bags are often exposed to wet, either from rain or in crossing rivers. Hence it is necessary to cover the parcels of seeds with a substance like India-rubber cloth, which is impenetrable to wet, since this has, upon the whole, answered remarkably well; but care must be taken that the seeds or fruits are not in a moist state when covered up, otherwise they are apt to become mouldy and to lose their vegetative power.

As it was desirable to attempt the transmission of cuttings, as well as of seeds, several endeavours have been made to effect this object. Here the difficulties were greater, because we have not only to exclude external damp, but to prevent the natural moisture of the cuttings from evaporating when exposed to the great heats of an Indian sun.

The first attempt was made by Dr. Lindley, at the request of Lord Auckland; when he adopted the plan of enveloping the cuttings of fruit-trees in the India-rubber cloth. Some of these, on their arrival in India, showed symptoms of life; but none vegetated when placed in the ground. The next year a second attempt was made; but, owing to a mistake, the success was not so great as during the first. The cuttings, when sent from the Horticultural Society, seemed so nicely packed that I did not think it desirable to open them out, but enveloped them in the water-proof cloth, not knowing till afterwards that this had already been done, and that the parcel was *much* more protected than was necessary. A third attempt was therefore made last winter, in which care was taken not to include too much moisture, by partially drying the cuttings, and by interposing a good non-conductor (cotton), which would prevent the cuttings from drying up, by excluding the influence, as much as possible, of external heat, while the ends were dipped in sealing-wax, as the only substance at hand when the packet was making up, and the whole enveloped in a layer of India-rubber cloth. Some were sent in large, others in small packets, so as to travel by the letter-dawk, part of them being loosely, and part closely packed. The results of this experiment are given in the following very interesting communications from Drs. Gibson and Falconer; the former in the Bombay Presidency near Poona, and the latter at Saharunpoor, a much more distant station:—

The letter from Dr. Gibson is dated Colabar, 25th Jan., 1842, and runs thus:—"I write to let you know the fate of the cuttings brought by the two last despatches. Those first sent appeared to have suffered much, and I had no hope of any of them when I put them into the ground; those last sent arrived in much better order. In the majority of these the wood was green. I put them in pots under charge of the collector. I will hereafter send for them to place them in the hills."—In another letter, dated 27th April, 1842, Dr. Gibson says—"Almost all the cuttings of the Jargonelle Pear, &c., &c., received by the mail, which arrived in January, have rooted, and till the beginning of the hot season were flourishing. Since then they have drooped much, and I fear they will die."

The following is Dr. Falconer's letter, from Saharunpoor, Feb. 16, 1842, upon the same subject:—"A signal triumph over the difficulties presented by distance and climate in transferring the living vegetable productions of one remote country to another has lately been effected between England and India, by means of the overland route. Most of the readers of the *Gardeners' Chronicle* are aware of the great success which within the last three years has attended the introduction of Himalayan seeds into England. The Deodar Cedar, Cupressus torulosa, Pinus Gerardiana, &c., which formerly used to cost from one to three guineas a plant, now ought to be had from nurserymen (some of them at least) at nearly the same price per score; and the supplies sent from India are now on such a large scale that in course of a few years they will probably be the most common acclimated Coniferæ in the country. This result has followed the establishment of the overland communication between England and India.

"Everything which it was desirable to effect in the transmission of the productions of India *to* England was accomplished to the fullest extent. But the same amount of success was not realised in the despatches *from* England *to* India. Seeds and bulbs of every description were received in excellent order: but failure had followed on almost every attempt to introduce the fine sorts of European fruit-trees into the temperate parts of India. If sent in Ward's cases, a considerable portion of them will reach Calcutta alive by sea; but the voyage up the river to Saharunpoor, at the foot of the Himalayahs, is certain destruction to them. The voyage occupies from two to five months, at the least. The same result invariably followed on numerous occasions.

"It thence became a matter of much interest and importance to determine whether cuttings and slips of fruit-trees might not be sent out from England by the overland mail; for although good sorts might in the long-run be expected to be raised from seed, the limited number of cultivators in India, and the small number of stations in the temperate parts, where the trial might be attempted, made it of consequence to effect that end by some speedier method. In the winter of 1838-39 a despatch, from the London Horticultural Society, of slips for grafts, consisting of Apples, Pears, Cherries, Gooseberries, &c., was sent out to Lord Auckland in India, by the overland mail; but not one of them reached alive. A similar trial was made in the winter of 1839-40, by a despatch from the India-house to the Botanic Garden, Saharunpoor. The package was made air-tight by means of numerous envelopes of India-rubber silk, and the slips were tied up in small bundles carefully rolled in moss. Their ends being left uncovered at the wounds, they all arrived dead, apparently through mildew and sphacelation. The moss was moist, and exhaled a yeasty odour, as if partially fermented. They were about three months between the India-house and Saharunpoor. The failure in this case appeared to have arisen from an excess of moisture; the slips had come, in fact, in a sort of vapour-bath,—and it was recommended to Dr. Royle to try a more open kind of package, to do the ends of the slips over with pitch, and to use perfectly dry moss.

"A third trial was made by a despatch from the India-house on the 30th Oct., which arrived at Saharunpoor on the 18th Jan., being 80 days. These cuttings were loosely packed, the ends of them being done over with sealing-wax, and the bundles rolled up, some of them in dry moss and some of them in cotton. They were all found on their arrival to be dry, crisp, and withered; the failure on this occasion appearing to have been caused by desiccation in consequence of the too free access of air. A fourth trial was made in a despatch of three small packets from the India-house on the 30th Nov., which reached the Botanic Garden at Saharunpoor on the 27th Jan. last, having been 58 days on the journey. The cuttings in this instance were packed in duplicate, in two different ways. All of them were rolled up in cotton, and done over with sealing-wax at the ends; but one packet was wrapped up in an envelope of India-rubber cloth, so as to be nearly, if not completely, air and water tight,—the other had only two loose covers of paper, so as to be freely permeable to air. In the first, or India-rubber packet, there were 12 slips, 7 of which were Apples and Pears, and 5 stone fruits, viz., Cherries and Plums. The latter were all found to be dead, the pith dry and brown-coloured, and the green colour of the liber gone. The 7 Apple and Pear cuttings were all in a more or less vigorous state; the pith moist and green, and the bark, although shrivelled, green and lively. The slips from yearling shoots were much weaker than the older ones; and the Pear slips were observed to be stronger than those of the Apple. In the second packet, with the paper wrappers, the slips were all dead, and appeared to have been so for some time. The contents of the third packet were confined to Hop-roots, put up in paper only; these were dead also. The live cuttings were immediately put in the ground; and there is every prospect at present of the development of the buds, and of roots being thrown out. The most promising among them are a Jargonelle Pear slip and Malo de Carlo Apple.

"The result is of no ordinary interest: Bombay being about 6,100 miles (via the Red Sea, Suez, Alexandria, and Malta) distant from Falmouth, and Saharunpoor about 900 miles from Bombay, the cuttings in question travelled all this distance, closed up for 58 days; they underwent two sea voyages, subject to considerable vicissitudes of temperature, and two land journeys, the latter of which, across the continent of India, was 900 miles, tumbled about with letters in a mail-bag carried by a runner. Yet with all these drawbacks, they reached their destination with a fair moiety of them alive. So much for the advantages of the steam communication between England and India, as affecting gardening matters. With the benefit of experience, greater success may be expected to attend future trials. The Stove plants and the Ribes tribe have hitherto been failures. Nurserymen in England may find their advantage in resorting to the plan with others of the colonies; and by extending it to suitable ligneous plants, besides fruit-trees, they may be able to introduce from abroad valuable and interesting species at a cheap rate. The plan has proved to be efficient for a distance of 7,000 miles, if travelled in less than two months.

"The method which the experience above referred to would suggest as the best, is this:—let the slips be cut early in winter—say in November—selecting oldish, firm twigs, with the greatest number of buds; roll them up separately in cotton, after paying over the wounds at the ends with cobbler's-wax, or some similar composition,—sealing-wax one would imagine must be injurious by scorching the ends, and thereby destroying the vitality of the terminal portions of the slips. Then make them up into bundles of from 6 to 10 each, and wrap these bundles separately in cotton, coiled round them with moderate firmness; 20 to 40 slips are enough for one packet. Put a wrapper or two of paper around the whole, and finish with an envelope of stout silk, or even cloth, freely spread over on the inside with India-rubber, in the liquid or adhesive state, so that the side and end folds may stick in close apposition, making the whole air and water tight."

A subsequent letter from Dr. Falconer, dated April 16, 1842, states that "Capt. Nesbitt, of the Windsor, brought out two of Ward's cases, filled with young fruit-trees. For the first time, they reached Saharunpoor in beautiful order; 11 plants being alive, consisting of Apricots, Peaches, a Nectarine, Apples, and a Black-currant bush. Most of these were in a vigorous state. There were Gooseberries, Red-currants, Raspberries, &c., in the case; but these were all dead."

In the proceedings of the Agricultural and Horticultural Society of India, it is stated that Baron Von Ludwig had a box containing 1,200 young plants despatched to him from Germany, which were five months in the box. Of these not more than two dozen failed to vegetate. The following method of packing was in this instance adopted:—"The plants are taken out of the ground in the depth of winter, when the *stems* are bare of leaves and all the *sap* has descended to the roots. The earth is carefully shaken from the roots, which are then immersed in a thin compost four or five times, till they are completely coated over to the thickness of $\frac{1}{2}$ to $\frac{1}{10}$ of an inch, and allowed to dry perfectly, when they are placed in a strong box prepared for the purpose, on a layer of dry straw. As soon as one layer of plants is completed, a layer of dry straw is placed over it, and so on till the box is completely filled, and well pressed down; the lid is put on, the seams well *pitched*, and the case made as air-tight as possible."

By puddling with clay, or according to the foregoing method practised in the transmission of living trees, &c., to the Cape of Good Hope, by a better selection of cuttings, and by improvements in the methods of packing, complete success will no doubt be attained.—*J. F. R.*

ON ORGANIC MINERAL MANURES.—No. III.

By PROFESSOR CHARLES SPRENGEL (translated from the German).

(*Continued from p.* 524.)

7. *Compost.*—Under this name is comprised an artificial composition of mineral, vegetable, and animal substances. Layers of these different materials are collected into large heaps, and moistened with water, urine, or dung water, if they are too dry; after lying for several weeks, they are carefully worked up, and immediately collected into heaps again, and again moistened as before if necessary; after which they are left quiet for a few weeks, again worked up, again put in heaps, and after a few weeks, subsequent to the last-mentioned operation, the compost is ready to be used as manure. In making compost, the chief point to consider is, that no substances are mixed together which act disadvantageously upon each other, or cause the evaporation of the manuring substances; on the contrary, such only are to be brought together as mutually decompose and improve each other. It is true, that for making compost, earth rich in humus, dung, marl, lime, common ashes, the ashes and lye of soap-boilers, loam, clay, gypsum, common salt, bone dust, the refuse of salt-works, peat, turf, weeds obtained from fields, meadows and gardens, dried heath, human excrements, the sweepings of thrashing floors—in short, all these materials may be used which we have hitherto spoken of; still, it requires a knowledge of their component parts and several qualities, so to mix them, that the best compost may be produced. In fact, it is not so easy as it is generally believed, to prepare a compost perfectly suited to the purposes of the cultivator. Whoever wishes to prepare the best possible compost, must leave nothing to chance; on the contrary, certain fixed principles must be attended to, and chemistry must be consulted; because it is that science only which can teach us in what substances soil is deficient, and what are to be applied, in whatever form, if the most abundant crops are to be produced.

However advantageous the preparation of compost be, it has, nevertheless, been stigmatised as useless; and it has been asserted, that it occasions unnecessary labour without producing any essential benefit. Its advantages are, however, undoubted. Among the principal are the following:—

1. By mixing different substances and putting them into heaps, their more perfect combination is secured by the heat thus generated. If, on the contrary, these substances are carried unprepared upon the land, they cannot come into close contact, and there is no generation of heat, which is such a powerful aid of chemical combinations.

2. By making compost, substances of little original value as manures are speedily converted into most powerful fertilisers, especially humus, whether in the state of coal or of acid, and vegetable remains, which, by close contact with dung, loam, lime, and marl, are changed into a fertile earth; for in this way many humates are created. If, therefore, in preparing compost, land be for some time deprived of manure, it is to be considered, on the other hand, that in the course of half a year, by one cart-load of manure, two cart-loads of sour or barren humus are converted into an excellent fertiliser, whereby the labour of making compost is fully repaid.

3. If dung and urine are mixed in compost heaps, with earth rich in humus, no part of the ammonia disengaged by those substances is lost, because it becomes chemically combined with humic acid. The longer, therefore, the dung is left in the dunghole, the more advantageous will be the preparation of the compost.

4. In compost heaps, the seeds of weeds, which are often contained in earth rich in humus, as well as in the dung itself, are brought into germination, so that the crops will be afterwards more clean.

5. If the earth used in the making of compost contains protoxide of iron, or other substances detrimental to vegetation, they are decomposed by their close contact with dung, ashes, lime, and marl, as well as by the heat and frequent working of the heaps (whereby contact with atmospheric air is much facilitated), and they cease to be injurious to plants.

6. In consequence of the heaps of compost comprehending all the materials of manure in a small compass, those substances are thus brought, without difficulty, into that condition which is most advantageous to plants. If scattered upon a field, they are often unable to attain the state of decomposition, because they are deprived of the necessary degree of humidity: a compost heap, on the other hand, may be wetted with water, urine, or dung water, if the substances which have to act upon each other are too dry.

7. When thoroughly well-prepared compost is used for manure, crops will not be laid, because the substances in dung, by which this is caused, have entered into combinations which will not over-force the plants.

8. By the use of compost, weak crops may be rapidly improved, because it can be applied as top-dressing even when plants have attained a considerable size. Compost always contains much perfect vegetable nourishment, which, as it can be at once received by the roots, improves vegetation speedily.

If, therefore, all the advantages of compost are considered, it becomes obvious that they are so important, that no opportunity of preparing it should be omitted. Compost is most generally used in England, especially in the counties of Bedford, Hereford, and Berks. It is of the greatest value in light, dry soils, which, as they are always rich in humus (or ought to be so at least), are thus kept damper. It also prevents the particles of manure from sinking into the under soil, for compost is always used as top-dressing, or is harrowed in with the seed. For a light, dry sandy soil, a fresh manure, or one composed of much straw, is more detrimental than useful; but if this sort of manure is brought into a heap of compost, it is converted into substances advantageous to vegetation, without any of the manuring substances being thereby lost.

One of the objections against the making of compost is, that much carbon is lost by being converted into carbonic acid, which, however, is only the case when ashes, marl, lime, loam, or alumina, have been added in too small a quantity. If these substances are not deficient, dung, as well as earth rich in humus, will yield humic instead of carbonic acid, which will combine with the bases of marl, ashes, &c., into humates, and thus become chemically fixed.

In making compost, some general rules are always to be observed, of which the following are most essential:—It is best to use fresh dung, containing much straw (especially horse or sheep dung), which, in decomposition, not only gives out a good deal of heat, but also—which is very important—keeps the heap loose, and facilitates the access of oxygen. By the decay of fresh strawy dung, ammonia is also generated, and acts as a solvent on the coal of humus, or, as the loose state permits a free access to oxygen, nitric acid is formed by the organic remains containing nitrogen. On the latter account, a frequent working and stirring of the heaps of compost is necessary, and has the additional advantage of bringing the substances better together, and mixing them more thoroughly.

If quicklime is used in making compost, no more is to be employed than is sufficient to saturate the humic acid of the humus, otherwise it will expel the ammonia which has been combined with humic acid. For the sake of preserving the ammonia, the lime, upon the first construction of the compost-heap, ought never to be brought into immediate contact with the dung; on the contrary, the quicklime moistened with water ought to be placed between two layers of humus. The same precaution is to be observed if fresh wood-ashes are used in the composition of compost, as the potassa equally expels the ammonia; which, however, does not take place so readily, because, being combined with carbonic acid, it is retained mechanically by the mass of materials.

If the earth employed is rich in humus and clayey, it is advisable to add Potato straw, Pea haulm, or coarse materials of a similar kind, so as to keep the mass more loose. The layer of earth should also not be too thick, or it will still become too compact.

(*To be continued.*)

ENTOMOLOGY.—No. XXXI.

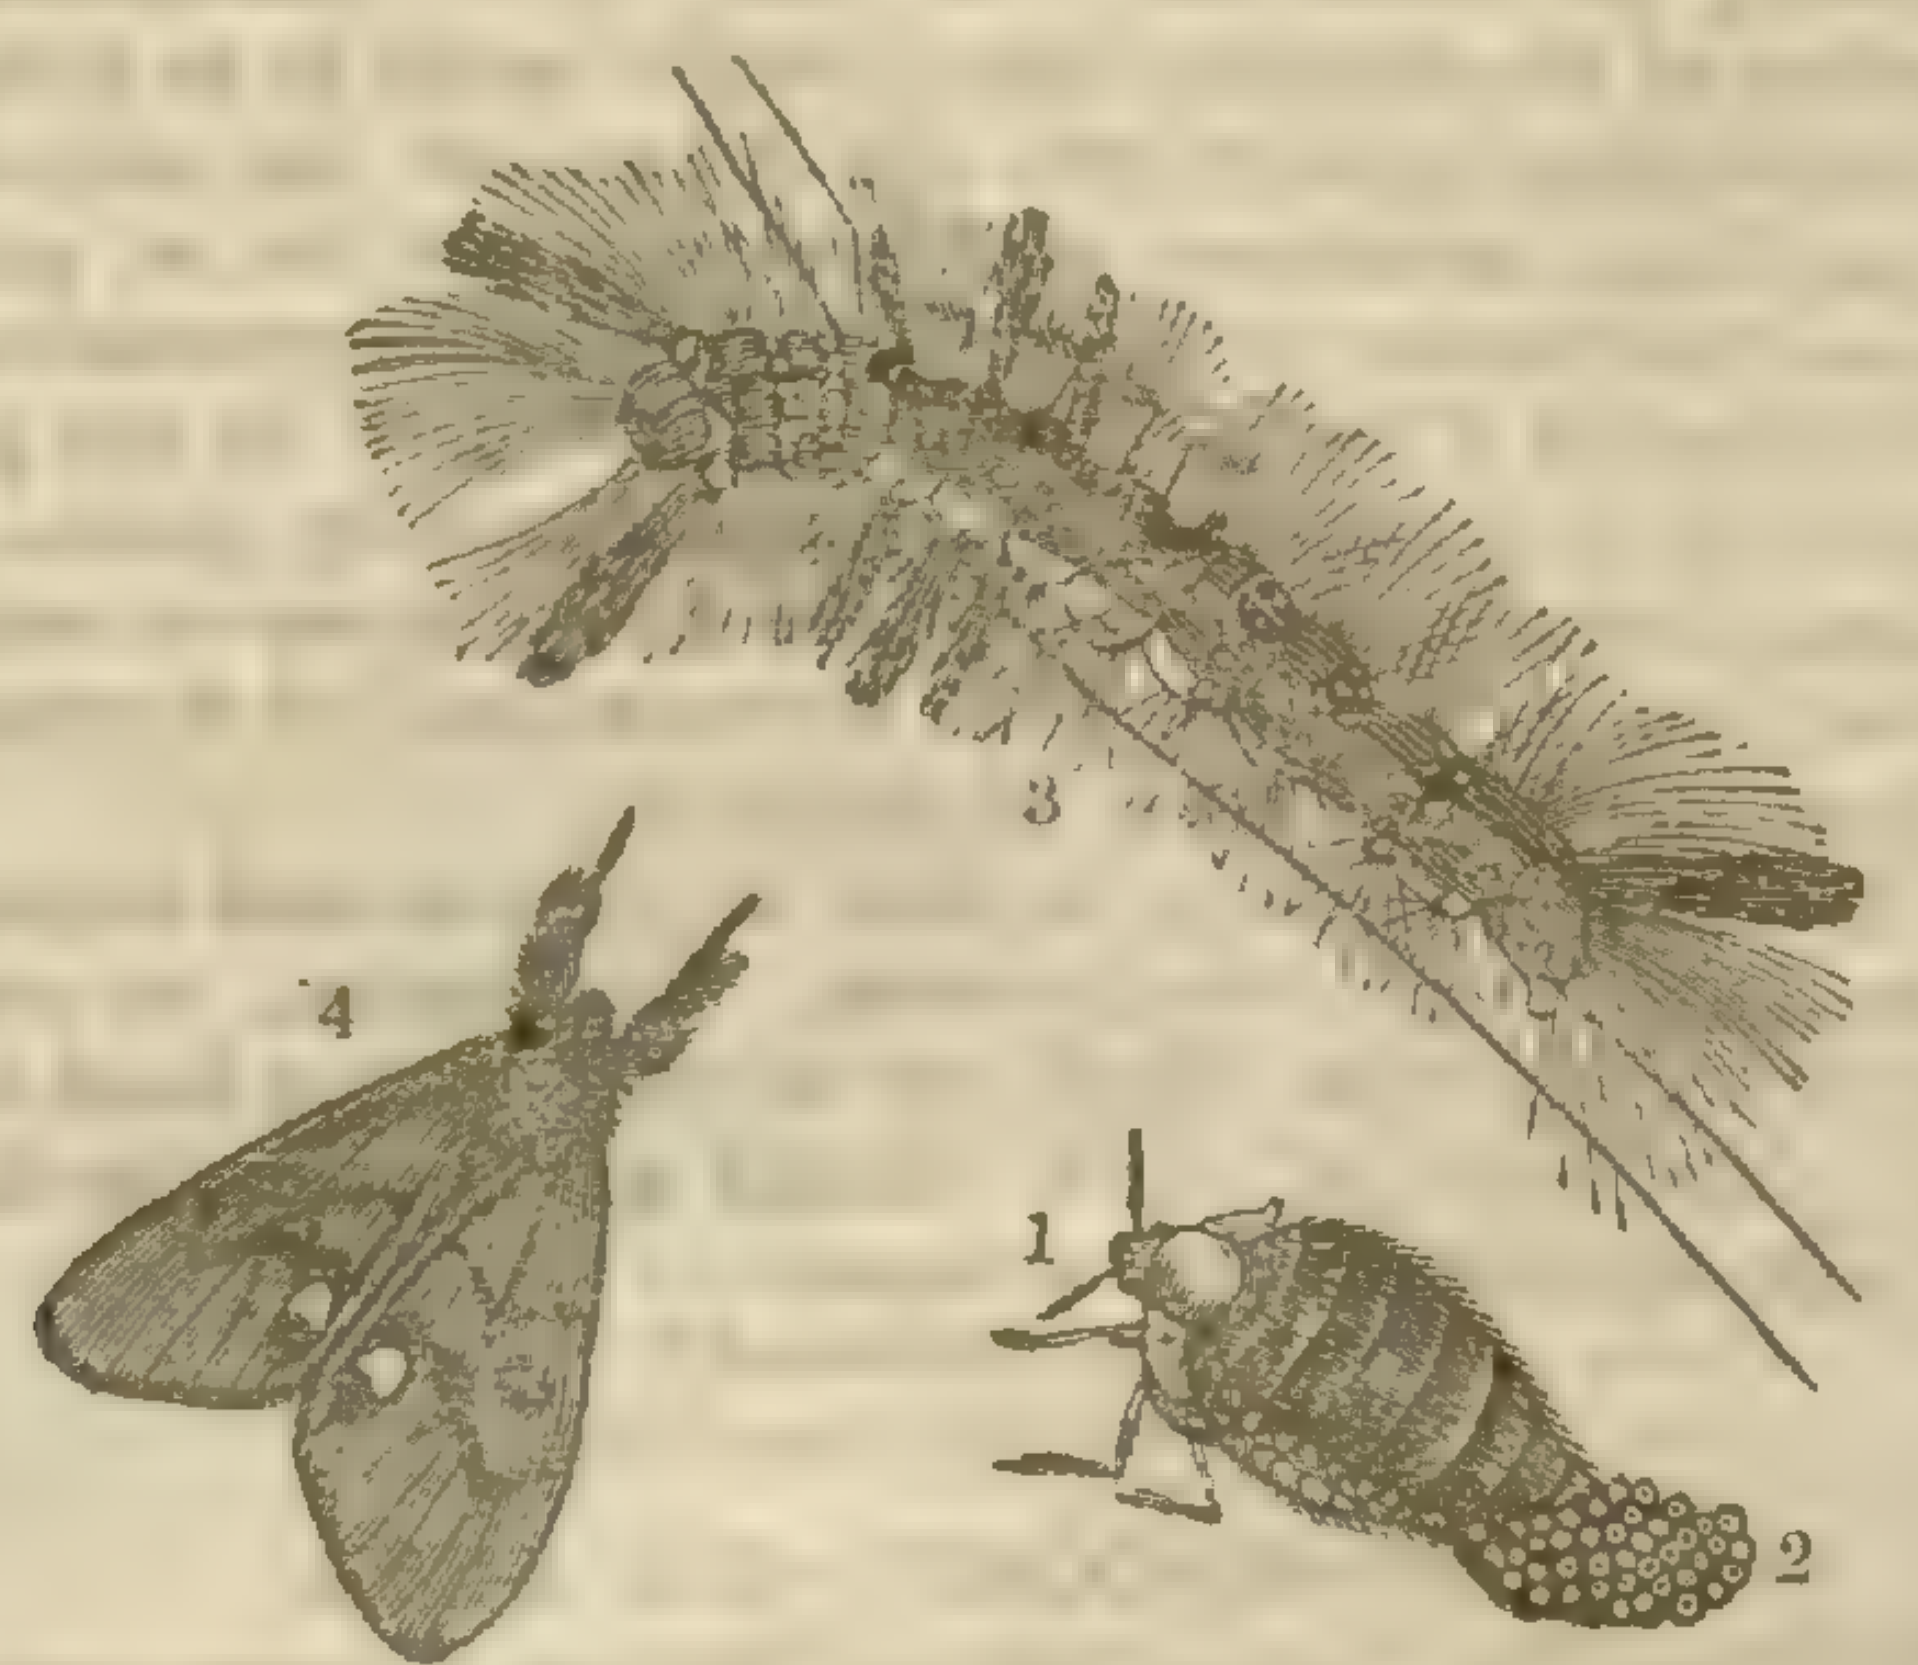
THE COMMON VAPOURER OR BROWN TUSSOCK-MOTH, Bombyx (Orgyia) antiqua.—During the last month, the gardens and squares of London, as well as the suburbs, have produced such multitudes of this pretty moth, that we have often seen it resting upon the windows of our sitting room, with its fore legs stretched out like the Puss-moth, and it has not unfrequently been observed flitting across the streets of our city.

To the naturalist this anomalous insect offers many interesting characters, and to the casual observer a knowledge of the history of this little animal, which is hourly crossing his path in the busiest haunts of man, may not prove unacceptable. From this time to the month of October, there will be a succession of the Vapourer-moths, the males flying about in pursuit of their consorts, who are not gifted with such aërial powers, for being destitute of wings, they are content to crawl out of their tomb, often not moving beyond the very web in which they slept, and after depositing a large number of eggs (fig. 2) they fall down exhausted and die; these eggs are somewhat ovate, depressed, and hollow on the crown, round which is a brown ring. They are of a pinky-white colour, and are fastened as they are laid by a glutinous substance to the bark of the tree, or whatever the parent happens to rest upon, frequently to the web containing the shell of the pupa; they are hatched the following April, when the larvæ attack a great variety of trees, feeding upon the leaves of Roses, Brambles, the Apple, Plum, Sloe, Hawthorn, Oak, Lime, Alder and Sallow, but I think the first and the last are their favourite food. The caterpillars often do considerable mischief to the Rose-trees by eating large holes in the leaves, and keeping on the under sides they are seldom visible until they are full-grown, when they are often an inch in length, and ramble about to select some suitable crevice in the bark of a tree, or other secure place, to spin their fine white silken web, strengthened and protected with the different hairs from their own bodies; in this web they change to pitch-colour and rather hairy chrysalides, from whence the moths are produced at various periods.

The caterpillar (fig. 3) is a beautiful creature, of a lead or light-slate colour, with various black velvety spots and many red tubercles round the segments of the body, producing bundles of spreading hairs. There are also some yellow spots, but the most remarkable characteristics are the two elegant long brushes of blackish hairs, projecting like horns on each side of its large head, with another elevated at its tail, and three smaller ones on each side of the body, which uniting with the graceful turn that is so often assumed by the caterpillar in repose, greatly contribute to the beauty of this singular animal. The black hairs look like little spears, and with a magnifying glass they will be found to terminate in a club, which resembles a little feather or brush; there are also four large tussocks of dull ochreous hairs, in a row, down the anterior portion of the back, so thickly united as to appear like very compact masses of spun glass. These caterpillars, as well as most of the Bombycidæ, the family to which Orgyia belongs, have six pectoral horny feet terminated by claws, and eight abdominal and two anal fleshy feet; the males are much smaller than the females.

The *male* moths (fig. 4) are very active, and of a rich snuff colour; the antennæ are rather short and bipectinated to the tips, the rays being long and finely ciliated; the head and thorax are downy; the eyes small and black; the superior wings, forming a triangle when at rest, are clouded with brown, with two irregular dark lines across them, and a largish kidney-shaped white spot near each posterior angle, surrounded with darker brown; the ciliæ are short and spotted with brown; the inferior wings, as well as the whole under side, are dark rusty orange; the body is slender; the legs ochreous and hairy, the fore pair most so. The *females* (fig. 1) are stout, oval, apterous, and sluggish, of a mouse colour, and clothed with soft short down; head small, with minute but prominent eyes; the antennæ are very short, and composed of about twenty joints, each having two short bristly branches on the under side; thorax small, not winged, but furnished with two small hairy appendages; the abdomen is distended with eggs, which are visible on the sides through the skin; the six feet are short, and the palpi are smaller than in the males, and they have no tongues for sucking flowers.

The caterpillars of the Vapourer-moth, although solitary in their habits, often injure tender plants in pots as well as Roses, and, therefore, the females should be searched for and destroyed, together with any eggs they may have deposited; the caterpillars may be picked off the plants or shaken from them and killed. There is another species very similar to this, called the "Scarce Vapourer,"* which likewise lives upon the Rose, Barberry, Bilberry, Nut, Birch, and Oak, but it is very seldom met with; it has, however, occurred in Coomb-wood. —*Ruricola.*



AMATEUR'S GARDEN.—No. XXXIII.

According to promise, I will now give a list and description of the different varieties of Strawberry most worthy of cultivation, in order that the amateur may either add the whole to his collection, or select those which are most likely to suit his purpose. I will take the older kinds first, in their order of ripening. *Old Scarlet;* a good fruit, and valuable as one of the earliest in cultivation. *Keen's Seedling;* a sure bearer, and one of the best for a general crop. *Roseberry;* very prolific, although not very large, and bears in succession for a considerable time. *Prolific Hautbois;* this is the best of the Hautbois, very distinct in appearance from the other varieties already named, and much prized by many for the high and peculiar flavour of the fruit; it bears in succession. *Downton* and *Elton;* excellent late kinds, raised by the late Mr. Knight; fruit large and high-flavoured. *Turner's Pine;* a very coarse sort, and only valuable as one of the latest of the large varieties. *Red Alpine;* this is a small sort, resembling the wild Strawberry of the woods, but valuable as bearing in succession from June until very late in autumn. It will grow in rather shaded situations, and may be planted as an edging for walks in some shaded part of the garden; it does best when raised from seed every spring.

Among the newer varieties, there are two which deserve a place in all collections. One is called *Swainstone Seedling,* which is a good Strawberry, and is said to have the merit of producing a second crop in favourable situations. The other is known by the name of *Myatt's British Queen,* and is certainly one of the largest and finest Strawberries which have yet been raised. There may be some others deserving of notice, but these are the only two among the new ones, with which I am acquainted, which are worth recommending to persons who grow only a limited collection. *Myatt's Pine,* of which so much has been said, is certainly one of the finest flavoured kinds yet raised, but it is difficult to cultivate in certain situations. Those who may be inclined to try it, had better plant the runners in rich soil on a sloping border. If the above list is too extensive, the following may be selected from it: Keen's Seedling, Roseberry, Elton, Downton, and Myatt's British Queen.

It is a frequent complaint in small gardens, that Strawberries run too much to leaves, and do not fruit well: this is owing chiefly to their being planted in confined situations. The only way to get them to fruit well in places of this kind, is to make fresh plantations every year, or at least every second year; and if allowed to stand two years, they must be well thinned in the autumn. When fresh beds are made, the strongest runners should be chosen from the most exposed situations, if possible from the fields or from an extensive open garden. In such places they will be found to be dwarf and strong, and the matter which feeds the fruit of the following year will be to a certain extent organised and ready. Moist showery weather should be chosen for taking up and planting the runners; and where it is convenient, the roots of each plant should be carefully preserved. This is of the utmost importance in small confined situations; as then the little ball of soil, which is necessarily removed with each plant, serves to nourish it, probably much better than the soil in which it is planted. The above treatment has been practised in a small garden, placed in a confined situation; the result of which is, that plenty of Strawberries are produced every year, where formerly all went to leaves and runners.—*R. F.*

HOME CORRESPONDENCE.

The Employment of Distressed Manufacturers.—In a late Number of your *Chronicle,* "W." recommends that the unemployed operative manufacturers should be taken upon the land by farmers residing in the neighbourhood of large manufacturing towns, for the purpose of draining the soil. Surely "W." cannot be aware of the fact, that effective draining is one of the most difficult, as it unquestionably is one of the most important, processes of practical agriculture; that to do it thoroughly and economically requires considerable knowledge—on the part of the master, of the nature of the soil, and stratification of the subjacent rocks; and on the part of the workman, no small degree of physical strength, and aptitude in the use of his tools. Now, to my own knowledge, which is pretty extensive, of the great mass of manufacturing operatives, vast numbers of whom are unfortunately at this moment out of employment,—and, as a consequence, involved in the deepest misery and distress,—they as a body possess neither qualification for draining land. A few might be found among the hand-weavers in the country that might be made useful in such a way; but the workers in factories, or the hand-weavers of light fabrics in towns, would, in almost all cases, be found deficient both in bodily strength and manual expertness in the use of heavy tools, not only for draining land, but for all other branches of laborious agricultural employment. In periods of commercial depression, it has been the practice in Lancashire to put a large number of such unemployed poor who apply for parochial aid to the breaking of stones for the highway. This employment, however good as a test for poverty it may be, is totally unsuited to the strength and habits of such people; and I have known the most painful consequences to ensue, especially in bad weather. Some other expedient than that of your correspondent must be devised to meet at all the difficulties of the case. Such of the manufacturing operatives as are young and healthy, and possess moral courage, and show an aptitude to learn other pursuits, would do far better to emigrate as shepherds or gardeners to some of our Australasian colonies, or even to Canada, than to attempt competing in an already overstocked market with strong and experienced agricultural labourers.—*A Practical Farmer.*

Glazed Pots.—In one of your leading articles you have returned to the subject of glazed pots, and have there held out that gardeners are to be tested by their ability to grow handsome plants in them. This is an admission, at any rate, that it is more difficult to grow healthy plants in such pots than it is in soft or unglazed ones; inasmuch as you assert that "he alone who can grow plants well in glazed flower-pots is a good gardener,—and he who cannot is a bad one." For my own part, I do not see that it is either difficult or impossible to grow plants well in any sort of pot, whether that pot be made of earthenware, or composed of slate, stone, iron, or any other material, so long as you give to the plant an equivalent for the porous pot. I can bear testimony to the observations of "A Gentleman's Gardener and Foreman in a Nursery," that when hard-burnt or glazed pots have been intermixed with porous ones, and filled with soil and plants after the same manner, the plants in the former generally became sickly and unfit to be seen. And I think that my experience in the cultivation of plants warrants me to expect some credit on the subject. having been employed in the cultivation of some of the first collections in Europe, and having seen all sorts of pots, and vases, and tubs tried—all, too, with equal or unequal success, just as the subject of porosity was attended to or not. Mr. Forsyth (at p. 499) instances Mr. M'Nab's heath-tubs as a proof that glazed pots will answer as well as unglazed ones; and I am of the same opinion, if every one would give the same attention to drainage and porosity that Mr. M'Nab does. Had Mr. Forsyth examined the tubs and pots in the Edinburgh Botanic Garden, he would have seen that porosity was the *primum mobile* in Mr. M'Nab's treatment. Although these tubs are themselves kept well painted and pitched, yet Mr. M. proves by his practice that he is well aware of the necessity of counterbalancing these non-electrical-conducting materials by introducing into his tubs plenty of broken porous pots, pieces of freestone, and coarse white sand. These form a free passage for all superfluous moisture, and leave the earth in the tubs in the best possible state to be pervaded by the atmosphere, or, in other words, by that almighty power which we call electricity. For I imagine that we succeed in the cultivation of vegetables just in the ratio that we render the soil pervadable by that most wondrous fluid. What else is the rationale of Mr. Smith's frequent drain system? Is it not the extraction of superfluous moisture, thus rendering the soil less cohesive, and leaving channels through which the electrical fluid can more easily reach the roots of plants? What is the rationale of the best growers of plants? Potting lightly, and in earths rendered porous by the introduction of fibrous material and incohesive substances? Is it not that the electrical fluid may more easily reach their roots? Or what reason is there for planting trees near the surface, and merely covering their roots with a little loose earth? Is it not that the electrical fluid may reach them the easier? Why does Mr. Hoare recommend planting Vines in a heap of gravel? (Such may be seen at Shirley Vineyard.) And why does he say—"It is almost impossible to make a Vine border too dry or porous; and that it is not mere earth that the roots require to come in contact with to induce growth and extension, but air also, which is as necessary to them as to the leaves and branches"? Why is it that the finest Peaches I have ever seen grew upon a light sandy soil, not more than nine inches deep, and reposing upon a bed of coarse gravel more than twenty feet in thickness? And yet these Peach-trees never wanted watering, and produced both fruit and wood in abundance? Why, but because their roots were in immediate contact with the atmosphere? Why does vegetation go on upon what is termed the barren rock? Why does the Green Byssus grow upon the exposed surfaces of things when they are in a certain state of moisture? Is it not by electrical action? What sustains the stupendous Chesnuts on Etna, where all around is rocky lava? What makes the Vineyards over this lava so fertile—what but its porosity and electrical action? Why is it that the growers of specimen plants succeed better the nearer they can keep the roots to the surface? Why is it that your favourite Orchidáceæ delight in atmospheric moisture, and thrive best in those pots rendered the most porous? Why is it that Crassuláceæ, Ficoideæ, Cactáceæ, Ericáceæ, and, indeed, all the *aceæ* throughout the three great kingdoms of nature, live and die, are decomposed and recomposed? Why, but by electrical action? But I think I have adduced sufficient to show the beneficial effects to plants of porosity, and the necessity of bringing their roots in as close a contact with the atmosphere as possible. A thousand instances will occur to every observer of nature of plants thriving well or ill, according as their roots are placed in a medium easily or not easily pervadable by the atmosphere. *Vide* nearly every fine tree, shrub, or other plant that you know of, are their roots exposed or not exposed? Or, in other words, are they enclosed in a glazed pot without drainage? However, I would not have it understood that I am insensible to the unsightly appearance too often presented by dirty flower-pots, but only wish to point out to my fellow-labourers the necessity of looking for the rationale of everything before they either condemn or approve. That there is much inconvenience attending the porous pot, I admit, especially in dry weather, as by evaporation the soil is left in an unfit state for vegetation. Nor is this altogether remedied by the glazed pot; neither do the glazed pots in certain atmospheres prevent the formation of filth. However, they are much easier washed, and upon the whole rather to be chosen; but great care must be used to drain them properly. The drainage proposed by Mr. Forsyth, in nine cases out of ten, will not do, unless he makes up for it by using earths of a very porous nature. There is a sort of ornamental pot made about London, or rather in use there, that adds to a perfectly smooth and easily-washed surface considerable porosity, which I think would be preferable to either of the others. Thus far I have endeavoured to show that it is not to the material of which a pot is made that we should look, but rather to providing a proper medium for plants to grow in. If we can join elegance and utility, who will gainsay it? I would not, however, in recommending any sort of pot, lose sight of the operations and influence of nature upon vegetation; for it is only by observing them that we can ascertain what sort of pot is likely to prove the best. I think the Tropæolum no test, as many such plants will live and grow freely for a long time without making one fibrous root; as, for instance, Tamus, several Mesembryanthemums, Tillándsia, &c. If any of your readers have tried the glazed pot since the time it was first brought upon the tapis, it will be interesting to know the result: all keeping in mind to state facts only, as well as the drainage, the sort of soil made use of, &c.—*A Reader from the commencement.*—[We wish this very sensible correspondent had left out his speculations about electricity, which he, we, and every one else, know nothing about, in its relation to vegetation.]

Vitality of Seeds.—Your correspondent, Mr. Lymburn, is mistaken in supposing that the committee appointed by the British Association to investigate the vitality of seeds inclose those intended for experiment in jars "pierced with holes for ventilation." By reference to the Report submitted by them to the Natural History section, at Manchester, it will be seen that the jars they employed have no other aperture excepting the one through which the seeds are introduced, and that this aperture is kept constantly covered with brown paper. It is true that they have deemed it proper to use jars of a material as porous as that of which ordinary garden pots are constructed; conceiving that if no escape were allowed for the moisture which naturally exhales from the seeds contained, its accumulation within the vessel would be likely to destroy their vitality prematurely. Nevertheless it will be at all times open to them to substitute some other plan, which, upon mature consideration, may be deemed preferable to the one they have selected; only it should be always borne in mind, that to multiply the methods of preserving the seeds of so large a number of species would entail a degree of labour and likewise require an extent of space, neither of which seems compatible with the means placed at their disposal by the Association. In the manner in which the inquiry is at present conducted, we may at least hope, in the long-run, to arrive at some comparative results as to the degree of longevity of the seeds of various species or tribes of plants preserved according to some one uniform system; and if these results should not be found in all cases to accord with the well-attested observations of others, that very discrepancy may lead to the detection of the method of preserving them which best meets the constitution of the particular species. It is therefore extremely desirable that experiments should be carried on by others, simultaneously with those undertaken by the committee, and that samples of soil taken from places which appear out of the reach of the seeds scattered about in the atmosphere should be exposed to the influence of air and moisture, whilst still protected from the access of any seeds from without, and that a careful watch should be kept during a period sufficiently extended to ascertain whether any and what kinds of plants shoot up spontaneously from soils so circumstanced.—*D.*

To Preserve Turnip Seeds from the Attacks of Insects.—Turnip seeds when kept over year are apt to be attacked by the larvæ of a species of weevil, which eats the inside and scatters the substance in the form of small particles, which, by the shaking and turning of the seed, are gradually spread over the other whole seeds, and has the appearance of mites, which I think has deceived your correspondent. The best way to kill these is, in a very intense frosty, dry day, to spread the seed thinly on bags and expose the insect to the cold air, which kills it; the powdery dust may then be blown off with the fanners, or it may require rubbing. The same appearance is never found on the outside of new seed, kept in new bags; but the general opinion is, that Turnips have less foliage and more rot when the seed is kept over year, and hence the prevalence of the practice of having old seed, which is generally attacked less or more. Peas, Onions, and other seeds kept over are often attacked in the same way.—*R. Lymington.*

---

* Curtis's Brit. Ent., fol. and pl. 378.

Budding.—Various hints having been given as to the best season and mode of budding Rose-trees, &c., and one or two of the plans proposed being rather difficult, and requiring more skill than many amateurs possess or are inclined to bestow upon the operation—I am induced, for the benefit of beginners in this art, to describe the system which I have pursued for the last four years with unfailing success. I commence my labours early in June, and continue them till the latter end of August. I select young wood both for the stock, and to take the buds from; *always leaving a small piece of the wood* to preserve the eye from injury. I raise the bark in the usual manner, and tie it down with common worsted instead of matting. This simple method, if followed with common care, is sure to reward the Tyro.—*W. W.*

Tape as a Substitute for Bast in Budding.—A question was asked in the *Chronicle* respecting the best bandage to use in budding. Bast, was the answer. Bast is used, I believe, mostly, if not always, in a wet or damp state, and in this state is tied firmly round the bud and stock. When the bast becomes dry, examine it, and it will be loose. The quick swelling of the stock may, and does, perhaps, partly remedy this; but a binding which will not loosen, but rather tighten, I consider far preferable. I have used narrow tape for years, which being used in a dry state, tightens on being wetted by rain or otherwise. I do not lose one bud in six. The same piece of tape, with care, may be used a dozen times or more. I use red tape, which has the advantage of being able to inform you, and that readily, which bud has been on longest; as the tape loses its colour in part by exposure to the air, and that which is of the lighter colour has, of course, been on longest.—*M. H. G.*

Tettigonia spumaria.—Few insects, individually, do so much harm to plants as this, and especially in dry years like the present. In rainy seasons the froth is washed away, and as they cannot bear exposure, they perish either from that cause, or by their natural enemies having readier access to them. Each frothy mass almost invariably contains two individuals, sometimes three, and seldom only one. Their early history is still, like that of most nations, somewhat obscure. The fact of their being, in most instances, in couples from the earliest stages of the larva state, and on plants originated from young cuttings of the same year, would lead to the inference, that the ova are deposited by the parent in pairs in the spring, near the spot where they are found feeding, rather than in the autumn, as supposed by "Ruricola." Probably there are two broods; as the perfect insects are just now emerging from the pupa state. I will endeavour to clear up this part of their history for you. My impression is, that "Ruricola" is wrong in stating that the pupæ skip about; I think they do not exercise their limbs much till after their final transformation, but spend the whole of their former life at the pumps. But to quit their history and turn to their destruction, which is what we gardeners want: nothing will do except hand-picking when they are in the larva state; and from their very conspicuous appearance, this is readily effected, especially if the labour be confined to one set of plants at a time, *e. g.* Pinks, Carnations, Chrysanthemums, &c. To attempt to catch them when fully dressed, will be about as profitable as trying to take birds by laying salt on their tails; for your Tettigonia is a wary fellow, always wide awake, and with his springs on "full cock," and finger on the trigger. To sweep them up with a net in a garden, will be very like cutting down a fine Oak to starve the larvæ of Tortrix viridana, which so frequently disfigure its foliage.—*S.*

The Cicada interrupta.—"Ruricola's" notice of the C. spumaria, in the last Number of the *Chronicle*, induces me to trouble you with this communication, which may be interesting to your above-named correspondent. There has been an insect unusually abundant this year in the Farnham Hop-grounds; and where the bine is deficient, some of the planters have employed persons to catch them. A man holds a tray well daubed with tar, while a boy gives the pole a smart blow with a hammer. By these means about three acres have been gone over in a couple of days, at an expense of about two shillings an acre; and the quantity of these insects deposited where these trays were emptied is astonishing. From the information of a labourer who works in the Hop-grounds, it appears that the larvæ covered the hedges surrounding the Hop grounds; and it is only since their perfect state that they have infested the Hops. In the grounds where the Hops are looking well and healthy, no insects are seen. In the weaker plantations, four or five have, in some instances, been found on one leaf; but where most numerous, upwards of a dozen have been found together. It is possible that this unusual and very mischievous species of Froth-fly may deserve more attention on the part of "Ruricola." I enclose some of the insects; but I fear, from their having been dead some days, they will not prove so acceptable as I could wish.—*Picus.* [We are much obliged for the specimens, which arrived safe, and prove to be the Cicada interrupta, Linn., which forms with some other species the genus Amblycephalus of Curtis's Brit. Ent., fol. and pl. 572, to which we beg to refer our correspondent.—*R.*]

Cypripedium Calceolus.—One of your correspondents asks how he is to propagate this beautiful plant. Such a proceeding should be a last resort if he wishes to succeed in growing it well. Several years ago, in June, I rode fifty miles to find a plant of it, in a locality which had been described to me. I met with it, and it had then eight stems, on some three or four of which were the remains of old faded flowers. I carefully separated it into four portions, and since that time no farther division has been made. One of these plants subsequently died, and the others have now about three dozen stems in the aggregate. The plants have not been moved for the last five years, nor has the spade disturbed the soil around them, yet they flower abundantly. This queen of our native flowers grows under the shade of trees, in damp places where the soil is a clayey loam; and such a situation and soil in a garden is its proper place. Great care ought to be taken to prevent injury being done to the new shoots when they are bursting through the soil in the spring; as this year all the blooms of one of my plants were destroyed by a weeder having inadvertently placed a foot upon the clump at that time.—*S.*

Myatt's Pine Strawberry.—The whole secret of growing this variety with success is to treat it as an annual. Six or seven rows of strong, healthy plants, which I had last summer, bore no fruit. I therefore let all the runners remain on, till they formed a dense mass. At the same time I made up a new bed, and planted the runners 9 in. every way; these also covered the surface pretty thickly by the autumn. I never disturbed the runners nor the surface of the bed, but merely gave them a slight top-dressing of light compost after the leaves had died down. I was delighted this summer by obtaining a splendid crop of fruit from both beds, especially from the new one. Another very material (I should say the most material) point connected with the cultivation of this kind (at least, so far as my experience goes), is the shade of its own leaves. There are many kinds of plants and fruits that will not grow in the shade of other plants or trees, which nevertheless seem to thrive best in a mass, where they can obtain the partial shade of their own foliage. The Strawberry is one of these, and is always found naturally in masses. I think I never saw the value and importance of leaves so beautifully exemplified as in this Strawberry. Persons passing by the beds would have supposed them nothing but masses of leaves: and every fruit which, from being near the edges of the bed, or from other causes, was exposed to the full glare of the sun, was shrivelled, diminutive, and worthless, compared with the rich and beautiful fruit, which, on searching among the leaves, was found in the greatest profusion and perfection. Acting on the above principle, I make my beds 4 ft. wide, planting them 9 in. apart every way, and 3 ft. between the beds. Thus, while I allow the plants in the beds to run together, and enjoy their own shade, the breadth of the spaces between the beds permits a free circulation of air and heat. Some people may imagine, that it would be impossible for the fruit to ripen treated as above; but as well may it be said that the Bilberry will not ripen in the dense shade of our woods and forests. The earliest ripe fruit of the Cherry and some other kinds of wall-trees are generally found totally concealed by the leaves, which, whilst they admit, prevent also the radiation of heat. I may add, in conclusion, that my soil is common brown loam, and rather stiff. I grow about a dozen kinds of Strawberries, but none with so much ease as Myatt's Pine.—*Cambricus.*

The Lisbon Onion.—As this is the season for sowing the "Lisbon Onion," I beg to acquaint you for the benefit of such of your readers as are not aware of the fact, that this Onion is as fine in flavour and as mild as the Spanish Onions which are usually imported. The best way of sowing them, to get the bulbs to a good size, is in drills about 18 inches apart, and in the spring thinning them to about 6 inches between the plants in the rows. They will keep very well until after Christmas.—*F. H. S.*

Names.—Pray do me the favour to interpret the paragraph subscribed "Erica Arbŭtus," in a late number of the *Chronicle*, which I cannot understand. Probably I know too little of Latin and Greek—one of those intruding wretches (?)—still less do I know of Chinese; and, not having visited the Celestial Empire, I may be reasonably supposed by your correspondent to be of obscured intellect. Some journalists discreetly preface their "Original Correspondence" with some precautionary declaration or other, to the effect that they do not hold themselves responsible for the opinions of their correspondents; nor do I hold you responsible for all that your correspondents may write, though you kindly publish it for them without any such provision.—*H. B., Essex.*—[We nevertheless trust that our readers fully understand that we are by no means answerable for all that appears in the Correspondence of this Paper.]

The Sting of a Bee.—Having seen several cures for the sting of bees and wasps in your Paper, I can add the following from my own experience. Touch the wound with Beaufoy's chloride of lime, and the pain will instantly cease; the swelling, however, will not subside for some hours afterwards.—*F. H. S.*——In reply to your correspondent, I have to observe, that I have always found the application of liquid ammonia (volatile alkali) to the wound inflicted by a bee, if promptly made, effectual in preventing inconvenience, in a very few minutes. I conceive that your correspondent had already neutralised the poison by the use of the alkali before the laudanum was applied. The alkali should be applied repeatedly for two or three minutes.—*Edward Bevan, Llanferry.*

Country Shows.—May I take the liberty of suggesting the plan of an index to all the Shows; by charging one shilling or any reasonable price per week for such, it being in fact an advertisement? I have no doubt most of the Societies would avail themselves of the plan; for how often it happens, after the expense of a month's advertisement, that some other fixes on the same day you have done, entirely through the advertisement being discontinued!—*J. Jackson, Kingston.* [We are, as we before stated, very willing to insert the dates of local shows, *free of expense*, if we are furnished with the necessary information: but if the local secretaries do not send us the information, of course it is impossible for us to do it.]

PROCEEDINGS OF SOCIETIES.

THE ROYAL HIGHLAND AGRICULTURAL SOCIETY.

THE annual meeting of this important institution has lately been held in Edinburgh, and is reported to have been one of great interest. An immense number of persons attended it, and the show of implements as well as stock was quite remarkable. On Monday a lecture was delivered by Dr. Madden "On the Condition of Soil at Seed time, as influencing the future prospects of the Crop." He proposed to give an account of the different soils at the time of putting seed into the ground; and to show that theory and practice were not so diverse as they were generally supposed to be. The first thing that occurred to the seed after sowing was germination—to which process air, moisture, and a certain degree of warmth were necessary. The soil, which is the vehicle through which these were communicated to the seed, consisted of particles of various shapes and sizes, and these were generally porous, though some of the smallest assumed a solid form. The fine dust of soil is found by the microscope to consist of broken-down vegetable matter. There were two distinct kinds of pores in soil; those between the different particles and those which exist in the particles themselves. Diagrams were produced representing soil when the pores were supplied with air alone, where the pores were superabundantly supplied with water, or with water alone; and when the pores in the particles were supplied with water while the other pores admitted air. The last was the proper state of the soil. Another diagram represented soil in which the interstitial pores were obliterated; this was in fact a clod, and of no more use for germination than a stone. The first state of too great dryness was very rare in this country, occurring in coarse sand, and the mode of detaining the moisture adopted in some places was to leave the stones on the surface, so as to prevent the evaporation of water. In the second instance, the water was absorbed by the pores of the particles passing through the canals, and the soil remained damp or moist, but was not wet. If, however, from the occurrence of spring water, too much water for the pores was furnished, the canals must of necessity be filled. This was the condition of undrained soil, and the whole process of germination and vegetation was materially interfered with. Hence the necessity for thorough draining. The first effect of this state of soil was to exclude the air, which was essential to germination; the second was to reduce the temperature of the soil in summer, to the extent sometimes of 6½ degrees, which was equal to an elevation of 1,950 feet above the sea—so that, supposing two fields on the same level, one of which was in a proper state, and the other was undrained, the difference was the same as between a field near the level of the sea and a field as lofty as the highest of the Pentland hills. But while in undrained soil the temperature was lowered during summer, it was unnaturally high in winter; for while the change of temperature amounted to between 30 and 40 degrees in the course of the year, the temperature of soil saturated with water ranged only between some 6 or 7 degrees; and thus the healthful influence of a variation in the temperature was lost. Dr. Madden then proceeded to show, in like manner, the necessity of attending to the pulverisation of soil, so as to prevent it from getting clodded, and to the advantage of drill sowing. He adverted to the benefits arising from attention to such points as those he had brought under the notice of the meeting; as neglect of the state of the soil, carelessness in sowing, and other circumstances within the control of the farmer, to some extent at least, were calculated to affect the seed in its various stages of germination, growth, flowering, and ripening. If anything caused the plant to flower too early, the produce was not so large as it would otherwise be; and so whatever tended to interfere with the due periods fixed by nature for the healthy performance of these various processes, should be as carefully guarded against as possible. After some remarks on the necessity for calling in the aid of practical knowledge to correct the deductions of scientific inquiries, he adverted, in conclusion, to the great utility of applying the results of scientific research in the cautious manner which he indicated to the improvement of agriculture—an art which was at once the most important and the most extensively cultivated.—At the great dinner some of the most distinguished agriculturists of England and Scotland were present, the Duke of Richmond in the chair. In the course of the evening the noble chairman took an opportunity of making some observations which deserve to be preserved, because of their truth and justice:—Never have I been able to find any one reason why we farmers should not bring to our assistance that science which learned men after great research have discovered. When I see the advantage which commerce has derived from the application of steam, when I see the enormous importance of the improvements which science has effected in our manufacturing system, I confess I cannot understand why the farmers should not endeavour to profit by it likewise. From the first, I have felt great interest in this Agricultural Society, because it gives the landlords an opportunity of meeting their tenants in friendly and social intercourse. I believe that we do great benefit to the country, by these re-unions. I think it is impossible for any man to go to the remote lands of this country, and to the far distant hills, without being convinced of the great advantages which have resulted from the efforts and advantages of the Highland Society. They have excited a thirst for useful knowledge; they have induced practical men to turn their minds to the improvement and the cultivation of the soil, and to the better management of stock; and they have promoted and fostered those Local Farmers' Clubs which I am of opinion have done great benefit. I hope you will not think me presuming if, in this great meeting, I should tell the Highland Society what, in my opinion, may be amended. You are aware that a similar society has been formed in England, which has been of great service to the farmers there. But at this moment the parent society is behind its child in one thing. The Society in England obtains subscriptions from its members; but to each of its members it sends a Quarterly Journal, not only comprising the prize essays paid by the subscriptions of its members, but also containing many useful papers from practical farmers; the effect of which is, that useful knowledge is disseminated in every parish of the country. I beg to call upon the Scottish landlords, then, to come forward; for it is by them that the great expense should be borne. I call upon them to come forward with their subscriptions for this purpose, to enable every member of this Society to know what has been done by his neighbours. They will there see the result of practical experiments—for *I do not call upon the tenants to make too great experiments*—I ask them to make experiments only upon such a scale as will not hurt them. But to the landlords I say that IT IS THEY WHO SHOULD MAKE EXPERIMENTS. [Let us hope that this sentiment of the Duke of Richmond will be long remembered and often quoted.]

COUNTRY SHOWS.

Cambridge Florists' Society, July 21.—The above society's exhibition of Carnations, Picotees, &c., was held at the Red Lion. We subjoin the award of the judges:—CARNATIONS.—P. P., Paul Pry, Mr. Ready. The class of *Scarlet Bizarres* was usurped entirely by Twitchett's Don John, Mr. Twitchett winning 3 prizes, and Mr. Headly 3 ditto. *Crimson Bizarres*: 1, Paul Pry, Mr. Ready; 2, Jaques' Georgiana, 3, Paul Pry, Mr. Rickard; 4, Paul Pry, Mr. Giddens; 5, Duke of Wellington, Mr. Headly; 6, Ely's Lord Milton, Mr. Twitchett. *Scarlet Flakes*: 1, 3, 4, 6, Wilson's William IV., Mr. Rickard; 2, Lydia, Mr. Giddens; 5, Dr. Barnes, Mr. Ready. *Purple Flakes*: 1, Empress of Purples—3, Queen of Sheba—6, Seedling, Mr. Headly; 2, 4, Queen of Sheba, Mr. Giddens; 5, do., Mr. Marshall. *Rose Flakes*: 1, Ely's Lady Ely—4, Lancashire Lass, Mr. Headly; 2, Hoyle's Beeswing—6, Wilson's Harriett, Mr. Twitchett; 3, Lady Petre, Mr. Marshall; 5, Devonshire, Mr. Giddens. *Seedling Carnations—Scarlet Bizarres*: 1, Mr. Headly; 2, Mr. Marshall. *Purple Flakes*: Mr. Headly. PICOTEES.—P. P., Headly's Sarah, Mr. Headly. *Red Picotees, heavy-edged*: 1, Duke of Wellington—2, Ely's Dr. Horner, Mr. Headly; 3, Duke of Wellington—5, Sir R. Peel, Mr. Giddens; 4, 6, Duke of Wellington, Mr. Ready. *Purple Picotees, heavy-edged*: Headly's Nannette, 4 prizes, Mr. Headly; 5, Sharp's Invincible, Mr. Giddens; 6, do., Mr. Twitchett. *Rose Picotees, heavy-edged*: 1, Green's Queen Victoria, Mr. Twitchett; 2, 5, do., Mr. Giddens; 3, do., Rev. J. Thackeray; 4, do., Mr. Green; 6, do, Mr. Ready. *Red Picotees, light-edged*. Mr. Headly won the six prizes with his seedling called Sarah. *Purple Picotees, light-edged*: 1, Rickard's Lady Peel, Mr. Rickard: 2, 3, 5, Vespasian, Mr. Giddens; 4, Purple Perfection, Mr. Marshall; 6, Vespasian, Mr. Ready. *Rose Picotees, light-edged*: 1, Sharp's Coronet, Mr. Headly; 2, Wain's Victoria—5, Seedling, Mr. Marshall; 3, 4, Fair Rosamond, Mr. Twitchett; 6, Miss Kitty, Mr. Ready. *Yellow Picotees* 1, 2, 4, Howlett's Paragraph—5, 6, Martin's Victoria, Mr. Ready; 3, Howlett's Paragraph, Mr. Rickard. *Seedling Picotees—Red*. 1, Mr. Headly; 2, Mr. Giddens. *Light edged Red*: Mr. Rickard. *Six Dahlias* 1, Mr. Ready; 2, Mr. Jaspar Taylor. *Three Dahlias*: 1, Mr. Freestone; 2, Mr. Boning; 3, Mr. Ready. *Two Dahlias*: 1, Mr. Boning; 2, Mr. J. Edis. *One Dahlia*: 1, Mr. Headland (Headly's Phœnix). 2, Mr. J. Edis. *Dahlia grown in a pot*: Messrs. Hudson; *Two Balsams*: 1, Mr. Ready; 2, Mr. F. B. Smith. *Cockscomb*: Messrs. Hudson. *Plant in a pot*: 1, Mr. Ready; 2, Mrs. Stittle. *Cut Flowers*: Mr. Catling and Mr. Ready (equal). *Bouquets*: 1, Messrs. Hudson; 2, Mr. Green. *Mr. Green's Amateur Bouquet*: Mr. Crisp. EXTRA PRIZES.—*Model of the Church of the Holy Sepulchre*: Mr. Catling. *Collection of Plants*: 1, Mr. Green; 2, Messrs. Hudson. *African Marigolds*: Mr. Boning. *French do.*: Mr. J. Taylor.—*Cambridge Chronicle.*

Newby Wiske Cottagers' Horticultural Society.—The third annual show was held on Thursday the 28th of July. The various productions were of a superior quality, and reflected credit on the industry and perseverance of the Cottagers. The following were the successful competitors for the first and second prizes:—POTATOES, *Kidney*: 1, J. Webster; 2, J. Warne. *Round*: 1, J. Warne; 2, T. Prest. PEAS: 1, J. Warne; 2, T. Richardson. BEANS: 1, J. Warne; 2, J. Rymer. CAULIFLOWERS: 1, J. Davison; 2, J. Warne. LETTUCE, *Cabbage*: 1, J. Webster; 2, J. Warne. *Cos*: 1, R. Sturdy; 2, J. Webster. CABBAGES: 1, W. Wetherill; 2, J. Warne. BEET-ROOT: 1, J. Davison; 2, W. Wetherill. RHUBARB: 1, J. Davison; 2, W. Miller. TURNIPS: 1, W. Priestman; 2, J. Davison. ONIONS, *Spring*: 1, J. Davison; 2, G. Richardson. *Winter*: 1, W. Miller; 2, J. Miller. POTATO ONIONS: 1, J. Rymer; 2, G. Walton. CARROTS: 1, J. Davison; 2, J. Dove. APPLES: 1, G. Smith; 2, J. Davison. CURRANTS, *Red*: 1, J. Williams; 2, J. Webster. *White*: 1, J. Davison; 2, R. Ramsdale. *Black*: 1, J. Williams; 2, W. Sorrel. GOOSEBERRIES, *Heaviest*: J. Webster. *Ripest*: do. RASPBERRIES: 1, J. Robson; 2, J. Webster. THE BEST BUNCH OF SWEET HERBS: E. Hogge.

Tamworth Royal Horticultural Society, Aug. 2.—The third exhibition was held at the Town-hall. The prizes were as follows: BEST STOVE PLANT, E. Peel, Esq. BEST GREENHOUSE PLANT: 1, Mr. Holmes; 2, Mr. J. Brammall; 3, H. Stokes, Esq. BEST FRAME PLANT, Her Majesty the Queen Dowager. ANNUALS: 1, H. Stokes, Esq.; 2, E. Peel, Esq. CARNATIONS: *Scarlet Bizarre*, 1, Hepworth's Leader, W. Green, Esq.; 2, Duke of Leeds, do.; 3, Game Boy, Mr. Clerk; 4, Woolridge's King, Capt. Inge. *Crimson Bizarre*, 1, Gregory's King, Mr. Clerk; 2, Paul Pry, do.; 3, Lord Milton, Rev. J. Brammall; 4, Duke of Bedford, W. Green, Esq. *Scarlet Flakes*, 1, Beauty of Eardley, Rev. J. Brammall; 2, Lydia, do.; 3, Ely's Volunteer, do.; 4, Madame Mara, H. J. Pye, Esq. *Purple Flakes*, 1, Rev. J. Gisborne, Mr. Clerk; 2, Squire Meynell, do.; 3, Sir R. Peel, Rev. J. Brammall; 4, Martin's Miss Wake, Mr. Clerk. *Rose Flake*, 1, Lady Grey, H. J. Pye, Esq.; 2, Lovely Ann, Rev. J. Brammall; 3, Duchess of Gloucester, W. Green, Esq.; 4, Lady Hood, Mr. Cowdery. PICOTEES: *Red*, 1, Sir Thomas, H. J. Pye, Esq.; 2, Mary, W. Green, Esq.; 3, Admiral Tatham, H. J. Pye, Esq.; 4, Criterion, Rev. J. Peel, Esq.

NOTICES OF NEW PLANTS WHICH ARE EITHER USEFUL OR ORNAMENTAL.

BORÓNIA ANEMONÆFÓLIA. Anemone-leaved Borónia. (*Greenhouse Shrub.*) Rutáceæ. Octándria Monogýnia.—This pretty plant was raised from seed received from New Holland, by Messrs. Loddiges, many years ago; but though they germinated quickly, the plants did not blossom till within the last two years. The leaves are composed of three and sometimes five leaflets, and have a bolder and more prominent character than those of any other species; they are also usually tinged with yellow or brown. The flowers are borne upon short peduncles upon the lower part of the branches; being of a lively pink hue, and beautifully varied by the yellow stamens in the centre. It will grow freely in light loamy earth, with a trifling addition of heath-mould. Particular attention must be paid to potting; for it is generally owing to a sourness or insufficiency of soil, or imperfect drainage, that plants of this character acquire a sickly aspect. Watering is, besides, a very important point; and hard water always injures species with fine roots sooner than others, so that it should be avoided with such plants as Boronias. Whenever the plant evinces a disposition to depart from its usual compactness, an occasional stopping of the shoots will be useful: indeed, while young, the practice may be adopted under any circumstances. The young shoots, thus removed, can be employed as cuttings.—*Paxton's Mag. of Botany.*

BEGO'NIA CRASSICAULIS. Thick-stemmed Begonia. (*Stove Herbaceous Plant.*) Begoniáceæ. Monœ'cia Polyándria.—A handsome species, introduced from Guatemala through the Horticultural Society from Mr. Hartweg. Like all the genus, it is very easy to cultivate, requiring nothing more than a cool damp stove, and any sort of light peaty soil. It has the singular property of producing its narrow panicles of white and pink flowers without the leaves. In the month of February they appear in profusion upon rugged fleshy gouty stems, and the leaves are not produced till some weeks later. Each flower consists of two petals only, which, being rounded and convex, give the appearance of a bivalve shell; or, when the flowers are unexpanded, the blossoms may be compared to clusters of fourpenny pieces.—*Bot. Reg.*

MISCELLANEOUS.

Botany.—Many persons are unacquainted with the manner in which this subject is now taught, and indeed with its general scope and tendency; fancying it to consist of technical names, and dry systematical details connected with the classification of Linnæus. For their information we print the following list of questions, which formed the Examination Paper in the senior class of Botany in University College, London, on the 30th July, 1842:—1. Explain the origin of the pith and medullary rays in the stem of an Exogen. 2. What is the most absolute distinction between an Exogen and an Endogen? 3. What organic connexion is there between a leaf and a stem? 4. What is the difference between an umbel and a cyme? 5. In what position must the ventral suture of a carpel necessarily be with reference to the axis of a flower, and why? 6. In the internal structure of a plant, what means of inter-communication are provided among the cells, tubes, and other cavities, so as to facilitate the transmission of fluids? 7. Describe the principal facts connected with respiration as distinguished from nutrition. 8. On what substances do plants feed? 9. Whence are those substances obtained? 10. What effects are produced upon plants by light? 11. At what seasons of the year should those plants be collected for medical use whose active qualities reside in the roots? 12. If a tree is deprived of its leaves, what consequences follow? 13. State the Botanical distinctions between Lauraceæ and Berberaceæ, and also the characters common to both orders. 14. What are the distinctions between Ranunculaceæ, Anonaceæ, and Magnoliaceæ, and what are the sensible qualities of each order? 15. Suppose a plant to have the following structure, what would probably be its medical use? An Exogen, with opposite leaves, a 5-lobed calyx, a 5-lobed monopetalous corolla, the same number of epipetalous stamens, and a superior ovary with two parietal placentæ. 16. To what purposes are Convolvulaceæ, Solanaceæ, and Scrophulariaceæ severally applied in medicine, and how are those three orders best distinguished from each other? 17. Distinguish Urticaceæ from Chenopodiaceæ. 18. Name the principal orders of Exogens which have a valvate calyx, and explain their differences.—It seems to us, that the person who can answer these questions will have learned something as much worth knowing as the construction of an obscure passage in a Greek or Latin Classic, or even the solution of an intricate mathematical problem.

Monument to the Earl of Leicester.—We are happy to state that the gentlemen of Norfolk have responded to the appeal made to them by the yeomanry on this subject, and that the subscription is proceeding rapidly. Upwards of 1,500*l.* have been already subscribed by the inhabitants of Norfolk alone, and we trust that we shall have to announce ere long such a sum as will suffice for a monument commensurate with the importance of Lord Leicester's services to his country. Upon this subject the testimony of the Duke of Sussex, who was for many years Mr. Coke's intimate friend, will be read with interest. In a letter addressed by His Royal Highness to Mr. Leamon, the chairman of the committee, is the following passage:—"I advise, that, in the first instance, the yeomanry, &c., should take the lead; and, after their subscription has been collected, that then the nobility and gentry, &c., should be applied to, when I shall not fail to subscribe my mite as a token of love, esteem, admiration, and respect, for one of the most honest, upright, useful, and important members of the human race, whose name will grace the page of British history during the last two centuries, and which name I am proud to engrave in my heart as one of my best friends, while as a good man I consider him to be 'one of the noblest works of God.'"

Gardener's and Botanist's Foreign Library.—The following new works are announced.—Neubert, W.:—Die Modepflanzen unserer Zeit (The Fashionable Plants of our Age). Vol. I., The Camellia and Cactus, a Treatise on their Culture and Propagation. Vol. II., The Roses, their Description, &c. 8vo, each vol., 2*s.*——Thouin, A. (feu M.):—Voyage en Belgique, en Hollande, et en Italie. 2 vols. 8vo, 15 fr.——Endlicher, S.:—Mantissa Botanica, sistens Genera Plantarum. Supplementum secundum. Vindob. 4to. 5*s.* 6*d.*——Endlicher et Martius:—Flora Brasiliensis, Fasc. 3, 4, 5, continens Cyperaceas, auctore Nees ab Esenbeck; Smilaceas et Dioscoreas, auctore Griesebach. Vienna, fol., 3*l.* 10*s.*——Quarizius, C. G.:—Populäres Handbuch (Popular Manual of Organic-Technical Chemistry). Berlin, 8vo, 8*s.*——Elsner, J. G.:—Hand und Hülfsbuch. Book of Advice for the Small Landowner and Farmer. Stuttgart, 8vo.—Die Deutsche Landwirthschaft. German Farming in its present state. Stuttgart. 2 vols., 8vo.—Die Politik. Politics of Farming. Stuttgart. 2 vols., 8vo.—Rathschläge. Advice how the Farmer has to speculate in the production and the disposing of his Stock. Stuttgart, 8vo.—Gutes Rath. Good Advice for buying and disposing of Farms. Stuttgart. 8vo.—Die Bildung. On the Education of Farmers in its widest meaning. Stuttgart. 8vo.——Letellier, Dr.:—Avis au Peuple. Advice to the People on the great resemblance and the small difference between Venomous and Alimentary Mushrooms. With coloured figures of 16 species. Paris, 4to.——Quarizius, C. G.:—Handbuch. Handbook of Organic-Technical Chemistry; or, Advice to analyse the simple Substances of Organic Nature, according to rational principles, for the use of Farmers, &c. Berlin, 8vo.; 40½ sheets of impression.——Heubeck, Dr. F. X.:—Beantwortung. Answer to the most important Questions of Agriculture, relating to Liebig's Organic Chemistry. Grätz, 8vo.; 8 sheets of impression.——Cours Complet d'Agriculture. Complete Course of Agriculture, edited by Messrs. de Morogue, Payen, Mirbel, Héricart de Thury, &c. Paris.——Dr. C. H. Schultz:—Die Cyclose. The Cyclosis of the Vital Sap in Plants. Edited by the Imperial Academy of Naturalists. Bonn. 4to., with 33 plates.——Schleiden, Dr. M. J.:—Dr. Justus Liebig, and his position relative to the science of the Physiology of Plants. Liepzig. 8vo.

Orchidaceous Plants.—We learn that a fresh importation of these plants is about to be offered for sale by Messrs. Stevens. Among them are, we hear, numerous specimens of the beautiful Epidendrum, Cattleya, and Maxillaria named after Mr. Skinner, and many novelties.

Prolific Pear Branch.—In the garden of Mr. Peacock, Slyne, near Lancaster, is a Pear branch about 10 feet in length, upon which are growing the extraordinary number of 900 Pears.

Immense Wasp's Nest.—A wasp's nest was found during the past week in a seed-room at Dallam Tower, near Milthorp, which was of an oblong shape, and measured 32 inches long by 28 inches across. It was supported from the roof of the building by four ropes of the same manufacture. The gardener has destroyed 69 wasps' nests in and about that garden this year.

GARDEN MEMORANDA.

Bayfordbury, the seat of W. Rt. Baker, Esq.—A short description of this place was given by Mr. Loudon, in his "Gardener's Magazine" for November, 1840; since which time, however, considerable improvements have been made—in fact, there are few places where so much has been done in the short space of 5 or 6 years. The mansion is a fine building, situated on a rising ground, in the midst of a magnificent and extensive park, finely ornamented with trees of various kinds, particularly the Cedar of Lebanon; of which there are some noble specimens, both on the north and south sides of the house, planted in 1765. Plants raised from the seeds of these trees were in 1840 grafted with the Cedrus Deodara, and planted out in the park in 1842, together with the above-mentioned Cedars of Lebanon, and the Silver variety; to form an avenue for a road, which is about to be made as an approach to the mansion from the west end of the park. These plants stand at present 4ft. high; and should they continue in the flourishing condition they are now in, they will, no doubt, in a few years, form a most splendid avenue. The lawn is situated on the south side of the house, and is very tastefully laid out in clumps of evergreens, and single specimens. Between the lawn and a gravel walk, about 150 yards long, and 5 wide, which runs the whole length of the house, are the flower-beds, surrounded by a neat box-edging, and filled with almost every variety of plants suitable for beds; which present a complete mass of colours from one end of the house to the other. At each end of the walk, also, are two fine specimens of Yucca aloifólia, one of which is now in flower; the flower-stalk measuring upwards of 12ft. in height. Along one side of the large walk many handsome vases are placed, which are filled with the different variegated and scarlet Pelargoniums. At the west end of the lawn another flower-garden presents itself, in the midst of which is a large piece of stone rock-work, covered with the different varieties of Asters, Helianthemums, Fuchsias, &c. In this garden, adjoining the mansion, stands the Orchidaceous house, in which the plants are looking in excellent condition, some of them promising large spikes of flowers. From the Orchidaceous house we proceed to the Heath-house, through the Rosary, which contains a fine collection of China, Tea-scented, Bourbon, and Dwarf Noisette Roses; the larger-growing kinds being trained upon poles from 10ft. to 12ft. high. The Heath-house, which is surrounded by large masses of rock-work, made up of burnt brick and covered with Roses, &c., is filled with some fine specimens of Heaths, and some of the leading Greenhouse plants, in very good condition. At the east end of the mansion is a large span-roofed Conservatory, which has lately been divided into two compartments: one, having been made into a dry stove, is appropriated to the growth of Tropical plants, amongst which there are two fine specimens of Musa Cavendishii and M. Dacca, doing extremely well. The rafters are well covered with the best Stove Climbers, including Ipomœa Learii, covered with several hundred blossoms, fully expanded; the other end of the house is filled with the larger-growing Greenhouse plants, such as Epacris, Chorizema, Camellia, &c. The east end of the lawn is covered with large clumps of Rhododendrons, Azáleas, hardy Heaths, &c., which, when in full flower, present a charming object. At this end also are three fine specimens of Araucária imbricata, one of which has stood the last six years, without the slightest protection, and is now 8ft. high; the other two are from 4ft. to 5ft. We noticed about the lawn several specimens of Musa sapientum and rósea, plunged in pots, and doing remarkably well. The Arboretum, of which a slight view may be taken from the lawn, is situated on the west side of a hill, and covers between six or seven acres of ground; very tastefully laid out in clumps and single specimens of hardy trees and shrubs, which are all arranged according to the natural orders of Jussieu. The approach to the entrance of the Arboretum is through an extensive collection of Thorns, Evergreens, and American Oaks, in the Park. The entrance itself is an archway, over which are planted the first order, Clematis and Atragene. The walk from the entrance leads to the top of a hill, where you may look down through Maples, ranged along the sides, upon a collection of Pæonias, Magnólias, &c., and a bank of seedling Berberises, raised from B. aquifólium, B. fasciculare, and B. repens; amongst which there are some good distinct varieties. Beyond this bank is a pretty piece of ornamental rock-work covered with Cistus, Helianthemums, &c. After passing from the summit of the hill, through a fine group of Pávias, Æsculus, Euonymus, &c., and a numerous collection of other genera, where we noticed a fine specimen of Ailantus glandulosa, and a pretty group of Hollies, whose glossy leaves are always pleasingly conspicuous, we are led to the Pinetum. Amongst a numerous collection of Pines and other genera belonging to the Coniferæ tribe, may be seen some fine young specimens of the new Mexican Pines, such as Pinus patula, which has reached the height of 3½ ft.; P. Teocote, 2¼ ft.; P. Montezumæ, 2⅔ ft.; Apulcensis, 2⅔ ft.; Pseudo-strobus, 2½, and Abies religiosa, 1½ ft. These, together with P. Hartwegii, Russelliana, Devoniana, and macrophylla, stood out the whole of last winter, with little or no protection. We noticed amongst the Strobus group, several Scotch Firs grafted with Pinus Lambertiana; one of which, intended for the specimen, had on it six grafts all growing vigorously, the others having three or four on each. These, together with many others in different parts of the ground, were grafted in the beginning of last June, on the Herbaceous system; which, we are informed, has in this place been attended with singular success. Some scions also of Pinus macrocarpa and Sabiniana were taken from two grand specimens in the ground, and grafted on P. Laricio, after the same system, in June 1840, and have this season made shoots two ft. long. On passing through the different varieties of Abies and Picea, we saw a noble plant of Abies Douglasi and two fine ones of Cedrus Deodara. The next thing that attracted our attention was a bank planted with the order of Cupressinæ, which may be ranked amongst the finest in the kingdom. The Kitchen-garden, which is about a mile from the mansion, consists of an octagon, containing about three acres of ground, with a neatly-built cottage for the residence of the head gardener, forming one of the sides of the octagon. The walls of the garden are well filled, both inside and out, with some of the finest sorts of Peaches, Nectarines, Apricots, &c. The forcing department consists of three Vineries, a Peach-house, and a Greenhouse, with several pits; one of which, heated by a brick flue, is intended for propagating cuttings and growing

Cucumbers during the winter months. A walk through a group of Yuccas leads to a rustic bridge over a deep ravine, which adds greatly to the romantic appearance of the place; over this bridge we made our exit, highly gratified with all we had seen.—*A. B.*

Reviews.

Journal of the Royal Agricultural Society of England. Vol. III. Part I. (*Continued from p.* 456.)

[From an occasional Correspondent.]

On the Draught of Ploughs, &c.—The importance of the subject of this article is increased by the necessity of endeavouring to diminish the cost of production in consequence of the acts passed during the present session for the purpose of admitting, gratis, foreign competition. During the continuance of highly remunerating prices, more attention was paid to increasing the amount of production than to diminishing the cost of it. Consequently, the cessation of high prices occasioned a great complaint of the want of remuneration on the part of those who had only lately followed the example of Lord Leicester and other great pioneers of agriculture, and incurred all the disadvantages without deriving any of the benefits arising from high wages and good markets. Of the length of time that may be required for the remuneration of very expensive agricultural improvements, some idea may be formed from the information given us by Lord Spencer, that nine years had been spent by Lord Leicester in bringing his barren wastes into such condition as would allow him to attempt the cultivation of wheat. Great merit is due to him for having entered upon a speculation which, at the time he commenced it, must have been too hazardous for any tenant to undertake.

Farmers are very unwilling to enter upon speculations of this kind until they are assured of their results by ocular demonstration, especially if their chance of remuneration depend upon that fickle despot, public opinion. The more thankful should we, therefore, be for the examples given by men of rank and wealth, particularly for the personal attention paid to agriculture by our revered sovereign George III.

We understand that the farm at Frogmore is now flourishing under female patronage in such a manner as will encourage the fairer sex throughout the kingdom to bestow on agriculture a part of that attention to which our instruction is principally indebted for its success. Horticulture is indeed the proper school of agriculture, and of cultivation generally. To this department, and, perhaps, to every department of science, the contributions of the ladies scarcely yield the palm to those of gentlemen. It is to be regretted that the Agricultural Society has entrusted the management of its affairs to a select committee of the lords of the creation, and its weekly meetings are not generally open even to men of science. Perhaps we ought not to regret this circumstance, because it places in a stronger light the advantages of the meetings at the rooms of the Horticultural Society, which are so numerously favoured by the attendance of ladies. There is another highly valuable society, which is conducted in the same liberal manner, but which, from its age, has stood in some need of renovation, and which will probably receive a greater degree of notice from this exclusiveness of the Agricultural Society. The principal objects of the Agricultural Society, indeed all of them in which it was not preceded by the Smithfield Club, have, from the first establishment of the Society of Arts in the Adelphi, been continually promoted there by premiums as well as by medals, of which the reports have contained many things that are very valuable. The discussions in its committees, which are open to all the members, have rendered them a most useful school of mechanics; and the attendance of ladies is invited at these meetings, where everything possessing peculiar interest is exhibited.

The establishment at the Adelphi is better adapted to large meetings and general purposes than that of the rooms in Hanover-square, where the members are not expected to attend generally more than twice in the course of the year. However, if the usefulness of the Agricultural Society were to be confined chiefly to the publication of its "Journal," that usefulness will be sufficiently valuable if it continues to be conducted as it has been hitherto. The want of a complete repository is somewhat compensated by description. The dynamometer described in the article upon which we are now commenting was considered of sufficient importance to be placed in the repository formed by the Chevalier Edelcranz, at Stockholm, afterwards attached to the Royal Agricultural Academy of Sweden. It has been properly applied to the purpose of measuring the efficiency of ploughs, and the means of economising the strength of men and horses; a consideration of very great importance towards demonstrating the cost of production.

CALENDAR OF OPERATIONS *for the ensuing week.*

We have lately seen what appears to be a useful contrivance for the shading of Cucumber, Melon, Pine, or other plants, which require it, in pits and frames. It is done by simply coating the lower surface of the glass with lime white-wash, which, if not made too thick, will break the force of the sun's rays without wholly excluding light, and thus supersede the troublesome necessity of spreading mats daily over the glass in bright and warm weather. When no longer necessary, the lime may easily be removed by washing.

I.—KITCHEN-GARDEN AND ORCHARD.

In-door Department.

Pinery.—Persevere in potting till the whole of the plants are done, as this is an operation which will not admit of delay. Take care not to overpot succession plants, and use plenty of drainage; let them also have sufficient room to grow, for if well attended to, they will increase very much in size before winter. Maintain a moist atmosphere in all the houses where the potting is completed, and frequently give the plants a light dewing with a fine-rosed syringe. Shade on bright days if practicable; in some cases the method above mentioned might be employed. Examine the beds daily, and if the heat should be found too great, immediately draw the bark away from the pots, which might be done without disturbing the plants. Those first potted will require water now, which, however, must be given sparingly till the plants get roothold.

Vinery.—So long as the present dry and hot weather continues, too much air cannot be given to ripe or ripening Grapes. Do not close the houses till the sun has left them, and let down the lights soon in the morning, before the atmosphere of the house becomes charged with warm vapour. In these houses the floors ought not to be sprinkled, but, on the contrary, every precaution should be used to keep the air in a dry state, as upon this both the preservation and the flavour of the fruit materially depend.

Peach-house.—Suspend nets to the trellis, or use some other contrivance, to prevent the ripe fruit in the latest house from being bruised in falling. As soon as any trees are cleared of fruit, let them be thoroughly washed. We do not advise the lights to be taken off late houses, because in the dull and damp weather which frequently occurs in the autumn months, their shelter will be necessary for the proper ripening of the wood; but with early houses, in which the fruit is ripe in May or June, the case is widely different.

Fig-house.—The second crop will now be swelling rapidly; therefore the trees must be freely watered at the root, and occasionally overhead. Pay particular attention to this last point, if any red spider are found upon the leaves.

Cucumbers and Melons.—Shading cannot be safely dispensed with so long as the sun continues so powerful: and the method described in the preliminary observations will be found worthy of trial. Let growing plants also be properly supplied with water; for wanting this, a short exposure to the sun would most likely destroy the principal leaves. As before stated, Melon plants ought not to be watered when the fruit is approaching maturity, for, owing either to a sudden accession of sap, or to the dampness of the atmosphere thereby induced, the fruit almost invariably cracks. Do not close the frames too early on hot days. If large enough, pot off the seedlings intended for fruiting in winter, one plant in a pot; they must afterwards be very carefully shaded.

Out-door Department.

Continue to cut herbs of all kinds as they become fit, and gather Capsicums, Radish-pods, Nasturtiums, Kidney Beans, and other Vegetables for pickling. The ground being so extremely dry, so much time is necessarily occupied in watering, that it will be useless to attempt planting until a change of weather takes place. All seed-beds should be shaded, if practicable; but the shading material must not be placed too near the plants, so as to draw them up weakly. If seeds must be sown, the ground should be well watered, and afterwards covered with litter till the plants appear. Clear away all crops of Peas, Beans, &c., as soon as they cease to bear.

Cabbages.—Do not suffer cracked or otherwise useless heads to remain uncut, or very few sprouts will be produced by the stalks. Water and shade the seed-beds. Embrace the first favourable opportunity to transplant a good breadth for Coleworts.

Cauliflowers.—In cold and late situations the spring crop should be sown about the middle of the week; but in warm gardens a few days after the 20th will be soon enough. Water the latest autumn crop liberally.

Celery ought to be most particularly attended to in watering; for if, from the want of sufficient moisture, the plants once acquire a disposition to put up flower-stalks, no after care can prevent the loss of the crop.

Endive.—Tie up for blanching, and thin the last sowing, leaving plants enough for removal at the first favourable change of weather.

Kidney Beans.—In dry ground these should be watered, or their fruit will not set.

Lettuce.—Some sorts, of known hardihood, should be sown in the course of the week, for the purpose of standing the winter. Of Cos, the Brown (by some called the Bath Cos) is a general favourite. Some of the French kinds also are very hardy, especially one called "Verte d'hiver." Of Cabbage, the best kinds we have seen are the Asiatic and the Brown-speckled; but these are probably not procurable from seedsmen. The Imperial and the Brown Dutch are hardy and good sorts.

Normandy Cress.—Sow to stand the winter.

Onions.—The Tripoli and the Brown or the White Portugal should be sown now; another sowing to be made ten days hence.

Peas.—Those intended to give a late supply should be well watered, and some rotten dung spread over the ground between the rows.

Spinach.—Sow the main winter crop on good ground.

Orchard.—In light soils which are not retentive of moisture, Peach-trees ought to be watered at the roots, not merely for a foot or two round the stem, but as far as the roots are supposed to extend. Previously loosen the surface of the border with a fork, and afterwards spread some dung or litter over the moistened part to lessen evaporation. Soap-suds may be used for washing the foliage, as it is more inimical than clean water to the red spider. If desirable to retain any old plantations of Strawberries, the plants would be strengthened by mowing off the old leaves, and spreading an inch or two of rotten dung or good compost over the surface. Look daily to earwig-traps; destroy wasps' nests, and use means for the destruction of all insects which are injurious to fruit.

II.—FLOWER-GARDEN AND SHRUBBERY.

In-door Department.

Stove.—Where alterations are in progress, protect as well as possible the plants placed in the open air. Things which are likely to come into flower in the autumn or winter, should, if practicable, be placed in a greenhouse or open shed, in order that their foliage may not be injured by the weather. The north side of a wall or hedge is also a good place for such protection.

Greenhouse and Conservatory.—Pelargoniums which were headed down early will now be fit for re-potting. Shake off all the old soil, prune the roots carefully, and re-pot the plants in smaller pots than they previously occupied; using light friable compost with the object of obtaining a healthy and vigorous system of roots. Set the plants in a vacant frame, where they can be shaded and encouraged to grow; but do not on any account crowd or over-water them. While the hot weather continues, all plants in pots will require strict attention in watering. Shading would not only prevent the expenditure of so much labour and water, but it would also benefit the plants.

Pits and Frames.—The first set of Chrysanthemums should now be shifted into their blooming pots, and any shoots stopped that take the lead. Likewise re-pot Balsams, Cockscombs, Globe Amaranths, and other annuals for blooming late. Sow Ten-week Stocks in pots for flowering in spring; likewise Mignonette in light soil and well-drained pots.

Out-door Department.

Many plants will ripen seeds this season which do not commonly afford that means of propagation to any extent; such, therefore, should be gathered as they ripen. Of these, Verbenas and Heliotropes may be instanced. Watering must not be omitted. Tie up Dahlias, remove dead flowers, and keep the surface of the beds and borders loose by hoeing. Very little mowing is necessary now; still the lawns should be gone over often enough to keep the surface smooth.

NURSERY AND FOREST DEPARTMENT.

Nursery.—See last Calendar.

Forest and Coppice Woods.—Besides the work mentioned last week, little can now be done, unless it be the repairing of old or making new dead fences. Gates, paling, &c., should also be painted while the wood is thoroughly dry, and before wet weather sets in.—*J. B. Whiting, The Deepdene.*

Fri. 19	73.3	52.1	62.7	5	0.24	—	1	1	1	1	4	5	—
Sat. 20	73.6	52.4	63.0	7	0.18	1	—	1	—	4	1	[illegible]	3

The highest temperature during the above period occurred on the 17th, in 1834—thermometer 94°; and the lowest on the 13th, in 1840—thermometer 41°.

State of the Weather near London for the Week ending August 11, 1842, as observed at the Horticultural Garden, Chiswick.

August	Barometer. Max.	Barometer. Min.	Thermometer. Max.	Thermometer. Min.	Thermometer. Mean.	Wind.	Rain.
Friday 5	29.930	29.904	79	50	69.0	S.W.	
Saturday 6	29.937	29.844	72	53	62.5	W.	
Sunday 7	29.963	29.919	78	48	63.0	S.W.	.15
Monday 8	30.029	30.025	82	51	66.5	S.	
Tuesday 9	30.029	29.844	86	55	70.5	S.	
Wednesday 10	29.772	29.621	93	60	76.5	S.E.	1.06
Thursday 11	30.131	29.832	71	47	59.0	W.	
Average	29.970	29.847	80.1	53.3	66.7		1.21

Aug. 5. Overcast; cloudy and fine throughout.
6. Cloudy; rain; clear and fine at night.
7. Clear and very fine.
8. Clear; hot and dry; very fine.
9. Hot and dry; cloudless.
10. Sultry; excessively hot and dry; distant thunder and slight rain in afternoon; heavy thunder-storm towards midnight, with rain in torrents.
11. Cloudy in the morning; afterwards clear and very fine.

Mean temperature of the week 3°39 above the average. The 10th was the hottest day since Aug. 5, 1836.

REPORT ON COVENT GARDEN MARKET,

For the week ending August 12, 1842.

The quantity of fruit which has been brought into the Market during the week has been immense, and considerably greater than the demand for it; vegetables have likewise been well supplied. Trade continues on the decline. *Fruit.*—There are some fine Pines offered, with little variation in price from last week. Black Grapes are from 2*s.* to 3*s.* per lb.; and Muscats have fallen to 4*s.* per lb. Peaches and Nectarines are from 8*s.* to 15*s.* per doz. Apricots abound; the best fruit fetches from 1*s.* to 2*s.* 6*d.* per doz. Green Gage Plums for dessert are selling from 2*s.* to 2*s.* 6*d.* per punnet; inferior fruit from 2*s.* to 3*s.* 6*d.* per half-sieve. The Orleans Plum and other less valuable kinds are selling from 1*s.* to 3*s.* 6*d.* per half-sieve. May Duke and Morello Cherries are the only sorts obtainable; the former at 2*s.* per lb.; the latter at 1*s.* per lb. Black and White Currants are no longer to be met with; a few Red may be had from 3*s.* to 5*s.* per half-sieve. Gooseberries are also nearly over. A small quantity of tolerably good Raspberries may be obtained, from 8*d.* to 1*s.* per gallon. Filberts are very plentiful and well filled, and fetch about 10*s.* per doz. lbs. Apples and Pears are remarkably abundant; the best dessert kinds of the former are the Devonshire Quarrenden and the Kerry Pippin. Amongst the Pears are some good samples of the Jargonelle and Windsor: the prices are somewhat less than those of the previous week. Cucumbers are considerably cheaper than they have yet been; the frame fruit fetches from 2*s.* 6*d.* to 4*s.* per doz., the natural fruit from 9*d.* to 1*s.* 3*d.* per doz., and Girkins are plentiful from 7*s.* to 10*s.* per 1000. *Vegetables.*—Very little variation of price has taken place during the past week. Cabbages are somewhat cheaper. Peas are on the decline, and it is extremely difficult to meet with a young sample; those offered are rather dearer than in last week's quotation. Carrots and Turnips have improved greatly; and the generality of the Potatoes appear to be uncommonly good. Tomatoes may be obtained from 1*s.* 3*d.* to 1*s.* 9*d.* per punnet. Capsicums are becoming plentiful; the ripe fruit fetching from 6*d.* to 1*s.* 6*d.* per doz. *Flowers.*—Those in pots consist principally of Myrtles, Fuchsias, Hydrangeas, &c.: and amongst the cut ones we observed Allamanda cathártica, Bignónia venusta, Ceanothus azúreus, several Passifloras, Gladioli, and Ericas.

PRICES, Saturday, August 13, 1842.—FRUITS:—

Pine Apple, per lb. 4*s* to 7*s*
Grapes, per pound, 2*s* to 3*s*
— Muscats, per pound, 4*s*
Melons, English, each, 1*s* 6*d* to 3*s* 6*d*
— Dutch, 1*s* to 2*s* 6*d*
Peaches, per doz. 8*s* to 15*s*
Nectarines, per doz., 8*s* to 15*s*
Apricots, per doz., 1*s* to 2*s* 6*d*
Figs, per doz., 3*s* to 4*s*
Plums, dessert, per punnet, 1*s* to 1*s* 6*d*
Greengages, per punnet, 2*s* to 3*s*
— Baking, per hf.-sv., 3*s* to 5*s*
Apples, dessert, per bush., 2*s* 6*d* to 6*s*
Pears, dessert, per hf. sieve, 2*s* to 6*s*
Raspberries, per gall. 8*d* to 1*s*
Cherries, wall, per lb. 1*s* to 2*s*
Gooseberries, per hf. sve., 2*s* 6*d* to 4*s*
Currants, Red, for wine, per hf. sve. 3*s* to 7*s*
— for dessert, 5*s* to 6*s*
Cucumbers, per doz., 1*s* to 4*s*
— Gherkins, per 1000, 7*s* to 10*s*
Oranges, per doz., 1*s* to 2*s*
— per 100, 6*s* to 16*s*
Lemons, per doz. 1*s* to 2*s* 6*d*
— per 100, 7*s* to 16*s*
Almonds, per peck, 7*s*
Sweet Almonds, per pound, 3*s*
Filberts, English, per 100 lbs. 60*s* to 75*s*
Nuts, per bushel—
— Brazil, 20*s*
— Barcelona, 20*s* to 24*s*

VEGETABLES.

Cabbage, per doz. 10*d* to 1*s*
— plants, or Coleworts, per doz. 2*s* to 3*s*
Cauliflowers, per doz., 2*s* to 7*s*
Peas, per sieve, 2*s* to 4*s*
— per half sieve, 1*s* to 2*s*
— per sack, 5*s* to 10*s*
Beans, Kidney, per hf. sv., 1*s* to 2*s* 6*d*
Potatoes, per ton, 50*s* to 80*s*
— per cwt. 2*s* 6*d* to 5*s*
— per bushel, 1*s* 6*d* to 3*s*
— Kidney, per bush., 2*s* to 4*s*
Artichokes, per doz., 2*s* to 4*s*
Turnips, per doz. bun., 2*s* to 4*s*
Carrots, per doz. bunch, 3*s* 6*d* to 5*s*
Red Beet, new, per dozen, 9*d* to 1*s*
Radish, per doz. hands (24 to 30 each) 9*d* to 1*s* 6*d*
— Turnip, p. doz. bch., 1*s* to 1*s* 6*d*
Horse Radish, per bundle, 1*s* 6*d* to 5*s*
Spinach, per sieve, 2*s* to 3*s*
Onions, Green, per doz. bun. 2*s* to 3*s* 6*d*
— Cooking, per doz. bch., 2*s* 6*d* to 4*s*
Chives, per bunch, 3*d*
Leeks, per doz. bun., 3*s* to 4*s*
Garlic, per lb. 4*d* to 6*d*
Shallots, per lb., 10*d* to 1*s*
Lettuce, Cabbage, p. score, 9*d* to 1*s* 6*d*
— Cos, 6*d* to 1*s* 6*d*
Endive, per score, 1*s* to 1*s* 6*d*
Celery, per bund., (12 to 15), 1*s* to 1*s* 6*d*
Small Salads, per punnet, 2*d* to 3*d*
Watercress, per doz. sm. bun. 4*d* to 6*d*
Parsley, per half sieve, 1*s* to 1*s* 6*d*
Tarragon, dried, per doz. bun., 2*s* to 3*s*
Mint, per doz. bunches, 2*s* to 3*s*
Vegetable Marrow, per doz., 6*d* to 9*d*
Tomatoes, per punnet, 1*s* 3*d* to 1*s* 9*d*
Capsicums, green, per 100, 1*s* 6*d* to 2*s* 6*d*
— Ripe, per doz., 6*d* to 1*s* 6*d*
Mushrooms, per pottle, 2*s* to 2*s* 6*d*

Notices to Correspondents.

Mr. PAXTON'S COTTAGER'S CALENDAR is now reprinted in the form of a small volume, for general distribution, price 3*d.* each copy; it may be ordered of all Booksellers. Gentlemen wishing to distribute copies among their cottage tenantry may have them *delivered in any part of London* by remitting a Post-office order to this Office, at the rate of 5*s.* for every 25 copies required.

D. W. S.—Of the Numbers you require fifteen are out of print.

A. C. will find the necessary information for dissecting the leaves of plants at p. 456 of this year's *Chronicle.*—‡

Herbaceous.—Your plants are,—1, Aconitum Napellus; 2 and 3, Potentilla pedata; 4, Digitalis ferruginea; 5, Hypéricum elatum; 6, Dracocephalum grandiflorum.—‡

A Regular Subscriber.—"M'Intosh's Practical Gardener" is one of the best practical works upon general gardening.—‡

An Amateur.—The latest period at which Pelargoniums may be left out of the greenhouse will vary with the season, and in different parts of the country. We would not advise you to expose your plants after the latter part of September.—‡

C. D. B.—Salvia patens is a perennial, and *may* be increased by cuttings in the same manner as other half-hardy herbaceous plants; the old plants will also live if repotted. We cannot answer your question respecting the Gaillardia, unless you inform us which species you refer to. Your Camellias would have succeeded better if they had been placed in a warm Vinery to perfect their growth, instead of being plunged in the open border. The plant of Aza'lea Smi'thii which has not flowered for some years, requires to be fresh potted and treated in the same manner. There is no way of eradicating Coltsfoot, except by pulling it up, or constantly destroying the leaves as fast as they appear. Pentstemon gentianoides is very different from P. Murrayanus. The plant whose leaves bear a great resemblance to those of a Carnation is the Lúzula campestris.—‡

Roderick.—Your plants are, 2, Lycopódium Selago; 3, Aspídium Filix mas; 4, Asplénium Filix fœ'mina; 5, Asplénium Trichómanes; 6, Arenária rubra. We cannot account for the death of your Beech-hedge in any other way than that it may have suffered from the excessive drought which has prevailed in many places through the summer.—‡

W. T.—Your plants are, 1, Chenopódium botryodes; 2, Linária vulgaris; 3, Illecebrum verticillatum.—‡

M. M., Ealing.—The Phlox is not sufficiently distinct to be useful. Your crimson Dahlia named Virgil is decidedly "first-rate;" we have never seen form more perfectly exemplified than in this flower. The crown of the bloom is so finely developed that no depression of the centre is perceptible when viewed sideways; and, from its having considerable depth of petals, its form is rendered complete.—*

A Novice, Blackfriars, who states that he has had a Fuchsia for the last three years which at the proper time puts forth a great number of buds, which drop off without blowing, although the plant is kept in the open air with others, and is in appearance healthy, should have informed us whether the plant has been re-potted during that period; as it is most probable that the blooms drop off from want of sufficient nutriment.—‡

Gamma.—Leonotis Leonurus, potted in light rich soil, and kept in an airy part of the greenhouse, will no doubt flower freely. Paulovnia imperialis requires plenty of pot-room to keep it in a growing state. If you *must* prune your Cedar of Lebanon, do it in midwinter; but it should be avoided if possible. Some varieties of Roses are very apt to sport in their colours.—‡

R. D.—A new edition of the Catalogue of Fruits in the garden of the Horticultural Society will appear very soon.—‡

Shorthand's insect is the Sirex Gigas, *Linn.* The history with figures of a species equally destructive to timber will be found in Curtis's Brit. Ent., fol. and pl. 253.—*R.*

Cadwallader's Caterpillars are the offspring, not of a Moth, but of a Tenthredo, or Saw-fly, allied to the Nigger, or Black Caterpillar, which occasionally destroys the Turnip crops; whose history and economy will be found in the 2nd vol. of the Royal Agric. Journ. Unless we could see the larvæ alive, it would be impossible to guess to what species of Tenthredo they belong; and we regret exceedingly that they were all dead when they reached us.—*R.*

Live and let Live is referred to p. 296 of vol. 1, and p. 252 of the *Gard. Chron.* for the present year, for the mode of getting rid of the Maggots destroying Onion crops, as well as for diminishing the Flies by killing their pupæ.—*R.*

Mr. William King's curious nest formed of Rose leaves is the work of a wild Bee, called the "Willow or Leaf-cutter Bee," and is the Apis Willughbiella of *Ray*. As this is an interesting subject, we will shortly give its history.—*R.*

Tyro.—We are not acquainted with any work which treats wholly upon plans for laying out Flower Gardens. You will find a great number interspersed in "Loudon's Gardener's Magazine;" and an old work called "James' Gardening" contains many curious ancient devices.—‡

A Constant Reader.—The true Swainstone Seedling Strawberry may be obtained of Messrs. Forrest and Co., Kensington Nursery.—‡

W. S.—Passiflora coccinea is a Stove, and not a Greenhouse plant.—‡

Ignoramus.—Your plants are, 1, Hibiscus Rosa sinensis; 2, Lantana Cammara; 4, Vinca rosea alba; 5, Vinca rosea. You will not be able to obtain a complete set of this year's *Chronicle*, six of the numbers being already out of print. Your insects next week.—‡

C. G. B.—Of your plants, No. 1 is Ipomœa Quámoclit; 2, Clerodendrum emirnense? 3, Clerodendrum floribundum?—†

A. S.—When trees have been barked all round the bole there is seldom a remedy, unless the extent of the barking is very inconsiderable; in which case the wound should be covered thickly with a mixture of fresh cow-dung and clay, and bound over with moss, or some contrivance to prevent the plaister being washed off again.—†

E. W.—The quality of your Well-water, so far as plants are concerned, is not likely to be affected by the impurities you describe, unless they should be too abundant. The loss among your plants has probably been occasioned by the long drought, in spite of the water, and not because of it. It is in reality of little use watering plants in this sort of weather, unless it is done much more abundantly than is customary. A much better plan is to *mulch* their roots with old cow-dung, when it is possible.—†

Querist will find the fact of some Mushrooms having heaved up a pavement stone mentioned at p. 535 of our last week's *Chronicle*. It is not so uncommon as is imagined; and, after all, why should it be doubted, when we see the prodigious forces of vegetation acting on other substances? The common Mushroom has been known to heave up a hard clay road baked by the summer's sun to the consistence of a brick; and the solid masonry of India is toppled over by the roots of Fig-trees.—†

Erith.—The colonial names of Guayana plants are little known; nor are the plants themselves familiar to botanists. Such plants are of no value in this country, because they require more heat than we have in the open air, and more space than we have in our stoves. Your Bell Apple appears to be a Bryony or a Momordica, but such things cannot be determined by single leaves. Send us leaves, flowers, and fruit, and we will tell you what it is.—†

A. Whittaker.—A list of Carnations, with their leading characteristics, will appear shortly, and will furnish you with the information you require. Twitchett's Don John was noticed, p. 782, in the *Gardeners' Chronicle* for 1841; the correctness of the description has been confirmed by the specimens exhibited this season, the striking peculiarity of the flower being the brilliancy of the scarlet stripe, which is well supported by the white and dark stripes. The colours are more equally divided; the white is clearer and it is fuller of petals than either Willmer's Conquering Hero or Strong's Duke of York; in the scarlet and white it is superior to Roi des Capucins, but in the dark stripe it bears a great resemblance to that flower.—*

M. C.—Your plants are, 1, Sálvia glutinosa; 2, Aconitum versicolor; 3, Commelina cœlestis; 4, Sphenógyne speciosa; 5, Callichroa platyglossa. The other plant is Hibiscus Syriacus, and *is* sometimes called the Rose of Sharon. Plants of Ribes sanguineum will continue to thrive for many years; and the unhealthy appearance of yours is more likely to have been caused by the long drought than by anything else, as they are not particular with regard to soil. If the seeds of Commelina cœlestis are sown early in the spring, in a hotbed, the seedlings will flower the same year; the tubers should either be taken up and preserved in the same manner as Dahlia roots are, or some ashes should be spread over the border in which they are. We can recommend no better remedy for the destruction of the large Garden Snails than to employ children to collect and destroy them. We have never heard of such a plant as the feathered Anemone.—†

A Subscriber.—The plant which you had sent to you last autumn as a yellow Fuchsia, is a Solanum; but, without a flower, we cannot determine the species.—‡

S. F. P.—Your bulbous plant is Gladiolus psittacinus.

R. Browne.—By referring to the back Numbers of the *Chronicle*, you will find that the Tamworth shows have *always* been announced the week previous to their taking place; which, from the tenour of your letter, you seem to have overlooked.—‡

A Lover of Gardening.—Liquid Manure may be used for all kinds of plants that are not too apt to run to leaf. We should, however, fear it would be too powerful for Picotees and Pinks. It should be always applied in small quantities at a time, and at considerable intervals of time. In all cases it should be given to plants when in full growth, or just beginning to grow. It is worse than useless when the growth is nearly over. You will find a *bottom* dressing of good rotten cow-dung better for Pansies than liquid manure. Why not use your pump to return to the dunghill the water that flows from it, so that the main body of the manure may be improved by it?—†

X. X.—By Lime-rubbish is meant the old mortar and plaister obtained when houses are pulled down. It is a most excellent manure for heavy land, and not at all heating. If, however, your gardener is afraid of it, why not try a portion of the ground prepared as we advise, and the remainder according to the gardener's way? Your question about Pond-mud is answered in Sprengel's papers on manures, now publishing in our columns. Gas-water will not *sweeten* it, most certainly. If you add powdered gypsum to the mud in the first instance, and then water it well with gas-water as you turn over the mixture, you will render the mud a far more powerful fertiliser. For Asparagus beds the best season is the autumn, and the best method that described at p. 187. Give them plenty of salt.

Quest will find the general facts concerning hybrids in the "Theory of Horticulture," p. 69, and more detailed information in Lindley's "Introduction to Botany," ed. 3. In a very short time we shall introduce the subject into our columns. For the present, we can only say that some hybrids are immediately sterile, and that others are fertile.—†

If *G. H.*, who sent specimens of the Green Pine Apple Strawberry to the *Gardeners' Chronicle* office a fortnight since, has any runners to spare, and will communicate his address, he may hear of a customer.—†

A Correspondent is very anxious to know the best method of preserving Green Peas till Christmas. Will any one favour us with the information desired?

E. M. W. informs us "that she has a fine swarm of bees which were last year hived in one of the "Conservative Bee-keeper's Boxes," the centre of which they have now completely filled; the side box is also well furnished with comb, and nearly full of honey, but not sealed up. She has been waiting to take it, but as it has not made much progress during the last 10 days, she is doubtful whether the bees will finish their work so late in the season; and wishes to know if she must wait to see what the bees will do, or take it in an unfinished state, before they begin to eat it themselves." [If *E. M. W.* does not live in a heath country, her bees will not do much more this season. She had better take the side box as soon as she finds that it does not get any heavier, and return the bees to the centre one.]—§

An Amateur, Tavistock.—Having examined the list of your Carnations and Picotees, we recommend you the following sorts, which will form a good variety with those you already possess.

Carnations.

Brook's Flora's Garland, R.F.
Ely's Lady Ely, R.F.
Greasley's Village Maid, R.F.
Pollard's First-rate, P.F.
Willmer's Hero of Middlesex, S.F.
Wigg's Earl of Leicester, S.F.
Willmer's Conquering Hero, S.B.
Smith's Duke of Wellington, S.B.
Bucknall's Earl Fitzhardinge, S.B.
Puxley's Prince Albert, C.B.
Chambers' Kate, C.B.
Jacques' Iris, C.B.

Picotees.

Sharpe's Duke of Wellington, Red Edged.
Sharpe's Hector.
Giddens' Teaser.
Russell's Incomparable.
Craske's Queen Victoria, Pur. Ed.
Kirtland's Queen Victoria.
Dickson's Trip to Cambridge.
Giddens' Vespasian.
Brook's Miss Brooks, Rose Ed.
Syke's Eliza.
Wain's Queen Victoria.
Beauty of Reading, Red Ed.

Decomposed Tan will not form a substitute for manure; but it will impoverish your compost. We cannot account for some of your Carnations not blooming and having a healthy appearance, unless it arises from their being overgrown.—*

C. Wenman.—Your Seedling Pelargonium arrived in bad condition, but we saw sufficient to convince us that it is not worth preserving, as it is deficient both in the substance and form of the petals.—*

J. R.—Your seedling Dahlia being badly packed, was so much bruised in its journey, that we cannot give a decided opiuion upon it. There are good points in the flower; for instance, the centre is well up, and it possesses considerable depth of petals, but these are too small for the size of the flower, and give it a crowded appearance; we should like to see it again. Of your seedling Picotees the heavy-edged purple is the best; the pod is good, and the guard petals large and of good substance. The principal defect is in the edging being too heavy, and not confined sufficiently to the edge of the petals, which are barred, and the colour occasionally broken through to the edge by the white. The heavy-edged light rose has the same fault as the purple, the petals being too much barred; the guard petals also are too small, and want substance. The other variety was curled up; we could see that the edging was good, but the petals wanted size, and were too few in number.—*

Anxious.—Verbenas are so numerous, that to raise one worth sending out, it should have some decided characteristic that will distinguish it from those we already possess; your seedling is a very good one, but we cannot recognise any peculiarity sufficiently strong to warrant its being sent out as a new variety.—*

K. T.—The Moyre' and Hybrid Microphylla are both Roses of acknowledged merit in their particular class; your blooms were very good ones.—*

R. Freestone.—Your seedling White Dahlia is a very good flower, being round, and having good petals of considerable depth, with the centre very slightly depressed. In the bloom we received the centre petals do not appear to open with sufficient regularity; the transition being too sudden from those fully open to those just unfolding. If the season overcomes this defect, it will prove a very useful show-flower.—*

F. M.—Your Pelargonium is an old variety, named Smith's Lord Nelson.—*

Kinghorne.—Your seedling yellow Dahlia, named the *Twickenham Rival*, we should like to see again, as the bloom sent appears to have been cut too early, the centre being too full of unexpanded petals. If this defect is not common to the flower, it will come into the first class; for it is fine in form, with a good petal, and of a very desirable colour. *Lady Blantyre* is a beautiful bright rose, of fine form and excellent petal; it promises to be a first-class flower. *The Chieftain* is a deep rich purple, possessing good properties; but having so many of the same colour, the flower is consequently of less value.—*

W.—The best of your seedling Picotees is B., which possesses a good petal, perfectly even on the edge; but the rich purple colour is too much splashed over the surface of the petals. In all the other blooms, the petals are too much serrated, the colour broken, and not confined to the edges of the flower; they are border flowers only.—*

A. B.—We do not remember the Pelargonium called Georgium Sidus.—†

Œdipus.—No. 1 of your plants is nothing more than Tropæ'olum tricolor; 2, is Mélia Azédarach; 4, an Ornithógalum; 5, Schinus Molle.—†

E. F. L.—We must refer you for information as to the best manner of preparing land for Myatt's Pine Strawberry, to the various communications we have lately published on this subject. We have ourselves no experience respecting it.—‡

S. M.—To protect your Wall-fruit from the Wasps, we would recommend you to procure some nets with small meshes. These nets should be stretched tightly in front of the trees, without leaving any open spaces between the edges and the wall. They must likewise be kept at a distance from the wall trees, by means of sticks, so that no leaves or branches project through the meshes, upon which the Wasps may alight. By these means few if any of these destructive insects will enter to attack the fruit.—‡

Légère.—It frequently happens that plants of Pentstemon speciosus, grown in a situation fully exposed to the sun, during a *dry* season, wither without expanding their flowers. This is probably the case with yours.—‡

Income-Tax.—The Shrubland Scarlet and Globe Scarlet are Pelargoniums, and not Geraniums. Our little wild flowers of this tribe are Geraniums, properly so called. The term "crumpled petals" could not with propriety be applied to the defect in the two Pelargoniums to which you allude; as the imperfection consists in a single ridge or fold being visible in one of the upper petals only of each flower. With this exception, the petals were perfectly even. The defect is slighter than you imagine; but it no doubt influenced the judges in their decision, as they were both placed in the second class.—† *

P. R. W.—Your plants are A'triplex littoralis, and Hierácium murorum.

A Novice.—Your plant is Gomphocarpus fruticosus.—†

S. M.—Guano is usually applied either by drilling it into the land *with* the seed, or by being spread upon the surface of the ground in small quantities. If used in the latter manner, it should be mixed with soil previously to being applied, as it is a very powerful manure; by which means it will be more equally distributed. It will be of no avail to use it during the present drought, as it only acts in wet weather.—‡

Birdstoniensis.—We know of no remedy for checking the Wireworm which has attacked your Carrots, unless spirits of tar, applied in the manner recommended at p. 53 of the first volume of the *Chronicle* should produce the desired effect. To thin the number of Wasps which attack your fruit, you must destroy the nests in the neighbourhood of your garden, and likewise hang up bottles containing a small quantity of sweetwort or sugar and water near the fruit. The insects will generally enter these, in preference to attacking the fruit; and if the dead wasps are cleared out every morning, great numbers may be so destroyed.—‡

A. B.—Your seedling Fu'chsia is one of considerable beauty, and differs in the great length of the divisions of the calyx from any which we have yet seen. Their colour is also bright, and not dimmed with that dirty tinge which usually prevails amongst this class of flowers.—‡

Ignoramus's larvæ, infesting his Pear-tree leaves, are called Slug-worms, and will change to a Saw-fly, probably the Tenthredo Cerasi of Linnæus. They never touch Apple-trees, but often attack the leaves of Plum and Cherry-trees.—*R.*

Geranium's Pelargonium-leaves appear to be spotted and blistered by the larvæ of some insect, but we cannot inform him what it is, as none of them were to be found in the leaves sent. If fresh green leaves, with blisters and spots upon them, be forwarded to Mr. Curtis, he will probably be able to give the required information.—*R.*

As usual, many letters have arrived too late for answers this week.

NEWS OF THE WEEK.

The labours of Parliament, after one of the longest and most arduous sessions on record, were brought to a termination yesterday. Her Majesty prorogued both Houses in person, with a speech from the throne. The speech alluded to their zealous exertions during the session, to the important measures of finance and commerce which they had passed, to the recent acts for improving the administration of the laws, and to the measure for the increased protection of her Majesty's person. It adverted to the friendly dispositions of foreign powers, and mentioned the gallant defence of Jellalabad, as a proof of what may yet be expected from the troops and their distinguished commander. It alluded to the providential prospects of an abundant harvest, and to the indications of a gradual recovery of trade. It expressed deep sympathy in the distress and privation of the manufacturing classes, and concluded by reminding the members of both Houses that their own personal influence and example within the sphere of their local interests cannot fail to encourage that spirit of order and submission to the law, without which there can be no enjoyment of the fruits of peaceful industry.

In France, the trial of strength on the Presidency of the Chamber of Deputies has terminated in the election of M. Sauzet, the Ministerial candidate. The four Vice-Presidents have also been chosen from the Ministerial ranks, and the Cabinet has succeeded in returning three out of the four Secretaries of the Chamber. These results are considered highly favourable to the Government. The Regency Bill was brought in on Tuesday; it fixes the majority of the Prince at the expiration of his 18th year; it gives the Regeney to the Prince nearest the throne at the time of the King's death, and declares that the full and entire exercise of the Royal authority, and all the legislative dispositions respecting the personal and constitutional rights of the King, are vested in the Regent. The guardianship and tutorship of the young King is given to the Queen, or to the Princess his mother so long as she remains unmarried, and in the event of their death to the nearest unmarried female relative on the father's side.—From Spain we have little news beyond the departure of the Infante Don Francisco and his family from Madrid. There is no longer any doubt of their intrigues for effecting a marriage between their son and Queen Isabella; and they will not be allowed to return to Madrid until the Queen's marriage be decided on.—In Portugal the Ministry continue seriously embarrassed with the difficulty of completing the Cabinet; the Chambers had been definitively constituted, but no legislative business has been transacted since the commencement of the present session, and no questions whatever had been discussed but such as assumed a personal or factious character.—In the Levant, another change in the Divan is expected to occur, by the recal of the exiled Grand Vizier, and the dismissal of the present Ministers. The preparations against Persia are actively proceeding, although it is believed that a general war will not take place.

From the United States we have the gratifying intelligence of the satisfactory arrangement of the North-Eastern Boundary question. The line is said to vary little from that laid down by the King of Holland. The American Government consents to surrender a small tract of land on the North-Eastern Border of Maine, while we give up Rouse's Point on Lake Champlain and the right to navigate the St. John above the Falls. An angry correspondence had taken place between the Secretary of State and the President of Mexico on the subject of Texas, in which Mr. Webster had refused, in the most decided terms, to admit the pretensions of Mexico.

Home News.

COURT.—On Thursday afternoon the Queen and Prince Albert, accompanied by the Prince and Princess of Saxe-Coburg, arrived in town by the Great Western Railway from Windsor. Her Majesty held a Privy Council immediately on her arrival, when the speech to be delivered at the Prorogation of Parliament was arranged. The Prorogation took place yesterday, the particulars of which will be found under our Parliamentary News. The Prince of Wales and the Princess Royal remain at Windsor, and are quite well. On Tuesday the Queen and Prince Albert visited the Duke of Cambridge at Kew, and returned to Windsor on the same day. It is rumoured that her Majesty intends to visit Scotland this autumn, and that the Royal Yacht is fitting out for the purpose.

Official Movements.—It is confidently reported that Lord Hill, in consequence of the state of his health, has expressed a wish to resign the office of Commander-in-Chief. It is understood that the Duke of Wellington will, on Lord Hill's retirement, be invited by her Majesty to resume the command of the army.

Exchequer Bill Report.—The commissioners have presented to Parliament their Report on the Exchequer Forgery; but the Government have announced that it will not be taken into consideration until next session. The Report is a long but very complete document, arranged with remarkable clearness, but from its systematic precision it is impossible to give more than a general outline of its contents. It appears that Mr. Beaumont Smith issued to Mr. Rapallo 377 bills of 1,000*l.* each, which have come under the notice of the commissioners, exclusive of a large number which had been destroyed or exchanged at various times; among the former, one parcel of 50,000*l.* was burnt at a single operation. Of these 26 found their way into the hands of Messrs. Price and Co., 21 into those of Messrs. Ransom and Co., 161 to Messrs. W. and J. Morgan, and 169 to Mr. W. Mariner, who passed the whole number to Mr. De Berekem. Messrs. Morgan and Mr. De Berekem put them into general circulation. The report divides the holders into 4 classes, each successive one having, in the opinion of the commissioners, a weaker claim to indemnity from the Government than those preceding. In regard to the 1st class, the commissioners find that "the holders came into possession of the bills in question in the usual course of business, and without knowledge or suspicion that they were other than genuine, or had been improperly obtained by any person whatever." The amount in the hands of the different holders of this class is 117,000*l.* The class includes all those claimants whose names are not hereafter specified under the three next classes.—The 2d class includes Sir J. Shaw and Messrs. Hichens and Harrison, who are mentioned in nearly the same honourable terms as those of the first class, but still some doubts are expressed as to the caution which they exercised. The commissioners rest these doubts on the number, frequency, and large amounts of the deposits made with them by the same party, on the fact that the borrower frequently submitted to pay interest above 5 per cent. per annum, and the long periods for which the loans were allowed to remain current, regard being had to the rate of interest charged upon them, as compared with the interest on the Exchequer-bills themselves. At the same time the commissioners are of opinion that there is not sufficient ground for an imputation of want of caution against any of the parties of the second class. The amount in the possession of the different holders of this class is 89,000*l.*, of which Sir J. Shaw holds 40,000*l.*, and Messrs. Hichens and Co. 49,000*l.*—The 3d class is composed of Messrs. Ransom and Co., Messrs. Price and Co., Mr. J. W. Scott, Mr. H. Tomkins, and Mr. L. Levy. The grounds upon which the Commissioners consider that there are strong reasons for supposing a want of proper caution in this class are founded chiefly on the circumstance that the advances to secure which the deposits were given, were not made to a broker, but to Solari, a person whose pursuits and condition in life were little known, and who kept the name of his principal concealed. The amount of this class is 93,000*l.*, of which Messrs. Ransom hold 21,000*l.*; Messrs. Price and Co., 26,000*l.*; Mr. J. W. Scott, 12,000*l.*; Mr. H. Tomkins, 18,000*l.*; and Mr. L. Levy, 16,000*l.*—The 4th class is composed of those of whom a doubt is expressed, whether when the bills came into their hands they did not suspect that they had been obtained by Rapallo through the medium of some fraud. The amount of this class is 78,000*l.*, of which Mr. S. J. Berckem holds 57,000*l.*, and Messrs. W. and J. Morgan 21,000*l.*

Foreign.

FRANCE.—*The Chambers.*—The election of President for the Chamber of Deputies terminated on Friday in the return of M. Sauzet, the Ministerial candidate. On casting up the votes there appeared, for M. Sauzet (Ministerialist), 210; M. Odillon Barrot (Opposition), 131; M. Dufaure, 39; M. Gros Preville (Legitimist), 22; M. Dupin (Count Molé's candidate), 16; M. Berryer (Legitimist), 3; lost votes, 5. None of the candidates having obtained an absolute majority of votes (one over a clear moiety of the members voting), another ballot was had, when M. Sauzet obtained 227 votes, M. Dufaure 184; giving to M. Sauzet a majority of 43. M. Sauzet was consequently declared duly elected. The anticipation of this important event had a favourable effect on the funds. The 3 per Cents. improved to the extent of 20 cents., and a further rise of 5 cents. followed the official announcement of the result. On Saturday the Cabinet still maintained its advantage; three of its candidates were returned for the Vice-Presidency by large majorities. These were M. Salvandy, who obtained 223 votes; M. Bignon, 208; and General Jacqueminot, 205; and who were, consequently, proclaimed Vice-Presidents for the ensuing session. M. De Belleyme, the fourth Conservative candidate, had 162 votes in this ballot, and was elected on the second ballot in the evening, so that all the Vice-Presidents are Conservatives. The Ministerial papers observe that the result of these elections proves that, notwithstanding the secession of M. Dufaure, the Conservatives still possess a majority of from 42 to 66 votes. The Opposition papers deny this statement, and contend that the victory of Ministers had been obtained by defections from the ranks of the Opposition—a fact not denied by the Ministerialists, who seemed perfectly satisfied with the victory, and convinced that future struggles would be attended with the like results. It appears conceded on all hands that no change in the Ministry will be brought about before the reassembling of the Chambers in December or January next, although it is considered impossible that Ministers can go on without a more stable majority, there being a fluctuating mass of 200 votes, which may, according to circumstances, become their supporters or their opponents. On Monday the ballot for the four Secretaries took place. M. De l'Espée and M. D'Anglas, both Ministerialists, were the only candidates who had an absolute majority; a second ballot took place for their two colleagues, when M. Lacrosse, an Opposition Member, was elected, neither of the other candidates having the required majority. A third ballot was, consequently, necessary for the fourth Secretary, when M. Las Cases, a Ministerialist, was elected. At the close of this ballot, the Ministerial bureau for the session was installed with the usual formalities, and M. Sauzet took his seat as President. On Tuesday the business of the Chambers commenced by the nomination of the committee on the address in reply to the King's speech. This was followed by the presentation of the Regency Bill, and by the carrying of M. Odillon Barrot's motion for a parliamentary inquiry into the elections. This last affair was regarded as a serious defeat of the Ministry, but the committee on the address was favourable, containing seven Ministerialists and two Opposition. The address, written by M. Lamartine, was brought forward on Tuesday, and was much objected to by the Journals on account of its affected style.

The Regency.—The Regency Bill was brought before the Chambers at their sitting on Tuesday. After an exordium, pointing out the necessity of the measure, and reviewing the law of France in regard to the hereditary succession, the Bill was read. It is signed and dated at the Palace of Neuilly, August 9, 1842, and contains 9 Articles as follows:—1. The King's minority ceases at eighteen years accomplished. 2. At the moment of the King's death, if his successor be a minor, the Prince nearest the Throne, in the established order of succession, according to the Charter of 1830, if he be twenty-one years of age, becomes invested with the Regency throughout the minority. 3. The full and entire exercise of the Royal authority, in the name of the King, belongs to the Regent. 4. The 12th Article of the Charter, and all the legislative dispositions protecting the person and constitutional rights of the King, are applicable to the Regent. 5. The Regent makes oath, in presence of the Chambers, to be faithful to the King of the French, to obey the Charter and the established laws of the kingdom, and to act in every other respect in the sole view of the interest and happiness and of the glory of the French people. Should the Chambers not be sitting, then the Regent is bound to convene them within three months. 6. The guardianship and tutorship of the young King belongs to the Queen, or to the Princess, his mother, whilst unmarried; and in the event of the demise of the Queen, or Princess, or both, to the nearest female branch on the father's side not married.

Funeral of the Duke of Orleans.—On Thursday the 4th, the mortal remains of the Duke of Orleans were committed to the family vault at Dreux, built by the Duchess Dowager of Orleans, daughter and heiress of the Duke of Penthièvre, in an old chateau of her ancestors Counts of Dreux. All along the road from Paris to Dreux by Versailles and Pont Chartrain, the National Guard, population and authorities received the funeral procession with honours and mourning. On arriving at Dreux the King and Princes joined the procession. His Majesty, who assumed all the firmness he could command, looked worn and pale from suffering. On reaching the chapel, the body was placed on the catafalque, His Majesty and the royal dukes taking their seats in front of it. All seemed overwhelmed with affliction, and the fortitude of the King, though for some time nobly sustained, at length yielded to his emotions, and his uncontrollable agony found its way to every heart. The sorrow of the princes was also most intense; and the papers say that altogether a scene more painfully afflicting it is impossible to describe or imagine. The ceremony of high mass was performed by the Archbishop of Paris. After the body had been removed to the vault, the King and the Princes were left with it almost alone, and here the affliction of the family is described as of the most heart-rending and agonising description. They sobbed aloud, and it was some time before they could be induced to leave the spot. As the clock struck four, a salute of artillery announced that the mortal remains of the lamented Prince had been deposited in their last home, by the side of his favourite sister, the Princess Marie of Wurtemberg. In reference to this painful subject the papers mention with praise that the Duke of Bordeaux, on hearing of the death of the Duke of Orleans, wrote a very touching letter of condolence to Louis-Philippe, who is his godfather; and a solemn mass had been celebrated at Kirchberg in the presence of the exiled royal family, as a proof of their affliction at the event.

The Capital.—Letters have been received in Paris from Neris confirming the rumour that an accident had happened in that town to M. de Chateaubriand. It was not, however, occasioned by a carriage, as at first stated; but as he was coming out of the Post-office, he slipped on the pavement, and fell with his head against the garden wall. These accounts add the gratifying assurance that the injury received by M. de Chateaubriand is not serious.—In the commercial circles of Paris it is stated that the bankers and capitalists of the Capital are indignant at the exaction of the income-tax in this country on the dividends of foreigners, and are using every possible exertion to induce the French Government to retaliate by some similar measure.—The ordinary routine of life in Paris is but slowly recovering from the shock occasioned by the death of the Duke of Orleans. The theatres are not yet well attended; one novelty, however, an English pantomime by English performers, at the Variétés, draws crowded audiences. The performers are said to have occasioned great scandal to the Parisians in the early part of the week, by resolutely refusing to play on Sunday, for which, of course, they are warmly commended by all the English residents.

The Provinces.—Accounts from all the departments inform us that the harvest is magnificent; not larger, in many districts, than in average years, but the quality of the wheat is so fine as to raise the produce far higher than that of an ordinary year. The straw of the oats and barley is, however, so short, that in order to make the most of it, the grain is not reaped, but torn up by the roots.—The Toulon papers of the 4th inst. announce that the transport corvette Le Rhin was on the point of sailing from that port for New Zealand, with the new Commander of the French naval station in the Pacific.

SPAIN.—Our accounts from Spain are to the 3d inst. The Infante Don Francesco de Paula and family left Madrid on the 1st for San Sebastian. After taking the baths there, it is arranged that they are to proceed on various tours through Spain, but are decidedly not to return to the capital until the Queen's marriage is decided on. The Regent, the Ministers, and several personages of distinction, had taken leave of the Princes. The troops of the garrison had been confined to their quarters, in consequence of a report that a riotous demonstration would be made on the occasion of the departure of the Infante; but there appear to have been no reasons for apprehension.—The "Gazette" publishes a decree ordering all the officers of the army who had not obtained a special permission to reside in Madrid, to return forthwith to their respective corps and posts.—Mr. Washington Irving, the American Envoy, had presented his credentials to the Regent, at the Palace of Buena Vista. Senhor Albuquerque, the Brazilian Minister, had also presented his credentials.—The journalists in Madrid had overcome the difficulties arising from the coalition of the compositors, and the papers are now published as usual.—Letters from Barcelona of the 2d announce that 15 military officers had been sent to Sarragossa, to await orders from the Madrid Executive, in consequence of seditious toasts which they had drunk at a dinner of Christinos, on the anniversary of Queen Christina's *fête* day.

PORTUGAL.—The Montrose steamer arrived at Southampton on Saturday, bringing advices from Lisbon to the 31st ult. The ratification of the treaties had taken place on the previous evening, when the British and Portuguese Plenipotentiaries met the leading members of the Government at the Duke of Terceira's; and the treaties, engrossed during the week, and signed by Donna Maria, who had come in from Cintra for that purpose, have arrived by this packet to receive the signature of Her Majesty.—The convention for tariff reductions had made no progress.—The Government of Costa Cabral was likely to fall a victim to a complication of intrigues; and there seemed, unfortunately, but little prospect of good government, or even of any government at all. Three weeks had already elapsed, and no legislative business, no preliminaries to the taking into consideration the pressing necessities of the State, had been arranged. Meanwhile the country was at a stand-still. There was the most urgent necessity in every direction for roads, harbours, water-ways, agricultural improvement, and all that constitutes material development; but in neither Chamber of the Cortes had any topic but factious motions been mooted. The Minister, unable to complete the reconstruction of the Government, intended to prorogue the Cortes immediately, and it was doubtful whether even an address in answer to the Queen's speech would be proposed in the Chamber of Deputies.—The authorities at Castello Branco had exhibited a fortunate display of energy in effecting the destruction of a band of robbers, of whose repeated incursions into Spain the latter Government had complained. Señor Aguilar had just returned to Lisbon from Madrid, charged with diplomatic remonstrances, and the event in question had occurred at a most fortunate crisis.

GERMANY.—The King of Prussia returned from St. Petersburgh on the 5th, and immediately proceeded to Sans Souci. The Senate of the University of Berlin has received a reprimand from the Minister of Religious Affairs and of Education, for refusing to sanction a society among the students of divinity, for supporting the historical view of Christianity against the attacks of the modern school of philosophy. The Senate modified its refusal on the ground of its not being able to refuse to sanction a scientific union in an opposite sense, if such societies were at all authorised; but M. Eickhorn intimated that no ceremony should be observed in suppressing any tendency to unchristian principles in the university. It is said to be very probable that a considerable reduction will shortly take place in the rate of postage throughout Prussia. The rate is in no case to be higher than six silver groschen, and the lowest to be one silver groschen.—The Rhenish journals inform us that an unexpected tumult took place at Coblentz, on the 25th ult., arising from a quarrel that spread from a low tavern into the street, in consequence of the interference of the guard from one of the gates. The soldiers were unable to withstand the mob, which induced a non-commissioned officer, not on duty, to join them. He was hard pressed with the rest, and cut a man down with his sabre. The whole fury of the mob then turned on him, and he was with difficulty got into a house, which the populace threatened to pull down. The arrival of the Governor-General with a strong body of troops restored order.—Preparations are making at Mentz for the meeting of German Natural Philosophers in September. The number of members is expected to reach 600. Alexander Von Humboldt and Professor Oken have declared their intention to be present.—The Heidelberg papers mention that Mr. Combe, of Edinburgh, has been lecturing in that town on phrenology, with great success, and that at the close of his course an address of thanks was voted to him, and signed by some of the most eminent men of the place.—Letters from Stuttgart announce that an Austrian officer named Birago has invented a new system of throwing pontoons over rivers, which was tried a few days ago in the presence of the King of Wurtemberg on the Necker, near Louisburg. A bridge, 250 feet in length, was completed in thirty-five minutes, and 100 pioneers, 100 tirailleurs, a battalion of infantry, a battery of artillery, and a regiment of cavalry, passed over it in succession at accelerated paces.—The "Augsburg Gazette" publishes a letter from Trieste, dated the 28th ult., stating that Mr. Waghorn is shortly expected in that town, to organise a service of correspondence for the East India Company by that route. It is believed that the despatches by the Trieste line could be in London before the Marseilles telegraphic despatch could reach Paris. The accounts also point out the importance of establishing the German line after the impediments thrown in the way of expresses by the French Post-office.

HANOVER.—The Crown Prince celebrated the ceremony of his betrothal with the Princess Mary of Saxe Altenburg on the 20th ult., and returned immediately afterwards to Hanover. The King had been at Ems. At the conclusion of the session of the Estates, his Majesty confirmed the vote of the Chambers for presenting the sufferers by the fire at Hamburgh with 100,000 dollars.

SWEDEN.—The Scandinavian naturalists have just held their annual scientific congress. They arrived at Stockholm on the 16th ult., and after visiting the public establishments, they assembled in the apartments of Baron Berzelius, in the University, where the foreign visitors had the opportunity of inspecting the valuable collections of the Swedish Academy. On the next day the scientific meetings commenced, and lasted six days. On the 23rd there was a visit to Gripsholm, where there are many remarkable curiosities. On the 26th all the members of the meeting dined with his Majesty the King, and the two following days were spent in excursions to Skokloster and Upsala. Of the 319 scientific men assembled at this meeting, there were two from France, one from Griefswalde, two from St. Petersburgh, one from Helsingfors, and fourteen from Norway; no English visitors are mentioned.

MALTA.—Some interest has been produced in this island by the prosecution on the part of the Crown of Signor S. V. Camilleri and Giovanni Fenech, two clerks of the archives of the Royal Courts of Malta, for the robbery and sale, as waste-paper, of certain public records of ancient date. The latter prisoner was discharged as a person of weak intellect, but Camilleri was found guilty. The Court, in passing sentence, declared that they could not, under the aggravating circumstances of the case, avoid inflicting the utmost rigour of the law, and consequently sentenced him to ten years' hard-labour at the public works, with a chain to his leg.—The Malta papers state, that an officer of the garrison, Mr. Wilder, formerly a Cadet at Woolwich, and well known as an amateur rower on the Thames, recently undertook to row round the island of Malta in a small English gig, built by Waterman, within twenty-four hours. At ten P.M., with a beautiful moon and water calm as could be desired, the signal for his departure was given from the lighthouse. On starting he pulled well out to the westward to get into the current, and performed eight miles an hour during the first two hours, and completed the whole distance, little short of sixty miles, in fourteen hours, eight minutes, and thirty-three seconds. He did not pull round the west end of Gozo, but kept in between the island of Comino and Malta. He was accompanied by a four-oared Maltese boat the whole distance, which had much difficulty in keeping within two miles of the gig, although there was a double crew to relieve each other. Many bets were dependant on the feat, which was accomplished in a masterly manner with nine hours, five minutes, and twenty-seven seconds to spare, Mr. Wilder having allowed himself two hours' rest on his excursion.

TURKEY AND PERSIA.—Recent advices from Constantinople inform us, that several minor changes have just taken place in the Ottoman ministry, which are considered the precursors of the fall of Izzet Mehemet, the Grand Vizier. It was expected that his successor will be the venerable Khosrew Pacha, the ex-Premier, disgraced a short time since for corrupt practices. It was also rumoured that Reschid Pacha would be recalled from Paris, where he now is as Ambassador, and resume his place in the Ottoman Councils. The result of these changes will probably be the abandonment of the hostile attitude of the Porte towards Foreign Powers, since they emancipated Ottoman rule from its difficulties, and preserved the integrity of its empire, during the government of the ministers now about to be recalled.—There is nothing new as to the Persian hostilities, except that their defeat at Suleymaniah, by the Turks, is now stated to have been much exaggerated. The Porte was embarking troops on the coast of Asia Minor, and on that of Syria, but had assured the Ambassadors that it will not come to a formal war.

UNITED STATES.—By the arrival of the packet-ships North America, Hottinguer, and Roscius, we have received intelligence from New York to the 25th inst. The Tariff Bill had a narrow escape from being rejected by the House of Representatives, which, however, ultimately passed it, with some amendments, by a majority of 116 to 112. A motion that Congress should adjourn on the 1st August, was rejected by a majority of 3.—An angry correspondence had passed between the Governments of the United States and Mexico, the latter demanding, in very strong language, that citizens of the former should be interdicted from trading with, and emigrating to, Texas. Mr. Webster, in his replies, states that his Government, having recognised the independence of Texas, its conduct in regard to the war between that country and Mexico will not be in the least degree altered, and "if for this the Government of Mexico sees fit to change the relations existing at present between the two countries, the responsibility remains with herself." A debate on the foregoing correspondence had taken place in Senate, when all parties were unanimous in applauding the spirit of Mr. Webster's replies; and a Mr. Sevier observed that he hoped the same high tone might be observed towards England. The President of Texas issued a message on the 29th June, in which he confined himself principally to the embarrassed state of the finances, and recommended that the public lands be disposed of in order to defray the Government expenses. The New Orleans, Union, and the Mechanics' and Traders' Banks, have stopped payment. The Bank of Louisiana was the only one which continued to meet the demands of its creditors. Mr. M'Leod had been hooted and hissed on his appearance in the streets of Buffalo, but he escaped without sustaining any personal violence. The papers by the Roscius convey the gratifying assurance that the negotiation between Lord Ashburton and the Government is satisfactorily concluded. The line agreed upon is that which the King of Holland recommended, as far as the small lake near the rise of the St. Francis. Thence it runs down to the south-west branch of St. John's river, leaving out a strip of American territory about 100 miles long and 12 broad. We give up the free navigation of the St. John above the Great Falls, and Rouse's Point on Lake Champlain. The French steam-frigate Gomer had arrived at New York, with commissioners on board, on their way to the southern ports, Havannah, Vera Cruz, Rio Janeiro, Buenos Ayres, &c., for the purpose of obtaining information, previously to the establishment by the French Government of a line of steam-packets between France, the West Indies, and America.

CANADA.—There is little news from Canada. Several robberies of arms and ammunition had taken place on the frontier under some patriotic pretext. Lord Morpeth was at Montreal.—The arrivals of emigrants this year at Quebec, to the latest date of return, are 31,938; in the short space of two days 20 vessels reached that port and landed more than 5,000 passengers.

WEST INDIES.—The Royal Mail steamer, Thames, arrived at Falmouth on Tuesday morning, bringing only the Jamaica and other island mails. We have neither Havannah nor Mexican mails by this vessel. The steamer remained four days at Nassau waiting for them; but not arriving, the captain did not feel authorised to detain the mails any longer. The Thames brings about 30,000*l.* on freight. Her dates are—from Jamaica, July 9th; Nassau, 20th; Bermuda, 25th; and Fayal, August 3d. The Countess of Elgin had been dangerously ill; but on the morning of the steamer leaving she was somewhat better. Lord Elgin was popular. The House of Assembly would open in October. The crops were expected to be very good. Severe shocks of earthquakes had been felt at Antigua and at Barbadoes towards the end of June. Sir Charles Adams had arrived at Bermuda from Belize, and sailed in the Illustrious, on the 23d, for Halifax.—The Report of the Select Committee appointed by Parliament to collect evidence respecting the West India Colonies, has just been published. The Committee state that they have examined witnesses from the colonies of St. Vincent's, Trinidad, Barbadoes, British Guiana, Grenada, Antigua, St. Kitt's, and Jamaica, and have agreed to the following resolutions:—1. That the great act of emancipating the slaves in the West Indian colonies has been productive, as regards the character and condition of the negro population, of the most favourable and gratifying results. 2. That the improvement in the character of the negro in every colony into the state of which this committee has had time to extend inquiry, is proved by abundant testimony of an increased and increasing desire for religious and general instruction; a growing disposition to take upon themselves the obligations of marriage, and to fulfil the duties of domestic life; improved morals; rapid advance in civilisation, and an increased sense of the value of property and independent station. 3. That, unhappily, there has occurred, simultaneously with this amendment in the condition of the negroes, a very great diminution in the staple productions of the West Indies, to such an extent as to have caused serious, and, in some cases, ruinous injury to the proprietors of estates in those colonies. 4. That while this distress has been felt to a much less extent in some of the smaller and more populous islands, it has been so great in the larger colonies of Jamaica, British Guiana, and Trinidad, as to have caused many estates, hitherto prosperous and productive, to be cultivated for the last two or three years at considerable loss, and others to be abandoned. 5. That the principal causes of the diminished production and consequent distress are, the great difficulty which has been experienced by the planters in obtaining steady and continuous labour, and the high rate of remuneration which they give for the broken and indifferent work which they are able to procure. 6. That the diminished supply of labour is caused partly by the fact that some of the former slaves have betaken themselves to other occupations more profitable than field labour; but the more general cause is, that the labourers are enabled to live in comfort and to acquire wealth, without, for the most part, labouring on the estates of the planters for more than three or four days in a week, and from five to seven hours in a day, so that they have no sufficient stimulus to perform an adequate amount of work. 7. That this state of things arises partly from the high wages which the insufficiency of the supply of labour, and their competition with each other, naturally compel the planters to pay, but is principally to be attributed to the easy terms upon which the use of land has been obtainable by negroes. 8. That many of the former slaves have been enabled to purchase land, and the labourers generally are allowed to occupy provision grounds subject to no rent, or to a very low one; and in these fertile countries, the land they thus hold as owners or occupiers not only yields them an ample supply of food, but in many cases a considerable overplus in money, altogether independent of, and in addition to, the high money wages which they receive. 9. That the cheapness of land has thus been the main cause of the difficulties which have been experienced; and that this cheapness is the natural result of the excess of fertile land beyond the wants of the existing population. 10. That in considering the anxious question of what practical remedies are best calculated to check the increasing depreciation of West Indian property, it therefore appears that much might be effected by judicious arrangements on the part of the planters themselves, for their own general advantage, and by moderate and prudent changes in the system which they have hitherto adopted. 11. That one obvious and most desirable mode of endeavouring to compensate for this diminished supply of labour, is to promote the immigration of a fresh labouring population, to such an extent as to create competition for employment. 12. That for the better attainment of that object, as well as to secure the full rights and comforts of the immigrants as freemen, it is desirable that such immigration should be conducted under the authority, inspection, and control of responsible public officers. 13. That it is also a serious question, whether it is not required by a due regard for the just rights and interests of the West Indian proprietors, and the ultimate welfare of the negroes themselves, more especially in consideration of the large addition to the labouring population which it is hoped may soon be effected by immigration, that the laws which regulate the relations between employers and labourers in the different colonies should undergo early and careful revision by their respective legislatures.

Parliament.

HOUSE OF LORDS.

Saturday.—The House met to get through some routine business. Several bills were brought up and read a first time, among which were the Exchequer Bills' Bill, the Ecclesiastical Leases' Bill, the East India Bishops' Bill, the Bonded Corn Bill, and several private Bills.

Monday.—Earl FORTESCUE moved for returns of outrages reported to the Irish constabulary, of which, he said, there had been a fearful increase, from which his Lordship inferred that there had been some recent change in the manner in which justice was administered. His Lordship then referred to the late trials of Ribbonmen at Armagh, and condemned in severe terms the employment of spies.—The Duke of WELLINGTON acceded to the motion, but ascribed the increase of reported outrages to the greater vigilance and efficiency of the police. The noble Duke eulogised the character of the Lord Chief Justice. The person described as a spy had not been employed by the magistrates to allure persons to the commission of crime. This charge had been advanced by the counsel for the defence, but abandoned during the trial. The testimony of the approver had been corroborated by unimpeachable witnesses, whose evidence left no doubt of the guilt of the prisoners.—After a few words from the Marquis of CLANRICARDE and the Earl of WICKLOW, the Earl of GLENGALL said the apparent diminution of outrages during the administration of the noble Earl was delusive. He had repeatedly warned their Lordships that it would not last, and that the seeds of sedition had been sown, which would soon bring forth their fruits.—Lord FITZGERALD only rose to express his conviction that the inquiry which the noble Duke had assured them had been instituted by the Irish Government would be fairly conducted.—The motion was then agreed to.

The Earl of HADDINGTON, having presented some petitions, took the opportunity of stating, in reply to a question put to him some days ago by a noble Marquis, that it was not the intention of Government to make an alteration in the line of packets between Donaghadee and Port Patrick.

The LORD CHANCELLOR brought up the report of the select committee, to which the bill on the law of marriage in Ireland had been referred, and in pursuance of its recommendations moved that the bill be referred, to-morrow, to a committee of their Lordships' House, with a view to its becoming law during the present session. The present unsettled state of the law was productive of great inconvenience and demoralisation to society.—After some remarks from Lord CAMPBELL, Lord BROUGHAM, the LORD CHANCELLOR, the Marquis of CLANRICARDE, and the Earl of WICKLOW, the motion was agreed to.

Tuesday.—The business consisted chiefly of passing bills through the necessary stages, preparatory to the close of the session. The Newfoundland Bill and the Marriage Law of Ireland Bill were advanced in their respective stages. The Portuguese Slave Trade Act Repeal Bill was read a first time, on the motion of the Earl of ABERDEEN, who laid upon the table a treaty of commerce and navigation between her Majesty and the Queen of Portugal, and another for the suppression of the slave trade.—Lord WHARNCLIFFE laid on the table the report of the commission of fine arts, and the report of the prison inspectors.

Wednesday.—The business was confined to giving the Royal Assent by commission to various bills, and to advancing the bills before the House in their respective stages.

The amendments of the Commons to the Bankruptcy Law Amendment Bill were, on the motion of the LORD CHANCELLOR, agreed to; the Lord Chancellor and Lord BROUGHAM having both expressed their regret that the Commons should have struck out the clause relative to the taxation of costs.

Thursday.—Several bills were read a third time and passed.

Mr. BURGE was heard at the bar as council for the petitioners against the junction of the Legislative Council and the House of Assembly of Newfoundland.—Lord CAMPBELL moved to omit the clause objected to; but the motion having been negatived, the bill was passed.

Lord BROUGHAM, in withdrawing his Insolvent Debtors' Relief Bill for the present session, expressed his gratitude to Government for the law reforms which they had effected, particularly for the Bankruptcy and Lunacy Bills of the Lord Chancellor. He lamented that all the measures they had introduced had not met with the same success, as they were all beneficial measures, and had encountered no other opposition than that which was founded upon sordid self-interest.

Friday.—Parliament was prorogued this day with the usual formalities. Her Majesty was accompanied by Prince Albert, the Prince and Princess of Saxe Coburg and a numerous suite. After the customary ceremonies, her Majesty read the following gracious speech.

"*My Lords and Gentlemen,*

"The state of public business enables me to release you from further attendance in Parliament.

"I cannot take leave of you without expressing my grateful sense of the assiduity and zeal with which you have applied yourselves to the discharge of your public duties during the whole course of a long and most laborious session.

"You have had under your consideration measures of the greatest importance connected with the financial and commercial interests of the country, calculated to maintain the public credit, to improve the national resources, and, by extending trade and stimulating the demand for labour, to promote the general and permanent welfare of all classes of my subjects.

"Although measures of this description have necessarily occupied much of your attention, you have at the same time effected great improvements in several branches of jurisprudence, and in laws connected with the administration of domestic affairs.

"I return you my especial acknowledgments for the renewed proof which you afforded me of your loyalty and affectionate attachment, by your ready and unanimous concurrence in an act for the increased security and protection of my person.

"I continue to receive from all Foreign Powers assurances of their friendly disposition towards this country.

"Although I have deeply to lament the reverses which have befallen a division of the army to the westward of the Indus, yet I have the satisfaction of reflecting that the gallant defence of the city of Jellalabad, crowned by a decisive victory in the field, has eminently proved the courage and discipline of the European and native troops, and the skill and fortitude of their distinguished commander.

"*Gentlemen of the House of Commons,*

"The liberality with which you have granted the supplies, to meet the exigencies of the public service, demands my warm acknowledgments.

"*My Lords and Gentlemen,*

"You will concur with me in the expression of humble gratitude to Almighty God for the favourable season which his bounty has vouchsafed to us, and for the prospects of a harvest more abundant than those of recent years.

"There are, I trust, indications of gradual recovery from that depression which has affected many branches of manufacturing industry, and has exposed large classes of my people to privations and sufferings which have caused me the deepest concern.

"You will, I am confident, be actuated on your return to your several counties by the same enlightened zeal for the public interests which you have manifested during the discharge of your Parliamentary duties, and will do your utmost to encourage, by your example and active exertions, that spirit of order and submission to the law, which is essential to the public happiness, and without which there can be no enjoyment of the fruits of peaceful industry, and no advance in the career of social improvement."

The LORD CHANCELLOR then announced that Parliament was prorogued to Thursday, the 6th October.

HOUSE OF COMMONS.

Saturday.—The House of Commons met at noon; and upon the motion for engrossing the Newfoundland Bill, in order to its third reading, Mr. B. WALL proposed as an amendment that it should be engrossed that day three months. His ground was the want of sufficient information upon which to legislate.—Mr. P. HOWARD and Mr. HUME supported the amendment, which was negatived on a division.

Lord ASHLEY's bill for the regulation of labour in mines and collieries came under consideration, in reference to the amendments introduced into it by the Peers. The noble Lord said he regarded them as impairing the utility of his measure, and entered into a defence of the commissioners. He believed that their report had been most carefully prepared, with the utmost impartiality and the strictest adherence to truth. He was convinced of this, not only by the fact of the high honour and respectability of the commissioners, but from numerous communications which he had received from the most influential coal-owners of the kingdom, confirming in every respect the statements contained in the report. It had been said in another place that his statement, that the whole trade in the North was in favour of his bill, was an exaggeration—was, in fact, a trick and chicane. He denied that his statement was exaggerated, and in confirmation of it read several communications from parties who were interested in the subject. Though the amendments made by the Lords in the bill would invalidate to a great extent the utility of the measure, yet he accepted those amendments on account of the great principle involved in the bill. The noble Lord concluded by moving the adoption of the amendments.—Lord PALMERSTON regretted the introduction of these alterations, but thought Lord Ashley exercised a sound discretion in not resisting them. The Government had by no means given to the bill that cordial support which they had promised. They had been wont, when in opposition, to taunt the then Ministers with succumbing to the other House of Parliament: it now appeared that they were themselves under the same sort of control.—Sir J. GRAHAM maintained that the support given to the bill by Government had been a truly cordial one, and that the alterations admitted were not inconsistent with the principles of the measure. He believed that his colleagues in the other House possessed its confidence as fully as the Ministers on the seats around him enjoyed that of the House of Commons. In both Houses Government had carried many and most important measures, and he trusted that the confidence reposed in them at the opening of the session had not been forfeited at its close.—Lord ASHLEY said he had acquiesced only because he could not help himself.—Mr. C. BULLER had not felt the full worthlessness of the amendments till he heard Sir J. Graham's defence of them. The Lords, he feared, were apt to view a measure with reference to the interests of land rather than of humanity. True, they had passed the income-tax and the tariff; but they would have spoiled the latter, had not the rules of Parliament withheld them.—Sir R. PEEL was amused with the contrast between the fears of the Opposition at the beginning of the Session, and their fears at its end. The Lords had passed the Corn Bill, and the Tariff—two measures of the most extensive change; and now the hon. Gentleman was in a state of alarm because they had made some amendments in a mine and colliery bill, not introduced by a member of the Government. He could not give pledges as to the mere details of any bill: the Lords were a deliberative body, and had a right to make their own modifications. Some of the changes in the present bill he certainly disliked; but others he thought were improvements. The main alteration, however, had been ingrafted by a member of the late Government, Lord Campbell.—After some further conversation, the amendments were agreed to.

Lord PALMERSTON moved for copies of all correspondence between the Chancellor of the Exchequer and any members who had applied for the Chiltern Hundreds since the 1st July. He thought that the Chancellor of the Exchequer, in refusing any of the late applicants, had contravened the understanding upon which Mr. Roebuck's committee had proceeded—that persons making full disclosure should be saved entirely harmless; whereas, if a Member had agreed to go out, or forfeit 2,000*l.*, the effect of the Chancellor of the Exchequer's refusal was a loss of 2,000*l.* to that Member. Moreover a Member who had agreed to go out rather than risk an exposure of his bribery, was by a refusal of the Chiltern Hundreds, retained in that seat which he had acquired by means thus confessedly corrupt. By the practice of nearly a century, the Chiltern Hundreds had become the recognised and legitimate way of vacating a seat; and had been refused only in two cases—one that of a member under mental incapacity, the other that of a member against whom some adverse proceeding was pending, such as a motion for expulsion.—Mr. GOULBURN himself seconded the motion. He wished the correspondence to be public: he had given his answer to Lord Chelsea's application in an official letter, for the express purpose of having it on record. He had thought it his duty, after what had passed, to do his best for discouraging these compromises, according to the intention of the House; and he thought the most effectual check to them would be the knowledge beforehand that they could not be carried into effect. In ordinary cases, however, he agreed that the Chiltern Hundreds ought to be granted without reference to the motives of the application.—Several members gave their opinions in favour of the course taken by Mr. Goulburn, which Sir R. PEEL said was to be regarded as the act of the Government.—Captain PLUMRIDGE, one of those who were under terms to vacate, announced that he had in his pocket a letter which contained his own application for the Chiltern Hundreds, but which he should now consider it in the worst taste to send.—The motion was then agreed to.

Monday.—Mr. WALTER took the oaths and his seat for Nottingham. The hon. Member was introduced by Sir R. H. Inglis.

Lord STANLEY moved the third reading of the Newfoundland Bill, when Mr. P. HOWARD moved, pursuant to notice, that the bill be read a third time that day three months. Mr. B. WALL seconded the amendment. The House divided in favour of the third reading by 55 to 12. The bill was then passed.

The House resolved itself into committee on the Bankrupt Law Amendment Bill. On clause 49 being proposed, Mr. B. WOOD moved an amendment to render the joint receipt of the official and trade assignees necessary for sums greater in amount than the security given by the former. After a protracted discussion the committee divided in favour of the clause by 52 to 16.—On the suggestion of Sir T. WILDE, the words permitting certificated special pleaders to be commissioners were expunged. The other clauses of the bill were agreed to, several amendments having been proposed and negatived by considerable majorities.

The CHANCELLOR OF THE EXCHEQUER said that it was not the intention of the Income-tax Act that the tax should be deducted from the dividends on foreign stocks payable in this country, unless when the parties entitled to receive them were inhabitants of Great Britain.—On the motion of Sir J. GRAHAM, the Boroughs Incorporation Bill passed through its various stages, the standing orders being suspended for that purpose.

In reply to questions from Lord PALMERSTON as to the reported order of the Governor-General of India for the withdrawal of the British troops from Affghanistan, Sir R. PEEL said—"Candahar and Jellalabad may at this moment be the scene of military operations. The death of Shah Soojah has placed this country in a new position with respect to the treaty contracted by Lord Auckland. The relations in which we stand are also, by his death, made the subject of diplomatic communications. I must, therefore, decline answering any questions as to the instructions that have been given, or the views which are entertained. The facts as to how things actually stand, I have no objection to state. At this moment our troops occupy Candahar. I have reason to believe they also occupy Jellalabad, and there is at present no probability of their immediate retirement. This is all the information which, consistently with my sense of duty, I can now give. The British troops occupy these places; and, considering the accounts that may arrive by the next mail, the House, I am sure, will not press me for further information."

Mr. LEFROY rose, pursuant to notice, to move that the Speaker be directed to issue his warrant for the election of a Member for the borough of Ipswich.—Mr. H. STUART seconded the motion.—Mr. T. DUNCOMBE moved, as an amendment, for leave to bring in a bill to incapacitate certain individuals from voting at elections to serve in Parliament, and for preventing bribery and corruption in the election of Members to serve in Parliament for the borough of Ipswich.—Mr. P. M. STEWART vindicated the conduct of the committee. His position as its chairman had been a most painful one, as it imposed upon him the duty of voting to unseat his most intimate private friend, Mr. Gladstone.—Sir R. PEEL opposed the amendment on the ground that the House could not pass a bill of pains and penalties without giving the parties affected an opportunity of being heard at the bar of both Houses of Parliament—that a great length of time must necessarily be consumed in this process—and that it would be manifestly unjust to suspend the franchise of a large constituency on account of the offence of a small number of individuals.—After some remarks by Mr. TUFNELL the House divided, in favour of issuing the writ, by 86 to 32.—The original motion was then agreed to.

Sir R. PEEL obtained leave to introduce a bill to repeal so much of the Act of 1839 as respected the slave trade carried on under the flag of Portugal. He moved that the House should allow the Bill to be read a first and second time that evening.—After a few words from Capt. PECHELL, the motion was agreed to.

Tuesday.—The House began its sittings soon after 12 A.M. The report of the committee on the Bankruptcy Bill was received, some additions were made to it, and the bill was ordered to be read a third time on Wednesday.

Sir J. GRAHAM postponed, with expressions of reluctance and regret, the County Courts Bill, to the next session of Parliament.—A conversation followed this announcement, in which Mr. T. DUNCOMBE characterised the County Court of Middlesex as a scene of extortion and injustice. He said that Mr. Serj. Heath derived 7500*l.* a-year from fees collected from the lowest classes of society in that court, and that 300 cases were often disposed of in as many minutes.—Sir T. WILDE defended Mr. Serjeant Heath, and recommended Mr. T. Duncombe to be more cautious and discreet in making charges against individuals. There was nothing to warrant that attack. Serjeant Heath had always borne the character of an honourable man, and acted as such; and he (Sir T. Wilde) was happy that his hon. friend was not able to produce a single fact derogatory to that gentleman's character for the upwards of 20 years that he presided in that Court.—The ATTORNEY-GENERAL spoke in high terms of Mr. Serjeant Heath and his deputy, Mr. Dubois.—After some further conversation the bill was passed through committee *pro formâ*, reported to the House, and the report ordered to be printed.

At the afternoon sitting Mr. HUME requested from Sir J. Graham an explanation of the circumstances under which the Home-office had commuted, for a fine, the sentence of imprisonment on a Mr. Johnston, convicted of an assault upon a servant girl in the house in which he was lodging.—Sir J. GRAHAM answered, that the case had been brought before him by Mr. Under-Secretary Phillipps, in consequence of a representation from Mr. Serjeant Adams, who had presided at the trial. The Home Office had at first hesitated to relax the sentence, but had referred for further information to Serjeant Adams, who had made a report in reply, declaring his impression, from evidence laid before him since the trial, that the assault was made simply to force her out of the room. The offence had been committed under irritation at her neglect to clean the room in time; but Mr. Johnston had behaved very violently, and had even struck her; and Serjeant Adams thought, that though it would be proper to release him from further imprisonment, the remission ought not to take place without the infliction of a fine for the offence.

The House having resolved itself into committee to consider of an address for the erection of monuments to the memory of Sir Sydney Smith, Lord de Saumarez, and Lord Exmouth, Sir R. PEEL rose to move the address. His only difficulty, he said, had been in selecting the fittest among so many fit names for such an honour. These tributes, so influential on the minds of brave men, were the cheap defence of nations. After recapitulating successively the brilliant services of these three officers, he said that it would not be necessary to ask for a large grant of money. The value of such monuments, in his opinion, did not altogether consist in their being splendid works of art; it consisted in the inscription on the monument, recording the services of the individual to whom it is erected, and stimulating others to similar exertions. He trusted, at the same time, that works of this kind might be made subservient, by a proper selection of artists, to the encouragement of art; but he was sure that the House would not consider it necessary to erect monuments of an expensive kind. On the contrary, he thought the public would more readily acknowledge the merit of these individuals if they found that these monuments had cost a moderate sum, and he therefore trusted the House would cheerfully and unanimously consent to the motion proposed. He hoped Mr. Hawes would not press his motion for adding the names of Herschell, Watt, and Davy. If scientific men were to be honoured with like distinctions, this ought to be substantively and distinctly done, and not as an appendage to a proposal of naval commemoration.—Mr. HAWES said he would at once give way, though not without the hope that Sir R. Peel would himself undertake the subject.—Sir R. INGLIS objected to the practice of placing in any ecclesiastical edifice monuments to persons not buried there. He would prefer the erection of such memorials in Westminster Hall and the approaches to the new Houses of Parliament.—Sir R. PEEL agreed that the selection of the site should be left to the discretion of the Crown.—Sir G. COCKBURN expressed the gratitude of the navy for this mark of respect to three of its most distinguished commanders, and gave several interesting details of their respective services.—Mr. HUME did not object to the proposed testimonial, but thought it incumbent on him to plead the corresponding claims of science, and to express his anxiety that all such monuments should be made the means of advancing the arts. Mr. WYSE put in a claim for literary men, and Sir F. BURDETT delivered a long eulogium on Sir Sydney Smith. Mr. BROTHERTON was unfavourable to such grants. The true glory of a country was to cultivate the arts of peace. He wished to see honours bestowed on those who saved lives, not on those who destroyed them; he wished to see medals or knighthoods given to men who distinguished themselves in peaceful deeds. After some other members had spoken in praise of the three officers, the address was carried.

The Coventry Boundaries Bill was read a third time and passed, on the motion of Sir J. GRAHAM, after a division on the amendment of Sir C. DOUGLAS, that it be read a third time that day three months, when the amendment was negatived by a majority of 44. The report of the Limitations of Actions (Ireland) Bill was brought up and agreed to, after some opposition from Mr. HAWES and Mr. HUME, who moved as an amendment that it be reported that day three months. On a division, the amendment was defeated by 41 to [illegible].

Wednesday.—The House met twice to-day. At the morning sitting Mr. MILDMAY and Mr. HOPE took the oaths and their seats for Southampton.—The Bankrupty Bill, with an amendment suggested by Sir T. WILDE, was read a third time and passed.—On the order of the day for the third reading of the Insolvent Debtors' Bill, Mr. T. DUNCOMBE made a speech on the subject of prison discipline. This led to a long discussion, which was put an end to at last on the point of order, as irrelevant to the question before the House. The bill was then read a third time, and passed.—The House adjourned, and resumed at 5 P.M.

Lord ELIOT stated that it was the intention of Government to introduce an Irish Registration Bill next session. The noble Lord took that opportunity of stating that the magistrates had exonerated themselves from the charge of having employed Hagan, the witness at the late trial at Armagh, as a spy.

Lord PALMERSTON, in moving for returns of the names and titles of Bills introduced during the session, took occasion to review the whole conduct of the present Administration since it came into power. After entering into an examination of the state of Europe since the close of the war in 1815, he referred to the new Tariff, the Income-Tax, and the Corn bill. The new Government, he said, had found nothing but facilities bequeathed to them for their foreign administration. Gentlemen might laugh: but the fact was, that this Cabinet had been living for months on the leavings of their predecessors. They had fed upon the provisions they had found in the larder; even the [illegible] Corn Bill, formerly the object of so much disgust, had now been gulped by them like men. They had been obliged, in her Majesty's speech, to express their satisfaction at the Slave Trade Treaty, at the treaty for the settlement of Turkey and pacification of Europe, and at the restoration of friendly intercourse with Persia. All these were works matured by the late Ministry, and merely wound up by the present. So much for the common cry, that the late Ministers had left a bureau full of embarrassments to their successors. Exceptions had been taken to the policy pursued respecting China; but on that head he would appeal to the declarations of the Duke of Wellington in the House of Lords, and he must himself observe that if our hostilities with the Chinese should terminate in a satisfactory arrangement of commerce with a nation containing 200,000,000 of people, a greater benefit to British manufactures could hardly be conceived. He would take some credit also for the settlement made with Denmark respecting the tolls of the Baltic, and he should be glad to know how soon the present Ministry would be able to produce a like settlement with Hanover respecting the tolls of the Elbe. He challenged praise for the efforts which he and his colleagues had successfully made to preserve peace, not only for England herself, but as between other states, to whom her mediation had been given, and referred with pride to no fewer than eighteen commercial treaties concluded by the late Ministers, comprehending, among other matters, the subject of the Slave-trade, and the question between England and France respecting the fishery of their respective coasts. He claimed approbation also for the steadiness with which individual subjects of Great Britain had always been protected against foreign oppression. The late Ministers had been blamed for not having settled the boundary question with America; but, in truth, that question had been unsettled ever since the year 1783; and, with a view to settle it, they had made great exertions. The late Government had also done much to widen the field of British commerce, not only in

China, but on the west of the Indus, throughout that Affghan territory which he had been taunted with assurance for alluding to. The disaster lately sustained there had no connexion with the policy or with the plans of the Government; and if the military arrangements had been what they ought, the result would have been as honourable as the defence of Jellalabad. He construed Sir R. Peel's answer to his question of the preceding night as an admission that orders had been given to withdraw our troops, and he should congratulate the country, if since the transmission of those orders, an overland despatch had reached the Governor-General, which would avert so deep a disgrace to the British arms, and so ruinous a blow to British commerce. He then adverted to the exports and imports of this country, and showed that between the beginning and the end of the Whig administration, there had been a considerable increase on both these heads. On the whole, the present prospects of the country at home were rather cheering; for the Government must now go forward with the principles of free trade; and if their own friends should leave them in the lurch, the Opposition would support them in such a career. Nor would that Opposition be less willing to aid them, if, abandoning the policy of submission and concession in their foreign diplomacy, they would resolutely maintain the independence of their country, making no encroachments and suffering none.

Sir R. Peel seconded the motion, and thanked the noble Lord for putting on record the successful legislation of the present Government. The noble Lord had attributed almost every good that had occurred to the late Ministry, and, above all, to his own foreign policy; and had shown that exports and imports had increased, all under the old Corn-law. He had cut the argument against the Corn-law to the very roots for the purpose of gaining credit to his colleagues and himself. The present Government had brought forward its measures, and, considering their magnitude, he could not complain of the protraction of the Opposition; but it had occupied 48 nights. He had persevered, and at last he had succeeded. In like manner, in 1835, he had staked his Government upon the malt-tax, and he had succeeded. In the present session he had staked the Government upon the cattle question, and he had succeeded. Had he followed the example of other Governments, he might have truckled and yielded his principles to keep his partisans. He had been accused of abandoning some bills. Why were they abandoned? Not from fear, but from absolute want of time. More business had been done in the last month than in any month of any former Ministry; but he would ask where, during that month, had been the members of that Ministry on whom the noble Lord had pronounced so inflated a panegyric? They had all fled. Not another man of the late Cabinet was left. Never was so strong a proof of confidence in a Ministry. The Opposition had all shrunk from the struggle of the session, and left the noble Lord, the last rose of summer, to waste his sweetness on the desert air. Perhaps it would be said, there was nothing particular to defend or enforce. What did the noble Lord say to the Bribery Bill? Lord John Russell, the great leader of Reform, left it to the late Attorney-General, the late Attorney-General left it to the late Secretary of the Admiralty, the late Secretary of the Admiralty to the Chairman of the Committee, and all these having successively quitted town, it was devolved on Mr. C. Buller, who devolved it on the Government. Was ever more conclusive proof of confidence in an administration? Now for the financial deficiency—a deficiency of millions—three wars on your hands, and a boast of being all the while at peace. Why had the noble Lord maintained silence during 16 nights' debate on the Income-tax, and now, on the last day of the session, fired this popgun at the measure? The reason of that former silence was, that he and his late colleagues had at first proposed to support the Income-tax. The Bankruptcy Bill had no doubt been deferred to a late period of the session; but it had been carried; and the intermediate delay of it had been mainly in deference to the wishes of Lord Cottenham. With respect to the national distress, Lord Palmerston had now, as before, used language tending to aggravate discontent; but all his contribution to the relief of it had been a barren assertion, that "something or other" must be done next session. He would now come to the foreign policy. The noble Lord had paraded his treaties about the Slave-trade; was that the main topic of a Foreign Minister's boast? What was the state in which, after all his old professions of a liberal union throughout Europe, he had left the great nations of the Continent? The late Opposition had given every aid to preserve the friendship of the French. This country had no hostility to France—no feeling of fear, or of rivalry; she knew the interests of the two countries to be the same. Lord Palmerston was alone answerable for having entered, at the close of the session, upon points of honour with France and with the United States, when every word he uttered was a two-edged sword; and for having employed, in some of his written negotiations, petulant terms, which were sure to widen any wound already made. So little had his diplomacy succeeded in conciliating even Portugal, that it had become necessary to pass an act of Parliament authorising English cruisers to search Portuguese vessels suspected of slave-trading. The noble Lord had alluded to the negotiation with Hanover; of which he would say, that when published it would be found in no wise inconsistent with the honour of England; and he read a document in vindication of the course taken by the present Government. The noble Lord, however, had left, for the climax of his speech, Affghanistan! He confessed he was surprised to hear the noble Lord touch upon that subject, as if he had utterly forgotten the reverses of last year. He had presumed much upon the forbearance of Ministers; and had even asked who had ever contemplated the abandonment of Affghanistan. "I," said Sir R. Peel, "could tell the noble Lord." "But," he continued, "I will make no disclosure on the present state of the subject, nor endanger one Indian soldier's life to relieve myself from these premature taunts." He went on to say that he would not adopt the objects of the noble Lord, nor make war for the sake of promoting the study of Adam Smith among the Affghans. That might be the noble Lord's way of opening commerce for England; but by the time he had taught the lesson, India, exhausted by his hostilities, would have no money left for his cottons. Sir R. Peel concluded by an eloquent peroration contrasting his private pursuits and personal feelings with the cares of office, and declaring the vanity and futility to him of successful ambition and extensive power, unless accompanied with the consciousness of integrity, the hope of an honest reputation, and the satisfaction of having served his country.

Mr. Cobden thought that in the present state of the people the House might do something better than squabble about Whig and Tory, or indulge in personal attacks.—After some remarks from Mr. Hume, Mr. Ewart, and Mr. P. Howard, the motion was put and carried; and the House agreed to adjourn till Friday.—Sir J. Graham then introduced his bill for the registration of voters in England and Wales, which is to be printed and circulated during the recess.

Friday.—A new writ was issued for South Hampshire, Mr. J. W. Fleming having accepted the Chiltern Hundreds. Several notices of motion for next session were given. A discussion took place, on a motion by Mr. Duncombe, respecting the spy system. —Sir J. Graham denied altogether the existence of any system of spies; in regard to Manchester he was resolved to support the authorities in the execution of their duty.—After some discussion, the motion was negatived.—The House attended in the House of Peers to hear her Majesty's Speech; and after some routine business the House broke up for the session.

CITY.

Money Market, Friday.—The Funds have been depressed by the news from the Manufacturing Districts. Consols for money closed 91⅝ to ¾; the same for account; Exchequer Bills, 2d. issue, 48s. to 50s. prem.; ditto, 2½d. issue, 50s. to 52s. prem.; India Stock, 249½ to 250½; Three per Cents. Reduced, 92⅜; Three-and-a-Half per Cents. Reduced, 101⅝ to ½; and New Three-and-a-Half per Cents., 100⅛ to ¼.

Metropolis and its Vicinity.

Prorogation of Parliament.—The Queen proceeded yesterday afternoon to the House of Lords, to prorogue Parliament in person. Her Majesty was accompanied by Prince Albert, the Prince and Princess of Saxe Coburg, the Great Officers of State, and a numerous and brilliant suite. The assemblage of persons was unusually large, and the Park and streets through which the procession passed, were crowded with spectators. Her Majesty was loudly cheered, both on entering the House of Lords and on her return to the Palace.

University College.—The distribution of prizes to the pupils of University College School took place last week in the presence of a large number of visitors. The distribution occupied more than an hour. At the conclusion, the chairman addressed the meeting, and said that an important change had been resolved upon in the management of the school. From the present time it would be under the direction of a single head master, instead of two, as formerly. Mr. Key, the late Professor of Latin, would become the sole master; and his late colleague, Mr. Malden, would give the institution the advantage of his great acquirements as Greek Professor in the College, continuing at the same time to give lessons in Greek to the senior class in the school. The council had filled up the vacancy in the Professorship of Latin, by appointing to that chair Mr. G. Long, the gentleman who was Professor of Greek in the College at its opening, and for several subsequent years. By this appointment the council had completed an arrangement which had been some time in contemplation, and from which many important benefits to the College are anticipated. The chairman concluded by stating that a regulation had also been made, by which a report of the state of the institution would henceforth be delivered twice in the course of the year.

Metropolitan Improvements.—We have before alluded to the restorations which have for some time been going on in Crosby Hall, in Bishopsgate-street. The works have just been successfully brought to a close. The building was opened last week as the lecture room of a literary and scientific institution, Professor Bell, of King's College, the president of the society, giving the introductory lecture. On Friday last the Rev. C. Mackenzie, vicar of St. Helen's, Bishopsgate, delivered an interesting lecture "on the history and antiquities of the Hall;" and there is now no longer any doubt that this fine specimen of an old English hall will be carefully preserved as one of the most interesting relics of the City. —The first meeting of the commissioners appointed under the Southwark Improvements Act has just been held. The contemplated improvements are confined to the district of the Mint, a locality which, from the reign of Edward IV. down to the present period, has been the favoured resort of highwaymen, thieves, coiners, and others of the very worst description. The Duke's Head, a notorious rendezvous for "gentlemen of the road" in those days, was much frequented by the highwaymen of the last century. Some curious particulars relative to this modern Alsatia are to be found in a report of the Statistical Society submitted to the House of Commons a few years back. It seems there were at that time ten or twelve lodging-houses for reputed thieves, each containing on an average seventy inmates: the beds were charged 4*d.* per night, or 3*d.* if two slept together. The houses were so constructed in the rear, as to afford every facility of escape when visited by the officers of justice. About two hundred of these houses are now to be razed to their foundation. It was originally proposed to form a new line of street, commencing at Blackman-street, near St. George's Church, and terminating at Charlotte-street, Blackfriars-road. For the present there is no intention of carrying the new street beyond the Southwark-bridge-road, but when completed it will form a direct communication between Great Dover-road and Southwark Bridge. The expense, as far as regards the compensation to the owners of property, will be comparatively small, nearly all the houses to be swept away being already in a state of dilapidation. The contemplated alteration will entirely get rid of the Mint district, which, notwithstanding the vigilance of the police, is still a locality not to be approached with impunity.—The Commissioners of Woods and Forests have ordered the sale of the materials of the Thatched House Tavern and the adjoining houses and shops, in St. James's Street, preparatory to the new improvements projected in that quarter. The site of the Thatched House has been taken of the Crown for the purpose of erecting a new club-house.—The new church of St. Thomas, Charterhouse, has just been completed, and will be consecrated this day by the Bishop of London. It is a brick structure of the Norman style, and has been built by the Commissioners of the Metropolitan Church Building Fund, on a piece of ground given for the purpose by the governors of the Charterhouse. The cost of the building is 5,560*l.* which will afford accommodation for 1,200 or 1,500 persons.

Public Meetings.—On Monday the Missionary bazaar at the Wesleyan Centenary Hall was resumed, when the tables were covered with a fresh supply of useful and ornamental articles, together with interesting additions to the specimens of natural history, and of the manufactures and skill of the barbarian or half-savage nations among which the influence of the missionaries prevails. The chased rings and necklaces from Coomassie, the capital of Ashantee, are particularly described as remarkable specimens of the perfection to which the Africans have arrived in the art of working gold.

St. Martin's-in-the-Fields.—Operations for rebuilding the spire of this church, which suffered so much during the late storm, were commenced on Saturday. Several workmen have been employed during the week in erecting scaffolding, and it is expected that the rebuilding and necessary repairs will occupy at least three or four months. In consequence of the alarm expressed by the neighbourhood and the pew renters, as to the present safety of the church, divine service has been suspended until further notice. It has been ascertained that the repairs will be effected without cost to the parish. It appears that a gentleman who was churchwarden some years ago, had an impression that the steeple was peculiarly exposed to the effects of lightning, and succeeded in inducing the vestry to insure against the consequences of damage from lightning, in addition to the fire insurance—an extra cost which appears to have been ever since continued. There has been some negotiation on the subject, as there was no actual fire; but the two fire-offices where the insurance had been effected have waived all objections, and consented to pay for the repairs. The steeple, it appears, is damaged in three places. The iron that had been inserted to strengthen the structure was completely melted, so that a great portion of the steeple must be removed. The repairs are expected to cost about 900*l.*

The Thames Tunnel.—The interest of the Tunnel has considerably increased since the completion of the new approach. There were rather more than 20,000 visitors to it last week, being more than double the average number that has heretofore inspected the work within the same period of time. The staircase just opened on the Middlesex side of the river excites general admiration.

Metropolitan Police.—The new arrangements to which we alluded a few weeks since, for the formation of a "Detective Police Force," came into operation this week. The commissioners have selected to form the company two inspectors and eight sergeants and constables, many of whom have already signalised themselves by their activity in taking offenders into custody. It is said to be the intention of the commissioners to increase the number of men immediately, should the company be found to answer their anticipations.

Greenwich.—On Saturday the Annual White Bait Dinner of the Ministry took place at the Crown and Sceptre. The Prince of Wales steamer conveyed the distinguished party from Hungerford-market Pier to Greenwich, leaving at six o'clock precisely, with Sir Robert Peel; the Dukes of Buckingham and Buccleugh; the Earls of Haddington, Bathurst, Ripon, Liverpool, and Shaftesbury; Lords Stanley, Wharncliffe, Jermyn, E. Bruce, G. Somerset, Lowther, Lincoln, Eliot, Sidney, Redesdale, Sandon, Abinger; Sir T. Freemantle, Sir G. Cockburn, Sir J. Graham, Sir G. Murray, Sir F. Trench, Sir E. Knatchbull, Sir W. Follett, Sir A. Grant, Sir G. Clerk; Messrs. Goulburn, Herries, H. Baring, Dawson, Sutton, Colonel Peel, &c. On arriving off the General Steam Navigation Wharf, Deptford, the Prince of Wales was saluted with a discharge of cannon, which was returned from the steamer. The ships of the company, and the yards of the Marine Society's ship, were manned, and gave three cheers to the visitors as they passed. The steamer arrived at Greenwich at twenty minutes before seven o'clock, when the party were again saluted. The party amounted to upwards of fifty persons.

Provincial News.

Andover.—At the meeting of the guardians of this union, on Saturday, July 9, the report of the accountant employed to investigate the union accounts, in consequence of the recent embezzlements committed by Mr. Maude, was laid before the board by the Assistant Commissioner, showing a deficiency of 1,338*l.* 13*s.* 3½*d.* Mr. Lamb immediately stated his intention of repaying that sum to the guardians, as he could not suffer the union to sustain any loss through the misconduct of a clerk who had represented him at that board; upon which the following resolution was unanimously agreed to by the guardians, and directed to be entered on the minutes of their proceedings:—"Upon the motion of Mr. Parker, Assistant Poor Law Commissioner, seconded by the chairman, it was resolved, that in the opinion of this board the conduct of Mr. Lamb, in stating his intention to reimburse the board of guardians the sum of 1,338*l.* 13*s.* 3½*d.*, of which the union had been defrauded by Mr. Maude, is honourable to his character in the highest degree." The above sum has been since paid by Mr. Lamb into the hands of the treasurer to the account of the union.—The Hampshire papers state that the oldest sportsmen have never remembered partridges so abundant as they are this season throughout this county. On the large farms adjoining the downs, the coveys run so strong, that in some instances no less than 18 young birds have been noticed in one company. The same favourable account of the broods of this season is received from Wallop, Tedworth, Shipton, Munxton, and the districts around. The birds are very forward, and unusually strong on the wing, and several sporting parties are expected to arrive here in the course of a few days, preparatory to their taking the field on the 1st September.

Bath.—This city has been thrown into a state of excitement for some days past, by the discovery that a Mrs. Parsons, the wife of a lodging-house keeper in Henrietta Street, had been murdered. Suspicion having fallen on the husband, he was taken into custody to await the inquest, which commenced on Monday. The evidence adduced clearly proved that deceased was murdered by her skull being fractured with the kitchen poker. The jury, on Wednesday, returned a verdict of Wilful Murder against the husband, who has accordingly been committed to take his trial.

Brighton.—The late unpleasant occurrence at the Chapel Royal, reported in our paper of last week, has brought letters from the Bishop of Lincoln, the Vicar of Barton-on-Humber, the Rev. G. G. Egremont of Lincoln, and also from heads of colleges, magistrates, and other respectable persons in that district, vouching the respectability of the Rev. Mr. Moore. The course intended to be adopted has not yet been decided upon, both Mr. Moore and his friend having placed themselves in the hands of one of the Queen's Sergeants, who happens to be a personal friend. It is generally believed that the affair will be arranged without going into a court of law.

Devizes.—At Melksham fair, on Wednesday, a countryman was looking at some horses which were exhibiting for sale, when a gentleman in clerical attire, and representing himself to be such, applied to him to purchase a particular animal, which he pointed out, saying that as a clergyman he did not like to be seen in such engagements, at the same time telling him he would give him a sovereign for his trouble. The trick succeeded—the young man paid 13*l.* 15*s.* for a horse not worth 5*l.* The clergyman, of course, was not to be found, and the purchaser had to take his bargain to himself, with "all faults."

Falmouth.—The first importation of foreign cattle into this port, under the new tariff, took place on Monday, when some cows were landed here on their way to Truro. The Bishop of Exeter, who is at present engaged in visiting the western districts of his diocese, proceeded on Saturday, in the Astræa barge, from the Green Bank in this harbour to St. Just on the opposite shore. After confirming a large number of young persons, in getting into the boat the bishop fell down, and injured his left leg, below the knee, against one of the seats. The wound was so painful as to prevent his lordship's preaching on Sunday, as intended, but it is understood that the inconvenience is likely to be only of a temporary character.

Great Malvern.—A new church is to be built and endowed at Barnard's-green, in this parish, under circumstances of a very unusual character. The design has been originated by a few farmers and poor labourers, who form a population of 372 persons, resident from two to four miles from the parish church. The sum of 81*l.* 1*s.* 6*d.* has been subscribed by these persons in amounts varying from 6*d.* to 10*l.* 10*s.* Mr. Foley, the lord of the manor, has given them a site and a subscription of 50*l.*; and the inhabitants of this town have formed a committee to collect subscriptions. The total amount required is 1,750*l.*—viz., 1,000*l.*, which the Bishop of Worcester requires for an endowment, and 750*l.* for the building itself. The chapel is to consist of chancel and nave, with seats and kneelings for 220 persons. All the seats are to be open and free. The materials are to be stone and unpainted deal, and the design simple and inexpensive. The building is so planned that aisles and a tower with spire may be conveniently added at any future time. The work is to be done by the village builder, and the farmers will haul the materials. The subscriptions already received amount to 550*l.*; the sum still required is 1,200*l.*

Liverpool.—In our Number of April 16, we noticed a singular case which had been brought before the magistrates of this place, arising out of the forcible abduction of Miss Crellin, by a Mr. M'Gill, assisted by several persons, among whom a man called Quick, and a Mrs. Clayton, were the principal actors. Miss Crellin was a lady of large property, about 50 years of age; the prisoners were charged with having kept her for some time in a state of intoxication, and with having removed her to Gretna Green, where she was married to M'Gill, while insensible from the effects of the potions they had administered. The trial of the prisoners took place on Tuesday before Lord Denman. The evidence ran to a great length, but the facts adduced differ in no important point from the statements in our Paper of April last. The Jury, after some deliberation, found all the prisoners guilty except two; adding, at the same time, the expression of their opinion that Miss Crellin had been highly culpable in the business. Lord Denman sentenced M'Gill to be imprisoned 18 months with hard labour, Quick 15 months, and Mrs. Clayton and Richard Jones 12 months.

Maidstone.—The Kentish papers do not report favourably of the appearance of the hop grounds. In the neighbourhood of this town the bines are somewhat benefited by the late warm nights, but are still much in want of rain, and, considering that an alternation of dry heats and colds has continued for so long a period, it is a matter of surprise that the condition of the hops is so good as it is. At Horsemorden, Marden, and Yalding some of the hops have done pretty well, while others have become worse. At Ticehurst the best grounds are now coming fast into hop, but are in want of rain, to give vigour to the bine. The weak grounds are turning yellow, and will not do much. At Mereworth, Wateringbury, and Nettlestead the hops have grown considerably, but cannot be considered as having improved in the manner usual at this time of year. Most grounds appear to be greatly suffering from the long drought and wet winter, and in many grounds that appeared healthy a fortnight since, the fire-blast has appeared, and increases very fast. Although there are some grounds professedly treated in a peculiar way that still look well, still should there not soon be a favourable change in the weather, no doubt they will give way as well as others. The crop will fall far short of the last year.

Manchester.—We regret to state that this week has witnessed the commencement of disturbances in this town and neighbourhood, which have assumed a threatening appearance, and required the utmost firmness and vigilance on the part of the civil and military authorities. Although these disturbances have taken the appearance of a turn-out for wages, it is said that they have a totally different origin, and are intimately connected with the recent outbreaks in Staffordshire and Scotland. A threatened reduction of wages at Stalybridge was seized upon as the pretext for their commencement. On Saturday it was well known in the district that there was to be a general turn-out of the Stalybridge spinners and weavers. Indeed, in the course of the week, meetings had been held not only in Stalybridge, but also in Ashton; and on Sunday a very large meeting was held on Mottram Moor, where eight or ten thousand people are said to have been present, and at which the extensive outrages committed on Monday and Tuesday were discussed and agreed upon. Their objects were stated to be the attainment of "the people's charter," and of "a fair day's wage for a fair day's work." On Monday the plans previously laid began to be rapidly developed. Messrs. Bayley's spinners and weavers did not go to work, and, having been joined by reinforcements from Ashton and the neighbourhood, consisting of spinners, weavers, colliers, labourers, and workpeople of all descriptions, they went in succession to all the mills in Stalybridge, insisted on the steam-engines being stopped, and forced all the hands sent out of the mills to join them. Proceeding from Stalybridge to Higher Dukinfield, they called at the print-works of Messrs. Hoyle, where they spoiled some work which was in progress. Thence they went to the different mills in the place, and compelled the owners to stop the works, and turn out the hands. At a small place close to Dukinfield-bridge, the rioters drew the fire from under the boiler, and thus put a stop to the operations on the premises. They next went into the town of Ashton, and, having assembled in the market-place, divided into two bodies; one of which, after visiting and stopping a mill at Hurst, went to Oldham, where they attacked several factories on that side of the town by which they entered. The other party visited all the mills at Ashton, and committed some acts of violence at two or three of them; after which, proceeding through Denton and Crown Point, and having forced the journeymen hatters to join them, they went forward to Hyde, where they stopped the whole of the factories. In the evening they determined to visit Manchester. Accordingly, on Tuesday morning they entered this town, having turned out all the hands at the factories they passed on the road. On their arrival, they held a meeting in one of the open pieces of ground, where they numbered about 5,000. Most of them carried sticks. Shortly after the meeting, a crowd of persons went along Newton-lane in a tumultuous manner, demanding bread at the various provision-shops. Some of the shopkeepers, aware of their coming, had closed their shops, but thought it most prudent, in some cases, to throw a loaf or two to the crowd. About the same time, another party assembled in the front of two shops at the head of Travis-street, the occupiers of which were also compelled to distribute bread gratuitously. Intelligence of these depredations having been conveyed to Colonel Wemyss, he proceeded to the spot with a troop of horse, a company of rifles, and a detachment of police; but, although the whole of the Ancoats district presented a disturbed appearance, from the number of factory hands who were walking about in all directions, no further attacks on property took place. Throughout the greater part of Tuesday afternoon, most of the shops in Oldham-street, Great Ancoats-street, and Oldham-road, were closed, through fear of the disorderly crowds which were perambulating the town. At 2 o'clock a mob, consisting chiefly of women, attacked the mill of Messrs. Preston, in Ardwick Island, and broke all the windows. They then attacked the dye-works in Ancoats Vale, belonging to Messrs. Barlow, and the mill of Mr. Kennedy, where 300 squares of glass were broken, and Mr. Kennedy, jun., assaulted. About 4 o'clock a large mob proceeded along Oxford-road, for the purpose of stopping Messrs. Birley's mill, and that of the Oxford-road Twist Company. On arriving at the latter, they demanded that the hands should be turned out. Mr. Henry Cooke, one of the partners, complied with their request, and immediately ordered the engines to be stopped. Not content with this, they demanded leave to enter the mill, in order that they might be sure of no one remaining inside. On his refusal to let them do so, they instantly smashed the windows of the porter's lodge and entered the mill-yard. Fortunately the military arrived at this juncture, and the only damage committed was the flinging a skipful of bobbins into the street. The police arrived at the same time, and succeeded, with the assistance of the military, in apprehending 14 of the rioters. While the military were escorting the prisoners to the Town-hall, the mob proceeded to Messrs. Birley's mill, the windows of which they immediately commenced breaking. The inmates set to work a force-pump, worked by the engine, to throw water on the crowd; but this not proving an effectual defence, they resorted to more formidable weapons. Several of them ascended to the roof, and flung down stones, pieces of iron, and other missiles with such fatal effect that several persons were hurt, and a young girl was killed on the spot. The ammunition of the mob having been exhausted before they had broken all the windows, they seized a cart loaded with coals, which was on its way to the factory, tilted it up, and employed the contents in finishing the work of destruction. On the soldiers and police making their appearance, the mob dispersed. While the military were employed in clearing the street, intelligence having been brought that the rioters had attacked the mill of Messrs. Sterling and Beckton, in Lower Mosley-street, a detachment of cavalry and a strong body of police were despatched to the spot. By the time they arrived most of the windows in the mill, and also those in the adjoining dwelling-house of Mr. Beckton, had been broken. Six of the rioters were apprehended here, and taken to the Town-hall. In the course of the afternoon a portion of the mob assembled before the shop of Mr. Rogers, in Charles-street, Oxford-road, and asked him to give them some bread; on which he flung several four-pound loaves among them, considering that it would not be safe to refuse. In the course of the afternoon a number of provision-shops in George's-road were entered by large parties, whose appearance made the shopkeepers glad to get rid of them by acceding to their demands. On Wednesday business was entirely suspended; placards had been issued announcing that the riot-act had been read; most of the shops were closed, and it was ascertained that an attempt had been made to cut off the gas-pipes. On Wednesday evening from 50,000 to 60,000 persons had been thrown out of employment by the riot. On Thursday morning the steam-mills of Mr. Mouncy, at Salford, were fired and burned to the ground. The workmen on the estate of Lord F. Egerton, at Worsley, turned out, and a general cessation of work took place in the course of the day at Bolton, Stockport, Hyde, and other villages in the neighbourhood. Manchester continues in a state of high excitement; three policemen have been killed; and it is impossible to estimate the consequences if the riot continues much longer.

Marlborough.—The Castle Hotel in this town has been purchased by a committee, and is to be immediately converted into a large public school, chiefly for the sons of the clergy, from 8 to 18 years of age, at a cost which will bring it within the means of many, whose limited means prevent their sons from obtaining the education which their station in society renders desirable. It will not, however, be confined to the children of the clergy, as it is in contemplation to take 500 boys, two-thirds to be the sons of clergymen, and one-third sons of laymen. The Archbishop of Canterbury will be visitor, and the Bishop of Salisbury president of the institution.

Merthyr.—The local papers mention that the colliers and miners in the neighbourhood of Abersychan are still "out," and that the Victoria works have come to a stand-still for the present. The colliers of the Pentwyn works have returned to their labour. The accounts from all parts of Wales inform us that sportsmen look forward for a good and plentiful season; the harvest will be in earlier than for several years past, and birds are expected to be numerous and strong on the wing. The Pembroke papers announce that H.M.S. Superb, pierced to carry 80 guns, is to be launched at the Royal Dock-yard in that harbour, on Tuesday, the 6th September.

Newcastle-under-Lyme.—The whole district of the Staffordshire potteries continues in a highly excited state. On Saturday night a serious riot broke out at Burslem. In the evening three men, calling themselves colliers, with a box, were asking contributions from persons in the market, when they were apprehended and put in the lock-up. No notice seemed to be taken of the affair, and the town was very quiet until a few minutes past 12 o'clock, when a crowd was observed within 50 yards of the Town-hall. A shout was given as soon as the mob was opposite the hall; they then kicked and knocked the locks off the doors, liberated the three men, and immediately commenced their attack on the windows, which have been riddled, and 90 squares broken. Several stones were thrown through the illuminated dial of the clock, which stopped in consequence of the damage it sustained. Another party attacked the George Inn, and demolished 135 sash squares. Several other houses were attacked, and large quantities of furniture were destroyed. On Sunday night the special constables met at the Town-hall, to consider whether it was advisable to protect the place during the night with a military force, but they did not think it necessary to do so. A detachment of the 1st Dragoons arrived early on Monday morning from Manchester. Many reports are in circulation respecting the plans that the mob intend to put in force; their first object is said to be the destruction of property belonging to the authorities and the coalmasters. They are well organised, for as soon as the military left Newcastle on Sunday morning, a rocket was discharged to apprise them of the fact, and at the time the missiles were thrown at the different windows, signals were given by the clapping of hands from the ringleaders. There seems to be a prevalent opinion that the Chartists are connected with the colliers. A meeting of that body took place on Tuesday at Hanley, and it was reported that Mr. O'Connor would be there on Wednesday. Business is nearly at a stand, and the market has been almost neglected. The distress is very great, for the workhouse is literally besieged with applicants for relief, and upwards of 10,000 were relieved by the union during the last week.

Plymouth.—It is now announced that twelve sailing packets are to be brought forward for commission to convey the West India Mails in the place of steamers, as mentioned in our last. The ordinary merchant-ships have latterly arrived in the Channel with more recent information than that brought by the steamers. It is said that the company, on winding-up, will be losers of nearly half-a-million sterling.

Shugborough.—The sale of the wines at Shugborough-Hall concluded on Friday. The lots generally realised high prices. The still Champagne fetched 6 guineas per dozen; Cyprus, 7 guineas; the Malmsey Madeira, 3 guineas per dozen; the Port and Sherry ran from 70*s.* to 90*s.* per dozen. Towards the close, the sale became slack, and Mr. Robins complained that at one corner of the table there was more freedom in the tasting than the bidding. The sale of the furniture commenced on Saturday. Many of the articles went off at low prices, and nearly all the best lots were bought by the London brokers who had assembled in great numbers, and seemed resolved to allow few purchases to be made by the local bidders. The sale of the sculpture and paintings has taken place this week; the pictures realised good prices, the great attraction of the gallery, the Vandervelde, fetched 1,186*l.* 10*s.* The sculptures numbered upwards of 90 lots, and the amount realised by the whole was nearly 3,000*l.*

Southampton.—This town was a scene of great excitement on Saturday, in consequence of the nomination of candidates for the representation of the borough. The proceedings lasted eight hours, and were remarkable for the violent language which passed between Lord Nugent and some of the principal electors on the Conservative side. Lord Nugent charged Alderman Lefeuvre with bribery, upon which the latter retorted in such terms as led to a hostile communication at the close of the election. Mr. Lefeuvre at once retracted the language applied to Lord Nugent, who explained that he did not intend to charge him with bribery; the affair then terminated without any further consequences. The official declaration of the poll was announced on Tuesday, when the numbers appeared as follows:—Mr. Mildmay, 685; Mr. Hope, 682; Lord Nugent, 535; Mr. G. Thompson, 532.

Stamford.—Her Majesty the Queen Dowager passed through this town on Monday on her way from Gopsal Hall, the seat of Earl Howe, to Burghley Hall, the noble seat of the Marquis of Exeter. Her Majesty was met by the clergy, the mayor, and the principal inhabitants, a short distance out of town, and escorted to the lodges of Burghley Park, amidst every demonstration of loyal attachment on the part of the assembled multitudes. On Tuesday about five hundred children connected with the parochial national schools of the neighbourhood, met at Burghley House, and were regaled on the lawn in front of the mansion. The christening of the infant son of the Marquis and Marchioness took place on the same day. The Queen Dowager took her departure on Thursday, on her return to Gopsall Hall, the seat of Earl Howe, and it is understood that her Majesty will visit Malvern in the early part of next week.

St. Asaph.—We learn by the daily papers, that the works at Kinmel Park have been temporarily suspended, in consequence of Lord Dinorben having found it necessary to obtain an Act of Parliament to enable his lordship to rebuild the mansion destroyed by fire, without diminishing the fortune set apart for the junior branches of his family. The edifice will shortly be commenced, and will afford employment to a large number of workmen in Denbighshire.

Winchester.—The local papers state that among the few vestiges of ancient hospitals, or almonries, now existing throughout the kingdom, may be enumerated that of St. Croix, situated about a mile from this city, on the road to Southampton. By the will of the founder, every traveller, "excepting rogues and lawyers," who knocks at the door of this hostel, on his way to or from Winchester, is entitled to receive from the porter a pound of wheaten bread and a cup of strong beer, of which many highly respectable persons have, out of curiosity, partaken. This hospital is a little way off the high-road, and is furnished with a good garden, which is kept in very neat order. Few persons who travel on the road are aware that such an institution is still in existence, and now that the Southampton railway has thrown the line of traffic into a different channel, it is very probable that the hospital will, in the course of a few years, become little, if at all, resorted to.

Windsor.—The Hon. C. A. Murray, the Master of her Majesty's household, having wagered with another member of the royal establishment that he would kill forty rabbits with a single-barrelled rifle, within twelve hours, upon one of the royal preserves in the neighbourhood of the Great Park, at Windsor, the affair, which created considerable interest, came off on Monday morning at Norfolk-farm. The Hon. Mr. Murray commenced as early as six o'clock, and such was the character of the shooting, that within four hours forty-three rabbits were bagged, only five discharges failing in their effect. The rabbits, notwithstanding the royal farm has been much shot over since the court has been at Windsor, are still extremely numerous, and will ensure plenty of sport during the season. Mr. Murray was accompanied by Viscount Jocelyn and the Hon. Captain Hood. Prince Albert and his brother, Prince Ernest, attended by their suite, shot over the Park on the same morning. Prince Albert shot 58 rabbits upon the preserves at Virginia Water, the whole number killed in the course of a couple of hours being from 130 to 140. Prince Albert, having the best position, killed the greater number; but his brother, who is a first-rate shot, killed one rabbit, which proved on stepping over the ground to be upwards of 80 yards distant.

Railways.—The following are the weekly receipts of the undermentioned railways:—London and Birmingham, 18,784*l.* 2*s.*; Great Western, 15,483*l.* 4*s.*; South Western, 9,104*l.* 15*s.* 3*d.*; Brighton, 4,586*l.* 5*s.* 4*d.*; Blackwall, 1,358*l.* 10*s.* 4*d.*; Greenwich, 918*l.* 11*s.* 4*d.*; Croydon, 455*l.* 11*s.* 3½*d.*; North Midland, 4,728*l.* 16*s.*; York and North Midland, 1,741*l.* 14*s.* 8*d.*; Edinburgh and Glasgow, 2,179*l.* 1*s.* 5*d.*; Liverpool and Manchester, 5,015*l.* 13*s.* 4*d.*; Manchester and Leeds, 4,801*l.* 11*s.* 1*d.* At the meeting of the Brighton Company, the report presented by the directors gave some explanation of those discrepancies in accounts which have already attracted much attention. The accounts show that the traffic during the last six months has produced 63,236*l.* 7*s.* 2*d.*, which, with the balance of last year's account, makes an amount of 75,806*l.* 9*s.* 10*d.* This, after making the usual allowances for expenditure, left a balance disposable by the company of 27,645*l.* 12*s.* It was proposed by the directors that a dividend of 10*s.* or 15*s.* should be declared, at the option of the majority of the meeting, it having been stated from the chair that the larger sum could only be declared at the expense of carrying over the half year's charge of interest, which fell due on the 30th of June last, to the end of the present year. After a very stormy discussion, and strong opposition from Sir I. L. Goldsmid and others, the dividend of 10*s.* per share was carried by a majority of 43 against 37, and the report was adopted.—The meeting of the York and North Midland Company was held on the 2d inst. From the report it appeared that the gross revenue for the last half-year amounted to 39,528*l.* 11*s.*, and that the expenditure amounted to 18,835*l.* 2*s.* 10*d.*, the expenses of working, &c., being 14,647*l.* 15*s.*, and the interest on debentures 4,187*l.* 7*s.* 10*d.* The directors recommended the continuance of a dividend of 2*l.* 10*s.* each upon the whole shares, and of 15*s.* each upon the half shares, to pay which a small amount was necessary to be abstracted from the reserve fund. This was agreed to, and the report of the directors adopted. The Income-tax will be paid out of the funds of the company, so that there will be no deduction from the dividend.—The Grand Junction Company have declared a dividend of 5*l.* per cent. upon the net revenue of traffic for the half year, which is stated to have reached 113,661*l.* 12*s.* To this would be added the balance of the last year's accounts; and after the payment of the dividend, with the charge for the Income-tax, there would be left 5,495*l.* 14*s.* 1*d.*, to be carried to the credit of the reserved fund, and applicable to future dividends.—The morning papers mention, as a proof of the rapidity with which despatches may be forwarded by railway, that the Government messenger, who arrived from Lisbon on Saturday with despatches, started from the terminus at Southampton by a special train, and arrived at Nine-elms in one hour and thirty-five minutes, including two stoppages. The Montrose left Lisbon on the previous Wednesday, and Lord Aberdeen was enabled to answer his despatches by the mail of Saturday night.—The reduction of fare on the Canterbury and Whitstable Railway has been productive of a considerable increase of revenue. The fare in July, 1840, was 9*d.* per passenger, and during that month the number conveyed was 1,407. In July, 1841, the fare was reduced to 6*d.*, when the number carried rose to 3,244; and in July of the present year, with the 6*d.* fare, the number has still further increased to 4,116.

IRELAND.

Dublin.—An active canvass for the representation of Trinity College, has been entered on by a committee, on the part of Mr. Longfield, and by Mr. G. A. Hamilton, on his own behalf, on the presumption of Mr. Solicitor-General Jackson being elevated to the vacancy on the bench, caused by the death of Judge Foster. Nothing definitive has transpired relative to the law appointments, but it is still the general impression that Mr. Jackson will be the new Judge.—The committee of the Irish Society have voted 1000*l.* for the purpose of laying the foundation of an exhibition in the University, for young clergymen acquainted with the Irish language, in order that they may preach in the native tongue. They have requested the Earl of Roden, Dr. Singer, and three other gentlemen to act as trustees of the fund.—The long-protracted Inquest at Rathmines, respecting the death of Mr. Byrne, has now been brought to a close. The Jury found that the deceased gentleman "was found dead in his bed on Saturday, the 9th ult.; that he met with his death at his own house between the 3d and 9th ult., under very mysterious circumstances; and that the strongest possible suspicions attach to Mrs. Ellen Byrne, his wife, as being accessory thereto." On Saturday the coroner received instructions from the Attorney-General, directing that, as the commission was so near, Mrs. Byrne should continue in custody of the police, as hitherto, until the case be investigated before the Grand Jury, and the result of their deliberations known.

Donegal.—During the last week 400 barrels of American flour have been imported into this town by Messrs. Rankin and Co., being the first arrival of flour direct from America into any of the northern ports of Ireland.

Kilkenny.—The local papers announce the death of Mr. John Banim, the well known author of "Tales of the O'Hara Family," and other popular works of fiction, who died, after a protracted illness, at his residence near this town, on Friday morning. Mr. Banim had for some time past almost wholly withdrawn himself from his literary pursuits. In early life he followed the profession of a miniature painter, but the success of his first dramatic piece, "Damon and Pythias," was decisive of his future fate, and the pencil, at which he is said to have been no mean proficient, was abandoned for the pen. He enjoyed a pension of 150*l.* per annum from the civil list, which was subsequently increased by the addition of 40*l.* a year for the education of his only child, a daughter.

SCOTLAND.

Edinburgh.—The Edinburgh meeting of the Highland and Agricultural Society, which has excited much attention for some time past, has just taken place. The preparation for the show had been completed some time previous, the show yard being erected in Warrender Parks, and the pavilion for the public dinner on the Castle Hill. The Earl of Roseberry presided, in the absence of the Duke of Buccleugh. The exhibition lasted for two days, and the meeting on the whole was very successful.—The papers mention that Sir W. Rae, the Lord Advocate, is confined at his seat, Eskgrove, near this city, by severe indisposition, which is said to render it doubtful whether he will ever be able to resume his official duties.—The sale of the Marquess of Huntley's landed property took place last week in the Old Signet Hall in this city. The barony of Finhaven, in the county of Forfar, was purchased for the sum of 75,000*l.* by the trustees of Mr. Gardyne, of Middleton, near Arbroath.

Glasgow.—The strike of the colliers in the neighbourhood of this place still continues. The accounts up to the end of last week state that they had attacked the potato fields, and carried off the crops, after severely maltreating the persons put to watch them. As the miners did not give the requisite warning before leaving their employment, five individuals had been apprehended and brought before the Sheriff, under the Act of Parliament, and the charge of breach of agreement having been satisfactorily made out, they were sent for 60 days to prison. A deputation from bodies of the colliers waited upon Sheriff Alison, in this city, on Saturday. The Sheriff stated to them that he could not interfere, except to see that they and their masters fulfilled their contracts to each other. The men explained their grievances, when the Sheriff gave it as his opinion that their general grievances and present proceedings arose from the avarice of the masters on the one hand and their own improvidence on the other. He believed that some of the poorest of the colliers spent as much on drink as he with his large family in a twelvemonth. The Sheriff advised those of them who had warnings to give to fulfil their engagements with their employers, and to return to their work.

Law.

House of Lords—Appeals.—*Lady Hewley's Charity. Short and others v. Wilson and others.*—Judgment was given, on Friday last, in this important cause—more particularly important as regards the Unitarians and Independents, with other Dissenters. The case had previously been for some time in the Court of Chancery—first, before the Vice-Chancellor; and secondly, before the Lord Chancellor, on appeal. The following is an epitome of the main facts:—Lady Hewley, widow of Sir John Hewley, who represented the city of York in Parliament towards the close of the reign of Charles II., a short time before her death, becoming desirous of devoting the principal part of her property for the purpose of encouraging the preaching of the gospel by Dissenting preachers, by her and others at that period designated "godly preachers," executed two trust deeds of the date of January 13, 1704, and April 26, 1707, conveying to seven trustees the manors of Kelling-hall, and Grey Croft, and Hayapark, with other lands in the county of York, for the purpose of providing for poor and godly preachers for the time being, and poor and godly widows, and for educating young men designed for the ministry, not exceeding in number, at one time, more than five such young men, and for the purpose of supporting an almshouse which she had built. At the time of her decease Dr. Coulton officiated at St. Saviour's meeting-house, which she had endowed, she being at the time in her 83d year. New trustees, as the old ones died, were appointed, and in the year 1755, on a new appointment of three, the Rev. Newcome Cappe was chosen to officiate as assistant to the Rev. Mr. Hollam, who had become feeble through age. The first introduction of Unitarianism into the chapel is attributed to Mr. Cappe, and on his death the Rev. C. Wellbeloved, a decided Unitarian, succeeded. After the lapse of some years, all the trustees became Unitarians, the newly-appointed trustees always being selected from that sect of Dissenters. When the Commissioners appointed by Parliament for inquiring into and correcting the abuses of funds and estates settled for charitable uses, visited York in 1826, a formal complaint was made against the application of the funds to the spreading and maintaining the Unitarian doctrine, which ultimately led to the information being filed in the Court of Chancery, and the consequent proceedings in that Court, which occupied not only days but weeks. When the case reached the House of Lords, it was deemed of so much importance that the learned judges were called in to give their assistance in bringing the House to a sound conclusion; and after it had been argued, certain questions, as to the construction to be put upon the two deeds above named, and "whether the extrinsic evidence adduced in the cause was admissable for the purpose of determining who were entitled under the terms 'godly preachers of Christ's holy gospel' to the benefit of the charity, and whether under the construction of the deeds, ministers or preachers of what is called Unitarian belief and doctrine are excluded." This was the substance of the six questions put to the judges in the course of last session, when the cause was argued. On the 10th of May last their lordships attended and entered into most elaborate arguments in the opinions they expressed. Lord Chief Justice Tindal, when speaking on these questions, respecting the construction of the deeds, whether or not they were friendly to the Unitarian doctrine, or whether persons professing that belief could have the benefit of the funds, thus expressed himself—"The opinion at which I have arrived, founded upon that which appears to me to be the true principle of construction of those deeds, is, that ministers and preachers of what is commonly called Unitarian belief and doctrine, and their widows and members of the congregations and persons of that belief and doctrine, are excluded from being the objects of the charities of both those deeds. First, taking the deed of 1704 by itself, I think the objects of it are limited to the ministers and others of the several bodies of Protestant Dissenters from the Established Church, which were generally known, established, and tolerated at the time the deed took effect; and I am unable to find any proof, from any authentic source, that the Unitarians did form in fact at that time a body or class of Protestant Dissenters known and established in the kingdom. On the contrary, so far as can be inferred from the evidence produced, or any other evidence of an historical nature, the Unitarians, as a body of persons of known religious tenets in England, were unknown until a period much later than the execution of either of the deeds in question; but further, so far were the persons who preached Unitarian doctrines from forming a religious body then known and acknowledged in the kingdom, that at the time of the execution of these very deeds such persons could not avail themselves of the benefit of the Toleration Act, 1 William and Mary, cap. 18, on the ground of their being persons who denied the doctrine of the Trinity, and, under the statute 9 and 10 William III., cap. 32, were at that time liable to certain penalties and disabilities if by writing or teaching they denied the doctrine of the Trinity. When, therefore, in the deed of 1704, provision is made for the 'godly preachers of Christ's holy gospel,' I think the answer to your Lordships' fourth question (viz. whether persons entertaining Unitarian belief are excluded from being objects of the charities of that deed?) must be in the affirmative—first, because there were existing at the time certain bodies of Protestant Dissenters, well known and ascertained, who preached doctrines which had been generally understood and believed in all ages of the church, and were also generally acknowledged at the time of the execution of the deed of 1704, to be the Holy Gospel of Christ, of which bodies the Unitarians did not at that time constitute one; and as the deed was so framed that the trusts were to take immediate effect and operation, it must be held to apply to the preachers and others of such bodies only which did then actually exist, and at that time answer the description in the deed—and secondly, because the deed describes the persons who are to take to be the preachers of the Holy Gospel of Christ, and it is undeniable that at the time of the execution of the deed both the Church of England as by law established, and all the known classes of bodies into which the Protestant Dissenters were divided, held the doctrine of the Trinity to be a fundamental part of their faith—that is, of the Holy Gospel of Christ; and that at the time of the execution of the deed, the Legislature also considered the belief in the doctrine of the Trinity as essential to the description of a preacher of Christ's Holy Gospel, punishing those who preached doctrines which denied it." Mr. Baron Parke, in reference to the same points, observed, "I am of opinion that Unitarians, who do not conscientiously believe the doctrines in the Creed, and Edward Bowles's Catechism, are excluded from the benefit of the charities of the deed of 1707, and I collect, from the answer and evidence in the case, that the generality of that body do not believe in the doctrine of original sin and the atonement in the sense in which those terms are used in that catechism, and therefore are not proper objects of this branch of the charity." The learned judge in another place said, "The poor persons who are to be admitted into the almshouses are clearly defined by the terms of the deed of 1707, and the rules made by Lady Hewley pursuant thereto. They must be Protestant; they must be able to repeat the Lord's Prayer, Creed, Ten Commandments, and Bowles's Catechism, and they must of course believe in the doctrines contained in the creed and catechism. If they are Protestants, though they may be of the Church of England, who do not conscientiously believe in those doctrines, they are admissible; if they do not, they are incapable of partaking of this branch of the charity." Upon the same question, Mr. Baron Gurney was of opinion, "that persons of Unitarian belief and doctrine are excluded from being objects of the charities of those deeds. The rules and regulations established by Lady Hewley require that the alms-people shall be able to repeat by heart (which I understand to mean, to repeat believingly) the Lord's Prayer, the Commandments, the Creed, and Bowles's Catechism. Bowles's Catechism is inconsistent with the belief and doctrine of the Unitarians." Mr. Justice Williams, on the same point, observes—"Understanding as I do the language of the foundation deed, and the belief and doctrine which I collect to be attributed to Unitarians (though upon this, not being in any degree a legal question, I speak with great uncertainty), I think they are excluded from being objects of the charities of the deed." Mr. Justice Coleridge said, "If I look to the words of the deeds, and consider them with reference to the history of the times, as to the then state of what is commonly called Unitarianism, I see in the former clear indications of an intention to provide for poor and godly members of a body, preachers to congregations, a succession contemplated in a ministry then in being, and known education provided for those who were to come into it; but history discloses that none of those circumstances were then applicable to this sect." "When I find that the denial of the doctrine of the Trinity and of the atonement formed the distinguishing feature of the Unitarians' faith," observes Mr. Justice Erskine, "and that those who at the time professed it were but few, that they rejected as unscriptural doctrines which all other Christians had held to be essential articles of the Christian faith; and that the name of Unitarian had been assumed to distinguish them from the rest of the Christian world, as paying supreme worship to God the Father only; and when I find that at the date of Lady Hewley's deed, those who denied the Trinity were, by the legislature, denounced as guilty of blasphemy; I cannot come to any other conclusion than that Lady Hewley did not intend to include them under the description of 'preachers of Christ's Holy Gospel,' and, consequently, not under the other descriptions in the deed either of 1704 or 1707, but that the phrase 'preachers of Christ's Holy Gospel' was selected for the purpose of excluding all who preached such doctrines." Mr Justice Maule was the only judge who entertained a different view from the learned judges upon this part of the case, he being "of opinion that the ministers and preachers, widows, members of congregations, and persons mentioned in the questions were not excluded from being the objects of the charities." With respect to the admission of the extrinsic evidence, for the purpose of determining who were entitled, under the terms, to the benefit of the charity, their Lordships thought that much of it was clearly admissible, but that other portions were not. That, however, did not influence them in their opinions.

Lord Cottenham said, the opinions of the learned judges had so far exhausted the subject, that he should not think it necessary to go into the question at any length. A very large mass of evidence was given in the Court of Chancery as to what was the intention of Lady Hewley. The judges were not on that point unanimous, but still there was enough to warrant the conclusion that the decree of the Court below was a sound one, and ought to be affirmed. As regarded the main question, all of them, except one, considered that it was right. He trusted that the funds would be administered in future in conformity with the decision of the House. No blame whatever attached to the trustees. This he begged distinctly to state, and, in conclusion, recommended the House to affirm the decree of the Court below—and he saw no grounds for deviating from the usual course in such cases—with costs. Lord Brougham said, he entirely agreed with his noble and learned friend that the appeal ought to be dismissed, and with costs. The case was before him in the Court of Chancery, and he heard the whole of it there except the reply, not possessing the Great Seal when the reply was made. No opinion was then given by him, nor indeed was any opinion come to, in the absence of the reply, which was heard by his noble and learned friend who had succeeded him (Lord Lyndhurst), and whose judgment it was now proposed to affirm. The opinions of the learned judges had undoubtedly been of very great use to their Lordships in assisting them in the question, and those opinions were six out of seven favourable to the decree of the Court below. Lord Campbell said that having argued this case as counsel at their Lordships' bar, he should wholly abstain from giving any opinion upon it. The question was then put and agreed to, affirming the decree of the Court below, with costs.

Ferguson and others v. the Earl of Kinnoul and the Rev. Robert Young.—Judgment was delivered on Tuesday on this appeal, arising out of the well-known Auchterarder case. In 1839 the Earl of Kinnoul presented the Rev. Robert Young to the Presbytery of Auchterarder for trial previously to his admission as minister of the parish; and on their refusal to take him on trial, application was made to the Court of Session, and an interlocutor was pronounced directing the said presbytery to take the said Robert Young on his trial. An appeal was made to the House of Lords, and their Lordships affirmed the decree of the Court of Session. The Lord Ordinary then pronounced another interlocutor, directing the presbytery and the appellants in this cause to take Mr. Young on trial. This decree was on the 2d of July served on the presbytery, and Mr. Young presented himself before them. Two motions were made, one that he should be taken on trial, and the other that the matter should be referred to the General Assembly. The latter motion was carried, and Mr. Young was never taken on trial. The Earl of Kinnoul, as patron, and Mr. Young, as his presentee, then pursued the appellants in the Court of Session for damages, and the Court unanimously decided that they were entitled to compensation. Against this decision an appeal was brought, which was argued a short time since at the bar of the House, and reported in our Paper of July 16. The Lord Chancellor, after alluding to the facts of the case, said that their Lordships had taken time to consider their judgment, not from any inherent difficulty in the case, but on account of the great interest it had excited, and the important principle involved. One point, however, was clear, and it formed the basis of the whole case. It was the manifest duty of the defendants to take Mr. Young on trial. That had been decided by the Court below, and affirmed by their Lordships on appeal. They had no discretion in the matter; they were bound to take him on trial. It was established law; it could not be controverted; it admitted of no appeal. The defendants could not plead ignorance, as they were parties to the former suit. The motion to refer the matter to the General Assembly was, therefore, nothing but an attempt to evade the law. The principle of law is, that where a person has a public duty to perform, he is bound to perform it, he has no discretion; and if he neglects or refuses to perform it, and thereby an injury accrues to an individual, an action for damages is sustainable. This was laid down by Baron Eyre in the case of "Sutton v. Johnson," in the Court of Exchequer. In the case of "Sterling v. Turner, mayor, London," the plaintiff was a candidate for the office of bridgemaster, and the mayor refused a poll. An action was brought for damages, and was held well brought. This was not the rule in England alone, but was just as much the law in Scotland. In the case of "Adam Innes v. the Magistrates of Edinburgh," the plaintiff recovered damages for injuries sustained by his falling into a pit in the public streets, which was left open when the streets were under repair. It was the duty of magistrates to take every precaution for the public safety; they had neglected this, and Innis recovered damages against them. It had been stated at the bar of the House, that the Presbytery had acted as a court exercising judicial functions, and, therefore, were not liable for an error of judgment. If they had taken him on trial, and then rejected him on his qualifications, this might be so; but in the present case they had no discretion, they were bound to take him on trial, it was imperative on them to do so. Under such circumstances, the action must be supported. Another objection was, that the action ought to have been brought against the presbytery in their corporate capacity; but the appellants had joined in preventing Mr. Young being taken on trial, and had thereby caused the loss complained of, and it was a principle of law that an action was sustainable against them collectively or individually. Those who did the wrong were liable to make compensation. It was said that some of the appellants might have voted in the minority; if any had voted for taking him on trial, that might have been, so far as they were concerned, a good defence; but this was not alleged on the record, and the presumption was the other way. In the case of "Rich v. Fulton," an action for a false return was brought against the Mayor of London; the defence was, that as the return was made by the mayor and aldermen, the action ought to have been brought against them, and not against the mayor alone, but the Court held that the action might be brought against them collectively or individually, notwithstanding a suggestion that the mayor might have objected to the return. The principle of the present case was this:—The appellants had a public duty which they were bound to perform, they were aware of their duty, that duty they had neglected; thereby they had caused an injury to the respondents, and therefore he submitted that the judgment of the Court below must be affirmed.—Lord Brougham said, that agreeing entirely with the proposition of his noble and learned friend, he felt that an apology was due for entering into the question at any length, nor should he have done so had it not been for the extraordinary interest of the case, and that, as the point was not before them, he was not prepared to state that if the presbytery had taken Mr. Young on trial, and had rejected him on his qualifications, they would have been acting judicially, and therefore would have been entitled to protection. With this single qualification he entirely agreed with the view taken by his noble and learned friend. The noble and learned lord then proceeded to review the facts of the case in detail, and after referring to the order of the Court below, that the defendants should make compensation to Lord Kinnoul and Mr. Young, said the only question was, whether the action was properly brought against the appellants individually, or whether it ought not to have been brought against the Presbytery collectively. As the interlocutor of the Court of Session found that the individuals constituting the Presbytery as well as the body collectively were bound to take Mr. Young on trial, in the event of their refusal an action would lie against them jointly or severally, and as the majority of the Presbytery had prevented the minority from obeying the law, they were answerable for the injury thereby incurred. The principle of law was, that any body of persons refusing to perform a public duty were answerable, both collectively and individually. An exception was made in the case of a court of justice, who were not answerable for an error of judgment, however injurious, as it followed from the nature of the discretionary power entrusted to them; but when there was no discretion, as in the present case, they were bound to perform the duty, and liable to the consequences of non-performance. The Court of Session, which was the superior, had found that the Presbytery, which was the inferior court, had acted illegally and in contravention of the law, and he had never heard of a case in which an inferior court had been upheld in its refusal to obey its superior court. It had been said that the Presbytery was not controlled by municipal law, but that an appeal from it lay to the synod, and thence to the General Assembly; but of course they who held that the Presbytery was exempt from the control of the municipal law would not acknowledge the jurisdiction of that authority over the synod or the General Assembly. This would be an *imperium in imperio*, altogether irresponsible to any law; and yet this was the doctrine which pervaded the whole of the reasoning on behalf of the appellants. They were not called on to decide, nor was he prepared to admit, that no action would lie against one of the superior judges for breach of duty in leaving his circuit without trying a cause. The Presbytery resembles the bishop. The bishop exercises his judicial functions by his officers; if they exceed their jurisdiction, or refuse to perform their duty, the temporal courts interpose, and so in the case of the judges of the Court of Admiralty. A bishop is liable to an action for refusing to license a clerk. By the 13th and 14th of Charles II., the Act of Uniformity, no person can be received as a lecturer unless duly chosen and licensed by the bishop. In the case of "The King against the Bishop of London," in East's Reports, an application was made for a *mandamus*, calling upon the bishop to examine a clerk, and then, if fit, to license. The *mandamus* was refused on the affidavit of the bishop, that he could not, after frequently hearing him, conscientiously grant him a license; but Lord Ellenborough, in his judgment, said that, although a bishop was so absolute that he might form his opinion of a clerk's fitness from a previous knowledge of his character, still he was bound to inquire and determine on his fitness. However, it could not be said that a presbytery was vested with so absolute a power as a bishop. An action against the presbytery for refusing to receive on trial was the same as an action against an ordinary for refusing to license. The doctrine that no individual of an aggregate corporation was liable for the illegal acts committed by such corporation was subversive of all good government, and was without foundation either in the law of England or Scotland. There was great laxity in the Scotch law relating to corporations. In England they could only be created by statute or by grant from the Crown; but in Scotland almost any body of persons acting together can form themselves into a corporation. An action lies for a false return to a *mandamus*; and it has been held that corporators are liable on this action in their individual character. From July, 1839, to the present time, the appellants have refused to take Mr. Young on trial, and this is tantamount to a wilful breach of the law; this house, therefore, is not liable to the charge that has been so often brought against it, of violating the rights of conscience. If persons were dissatisfied with the state of the law on this subject, a remedy or an escape was open to them. The parties to whom the Presbytery had had recourse for advice were the parties who had before recommended them to refuse obedience to the law. It was fit that these men should learn the lesson of obedience to the authorities set over them; it was just that they should make reparation to the persons they had injured by their pertinacious refusal to perform the duty enjoined by the law. Their duty was not a doubtful one, they had not even the excuse of error in judgment; and must, therefore, abide the consequence of such violation of the law.—Lord Cottenham said, he felt great satisfaction at the manner in which the subject had been treated by his noble and learned friends. He had never felt that there was any difficulty in the case. The principal ground of defence was this,—an exercise by the presbytery of their judicial duties, and therefore they were not liable to an action for error in judgment. The interlocutor showed that there was no ground for this defence. The Court of Session had decided that the presbytery were bound to take Mr. Young on trial, that was therefore the declared law of the land, and they were bound to obey it: any violation of such law whereby an injury resulted to the parties, rendered them liable for the loss sustained. The only other ground of defence was, that the defendants were not individually liable for the acts of the body. There was hardly any ground for such an exposition of the law in England, and certainly not in Scotland. The case quoted by his noble and learned friend of "Innes v. the Magistrates of Edinburgh," showed that if wrong had arisen and damage had been sustained by the negligence or illegal acts of a body, each individual member was personally responsible. If, therefore, the law was clear on those two points, there was an end of the case.—Lord Campbell said, that he was of opinion that the judgment of the court below ought to be affirmed. The general rule was that an action would lie for an injury. There was no doubt that Mr. Young had sustained an injury by the conduct of the presbytery. They ought to have known that while they continued members of that body they were bound to perform the duties of that body. Those duties were declared by the act of Queen Anne, and could only be altered by the highest legislative authority. Wrong was committed by the defendants, and loss was sustained by the pursuers; therefore the action was well brought. The laws of England, Scotland, and all civilised nations upheld this principle. A Court acting judicially were not answerable unless malice was alleged and proved. If the presbytery had taken Mr. Young on trial, and rejected him on his qualification as to morals or orthodoxy, no action would lie. But here they were required as a mere ministerial act, to take him on trial; they had no discretion. They were just as liable for refusing to do a ministerial act as for exceeding their jurisdiction; in both cases an action would lie. This was not an order from the civil power to admit to holy orders, but only to admit a person duly qualified to a certain status in the church. A bishop was bound to license an orthodox person, and an action would lie for his refusal. Lords Holt, Lee, Mansfield, and Ellenborough had laid down this principle. This action was brought against each member for his own delinquency. Proceedings might be taken against a body to compel them to do a certain act, but this was an action against those members only who committed the wrong. Malice consisted in a known disobedience to the law; and such there was here. The temporalities were united to the spiritual office by the law of the land, and the civil courts recognised and enforced this. A renunciation of temporalities could not be made by those who remained members of the church. The presbytery was under a solemn obligation to act in obedience to the supreme authority. In the most palmy days of Popery, if the courts Christian exceeded their authority, the courts at Westminster interfered by prohibition. When the law was clear the hardship of obeying it was a topic not to be admitted; the love of power, and especially of religious power, insidiously took possession of the human heart, and the setting up of conscience above law was calculated to produce the most dangerous results. The reference to the General Assembly was not alone an evasion, but a violation of the law, as the motion of adjourning the consideration of a church rate for a twelvemonth had been held to be a total refusal of such rate. In conclusion, he could not but regret the course which the appellants had pursued; for, as the son of a clergyman of the Church of Scotland, he felt a deep interest in her welfare, being satisfied that to the ministration of her clergy were mainly owing the honesty and intelligence of her population. He trusted she would be permanent and prosperous; but to insure this she must learn the lesson of the supremacy of the law, and pay implicit obedience to it. Nor was there any disparagement in this. If they felt aggrieved, let there be an application to Parliament, and both Houses would give their serious attention to the subject; but perseverance in their late ill-advised courses must lead to its subversion.—The judgment of the Court below was then affirmed with costs.

TATTERSALL'S, FRIDAY.—A very thin attendance, and only three bets booked, namely, 17 to 1 agst Cattonite and 18 to 1 agst Artful Dodger for the St. Leger, and 100 to 4 agst Cabrera winning that race, and Philip the Derby.

MARK LANE, FRIDAY, AUGUST 12.—There has been but little Wheat at Market in addition to Monday's supply, and that could not be sold unless a further decline of 2s. was submitted to.—The sale of Foreign continues very limited, and lower rates are taken where sales are effected.—No inquiry for bonded. Barley, Peas, and Beans remain unaltered in value. There is rather more doing in Oats, but at no improvement in prices.

Soil, lecture on its proper condition at the time of sowing . 543 *c*
Strawberry, Myatt's Pine . 542 *b*
Tape, a substitute for bast in budding . . . . . 542 *a*
Tettagonia spumaria . . 542 *a*
Wall-fruit, to protect from Wasps . . . . . . 545 *b*
Wasp's Nest, immense . . 542 *c*
Wasps, to diminish their number . . . . 545 *c*

HORTICULTURAL SOCIETY OF LONDON.
EXHIBITIONS AT THE GARDEN.

All persons interested in these Exhibitions are invited to suggest such improvements as may occur to them. The desire of the Society is to do everything that is calculated to attain the great object for which the Exhibitions were instituted, namely, the promotion of Horticulture; and any suggestions that may be made by letter, addressed to the Vice-Secretary, 21, Regent-street, will be laid before the Exhibition Committee for consideration. The following were the regulations observed during the past season:—

Subjects of Exhibition.—These will be divided into Classes, as explained further on. No articles not of horticultural produce will be allowed to be placed upon the tables. Exhibitors will do well to make themselves acquainted with the arrangements described in the following list, as they will in all cases be required to sign a declaration stating under what letter their plants are to be shown; and they are particularly requested to take notice, that if errors in the awards of the judges should occur, in consequence of mistakes on the part of exhibitors in filling up such declarations, the Society cannot undertake to rectify such errors afterwards. To enable the officers of the Society to attach names to the objects exhibited, it is requested that correct lists may be delivered to the clerk as soon as the exhibitor reaches the Garden.

Class I.—Flowers for which Nurserymen and Private Growers exhibit independently of each other.

A. Greenhouse Azaleas, to be shown in numbers not exceeding 12, GB, LS, SK.
B. Carnations, in pans of 24 blooms, LS, SK, SB.
C. Picotees, in pans of 24 blooms, LS, SK, SB.
D. Pinks, in pans of 24 blooms, SK, SB.
E. Cape Heaths, in collections of 20 species, GK, SG, LS, SK.
F. Cape Heaths, in collections of six species, GB, LS, SK.—*N.B.* No person who shows in E will be allowed to exhibit also in F.
G. Exotic Orchidaceæ, in collections of not fewer than six species, GB, LS, SK.
H. Exotic Orchidaceæ, in single specimens, LS, SK, SB.
I. Pelargoniums, in collections of 12 varieties, in pots, not exceeding 12 to a cast, GB, LS, SK, SB.
K. Pelargoniums, in collections of six varieties, in pots, not exceeding eight to a cast, SG, LS, SB.
L. Rhododendrons, in pots, not fewer than 12 plants, in 12 varieties, LS, SK, SB.
M. Moss Roses, SK, SB.
N. Common Garden Roses, exclusive of all Chinese or Chinese Hybrids, LS, SB, SK.
O. Chinese or Hybrid Roses, such as Bourbon, Noisette, Tea-scented, and similar varieties, LS, SB, SK.—*N.B.* No exhibitor of Roses can be allowed to occupy more than 15 ft. run of tables for all his Roses, which, being double, is equal to 30 ft. of boxes. If any Exhibitor gains the first medals both in M, N, and in O, he will be entitled to a Gold Banksian medal instead of the three Silver ones.
P. Stove or Greenhouse Plants, in collections of from 50 to 60 plants, GK, GB, SG, LS.
Q. Stove or Greenhouse Plants, in collections of from 15 to 20 plants, GB, LS, SK.
R. Stove or Greenhouse Plants, in collections of six distinct species, LS, SK.—*N.B.* Persons exhibiting in P and Q will not be allowed to compete in R also.
S. Herbaceous Calceolarias, in sixes, LS, SK, SB.
T. Shrubby Calceolarias, in sixes, LS, SK, SB.

Class II.—Flowers, for which all persons are admitted to equal competition:—

U. Collections of Stove or Greenhouse Climbers, GK, GB, LS, SK.—*N.B.* The Gold Knightian medal is not to be awarded for fewer than 12 distinct kinds.
V. Tall Cacti in flower, LS, SK.
W. Single specimens of Ornamental Plants, LS, SK, SB, C.
X. Miscellaneous Flowers, SK, SB, C.—*N.B.* Cockscombs, Hydrangeas, and cut flowers, are altogether excluded from prizes.
Y. Seedling Florists' Flowers, SK, SB, C.—*N.B.* Every seedling must be shown singly, and must be marked with the name it is to bear. The same seedling cannot gain a prize more than once in the season. Pelargoniums are to be shown in single trusses, with a single leaf, so far below the flowers as not to support them; and they are not to be dressed with cotton or wool, or any similar substance, but must be shown exactly as they grow on the bush.

Class III.—Fruit, for which market-gardeners, or persons in the habit of regularly supplying the market, and private growers, exhibit independently of each other.—*N.B.* All Fruit must be ripe and well-coloured; if the contrary, it will be disqualified.

Z. Miscellaneous collections of Fruit, consisting of at least three different kinds, Peaches and Nectarines being considered as only one kind, GK, GB, LS.—*N.B.* Cucumbers Tomatoes, Gourds, and similar kitchen-garden produce, are excluded from this letter.
AA. Grapes, SG, LS, SK, SB.
BB. Pine-apples, SG, LS, SK, SB.
CC. Peaches or Nectarines, in dishes of six specimens, SK, SB.
DD. Miscellaneous Fruit, SK, SB, C.

Judges.—The Judges have the power of increasing or diminishing the number and value of the Silver Medals offered by the Society for particular objects, and also of conferring Silver Medals or Certificates in cases not contemplated in these regulations, if they think it necessary to do so.

The judges are also required to bear in mind that the Society's medals are offered, less for new and curious objects, than for fine specimens of Horticultural skill, the design of the council in instituting these meetings being not so much to encourage the collector as to reward the skilful gardener; they are also not to make any award in cases where the objects exhibited do not appear worthy of a medal; otherwise a bad single exhibition might obtain a prize, merely because there is no better exhibition of the same class to oppose it.

WINDSOR AND ETON ROYAL HORTICULTURAL SOCIETY.

THE GRAND ANNUAL SHOW of this Society will take place at Windsor on Saturday, the 3rd of September, when handsome Prizes will be given for every description of Flowers, Fruit, and Vegetables. Printed particulars may be had on application to Mr. J. Cleave, Windsor.

Wm. Wright, Hon. Sec.

MAIDENHEAD HORTICULTURAL SOCIETY.

The Second Show of this Society for the present year, for the Exhibition of DAHLIAS, &c., will be held at the Town Hall, at Maidenhead, on Friday, the 9th Sept. next, when, in addition to other prizes, THREE SILVER CUPS, of the value of Four Guineas each, will be given by the Inhabitants of Maidenhead, for collections of Dahlias of 24 varieties, *Open to all England.*

Further particulars and Schedules of Prizes may be obtained on application to the Secretaries.

Fred. T. Ward } Hon. Secs.
J. W. Shackel }

Maidenhead, 13th Aug., 1842.

HULL BOTANIC GARDEN.—DAHLIA, &c., SHOW.

THE GRAND ANNUAL EXHIBITION OF DAHLIAS, FLOWERS, PLANTS, FRUIT and VEGETABLES, open to all England, will be held in the Botanic Garden, Hull, on Tuesday, 30th August, when prizes amounting to nearly *One Hundred Pounds*, including *Three* handsome *Silver Cups* of the respective value of *Sixteen Guineas, Seven,* and *Five Guineas,* will be awarded.

Schedules of Prizes, Regulations, &c., may be had on application to Mr. Smith, Curator, at the Gardens.

In the Evening, Mr. Southby, of the Royal Surrey Zoological Gardens, London, will exhibit the awfully grand and sublime Historical Spectacle, the

ERUPTION OF MOUNT VESUVIUS, WITH THE CITY AND BAY OF NAPLES, &c.

The magnificent effect of this terrific Outbreak of Nature cannot, unseen, be conceived.

F. R. Horner, M.D., President, at the Botanic Garden.
Hull, Aug. 16, 1842.

A PRIZE of £10, open to all England, will be awarded at the THANET FLORICULTURAL and HORTICULTURAL SOCIETY'S EXHIBITION, to be held September 8th, at the Ranelagh Gardens, St. Peter's (two miles distant from Margate), for the best 24 Dissimilar Dahlias.

J. G. Hodgson, Hon. Sec.
Vicarage, St. Peter's, August 16, 1842.

N.B.—Exhibitors to provide their own Stands.

HIGH WYCOMBE HORTICULTURAL AND FLORAL SOCIETY. The Autumn Show of the above Society will be held in the Town Hall, High Wycombe, on Wednesday, the 7th of September next.

High Wycombe, Aug. 17, 1842.
J. G. Tatem } Hon. Secs.
Thos. Wheeler }

UNION ROAD NURSERIES, PLYMOUTH.

WILLIAM E. RENDLE, Nurseryman, Seedsman, and Florist, has the pleasure of offering to the Nobility, Amateurs, and the Trade, the following new varieties of

PELARGONIUMS,

raised by P. E. Lyne. Esq., of Sepson, the entire stock of which he has succeeded in obtaining:—

	£	s.	d.	
Lyne's Sunrise	£3	3	0	each
„ Duke of Cornwall . . .	3	3	0	„
„ Lord Ebrington . . .	2	2	0	„
„ Princess Royal	2	2	0	„
„ Cynthia	1	10	0	„
„ Modesty	1	10	0	„
„ Hamlet	1	10	0	„
Bassett's Glory of the West . .	2	2	0	„

The usual Discount to the Trade.

Strong Plants of Princess Royal and Glory of the West are now ready for delivery. The other sorts will be sent out in October.

Agents in London—Messrs. Warner, Seedsmen, Cornhill, and Mr. Wm. Bristowe, Seedsman, Knightsbridge; from whom Plants and descriptions can be procured, and where drawings of some of the sorts may be seen. Descriptions of the Seedling can also be had on application at the Union Road Nursery, Plymouth; or by reference to the *Gardeners' Chronicle* of August 6, 1842.

Union Road Nursery, Plymouth, August 3, 1842.

LILIUM LANCIFOLIUM.

H. GROOM, Clapham Rise, near London, (Removed from Walworth,) by Appointment Florist to Her Majesty, respectfully informs the Nobility, Gentry, and Public, that he has a fine stock of Lilium lancifolium, album, and punctatum, which he can supply at very moderate prices.

He begs to say his Catalogue of Geraniums is ready for delivery, and can be had on application.

MYATT'S BRITISH QUEEN STRAWBERRY, after two years' competition, still maintains its pre-eminence; and, in returning thanks to their numerous patrons and friends, J. and W. Myatt beg to say they can with confidence recommend it as the most superb fruit yet known.

Also their new Seedling Strawberry Prince Albert, which for productiveness and size cannot be equalled. Price per 100, each, 50*s.*; and their Eliza, 20*s.* Runners are now ready, and may be had on application to them at Manor Farm, Deptford.

Myatt's famed Victoria Rhubarb, 50*s.* per 100 sets, or 1*s.* 6*d.* per root, will be ready in October.

PAULOVNIA IMPERIALIS.

CHAS. VAN GEERT begs to offer the above new and splendid tree, which has (after three years' trial) proved to be perfectly hardy, bearing leaves similar to, but tenfold larger than a Catalpa; its growth is very rapid, and flowers at the height of 10 to 12 ft. The blossoms (which grow in clusters) are larger than a Gloxinia, of a fine bluish lilac, and of a beautiful effect in spring.

Strong young plants, 15*s.* each, and a discount of one-third will be allowed where six plants are taken. All orders to be prepaid to the address below, and accompanied by a remittance from unknown correspondents.

Chas. Van Geert, Nurseryman, Antwerp, care of Mr. G. Rhan Crescent, Minories, London.

N.B.—The carriage will be paid to London.

STAPLETON ROAD NURSERIES, near BRISTOL. W. MAULE and CO. beg to call the attention of Horticulturists to a new and desirable FUCHSIA, which they intend sending out by the name of "Racemiflora élegans." Its habit is gracefully elegant; the lateral branches are set at every joint with numerous long deep-red flowers, 1½in. to 2in. long, drooping around the main stem of the plant, forming a complete column of beauty. It is allowed by competent judges to be one of the best varieties in cultivation.—Fine strong plants, in bloom, will be sent, if ordered, at 5*s.* or 7*s.* 6*d.* each.

TO GROWERS OF HYACINTHS, AND OTHER DUTCH BULBS.

YARMOUTH approximating so closely to Haarlem, the transit between the two places not occupying more than 10 or 12 hours, has induced Messrs. Youell to pay repeated visits, for the purpose of inspecting not only the Blooms, but of ascertaining the best Growers; and having concluded the objects they had in view in this respect, they have now the pleasure of announcing that this Season they will import a large quantity of Hyacinths, and other Bulbs for which Haarlem is so justly celebrated; and they confidently assert that the many causes of complaint so frequently made, and in most cases not without good grounds, of Bulbs proving unsatisfactory when blooming, will now be obviated. The Bulbs, they beg to add, are remarkably fine; and parties at a distance favouring them with their commands will have Bulbs included, to compensate in some degree for carriage.

Catalogues may be had on application.

Great Yarmouth Nursery, August 11th, 1842.

TO NURSERYMEN, PINE GROWERS AND OTHERS.

MESSRS. PROTHEROE & MORRIS are instructed by the Trustees of Messrs. Adamson and Son, Stoke Newington Common, to submit to public competition, early in Sept. next, the whole of their celebrated Stock of Fine plants, Greenhouses, Hothouses, Graperies, Carts, Waggons, and general Farming and Agricultural Implements, and a considerable quantity of Building Materials. The whole comprise about 35,000 feet of Glass, with Brick and Ironwork and Water Apparatus complete; about 10,000 Pine plants of the first quality, and well-known established Stock; a considerable number of Cucumber, Melon, and other Frames and Lights; the stock of Greenhouse and other Plants. Further particulars will shortly be advertised. The whole of their splendid Nursery and other Stock will be disposed of by public Auction about the third week in October next, of which timely notice and particulars will be given.

American Nursery, Leytonstone.

VALUABLE ORCHIDACEOUS PLANTS.

MESSRS. THOMAS WINSTANLEY AND SONS (of Liverpool) announce to the Admirers of curious and rare plants, that they are instructed to sell by Auction on the Premises, Aigburth, near Liverpool, on Monday, the 29th of August next, and following days, at 12 o'clock precisely each day,

THE UNIQUE, WELL-KNOWN, AND JUSTLY-CELEBRATED COLLECTION OF ORCHIDACEOUS PLANTS,

The Property of Richard Harrison, Esq.

In the collection will be found large and rare specimens of the Angræcum Eburnium; Cattleyas, including Skinneri, Perrini (fine), Labiata (very fine), Crispa (very large), Mossii, Lodgesi, Guttata, Citrina, Superba, &c. &c. Epidendrums, all fine; named and several unnamed Maxillarias, Oncidiums, Dendrobiums; Ae'rides Brookii, cornutum, and odoratum; Odontoglossum grande, maculatum, &c.; with about four hundred other varieties of choice Parasitical Plants, including Fernandesia, Grobya, Gongora, Heterotaxis, Hillia, Lissochilus, Leptotes, Cyrtopodium, Calanthes, Cypripedium, Coryanthes, Cirrhæa, Catasetum, Cœlogyne, Cyrtochilum, Cycnoches, Cymbidium, Neottia, Brassavola, Vanda, Rodriguezia, Myanthus, Mormodes, Miltonia, Phaius, Brassia, Burlingtonia, Bifrenaria, Batemannia, Stanhopea, &c. &c.: Lælia anceps, autumnale, and others. Together with a general assortment of Hothouse Plants of an important character, and highly interesting to the lover of Botany.

The above Collection, for its extent, is allowed to be one of the finest in Europe, and is the result of twenty years' formation, by Mr. Harrison, regarding only variety and perfection.

The Plants having been attended to by a skilful gardener, are in excellent condition, and will be sold without reservation.

The whole may be viewed on Friday 26th, Saturday 27th August, and on the mornings of Sale, and Catalogues, which will be ready in a few days, had at the following places:—The Offices of the *Gardeners' Chronicle* and the "Gardeners' Magazine;" Messrs. Winstanleys, Paternoster Row, London; at the place of Sale, and of Thos. Winstanley and Sons, Liverpool.

HEATING BY HOT WATER.

HOTHOUSES, and every description of Horticultural Buildings, Churches, Chapels, Public Buildings, Mansions and large Rooms, fitted up with the above apparatus on the most improved and scientific methods.

W. WALKER and Co. (late of Mosley-street, Manchester) beg to announce that they continue to execute works of the above description, in which they have introduced a variety of important improvements of a satisfactory nature, especially to Horticulturists. They have applied this principle on a more extensive scale than has ever been hitherto adopted at the stupendous Conservatory and Hothouses of his Grace the Duke of Devonshire, and in numerous other extensive establishments, with the most complete success.

They have also successfully applied C. W. Williams' Patent Argand Furnace to their boilers, and have made arrangements with the Patentee for its general adoption. It economises fuel, and removes the nuisance and disfigurement of smoke, so much complained of by Gardeners, and is a new and valuable feature in these Apparatus.

Works executed in every part of the United Kingdom with punctuality and despatch.—33, Brown-street, Manchester.

HOT-WATER APPARATUS, for Horticultural and other Buildings.—STEPHENSON and Co., Agents for the Old Park Iron-works, and Manufacturers, 61, Gracechurch-street, London, solicit an inspection of their improved Conical Boiler. (See Editor's description, *Gardeners' Chronicle,* March 12, p. 175.) To Amateurs these Boilers will be found invaluable. They are complete without furnaces or setting in brickwork, movable at pleasure, very ornamental in appearance, and require attention only once in 14 or 15 hours, price 5*l.* 5*s.* and upwards. Further particulars, with plans and estimates for heating any description of building, may be obtained as above: where also may be seen the improved Wrought-iron Boiler, as applied with Chanter's Smoke-consuming Furnaces at Chatsworth, and many other of the Nobility's Seats. Iron Fencing, Hurdles, Bedsteads, Ornamental Wire-work, Garden Implements, &c. &c. The trade supplied with Hot-water Socket-pipes.

N.B.—Wayte's New Patent Land-pressers and Drills.

HEATING BY HOT WATER.

JOHN WALKER, 46, St. John's Square, Clerkenwell, London, having been for many years extensively engaged in Warming Churches, Manufactories, Hospitals, Hothouses, Conservatories, and Private Houses, by means of Hot Water, either in Pipes or Pedestals, can confidently recommend this mode of heating in preference to any other. Numerous references can be given both in town and country, where he has successfully and satisfactorily applied it. Baths fitted up and heated in a superior manner. Orders executed in all parts of the Country with punctuality and despatch.

HOT-WATER APPARATUS FOR HEATING HORTICULTURAL BUILDINGS, DWELLING-HOUSES, CHURCHES, and MANUFACTORIES, upon improved principles, and at very moderate charges, erected by **DANIEL and EDWARD BAILEY, 272, HOLBORN.**

D. and E. BAILEY having devoted much time to the consideration of this subject, and had much experience in the erection of apparatus for the above-mentioned purposes, have, by improvements suggested in their practice, rendered their mode of heating not only very efficient, but very simple, and have combined durability in the apparatus with economy in the charge. They have erected apparatus in England, Scotland, and Ireland, for many noblemen and gentlemen, and have had the honour to be employed by the Horticultural Society of London, in executing the works of their splendid Conservatory, lately erected at Chiswick.

D. and E. BAILEY also construct in metal all descriptions of Horticultural Buildings and Sashes, and invite noblemen, gentlemen, and the public to an inspection of their various drawings and models, at 272, Holborn, where they have the opportunity of exhibiting, amongst other metal works, an extremely complete and convenient kitchen apparatus, or range, adapted for the continued supply of hot water, and an arrangement of the oven more complete than has hitherto been brought before the public.

D. and E. BAILEY were the first to introduce metallic curvilinear houses to horticulturists, and can refer to the Conservatory attached to the Pantheon as one of their works, besides many others in this country and on the Continent.

D. and E. BAILEY have prepared a quantity of the Galvanic Plant Protectors, which are now ready for immediate delivery; they beg to introduce to public notice a new Trough Pipe, for Orchidaceous or other Houses where vapour is constantly, or at intervals, required, and which may be seen at their manufactory.

THE CONICAL HOT-WATER BOILERS invented by J. ROGERS, Esq., may be obtained of any size from **JOHN SHEWEN,** Ironmonger, &c., Sevenoaks, Kent.

J. SHEWEN having had every opportunity afforded him by an extensive practice to bring this apparatus to perfection, begs to offer it as most efficient and economical: it may be seen at Messrs. Chandler & Sons' Nursery, Vauxhall; Messrs. Loddiges', Hackney; Messrs. Henderson's, Pineapple-place; Mr. Knight's, King's-road, Chelsea; Messrs. Veitch and Son's, Exeter; and at the Gardens of the Horticultural Society of London.

TO FLORISTS, HORTICULTURISTS, AMATEUR GARDENERS, &c.—CLARKE'S AIMATIC COMPOST, for the Flower and Kitchen Garden, Greenhouse Plants, Pineries, &c.: the application of this COMPOST will add greatly to the beauty of the Flower and produce of the Kitchen Garden. In making new Gardens it will be found invaluable; it has long been in use in the Royal Gardens at Kew. Price One Guinea per bag, containing two cwt., sufficient for a good-sized garden for one year.

Also, Prepared HAIR DUST. This Preparation will effectually preserve Flowers, Plants, Bulb-roots especially, from the ravages of worms, grubs, and all kinds of crawling insects. From its imperishable nature, its effect will be lasting. Price One Guinea per bag. Address, Stanbridge Clarke, St. Pancras Wharf, King's Cross; or Henry Clarke, seedsman, 86, High-street, Borough.

ORNAMENTAL WIRE-WORK, &c., FOR THE GARDEN.
390, OXFORD STREET, LONDON.

G. B. THOMPSON having added to his General Stock of FURNISHING IRONMONGERY a large assortment of WIRE-WORK, Suited to the Flower-Garden and Greenhouse, begs to submit for the inspection of the Nobility and Gentry who patronise Horticultural pursuits his numerous patterns of FLOWER BASKETS, TRAINERS, BORDERS and STANDS, with GARDEN ARCHES, SEATS, and VASES, which for variety, elegance, and utility stand unrivalled.

Also his Improved GARDEN and HOTHOUSE ENGINES, FUMIGATORS, SYRINGES, and PATENT WATER-POT, with every other Implement.

GAME and CATTLE FENCING in variety.

EDWARD BECK, MANUFACTURER IN SLATE, Isleworth, Middlesex, respectfully informs Horticulturists, that his IMPROVED SLATE TUBS for Orange Trees and Conservatory Plants, mounted upon rollers, Slate Cisterns, Shelves, and Edgings for garden paths, may be seen in use at his house upon application to the gardener.

A PLAIN and PRACTICAL GUIDE to the INCOME TAX. By a COMMISSIONER. (Price One Shilling, post free.) For the Public to fill up their own Papers, without exposure or expense; with copious Information and valuable Instructions on Abatements, Affirmations, Allowances, Annuities, Appeals, Arrears, Affidavits, Awards, Assessments, Claims, Compounding, Contracts, Costs, Declarations, Deductions, Dividends, Disputes, Dwelling-houses, Debts, Evasions, Evidence, False Exemptions, Expenses, Forgeries, Fines, Householders, Houses used in Trade, Inspection of Books, Objections, Oaths, Penalties, Partners; Perjury, Profits, Rents, Salaries; Schedules A, B, C, D, E; Secrecy, Provisions to ensure, and Oath of; Sets-off, Shops, Seizure for Recovery, Valuations, Witnesses, &c. &c.

London; published and sold by E. Smith, at the Central Office, No. 6, Wellington-street, Strand; and W. Strange, 21, Paternoster-row.

NEW TRACTS FOR COTTAGERS, BY THE REV. W. C. COTTON.

In 12mo, price 6d., or 5s. per doz., (with Woodcuts,)

MARY THOMPSON'S COTTAGE WALLS.—
By the Rev. W. C. COTTON, M.A.,
Student of Christ Church, Oxford; Chaplain to the Bishop of New Zealand; and author of "My Bee Book."
Rivingtons, St. Paul's Churchyard, and Waterloo-place.

Also just published, by the same Author,

1. The VILLAGE. 2. The VILLAGE SCHOOL, Part I. (To Children.) 3. The VILLAGE SCHOOL, Part II. (To Parents.) 4. The VILLAGE SCHOOL, Part III. (To Schoolmasters and Mistresses.) Price 6d. each, or 5s. per dozen.

Just published, in 2 vols. 8vo. cloth, price 24s.

HISTORICAL MEMOIRS of the QUEENS of ENGLAND. By HANNAH LAWRANCE.

"These laborious and interesting memoirs."—*Athenæum.*

"This very industrious and interesting work."—*Examiner.*

"One of the most pleasing and valuable contributions which English history has received for many years."—*British Mag.*

"Narratives of as much interest as if they were pure dramas."—*Atlas.*

Edward Moxon, Dover-street.

HORTICULTURE.

Saturday, Sept. 3d, will be published, price 3d., 16 pages royal 8vo, Illustrated with Wood Engravings, to be continued Weekly,

THE GARDENER & PRACTICAL FLORIST, No. 1.—A new Work, comprising Original Papers by distinguished Writers on the Culture, Properties, and best Modes of Exhibiting Plants, Fruits, and Flowers; Critical Notices of New Books, Flowers, Plants, Implements, and other subjects connected with Horticulture; Observations on the Proceedings of Public Societies, and the Management of Public Gardens; and the spirit of all valuable Works on the various branches of the Science; forming a TEXT-BOOK FOR THE FLORIST, a Guide to the Amateur, a Library for the Gardener, and a useful Book for the Million.

London: Richard Groombridge, Paternoster-row, where Advertisements, Books, Plants, Communications, &c. for the Editor may be forwarded.

DARLEY'S SCIENTIFIC LIBRARY, for the Use of Schools, Private Students, Artists, and Mechanics. It is the purpose of this Work to furnish a Series of Elementary Treatises on Mathematical Science, adapted to the wants of the Public at large. To youth of either sex at public and private schools, to persons whose education has been neglected, or whose attention has not been directed in early life to such studies, and to Artists and Mechanics, these little Works will be found particularly suited. The principles of the various Sciences are rendered as familiar and brought as near to our commonest ideas as possible; the demonstrations of propositions are made plain for the mind, and brief for the memory; and the Elements of each Science are reduced, not only to their simplest, but to their shortest form.

1. A. SYSTEM OF POPULAR GEOMETRY. Containing in a few Lessons so much of the Elements of Euclid as is necessary and sufficient for a right understanding of every Art and Science in its leading Truths and general Principles. By GEORGE DARLEY, A.B. Fourth Edition, 4s. 6d. cloth.

2. COMPANION TO THE POPULAR GEOMETRY, in which the Elements of Abstract Science are familiarised, illustrated, and rendered practically useful to the various purposes of Life, with numerous Cuts. (A Second Edition is now ready.) 4s. 6d. cloth.

3. A SYSTEM OF POPULAR ALGEBRA, with a Section on Proportions and Progressions. Third Edition. 4s. 6d. cloth.

4. A SYSTEM OF POPULAR TRIGONOMETRY, both Plane and Spherical, with Popular Treatises on Logarithms, and the application of Algebra to Geometry. Second Edition, 3s. 6d. cl.

"For students who only seek this limited knowledge of these sciences, there are perhaps no treatises which can be read with more advantage than Darley's Popular Geometry and Algebra."—*Library of Useful Knowledge, Article "Mechanics."*

Taylor and Walton, Booksellers and Publishers to University College, 28, Upper Gower-street.

In Monthly Nos., 8vo, with Four beautifully-coloured Plates.
Price 2s. 6d.

PAXTON'S MAGAZINE OF BOTANY. The Number for August, 1842, contains highly-finished drawings of *Aérides Brookii, Mimulus Maclainiànus, Oxylòbium Pultenæ'æ,* and *Achimènes longiflora*; likewise Papers on Gardening as a science; on the Arrangement of Plants in Groups; and Culture of Chorozema cordatum. Floricultural Notices of new and beautiful Plants figured in the leading Botanical Periodicals for July, and of those in flower at the principal Suburban Nurseries and Gardens; together with a complete Calendar of Monthly Operations for the Garden.

This work comprises, monthly, four admirably-coloured plates, and twenty-four pages of interesting and useful letter-press. The admirers of flowers are requested to observe—

1. That all the drawings are taken from nature, and are consequently made from plants which have flowered in Britain.

2. That, with few exceptions, they are all done by one artist, whose abilities are of the highest order, and who travels himself to the places where the plants are in flower.

3. That they are lithographed by the same individual, and, being coloured in a superior manner, have all the spirit and elegance, and much of the finish, of the original drawing.

4. That about one-half of the drawings are from plants which have never before been figured in this country, the rest representing the most popular novelties, as well as the more neglected, though sometimes far handsomer, old species; the majority being such as can be cultivated by every one possessing a flower-border and a greenhouse or frame.

It may, in conclusion, be safely asserted that, both for the beauty of its embellishments, and the utility of its contents, this work is well adapted to the wants of all who delight in gardening; and as the improved system of having the plates lithographed commenced with the present year, and as it is intended that each volume shall now be perfect in itself, the present is a desirable opportunity for those who wish to become subscribers.

London: W. S. Orr and Co., Paternoster-row.

HAND-BOOKS FOR THE PEOPLE.

THE HAND-BOOK OF GARDENING; expressly intended for Persons possessing and fond of cultivating a Garden of moderate size. Price 2s. cloth, a New and Enlarged Edition.

THE HAND-BOOK OF BOTANY;
Or Linnæan Lessons on Common Plants, for Field and Garden Practice. Price 2s.

THE HAND-BOOK OF AGRICULTURE;
Chiefly for the use of those interested in the Allotment System. Price 1s. 3d.

THE HAND-BOOK OF COOKERY;
Intended for the use of the Middle Classes. Price 2s. cloth.

THE HAND-BOOK OF THE TOILETTE;
Having in view the union of Bodily Health with Beauty of Person. Price 2s. cloth.

THE HAND-BOOK OF THE LAUNDRY;
Expressly intended for those who "wash at home." Price 1s. 9d.

THE HAND-BOOK OF MEDICINE;
Forming a Useful Manual in time of Need, when Professional Aid cannot readily be procured. Price 2s. cloth.

THE HAND-BOOK OF NATURAL PHILOSOPHY.
Price 1s. 9d.

London: W. S. Orr and Co.; and W. and R. Chambers, Edinburgh.

FUN FOR THE FIRESIDE!!

Bound in cloth, price 5s. 6d.,

JOE MILLER'S JEST-BOOK. A Reprint from the first and genuine edition, such omissions and alterations only having been made as were required by the greater delicacy observed in modern conversation; but, that the volume might have some substance, and be a good table or travelling book, copious additions have been made from other old volumes of Facetiæ.

Extract from the Preface.

"Another strange circumstance connected with this work is, that everybody presumes that he himself and everybody else is perfectly familiar with its contents ...... and yet, if the reader will ask his acquaintance, it will appear that not one in five hundred ever set eyes on a copy. It is in consequence of like questions that this edition is published."

London: Whittaker and Co.

WANTS a Situation as GARDENER, a Married Man, aged 40, without incumbrance; his Wife would not object to attend to the Dairy, or take care of a Mansion; can have a good reference from his last place, where he has been upwards of seven years. Apply to Mr. Ronalds, Nurseryman, Brentford, Middlesex.

WANTED a Situation as GARDENER, at Michaelmas next, by a Married Man, aged 30, without a Family, who well understands his business, in all its various branches, as a thorough practical Gardener; can have a most unexceptionable character from his present employer, having been in his service nine years and a half. Wages, £50 per annum, with Cottage. Address by letter, post-paid, to A.B., care of Mr. J. Greaves, 4, King's-lane, Cambridge.

TO SEEDSMEN.

WANTED, by a Person who has been above seven years in one of the first Seed Warehouses in Scotland, a Situation as TRAVELLER, CLERK, SHOPMAN, or WAREHOUSEMAN. The most respectable references can be given. Address, A. C., Mr. Boys', 29, Bread-street, Cheapside, London.

WANTS a Situation as GARDENER, a Young Man, who understands his business, and can produce the best testimonials from the place he has just left. Address A.B.C., care of Messrs. T. and C. Lockhart, Florists, 156, Cheapside, London.

WANTED, by a Young Man, aged 22, who has a general knowledge of Gardening, a Situation for improvement in some extensive Private Establishment. He can be well recommended. Address J. O., Mr. Wallins', Slough, Bucks.

TO GENTLEMEN'S GARDENERS.

WANTS a SITUATION as FOREMAN, or SECOND HAND, in a Gentleman's Garden, a Young Man, where the Cultivation of Plants is well attended to, Early Forcing, &c.; has been five years in the line. He will give a premium according to the work done. Can have two years' character from his late master.—Direct F. G., Mr. Talbott's, Bridge Road, Barnes, Surrey.

WANTS a SITUATION as GARDENER, a steady active married man, aged 35, who thoroughly understands the Hothouse, Greenhouse, Kitchen, and Flower-Garden. Distance no object. He can have an unexceptionable character from his last place. Address M. A., Mr. Odam's, grocer, Wandsworth.

WANTS a SITUATION as GARDENER, a single man, aged 24, of good practical experience in the various branches of Forcing, Flower, and Kitchen Gardening, and can have a most excellent character from present and former employers. Address C. C., care of Mr. A. Dawson, West Green, Tottenham, Middlesex.

WANTS a SITUATION as GARDENER, a steady, respectable Man, aged 34, who perfectly understands his business as Forcing, Kitchen, and Flower Gardener; he can have from three to four years' unexceptionable character from the Situation he has lately left. Direct A. B., at Cormack and Oliver's, Bedford Conservatory, Covent-Garden.

WANTS a SITUATION as GARDENER, a respectable Young Man, aged 28, who has a perfect knowledge of the Forcing, Flower, and Kitchen Gardens, and can be well recommended from the situation he has just left, from which he can have two and a half years' undeniable character; likewise having lived in the first of families. A single handed place objected to.—Direct to E. H., 2, Ingleton-street, North Brixton.

Just published, price 6s. cloth,

THE HAND-BOOK OF CHEMISTRY; with a complete Index of Reference. By G. H. CAUNTER, Esq.

London: W. S. Orr & Co.; and W. & R. Chambers, Edinburgh.

TO FLORISTS AND GARDENERS.

TO BE LET ON LEASE, a small established Nursery near the Lark-hall Tavern, Lark-hall-lane, South Lambeth. A small capital will be required on taking possession. For further particulars inquire of William Cox, on the Premises.

SHIPS FOR NEW ZEALAND, under Charter to the New Zealand Company, to sail as under mentioned, viz.—

FOR NELSON AND WELLINGTON:
PRINCE OF WALES, A 1, 516 tons, from London, 1st Sept.
FOR WELLINGTON AND NEW PLYMOUTH:
ESSEX, A 1, 300 tons, from Plymouth, 1st Sept.

For further particulars apply at the New Zealand House, Broad-street Buildings.

HODGSON and ABBOTT'S PALE ALE.—The above celebrated Beer, so strongly recommended by the Faculty, is to be procured only from E. ABBOTT, Brewery, Bow, Middlesex. The Trade not being supplied, the Pale Ale cannot be genuine if procured elsewhere.

City Office, 98, Gracechurch-street.

THE "ROYAL ESSENCE OF EGLANTINE" for the Handkerchief is prepared only by Mr. WHITE, Chemist, 24, Cornhill, London, in bottles at 2s. 6d., 4s. 6d., and 8s. each. Where also may be obtained the "AROMATIC PUNGENT ESSENCE" so useful in Headaches, Fainting, &c., at 3s. each.

N.B. Public Offices and Merchants can be supplied with Postage Stamps and Envelopes in any quantity at Government Prices.

FISHING NETS, SHEEP NETS, WASP NETS.— Fishing Nets, from 4 to 400 yards long, Seines, Flues, Trammels, &c. &c. Sheep folding Net, 3½ feet high, 4½d. per yard—much approved for fences, &c. &c. Wasp and Fly Net, to protect Peaches, Grapes, Plums, &c., 6d. and 7½d. per yard. Garden Net, 1½d. per yard. Long Hare and Rabbit Nets. Tarred Fence Net, 1 yard high, against rabbits, cats, dogs, poultry, &c., 2d. per yard. Expanding Tents, for Lawns, (made on a new principle,) 36 feet round, 6 feet high in lowest part, 5l. each.—ROB. RICHARDSON, Net and Tent Maker, 21, Tonbridge-place, New-road, near Euston-square.

WHITE TEETH. ROWLAND'S ODONTO, or PEARL DENTIFRICE.—This is an efficient White Powder for the Teeth, solely prepared from Oriental Herbs of the most delightful odour, and of sovereign virtue for strengthening, preserving, and thoroughly cleansing the Teeth. It eradicates tartar from the Teeth, removes spots of incipient decay, polishes and preserves the enamel, to which it gives a pearl-like whiteness; and, above all, from its disinfecting properties, gives sweetness to the breath. As an antiscorbutic, the gums also share in its transcendant powers. Scurvy is eradicated from them, a healthy action and redness are induced, that offer to the notice of the medical practitioner the most indubitable signs of their healthful state. Price 2s. 9d. per box, duty included. *⁎* NOTICE—The Name and Address of the Proprietors, A. ROWLAND AND SON, 20, Hatton Garden, London, are engraved on the Government stamp which is pasted on each.

⁎ Be sure to ask for "ROWLAND'S."

HORTICULTURAL SOCIETY OF LONDON.

NOTICE IS HEREBY GIVEN, that the MEETINGS OF THE SOCIETY in Regent-Street are DISCONTINUED till Tuesday, October the 4th, in consequence of the Meeting-room being under repair.

The Gardeners' Chronicle.

SATURDAY, AUGUST 20, 1842.

"CAN you tell me," says a correspondent, "the reason why the Phlox changes its colour during the day? In a large garden, with a variety of flowers, are two clumps of the common Phlox, in a border facing the north-west; the ordinary colour is a bright pink. In the early morning, by five o'clock, the colour is a lightish blue, which continues to alter as the sun advances, and by 9 or 10 o'clock becomes its proper colour; the clump which catches the sun's rays first, first changes, whilst the other is still blue. Is it the rays of the sun which cause this? why is the Phlox the only flower? or is it the only flower? There are Fuchsias, Geraniums, Verbenas, Peas, &c. &c., and no change is perceptible in them."

We wish we could answer this question satisfactorily; for it is one connected with most curious phenomena, now, we believe, observed for the first time in the Phlox, but long since remarked in other cases.

Fruits in ripening change from green to red, or purple, or yellow, if they change at all; but then the alteration is gradual, and so common that we do not observe it. The same thing occurs in the foliage of trees, which, from being green, assumes all the colours of the rainbow, and in the autumn rivals the beauty of the flowers which were borne in the pride of summer. The great similarity of these changes, in fruit on the one hand, and in leaves on the other, lead to the suspicion that in both cases the cause is the same. And it is stated that this cause is the continued absorption of oxygen gas, without any corresponding decomposition of carbonic acid, the effect of which is to produce an accumulation of oxygen, and an oxidation of the parts thus acted upon. From this oxidation are said to result certain colours, dependent upon the quantity of oxygen absorbed, and the nature of the secretions upon which that gas acts. Thus infusion of Brazil wood is changed by acids (containing oxygen) from yellow to red.

But it is not necessarily a red colour that is produced by the action of oxygen; what the colour will be depends upon the chemical nature of the substance acted upon. Thus, it is well known, that if the wounded leaf of a Soccotrine Aloe is exposed to the air, the juice that exudes becomes at first violet and next brown. This is supposed to arise from the direct action of the oxygen of the atmosphere upon the peculiar secretions formed in the Aloe. The wounds in certain kinds of Fungi become blue when exposed to the air. Boleti thus affected have been proved experimentally to alter their colour thus, if they are exposed to oxygen gas, or to gaseous mixtures containing free oxygen, or to oxide of nitrogen; but the colour is not produced when the Boleti are only exposed to nitrogen, hydrogen, or carbonic acid. The inevitable conclusion from this is, that as Boleti become blue when exposed to the atmosphere, and as the atmosphere contains nothing but oxygen, hydrogen, nitrogen, and carbonic acid, it must be the oxygen that brings out the colour, because experiment shows that the other principles are incapable of doing so.

The change in the colour of the Phlox, although new to us, so far as that flower is concerned, is far from being a new phenomenon. On the contrary, we all know that the four-winged Evening Primrose (Œnothera tetraptera) has white flowers changing to red; in the Snail-flower (Phaseolus Caracalla) the white changes to yellow, having originally been violet. The climbing Cobæa has flowers green the first day, and violet the second; and there is the curious case of the changeable Hibiscus. This plant, says M. Ramon de la Sagra, has flowers white in the morning, pink at noon, and bright red by sundown.

In all these cases the accumulation of oxygen is thought to be the cause of the changes in colour. It accumulates in flowers during the night, and diminishes during the day; this is strikingly shown in the common Budleaf (Bryophyllum calycinum), which is acid in the morning (in consequence of the accumulation of oxygen), becomes insipid by noon (when the surplus oxygen is diminished), and is bitter at night (when the quantity of oxygen is further decreased). This plant, the Fig-like Cacalia (Cacalia ficoides), the African False Purslane (Portulacaria afra), and many others, will stain litmus paper red in a morning, because of their acidity, caused by the accumulation of oxygen during the night—but will not alter its colour at noon, because at that time the surplus oxygen is lost again. (Link, *Elementa*, § 147.)

In the case of the Phlox, it is to be supposed that some substance is present which becomes blue by the action of excess of oxygen gas accumulated during the night; and that, as the oxygen is lost while the day advances, the blue colour disappears; while the red, which had been partially discharged by the same cause, is restored as the oxygen is lost. Those flowers that from white become red, are, it is imagined, affected in like manner. They are not made blue, because the principle required to form that colour is not in them; but the red is discharged by accumulated oxygen, which, as it passes off, allows the red colour to be restored.

It will doubtless have been remarked, that all this has been explained in a very guarded manner. In fact, we know very little about the cause of changes in colour, either in plants or animals. The most we can pretend to is, to put into a popular form some of the received ideas upon that part of the subject which is connected with our correspondent's inquiry.

Is there any manure that will kill WEEDS? is a question not unfrequently put to us. Will nitrate of soda, or nitrate of ammonia, or guano, or urates? That such questions should be asked proves one thing at least, that there is a general desire to know how to extirpate weeds. We wish we could add, that they also indicate some acquaintance with the rudiments at least of vegetable physiology.

Weeds, like other plants, have each their peculiar constitution, prefer certain kinds of food, and perish upon the application of others. We have seen a pound of nitrate of soda administered to a Seakale plant without visible effect; half an ounce would probably destroy a Rhododendron. Common stable manure is prejudicial to Coniferous plants, and in overdoses will kill them; an Oak feeds greedily upon it. So it is with weeds. Excessive doses of salt will destroy all ordinary vegetation, weeds included, but promote the growth of Asparagus in a most remarkable degree, as has been shown by one of our correspondents, thus proving itself to be a poison to one plant and a nutritious food to another. But salt cannot be used in large doses to extirpate weeds generally, because some may imitate the Asparagus, and *may* flourish under its action, and most crops will certainly be destroyed by it. Professor Henslow succeeded in destroying Moss and weeds on gravel-walks, by means of corrosive sublimate, green vitriol, and blue vitriol, especially the last. But corrosive sublimate destroys every living form of vegetation, as well as the weeds, and the two sorts of vitriol have no permanent action, encouraging the subsequent growth of many sorts of plants, and so promoting the vegetation of weeds rather than destroying it.

In practice these chemical agents can only be employed for the destruction of weeds in certain special cases, such as the Asparagus, which thrives under doses of salt which kill most other plants; or as Seakale, which seems to be affected in the same way; or as Tobacco, which feeds greedily upon quantities of nitrate of soda which would destroy any ordinary vegetation. In general, we must look to other means for ridding ourselves of troublesome weeds, and we shall find those means in industry and common sense. The two separate are good things, but they are better mixed together.

Among the more troublesome weeds are common annuals, such as Chickweed, Groundsel, Sowthistle, and Fat Hen. In slovenly gardens they are abundant; in a well-kept garden they are unknown; in neglected places they overrun everything for a time. It is discreditable to a gardener that any one of them should ever be seen upon his premises bigger than a seedling; in that state they *must* be found, because their seeds are brought from a distance by the air, by manure, and by other means. Yet we do see them far too often, in full bloom, and in places where better things should be expected. When the slovenly gardener is remonstrated with for their presence, his answer usually is, "Why, I am always hoeing them up; but they breed so fast that there is no keeping them down." To be sure they do. They were created to produce food for small birds, and an unusual power of reproduction is given them in order to furnish such creatures with a constant supply of seed. But there is no occasion to make a garden into a bird-farm; the woods and the fields afford ample space for the harvest of our feathered friends. "But," says the slovenly gardener, "I am always hoeing them up; what can I do more than *that?*" and this, he thinks, settles the question. If, however, we cast only a glance at the sloven's proceedings, we find those weeds which he is always hoeing up, lying on the ground in full flower, ripening there, and scattering all around them a new crop of seedlings; so that the sloven by his own act is perpetually renewing his labour. The ancients had a fable of a hero, named Sisyphus, a great freebooter, who, for his misdeeds, was condemned by Pluto to the punishment of pushing to the top of a mountain a large stone, which, as soon as it reached the summit, rolled back into the plain below, whence the unlucky Sisyphus had to push it up again. Now, our gardener, who cuts up his weeds just in time to let them sow themselves again, is only a Sisyphus in a small way; with this difference, however, that he rolls his stone at his master's expense, and not his own. When the master complains of the scandalous state of his garden, our horticultural Sisyphus bustles about; exclaims "I'll put it all to rights directly, sir;" plies the hoe and rake, and, *presto*, the garden is clean, and, *in seeming*, what it should be; but the first shower of rain brings up all the seeds that have been sown, and there is a green carpet of Groundsel, Chickweed, and their fellows.

There is no excuse for this sort of mismanagement, because it costs less to destroy such weeds in the right way than in the wrong. The plain and obvious rule is to pull them up as fast as they appear, and while still in the state of seedlings. Then every plant that is removed is effectually destroyed, and leaves no young ones behind it. Any boy, at half-a-crown a week, can be taught to distinguish them; and if the plan is persevered in, there will very soon be nothing for the boy to do. Strict attention must, however, be paid to their thorough extirpation when young; it will not do to pull up *almost* all, and to leave the remainder to seed; for in that case the labour has to be all gone over again, just as if a gardening Sisyphus had been at work.

People are hardly aware of the rate at which such a plant as Groundsel increases. A little calculation will make that evident. Each flower head of the Groundsel produces about 60 seeds, furnished with feathery wings whereon to fly from place to place. A very moderate specimen of the plant bears 20 heads capable of producing ripe seeds at the same time, even when cut up; therefore every neglected plant of the Groundsel, even if eventually destroyed, fills the soil with twelve hundred seeds, every one of which will in all probability grow. This, however, is a very low computation; and if a single plant, instead of being pulled up, is allowed to stand and flourish, and scatter its seed abroad upon the wings of the wind, twelve thousand, or even ten times twelve thousand, seedlings will be produced: and that is a pretty considerable stone for a garden Sisyphus to roll up-hill again. Every precaution should therefore be taken to prevent one single specimen of a Groundsel producing even its flowers, not to say seeds, in a well-managed garden.

What is true of Groundsel is equally true of Sowthistle, Chickweed, Shepherd's-purse, Sun-spurge, and the whole race of weeds, whether annual or perennial, multiplied by seeds. A little labour well applied at first, and steadily persevered in, will save a large amount of it at last, and is the only effectual means that exists of extirpating this large class of plants.

Perennial weeds, which multiply by their creeping stems, or their roots, require special considerations, which we must defer till another opportunity.

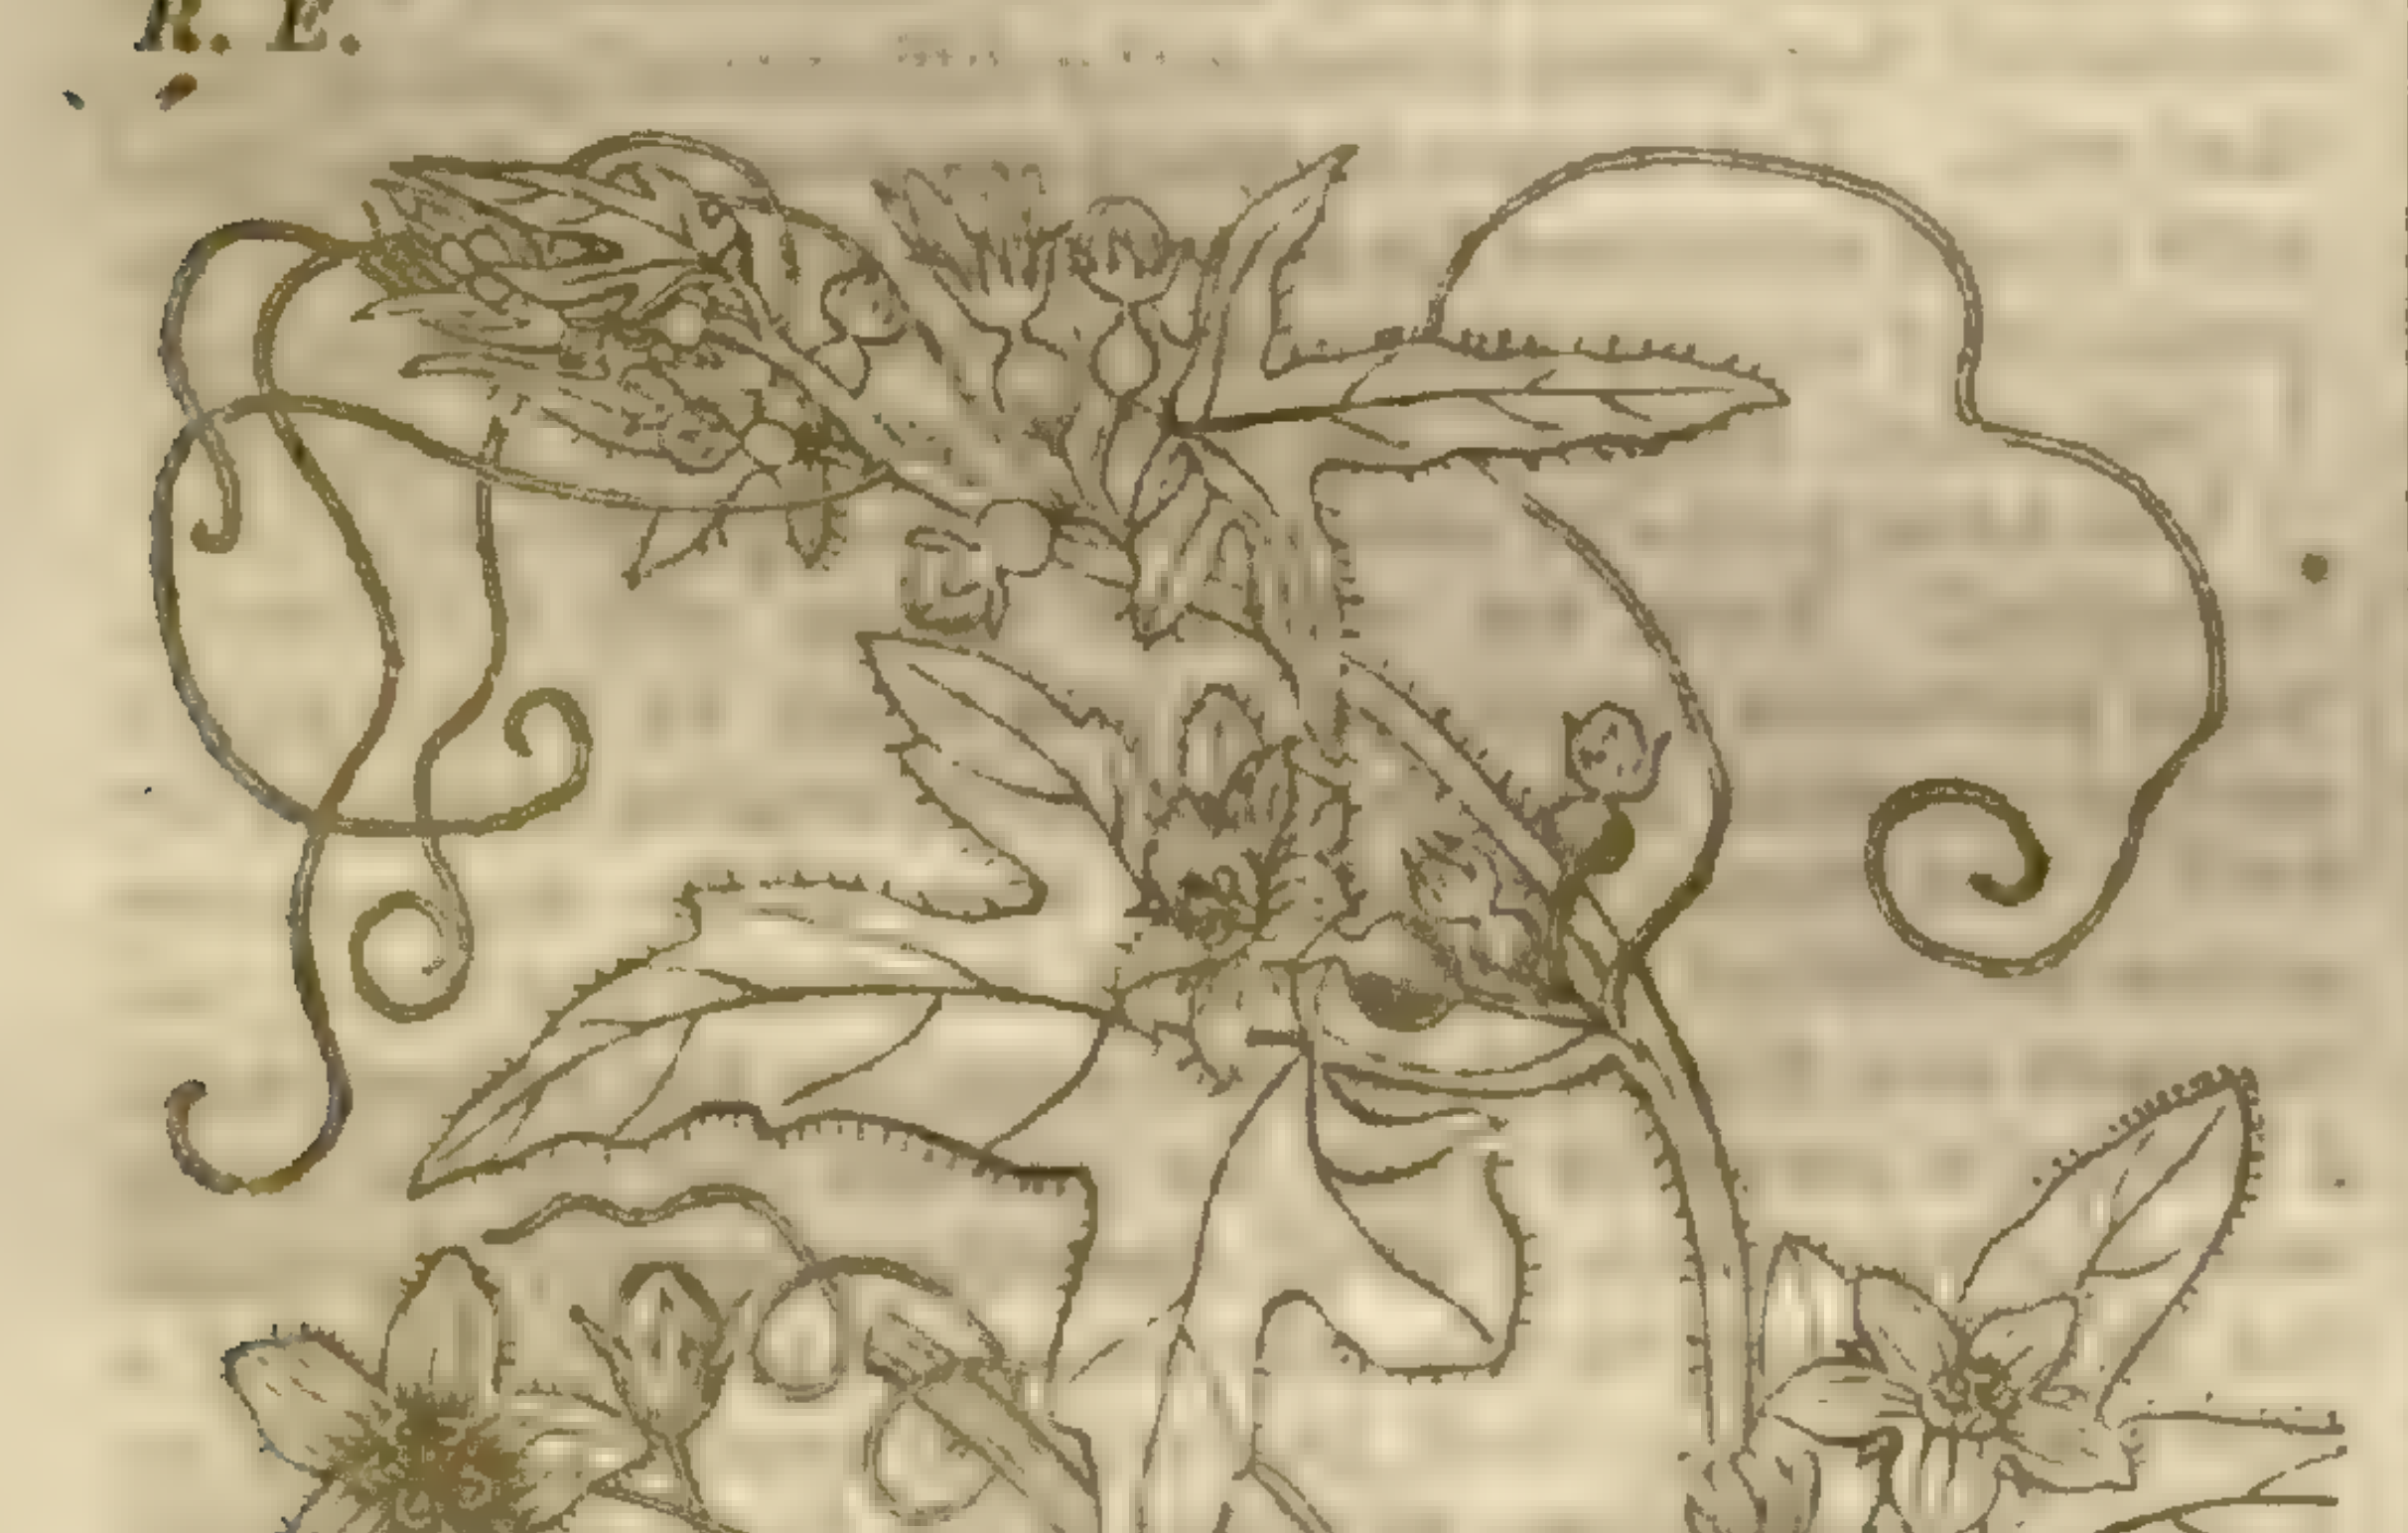
FAMILIAR BOTANY.—No. IX.

———I know
Where the herbs that hold the poison grow.

The Bryony.—What is that herb whose winding, and scrambling stems, and coarse rough angular leaves, remind us of the Gourd; but whose small red berries speak of Bittersweet and poison? It is indeed a Gourd. So say its flowers, with their surface all indented with deep green veins, bearing stamens in one cup, and stigmas in another; so, too, tell us the chrystal points with which the herbage is frosted and hardened. But where are the gourds? Or is it rather a Bittersweet, and a sister of the Dwale, whose tempting fruit is death to the heedless woodman? But why, then, is its fruit below the calyx? and wherefore are the flowers of two different sorts? It cannot be of the kindred of the Bittersweet; it may have some relation to the Gourd. Let me examine it more particularly.

When I compare the flower of this plant with that of a Gourd, I find, in the first place, that it is much smaller; next, that its flowers are green and yellow; and then, that the young fruit is a little ball, instead of a large ribbed pear-shaped body. If I cut this part open, I find only a very few seeds in my wild flower, and there is a great many in a Gourd. At last, when I come to the fruit, I perceive that the red round berries of the wild flower have a thin skin, and contain a quantity of pulp; but the Gourd has a hard skin—it, however, also contains much pulp. That this is not a Gourd, then, is certain; but why should it not be a near relation of it? I know that the size and colour of flowers are not of much consequence in settling the family limits, or, as we may say, the clanship of plants, because the Garden Pink, for all its large red flowers, is of the same family as the tiny-blossomed Chickweed. I also know that the shape of the fruit is no matter in these inquiries, because the Apple, the Pear, and the Mountain Ash are all also blood-relations, and yet their fruit is all different in form. The quantity of seed is also nothing to signify, because an Apple has only two seeds in each of its cells, and its first-cousin, the Quince, has a great many. Is, then, the hard rind of the Gourd a proof that my wild flower, with its thin and tender skin, has no claim to a family alliance? Why, if Tobacco and Stramonium, which have a hard-shelled fruit, are very near to the Nightshade, which has a thin skin—why should not my wild flower also claim a place in the family circle of the Gourd?

Such were the speculations and meditations of little Dunny Roseall, when she was joined by her father, who had heard a good part of her soliloquy. "You are quite right," said he, "Dunny dear, in these learned pros and cons; the plant you have found is the Bryony, and it ranks in the Gourd tribe, along with the Melon and the Cucumber, and that curious spirting fruit that attacked us last year at Toulouse, when you fancied that somebody was throwing dirty water at us from behind the wall. In this very Bryony the pulp comes out of the berries in the same way, only with very little force. You must not, however, eat them, for they are poisonous, and the whole plant, especially the root, is extremely dangerous, except in the hands of medical men. This root is so acrid, that if a slice is laid on your hand it will soon blister it. This may seem strange to you, when you remember how harmless the Melon and Cucumber are; but it sometimes happens that you have these differences in the same family. The Melon and Cucumber, and Gourd and Vegetable Marrow, form only a very small part of the Gourd tribe, and are used for food because experience has shown them to be harmless; but hundreds of other kinds are known to botanists, many of which, like this Bryony, are anything but relations for a Melon to be proud of. Think of the Bottle Gourds, the Orange Gourds, that spirting Cucumber you know of—all bitter, poisonous plants. Indeed, you will find in your Bible a story about one of these plants, which shows how unsafe it is to use any except those which are commonly eaten. When there was a famine in Gilgal, and the Prophet Elisha came into that country, 'He said unto his servant, Set on the great pot, and seethe pottage for the sons of the prophets. And one went out into the field to gather herbs, and found a wild Vine, and gathered thereof wild Gourds, his cap full, and came and shred them in the pot of pottage, for they knew them not. So they poured out for the men to eat. And it came to pass, as they were eating of the pottage, that they cried out and said, O thou man of God, *there is death in the pot*, and they could not eat thereof.' It is thought by some that these wild Gourds, or Cucumbers, were the very spirting Cucumber I have already reminded you of, which the Arabs to this day call the Ass Cucumber. At all events, it was a poisonous relation of the Gourd."—*R. E.*



SUMMER PRUNING OF WALL-TREES.

As this is a subject upon which great diversity of opinion exists, and as discussion may do something towards eliciting the proper system of management, I beg to offer a few remarks upon the article of Mr. H. Bowers at p. 470 of the *Chronicle*, the leading features of which I shall enter upon separately. First, his intention appears to be to check the flow of the sap in the strongest-growing shoots about the end of June, by carefully breaking down each superfluous shoot, leaving it about the fourth of its original length, with two or three eyes at the base; and these broken shoots are "removed by pressing them upwards with the hand in September." Now, apart from the necessity or utility of leaving the branches in this pendulous form, I think the untidy appearance of the system must ever banish it from gardens where neatness is a desideratum; for be it as useful as it may, you cannot banish the idea of broken branches from the mind; and, consequently, that harmony which is so indispensable to the proper appreciation of garden scenery, is disturbed. Secondly, "the young wood lives in this pendulous form, and the leaves continue slowly to perform their functions." If by this Mr. B. means that the leaves continue to return the elaborated sap to the trees, I think he is mistaken; because the first effort of nature will be to heal the wound caused by breaking the shoot, and as this can only be accomplished by the returning elaborated sap, and as "the leaves only slowly perform their functions," it will be some time before this is effected; more especially as these pendulous shoots must be ever waving to and fro in the breeze, and consequently lacerating the wound afresh as fast as it is healed. But even allowing them to perform their functions properly, the shade which they occasion to the fruit and leaves at the base of the shoots must fully counteract any good that may accrue from their retention. The only utility of these branches is, that they serve as "waste-butts," as Mr. Errington designated them, some years back, in the "Gardeners' Magazine," for the superfluous sap; but it is my decided conviction that this sap would be much better expended either in accelerating the growth of the leader, or more weakly natural spurs; in feeding the fruit; or, if it must have vent, in the production of a second shoot. It may be thought that in thus checking the flow of sap, some of the embryo fruit-buds will be forced into premature growth; but of this there is no fear, if the shoots are removed as will be directed in the concluding part of this paper. Thirdly, the removal of the pendulous branches "invigorates the trees by assisting the eyes upon the spurs to become plump fruit-buds." Does Mr. B. mean to say, that in Pears, the eyes on the spur at the base of the pendent branches will become fruit-buds? If so, the system is indeed excellent. In Plums or Cherries such will be the case; but in Pears, the leaf-buds will only be advanced into the state of embryo fruit buds, which will probably produce fruit in the third or fourth season of their growth. The Pear rarely, if ever, produces fruit-buds at the base of a shoot in the first season of its growth. The most terminal buds are sometimes in such kinds as Marie-Louise, Brown Beurré, Jargonelle, and a few others, converted into fruit-buds; but this is a mere accidental circumstance, and, therefore, not to be taken into account. Fourthly—"It is well known that the too free application of the knife, in summer management of fruit-trees, is the source of great evil." If Mr. Bowers had said the use of the knife is the source of great prejudice among some practical gardeners, he would have been nearer the truth. The fact is, this imagined injury of the knife is a mere *ignis fatuus* of our own creating, which has been handed down from time immemorial, from father to son, but has no existence in reality. I recollect the time when, in dressing Cucumbers or Melons (excuse me for introducing a pet child), I was not allowed to remove a leaf, except by the extreme point of the petiole, and then only between the finger and thumb; as to using a knife, it would have been almost a criminal offence, and would have subjected me to a severe lecture, if not to the loss of my situation. I have found that the decaying of the leaf-stalk was a very prolific source of canker in the branches, and I hope to see the prejudice against the use of knife in summer pruning of trees "numbered among the things that were." For my own part, could I command sufficient assistance, I would never allow a single branch to be removed, after it had formed woody fibre, without the knife, not even in disbudding Peaches or Apricots; for I am satisfied it is preferable to the system of lacerating the bark in all directions, so frequently the case in disbudding by hand. Fifthly—"It must be wrong to deprive a tree in the middle of its growth of so much young wood, every leaf being a vital organ to give life and strength; therefore, this summer pruning must reduce the resources of the tree and hasten decay." If the object of the gardener was to produce luxuriant growth, and, consequently, wood instead of fruit, this dictum would be correct; but with the physiological fact before us, that luxuriant growth is inimical to the production of fruit, and *vice versâ*, ought it not to be our object to moderate the growth of the tree, and consequently induce fruitfulness? But how can this be done if trees are allowed to run wild until midsummer?—*W. P. Ayres, Chicksands Priory, Bedfordshire.*

(To be continued.)

A LIST OF SOME OF THE BEST CARNATIONS, WITH A SHORT DESCRIPTION OF THEIR LEADING CHARACTERISTICS.

SCARLET BIZARRES.

Twitchett's Don John; form good; petals firm, smooth, and even; scarlet very superior, white fine and free from specks, striping broad and very distinct. This flower, being high-coloured, is apt to run.

Martin's Splendid; good form, petals firm and slightly cupped, colours bright and equally distributed.

Headley's Achilles; the form of this flower is good, the petals are very broad and regular, the scarlet high-coloured, and the white fine, without pounce or speck; but the colours are not so well distributed as in Don John.

Headley's William Cobbett; form good, petals of a good substance but sometimes a little serrated, scarlet very bright, white fine, and the striping equally divided.

Bucknall's Earl Fitzhardinge; good shape; petals slightly cupped, smooth, with plenty to form a good crown; scarlet high-coloured, white very clear, and striping equally divided.

Strong's Duke of York; form good; guard-petals very fine, and enough of others to form a good centre; scarlet good, white clear, striping broad and distinct.

Willmer's Conquering Hero; good form; petals broad and smooth, round on the edges; colours bright, but the striping rather irregular.

CRIMSON BIZARRES.

Puxley's Prince Albert; good form, petals of fair substance; crimson very rich, white pure, striping broad, and the colours well mixed.

Holmes' Count Paulina; good form, petals smooth and free from serrature, stripes narrow, clean, and colour well distributed.

Mansley's Robert Burns; petals well formed, crimson rich, white pure, and colours well divided.

Ely's Lord Milton; petals large and well formed, crown fine, and colours very distinct.

Jaques' Georgiana; form good, petals firm and of good substance, crimson very rich and high-coloured, white good, but the striping rather irregular.

Chambers' Kate; petals well formed, with a fine crown; colours bright, but the striping irregular.

Jaques' Iris; petals of good form, edges smooth and even, pink very fine, white good, and striping well divided.

Parker's Sophia; petals well formed, colours very bright and distinct, but the striping narrow and irregular.

SCARLET FLAKES.

Twitchett's Queen of Scarlets; petals well formed, smooth and even on the edge, scarlet very high coloured, white fine, and the striping broad and equally distributed.

Wigg's Earl of Leicester; petals well formed, crown fine, the colours brilliant and well divided.

Bucknall's Ulysses; petals broad, and even round the edges; scarlet very high-coloured, white pure, striping broad and well distributed.

Wilson's William the 4th; good petals, with the colours bright and well divided.

Willmer's Hero of Middlesex; petals of good substance, colours bright, striping broad and regularly divided.

Addenbrook's Lydia; the petals well formed; the guard-petals broad, with good crown; scarlet and white very fine, striping regularly divided.

PURPLE FLAKES.

Mansley's Beauty of Woodhouse; petals well formed and of good quality, purple very brilliant, white clear, and striping well divided.

Headley's Empress of Purples; petals smooth and even on the edges, purple very dark, white fine, striping broad and distinct.

Headley's Incognita; beautiful dark purple flake, petals broad and fine, colour bright, striping well divided.

Pollard's First-rate; dark purple; guard-petals very broad and strong, with a good crown; striping broad and very regular.

Willmer's Solander; light purple flake, petals broad, purple very bright, white good, and striping well divided.

Millwood's Premier; bright purple flake, white good, and stripes well distributed.

Strong's Esther; dark purple, white fine, and stripes well divided.

ROSE FLAKES.

Brooks's Flora's Garland; high-coloured rose, petals slightly cupped, crown good, striping very regular.

Greasley's Village Maid; delicate rose, white very fine, form excellent, and striping well divided.

Wilson's Harriet; high-coloured rose; a large flower, with fine petals; white clear, striping well divided.

Ely's Lady Ely; high-coloured rose, a well-formed flower, colours bright, and striping equally divided.

Siclamore's Lady Rowley; fine light-rose flake, petals well formed, white clear, stripe even, with good crown.

Pearson's Madame Mara; high-coloured rose flake, petals firm, and slightly cupped, white very fine, with stripes regularly divided.—*John Dickson, Acre Lane, Brixton.* *(Picotees next week.)*

ON THE HELIOTROPE.

ALTHOUGH so many different subjects have been treated upon in your *Chronicle*, nothing has yet been said of the cultivation of the Heliotrope. As it is a plant which many persons find a difficulty in preserving through the winter, and as it merits a place in every collection, both for blooming in the greenhouse and for bedding out upon the lawn, a few hints upon its treatment may not be unacceptable.

For striking cuttings of the Heliotrope to be planted in the open ground next spring, a better time than the present cannot be chosen, as with ordinary care they will have formed good roots before the approach of winter. The loss of young plants, which so many experience during that season of the year, may be attributed mainly to the cuttings being insufficiently rooted, and to a superabundance of water being given them during cold and dull weather.

Prepare as many shallow 32-sized pots as will be required, by filling them to the depth of an inch and a half with broken crocks, upon which a layer of the rough siftings of leaf-mould should be laid; the remaining space should be filled with a mixture of finely-sifted leaf-mould and silver-sand, previously well incorporated; which, when pressed down firmly, should be exactly level with the border of the pots.

For cuttings, the tips of the young shoots, about three inches in length, should be chosen, and these should be taken off immediately below a joint or the base of a leaf-bud. After removing two or three of the lower leaves, plant the cuttings in the pots prepared about an inch and a half deep, and two inches apart; water them well with a fine rose, two or three times, so that every part of the soil may be thoroughly moistened, which may easily be known by the water percolating through the bottom of the pots. If this is not attended to, and the surface soil alone is penetrated by the water, certain failure will be the result.

The cuttings, when planted, should be removed to a Cucumber or other frame, where a tolerably damp heat can be supplied; they should be kept shaded from the sun, and air admitted in small quantities only, during the hottest part of the day. In about a fortnight the plants will begin to form roots, and the shading may be gradually diminished during the morning and afternoon; the quantity of air given them may be increased by degrees, and at the end of a month from the time of planting, the cuttings will be ready for potting off singly.

For this purpose large-sized 60's are best adapted, and the soil should be composed of equal parts of loam and sandy peat, with small quantities of leaf-mould and well-decayed manure. The two latter only should be sifted, the loam and peat being left rather rough, and a fair portion of drainage being used, will allow the water to pass off more freely, which is of the greatest consequence during the winter months. The tips of the shoots should also be pinched off, to render the plants bushy.

When potted, they may be taken back to the frame and kept rather close for a few days, until they begin to root into the fresh soil; after which air may be freely admitted to them. About the beginning of October they may be removed to an airy part of the greenhouse, where, if protected from frost and due attention be paid to watering, they will survive the winter uninjured.—*T. R.*

ON WINTER LETTUCES.

As the time is now approaching when the seeds of Lettuces for winter use should be sown, and as many persons suppose that there is some secret attached to the Dutch method of growing them, it may be worth while to detail the simplest and cheapest way of producing them, with a short description of the kinds most suitable for such purposes.

Procure seeds of any of the following Cabbage Lettuces: —viz., Hardy Hammersmith, Tennis Ball, White and Brown Dutch, the true seeds of which may be had of any respectable seedsman. About the latter part of this month, sow them on a rich warm border, in the ordinary way, for the first crops; and about the middle of September for all others. The plants will soon come up, and when large enough, select the largest and prick them out on a fresh piece of ground, allowing them about three inches each way; and as the smaller ones, which are left in the seedbed, increase in size, prick them off in like manner. By so doing, each transplanting will make a succession for planting in pits or frames, where they are to remain during the winter and early spring.

Towards the end of October, choose an old exhausted Cucumber bed or Melon pit, and clear off the soil; fork up the old dung of the bed about a foot deep, and replace the soil, adding to it about one fourth of good sandy peat and a little well-rotted dung. Afterwards, water the whole thoroughly, and when sufficiently dry, make the surface of the bed firm, and keep it well up to the glass; giving the lights (if a frame) a good pitch, to prevent the drip in winter. For the first crop of plants, select the largest of those transplanted, taking great care to remove them with as large balls as possible, and plant them on the bed, about six or eight inches apart. When planted, give them a little water, replace the lights and keep them close for a few days, until the plants have recovered from their removal. The lights should afterwards be tilted at both back and front, to cause a free circulation of air in fine weather; and great care must be taken that no rain is allowed to fall upon the plants. They should have plenty of air, both day and night, in mild weather, which will prevent their becoming mildewed or cankered; but should either these or slugs make their appearance in the frame, the best remedy is to dust them over with a little fresh lime.

Thus, by making various transplantings from the middle of October to the end of November, Lettuces may be had throughout winter; observing, however, that those for use in midwinter are not so large, or so fine, as the later ones in spring. The young plants, which are pricked off from the late seed bed should have a frame placed over them when pricked out; and if not wanted, or there is no room for them on dung-beds, as above stated, they may remain until spring in the frame, and then be planted in the open ground, to come into use after the frame ones are done. It must also be observed, that during winter, the frost must be excluded from the frames or pits, by covering them with mats or long litter. If the plants are small and do not grow fast enough for use during midwinter, use a very gentle lining of hot dung to the beds about the beginning or middle of December, to keep them growing; this, however, must be done with great care, as too much heat would soon destroy the whole crop. If the bed has been well watered at first, the plants hardly ever require any more water during the winter; but if they should become very dry, a little water may be given to them by pouring it between the plants, being cautious, however, not to wet the leaves, for if these are wetted, or the soil is made too moist, during midwinter, both the mildew and canker will very soon destroy the crop. It is a good plan, and particularly if the bed is to be forced, to put a thin coat of fine sand over the surface after planting, which prevents the injurious effects of damp.

The following are those kinds of Lettuces best suited for winter use, with the synonyms which they bear in the seedsman's lists:—

No. 1. *Hardy Hammersmith Cabbage Lettuce.*—Synonyms—Hardy Green, Roman Cabbage, Green Cabbage, Early Frame, Green Dutch, Grand Admiral, Early Dwarf Dutch, Prussian Cabbage, and Lattughe verde of the Dutch. This Lettuce has leaves of a dark green colour, much wrinkled, and slightly concave. It is of middling size, of excellent quality in winter, but is not a suitable variety for summer use, as it soon runs to seed. It is the hardiest Lettuce of this kind in cultivation, and cabbages freely. The seed is white.

No. 2. *Tennis Ball.*—Synonym—Button (not Britton as written in some lists). The leaves of this variety are of a dark green colour, much wrinkled and slightly curled; the inner leaves, forming the head, being very white and crisp. It cabbages freely; the heads are small, firm, and remain for a long time in perfection; of excellent quality, and very early. This is a much better and larger variety than either of the French Gotte Lettuces. The seed of this sort is black. This and the preceding variety are the best suited for the first winter crops, and the following two for early spring use; but they are all well adapted for winter planting.

No. 3. *White Dutch.*—Synonym—Early White Cabbage, Laitue à bord rouge of the French. This variety has nearly round leaves, wrinkled and slightly undulated at the base, of a light yellowish-green colour; sometimes slightly tinged with a dull brown on the margin and extremity of the heads when full grown. It cabbages freely, is firm, and of rather a large size; its quality is good, and it remains for a long time in perfection. The seed is white. This is the kind grown so fine in Essex, by the Dutch method.

No. 4. *Brown Dutch.*—The leaves of this Lettuce are of a brownish-green colour, roundish, tapering a little to the base; much wrinkled and slightly curled at the margins. The upper surface of the expanded leaves is of a dark brown, the under quite a dark green; the exposed part of the head is also dark brown. It cabbages freely, is rather firm, large, very hardy, and of excellent quality. The seed is white.—*George Gordon.*

AMATEUR'S GARDEN.—No. XXXIV.

A LADY was complaining last spring of the death of some favourite window Pelargoniums, which she had struck from cuttings and reared with great care for several years. She said they were growing rather tall, and losing the leaves near the base of the stems, and that she cut them down in order to make them send out fresh branches and become handsome bushes. But she was disappointed, for no fresh leaves were formed; the bark began to turn black and rotten, and the plants died. The reason for this failure was simply this—they had been cut down when it was too late in the season. As I have known this happen frequently, I would advise all who have window Pelargoniums, which they intend to prune or cut down this year, to do so now. This operation is generally put off as late as possible, until the flowers have all expanded, and the plants become less interesting; but treatment of this kind is evidently wrong. But why, it may be asked, are they more likely to die when cut down late in the year, than if cut down now? I will endeavour to explain how this happens. A plant, when cut down, will not live for a great length of time unless leaves are produced; by which the food is drawn up from the soil, and the system kept in an active state. If it is young and healthy, having the stems near its base covered with buds and full of sap, it will send out fresh leaves and branches, even if cut down in mid-winter; but if it is old and not over-vigorous—as is the case with many plants which are grown in rooms—the stems are hard, few buds are upon them, and, when deprived of the stimulus which was given by the leaves, the bark withers, the roots cease to draw nourishment from the soil, and the plant dies. But if cut down at any other season of the year, the sap, which is rising rapidly, forms buds, and forces them into leaf immediately; and the life of the plant is thus preserved.

When plants of this kind are grown in greenhouses or pits, having all the convenience of an artificial climate, it is not of so much consequence when they are cut down; for heat and moisture can at any time be applied, which will enable them to commence their growth; and hence many persons allow their Pelargoniums to grow in the beds of the flower-garden, until the flowers and leaves are injured by frost, when they are taken up, cut down, and potted, for the purpose of being turned out again the following year. Another reason for cutting down window Pelargoniums now, is that some use may be made of the cuttings, for any one can strike them at this season. The branches ought not to be cut too low; but this must be left to the good sense of the amateur, for it is impossible to give directions which will be applicable to all, as different persons want their plants to assume different forms, and these will, of course, be taken into consideration when they are pruned. After the operation is performed, the plants ought not to be too much exposed to the sun; but they should be kept warm and moist by being plunged in warmest part of the garden, and shaded with a mat. When they begin to grow, repot them, and treat them in the manner which was formerly recommended for greenhouse management. Where it is desirable to have plants in full leaf at all times, two sets ought to be kept, one to cut down now and the other in spring.

Chrysanthemums ought now to be carefully attended to. Supply them liberally with manure water, at least twice a week, and they will show by their luxuriant foliage that it agrees with them. This is a good time for making dwarf flowering plants by layering them.—*R. F.*

HOME CORRESPONDENCE.

Pruning Forest Trees.—The Rev. Micaiah Balwhidder—the hero of Galt's "Annals of the Parish"—is represented to have been one year smitten with a strong desire to write a book; but his great difficulty was to decide what it was to be about! A late noble Poet, too, commences one of his works thus—

> "I want a hero!—an uncommon want,
> When every year and month sends forth a new one."

Be this as it may, it will readily be conceded that habits are stubborn things, and when a man is turned of forty, his ruling passion grows so upon him that there is no clipping its wings. This may be seen exemplified in your columns, both as regards sentiments and actions. The forest pruners stick to their axes, saws, and pruning-hooks, spite of nature, reason, and argument; and so I, on the present occasion, will stick to my old text, which you have so well epitomised into a sterling maxim—"Prune not at all, if you can help it." It is marvellous that men who are so conversant among trees, cannot see that its effects must necessarily retard the progress of their growth. Without at all entering on the physiological question, or such illustrations as you have so elaborately adduced from Garlic, Potatoes, and Dutrochet, the subject only requires a little observation, conducted with common sense—or, what Mr. Cree styles, the analogy of nature in trees or other plants. To adduce a few examples, let us begin low. You may kill and extirpate the most inveterate weed, by constantly depriving it of leaves. You may also kill a strong Oak by the same process. Take a Dog-Rose stem and work a Rose de Meaux, or Dwarf Burgundy, on it; the stem, if it does not die, will make little or no increase of girth. Work another of like strength with Noisette grandiflora, and the stem will soon far exceed its own natural dimensions. Or, take two of a sort, and prune the one hard, and the other very sparingly, or not at all; the effect on the stem will be the same, showing clearly how essential head is to promote growth of stem. Should any one exclaim, "But see how these Children of the Forest have thriven under my system; it *must* be the *true one!*" I would just beg to whisper in his ear, "Ay, they have thriven in a degree, 'tis true, but can you tell how much better they would have thriven had you let them alone?" Again, work any common Garden Rose on the rough Applebearing, as it is called, for a stock. If not allowed to have any other head, it will surely linger —if not die. This is precisely analogous to keeping the head (by pruning) below the natural proportion, and may strikingly illustrate its effects.—*Quercus.*

The Spanish Chesnut.—With reference to an allusion made in one of your late leading articles, I beg to state that I have a quantity of seedling Spanish Chesnuts which were never transplanted, nor was the tap-root ever shortened. Their laterals (several on each), however, seemed to compete with the leaders; and each plant has now the appearance of a bush, as wide as it is high, although ten or twelve years old.—*W. Godsall, Hereford.* [Then in this case the laterals ought to have been stopped.]

Application of Sulphur.—I find that Mr. Whiting invites further testimony as to the efficacy of sulphur in destroying or preventing the ravages of the Red Spider. About ten years since I happened to call at Skirving's nursery, near Liverpool, and in conversation with the foreman I happened to name the difficulty of getting rid of that pest. The house in which we were was partly filled with plants notorious for encouraging that insect; and I remarked the cleanly state of the plants to him, adding that I had tried sulphur, but never could find it efficient. "You have probably never gone far enough with sulphur," he replied. Facts are stubborn things, and I of course made particular inquiry as to how much he would use in various cases, in order to obtain fixed data on which to lay hold. The house we were in was, as far my memory serves me, about thirty feet long, fourteen feet wide, and the back and front wall about ten and six feet respectively. I felt quite surprised when he told me that (by the mode and quantity which I shall describe presently) he could bid utter defiance to this microscopical scoundrel. For a house such as described, he used four ounces; and in conducting the operation, he chose a dull day for the purpose. The pipes or flues were maintained at a medium heat, on purpose, for the sulphur operation; and no air was given during the day, unless the sun suddenly burst forth, when some of the fumes were for that period allowed to escape. The sulphur was of course spread equally over the pipes or flues, with the exception of, perhaps, the part where the fire entered, which might prove too severe. I have used this recipe ever since, and have never known it to fail; or at least, I am never troubled with the Red Spider in my houses. In fact, this season, for instance, I have two vineries, in which quantities of succession crops of French Beans and Strawberries, with various stove plants, such as Thunbergias, &c., &c., have been growing all the spring, together with Vines overhead; and we have never met with Red Spider until the last three weeks, and since then only on a Thunbergia or two; and that in consequence of the sulphurizing process having been put off beyond its usual time. On an average, I do the houses through about three times in the year. The best advice, however, which I can offer, is to go through the process whenever a Red Spider makes its appearance. The sulphur is applied by means of a dusting brush; the operator has the sulphur in a bowl, and by dipping his brush in water occasionally, and then in a damp state rolling it in the sulphur bowl, he is enabled to lay it on precisely in the way of paint. After all, let me add, that sulphur is a thing always to be used with much caution; and those who are inclined to try it had better begin in a small way at first, and increase their quantity each time a little. Of course the hotter the pipes or flues, the greater the danger; and in such cases I should keep the fire extremely moderate for the first forty-eight hours. If the day on which the operation is performed turn out sunny, and the pipes are hot, great caution will be necessary. However, let me add, that I have never yet suffered in the least from it, excepting in the case of Fuchsias and Mignonette, which are by no means partial to it; and Fuchsias should by all means be removed before the operation commences. In my opinion, it is the length of time during which the sulphur is in continuous operation, to which its power over the Red Spider is to be attributed; and this is where Mr. Whiting has, I perceive, erred; for I should never have fancied it would be effectual in the case of the Thunbergia quoted by him. This spring I had my Peach wall done on the same principle; in that case, I mixed my sulphur with soapy water, and added a little clay to it, to the consistence of a thin paint, daubing a broad band up every open space between the Peach shoots. My trees are quite clean, and I have neither insects of any kind, curled leaves, nor mildew, with an abundance of fine fruit.—*Robert Errington, Oulton Park Gardens.*

Effects of Flour of Sulphur on Ants.—I have found Sulphur an effective remedy in the expulsion of Ants; but it does not appear to kill them, as I can find none dead, though I have minutely examined the soil. After its application, however, they invariably leave the spot, and are not again to be found in the neighbourhood of their late locality. It affects equally the black and the red Ants.—*A. P. V.*

Black Beetles.—Mr. Major recommends that certain insects thus designated should be scalded to death for eating ripe Strawberries; and if by this name he means the Blattæ, I quite agree with him; but if, as I suspect, he intends the ordinary beetles of that colour, the Geodephaga, to be found running in the open garden, then, as an old entomologist, and not a very "juvenile" gardener, I entirely differ in opinion with him. The Geodephaga are the most useful insects the gardener has, and for one Strawberry devoured, a thousand larvæ and plant-feeding insects will be destroyed. As well might he recommend the destruction of the Black-cap, "bless its merry heart!" as Waterton says, or the other warblers, because they help themselves to a few of the fruit they so carefully preserve from the caterpillars. Very few insects of this division of the Coleoptera attack vegetable substances. Labrus gibbus is the only one I know to do so, and they ought by all means to be encouraged in gardens. For my own part, I carefully avoid killing them; and at this season of the year, when many species are just making their appearance, I dare say I have hundreds, or, I may say, thousands, of one beautiful species of Pterostichus alone (P. brunnipes, Sam.), both in my plant-houses and the open ground, which, until discovered here, was so rare that three specimens found by the late Dr. Leach, in Devonshire, constituted the entire stock in all the cabinets in Britain.—*S.*

To protect Wall-Fruit from Wasps.—In your last number you tell "S. M." to *net* his trees to keep off the wasps from his Wall-Fruit. As neither salmon, herring, nor pilchard net will do this, allow me to acquaint you with an efficacious substance. Take a quantity of what manufacturers and merchants call "foundation muslin" (popularly called Scotch gauze); cut it in lengths answering to the height of the wall, and sew enough, edge to edge, to form an oblong sheet of sufficient length to cover one tree; edge or bind it all round with strong list, and nail it close over the trees, turning up the lower edge inwards about 6 or 8 inches, so as to form a pocket. In this the fruit drops, when ripe, in perfect safety. This I have practised for years, and can say it is perfectly efficient.—*Quercus.*

Bees.—Some of your readers may, perhaps, be interested in learning the following simple and successful plan of taking the honey from the side of one of Nutt's boxes. In the middle of a fine day the slide between the middle and side box was introduced, thereby cutting off all communication with any outlet. The prisoners soon became exceedingly agitated, proving at once that the queen was not of their number. After keeping them in durance about an hour, the slide at the bottom of the back of the side box was partly withdrawn, sufficiently so to allow free egress to the Bees, which rushed out and flew over to the usual entrance in the front. Whenever any seemed disposed to return, the slide was replaced. By this plan, in a very short time, the box was entirely emptied of Bees; none were destroyed, and no one was stung. In the evening the box was moved, and the comb did not contain a single brood cell. This, no doubt, was owing to the care that had been taken to ventilate them: they are now working very industriously in the other end box. The quantity of honey and wax taken was 28 lbs.—*A Lady, Westbury.*

Poisonous Honey.—I must beg to demur to your inference, that because hares will not eat the shoots of the Rhododendron Ponticum, its saccharine secretions may be poisonous, as a nonsequitur; since I can assure you that the sugar of the Rhododendron is not poisonous, nor need I remind you that goats, pigs, &c., will eat with impunity what is rejected by many other animals, and what would not only prove injurious, but fatal to them.—*J. Murray.*

Toads.—Among the enemies of Bees, the Toad has not been mentioned. I am not willing to bring a charge against any of my fellow-creatures, however humble in the scale of creation; but the Toad destroys many Bees. I have seen several skulking near mine, and been informed that, on destroying a Toad, more than a dozen Bees were discovered in its stomach.—*J. Murray.*

The Laburnum.—My cows for many years past have had free access to several Laburnum trees, but whether they have eaten the seeds or not I cannot say. This I do know, that they have never been poisoned, probably because their natural instinct teaches them to avoid that which is not proper for them to eat.—*F. H. S.*

On the Management of the Vine.—I observe that the usual practice of syringing and stopping vines, denounced in No. 26, by "A Tyro," has been partially defended by "Vitis." I agree to what has been advanced by the latter correspondent, who evidently writes from experience; and I beg to add some additional remarks on the subject. "Tyro" writes to the effect that syringing is a complete absurdity: and that abundance of moisture, constantly diffused in the atmosphere, is preferable. Syringing is as good an imitation of rain as gardeners in general can command: and, particularly of those heavy rains which vines in the open ground, in more southern latitudes, are exposed to. Subject to alternations of hot sun and drought and heavy rains, the vines on the hills of the Continent live for one or more hundred years; and the wine they produce is richer than that from grapes produced in humid valleys. From this, it appears to me in vain to argue about the absurdity of syringing; for, if the latter do no more harm than rain, of which it is an imitation, plants will die a natural death before they give evidence of its ill effects. I have no hesitation in saying that judicious syringing is highly beneficial, and infinitely preferable to an atmosphere constantly loaded with moisture. We are told that when the air is not so saturated leaves perspire; which exudation is apt to condense on their surface, and it is more than probable that rain clears off this obstructing matter, especially as ammonia, a detergent, is found in rain-water. I admit, that, in one respect, "air charged with moisture continually does more than syringing;" it effectually prevents perspiration—one of the most important functions of leaves. The consequences arising from the use of impure water form a very untenable argument in favour of non-syringing, where pure can always be obtained. The stains apparent on the surface of the berries, which are generally ascribed to dust, or impurities in the water, are more frequently owing to the *bloom* itself being displaced, and driven into patches. This is most apt to happen when the bloom is being first formed on the fruit, and before it has become fully established. With regard to stopping the shoots, let us suppose, in the first place, that a vine has a fair proportion of roots, to supply nourishment to 1000 medium-sized leaves, produced on shoots growing in the uncultivated manner "Tyro" has suggested; but that, instead of allowing all to remain, the stopping system is adopted to such an extent that only 500 leaves have to be supported: what is the consequence? "Vitis" and others will agree, that the 500 leaves, having a much greater supply of sap than if 1000 had to be fed, will increase in size; and in proportion to this increase in the size of the leaves, so will be the enlargement of the buds at their bases; on which the size of the bunches in the following season depends. It may, however, be observed, that the quantity of roots formed by the elaboration of the 500 large leaves, will not quite equal that which would have resulted from the 1000 of medium size; but if the increased size of the former, and their better exposure to light, be taken into account, the difference will not be very considerable. It was, moreover, ascertained by Mr. Knight, that the more recently formed leaves, such as those at the extremities of young shoots, contribute very little to the formation of wood and roots, until the fabrication of their own substance is considerably advanced. Such extreme parts may, therefore, be dispensed with, without materially affecting the future vigour of the plant; whilst, by so doing, the sap, that would have been appropriated by those extreme parts, is diverted into others that require to be invigorated, in order that larger and finer fruit may be obtained than would be the case if the vine were left to ramble uncontrolled.—*T. N. R.*

To preserve Green Peas.—Your correspondent will find the following an excellent plan "to preserve Green Peas for the table until Christmas:"—Shell them and put them into boiling water, give them two or three warms only, and pour them into a cullender. When the water is completely drained off, turn them out on a cloth, spread on a dresser to dry them. From this cloth transfer them to another until they are perfectly free from moisture. Then bottle them in wide-mouthed bottles, leaving sufficient room to pour clarified mutton suet, one inch thick, on the top; cork them tightly, and rosin the corks, and keep them in a cellar or in the earth. When used, boil them until they are tender with a bit of butter, a spoonful of sugar, and some mint.—*Oddity.*——The following receipt I have frequently used, and never found it fail. When gathered, scald them and dry them on a cloth in a warm room, and afterwards put them into wide-mouthed bottles. I light a match and hold it for a moment or so in the bottle, and quickly fit the cork, which is fixed down with rosin. It is best to bury them till wanted for use; and the only addition to what is generally added to them is a very small portion of sugar. French Beans will keep for many months by placing them alternately with layers of salt; closing them with a piece of wood fitting the inside of the keg used, and placing a heavy stone to keep them pressed.—*A. C. E., Southampton.*

To prepare Cuttings for India.—On reading *J. F. R.'s* very interesting account of the transmission of seeds and cuttings to and from India, in your last number, it occurred to me, that with a little gardening process, cuttings destined for either journey might be made more capable of sustaining their vegetative powers with greater certainty than if left to their natural course. This is the best time of the year to prune delicate and diseased fruit-trees, with a view to strengthen them or bring them to a healthy condition. The rationale of this is, that the eyes left are doubled in strength before the end of the growing season by the accumulation of the ascending sap, and are thus enabled to push with greater vigour next year. This is a good time, therefore, to apply this system to such shoots as are to be sent to India next October or November, by cutting off one-third, or more in some cases, of their length. Cut the tips off half-way between two buds or joints, and the force of the ascending sap will nearly heal over the wound in two months. Now, if you ring the shoot where you intend it to be cut off, you will have all the strength and accumulation of this autumn's growth concentrated in the graft, as far as art can do it; and this, no doubt, will help, so far, their safe transmission. Besides, the store of vegetable matter, which will accumulate in the callosity over the ring, will be ready to break forth into roots as soon as the shoots are put into their natural element. Moreover, the partially healing over of the wounds, in this way, will be almost sufficient to supersede the use of the wax altogether.—*D. Beaton.*

Peat useful in promoting the Vegetation of Seeds.—It will happen at times that small seeds, such as Cabbage seed, Broccoli, Brussels Sprouts, &c., do not come away after they are sown, during dry and warm weather. Last spring, some of my crops failed in the first sowing; and, if I recollect rightly, mention was made in the Calendar of Operations of failures having occurred in some parts of England, and sowing over again was recommended. About a month after the regular time for sowing these seeds, a few drills were made in moist peat, and in the drills was put some guano, to cover which peat-mould was also used. The seeds were afterwards sown, being chiefly Broccoli, Cabbages, and Iceland Greens. After they were sown and covered up, the heat still continued; the surface of the peat became as dry as tinder, and would have burned if fire had been applied to it. However, the seed that was sown vegetated freely, the plants grew rapidly, and were as fit for planting out at the proper time as the few that remained of those that had been sown a month before. Another great advantage attended those that were sown in the peat: when they required to be lifted, the roots brought a ball of peat along with them, which I think was very beneficial to the plants, in keeping the roots moist after they were planted in the ground where they were to remain. It may not be necessary to sow at all times in such a soil; but I believe that a garden would be none the worse in having a few square yards of well-broken peat for sowing some kinds of seeds upon, as occasion might require.—*Peter Mackenzie.*

Mildew on Peach Trees.—I never find a single case of mildew on my Peach-trees, either in-doors or out. I plant all on mounds of brick, with the roots flat upon them, without any soil beneath; and of course the soil, altogether, is not more than a foot deep. I, however, take care to use a sound clayey loam. Mildew in the Peach arises, in my opinion, from stagnation at the root, and either excessive drought or wet, or a baked soil, will produce it. My border is always free; for if the weather prove excessively hot and dry, I rejoice on account of the Peach-wall, and the only precaution I find necessary is to spread three inches thick of rotten dung over their roots, and water heavily on the dung once or twice. If, however, the trees are in a luxuriant state, they should neither be mulched nor watered by any means, until the last swelling of the fruit, about the beginning of August.—*Robert Errington, Oulton Park Gardens.*

White Scale on Pine Plants.—As the ammoniacal gas evolved during the process of the fermentation of dung is said to destroy the scale on Pine plants, would not the ammoniacal liquor of the gas-works, if it were used for steaming the houses, or occasionally, in a diluted state, for syringing the plants, answer the same purpose? I wish some one, unfortunate enough to be troubled with this insect, would try the experiment, and report the result.—*W. P. Ayres.*

Statement of the Weather.—In consequence of the present very hot state of the weather, many inquiries are being made respecting the comparative temperature of this and other seasons. The following is a statement of the mean temperature in the shade, in the neighbourhood of London, for the last sixteen years, 1826 to 1841 inclusive, for the months of January, February, March, April, May, June, July, and up to the 15th August; with which the mean temperature of the current year from Jan. 1st to August 15th is contrasted:—

Average.	Jan.	Feb.	March.	April.
1826-1841.	36.23	40.08	43.05	47.52
1842.	32.45	40.33	49.98	46.28
Difference	—3.78	+0.25	+6.93	—1.24

Average.	May.	June.	July.	Aug. 1 to 15.
1826-1841.	55.36	60.76	64.18	63.17
1842.	53.74	63.56	61.80	66.53
Difference.	—1.62	+2.80	—2.38	+3.36

It appears from the above that the months of January, April, May, and July, of the present season, have been somewhat below the average temperature; and the months of February, March in particular, June, and August up to the present time, have been warmer than usual; the difference on the whole being nearly 4¼° in favour of the higher temperature of this season. The summer of 1826 was considerably hotter than even this, for the mean temperatures of the months of June, July, and August of that year were respectively 65.60, 66.60, 65.00. The following table of the temperature in 1826 and 1842 will probably be interesting to many persons:—

Aug.	1826.		1842.		Aug.	1826.		1842.	
	Max.	Min.	Max.	Min.		Max.	Min.	Max.	Min.
1	82	59	72	43	10	75	63	93	60
2	80	60	79	53	11	66	47	71	47
3	77	56	83	52	12	73	42	78	55
4	75	55	86	62	13	74	45	73	56
5	72	51	79	59	14	77	45	85	48
6	75	55	72	53	15	73	56	92	58
7	80	50	78	48	16	75	51	90	57
8	80	52	82	51	17	76	60	80	58
9	79	54	86	55	18	81	61	93	

On five days between the 1st and 18th of August, in the remarkably hot season of 1826, the thermometer rose to 80°, and not exceeding 82° in the shade; but between the 1st and 18th of the present month it has risen in ten days to 80° or more, and even as high as 93°.

Salvia patens.—I have a garden, in an airy situation, where Salvia patens grows strong and healthy in common garden soil, and occasionally presents a very beautiful appearance by having several large and handsome spikes of flowers expanded at the same time. Frequently, however, I find the ground strewed with unexpanded buds, in various stages of growth. I have observed this to occur not only when the nights have probably been chilly, but quite as much so during the present warmer temperature. I water the ground surrounding the roots (with rain-water when it is to be had), freely almost every evening. I believe it is a characteristic feature of this truly beautiful plant to drop its buds; but can I pursue any other plan than that adopted, to render such result less frequent? and is there any particular soil that best suits this plant? —*Amateur.*—[This species of Salvia, like all others of the genus, prefers a light, rich soil. Such complaints as yours are of frequent occurrence; but we believe that the falling off of the blooms before expansion has never been satisfactorily accounted for.]

PROCEEDINGS OF SOCIETIES.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

Aug. 3.—The last council of the session was held in Hanover-square, H. Handley, Esq., in the chair. J. W. Scott, Esq., was elected a governor, and 12 gentlemen members. Col. Challoner laid before the council the report of the finance committee at Bristol, from which it appeared that, at the gates of the show-yard alone, the sum of 2,393*l.* had been received. He then read his draught of regulations for the arrangement of the business at the Derby meeting next year. The following appointment of the General Derby Committee was unanimously agreed to:—The Duke of Richmond, Chairman; Col. Challoner, Vice-chairman: Earl Spencer, Sir J. Johnstone, Bart., M.P., Hon. Capt. Spencer, Col. Austen; E. S. Chandos Pole, C. R. Colvile, M.P., J. V. Shelley, T. R. Barker, J. Dean, P. Pusey, M.P., W. Miles, M.P., J. W. Childers, M.P., W. G. Hayter, M.P., H. Gibbs, W. Shaw, and W. Hobbs, Esqrs. It was resolved that the Duke of Richmond should be requested to name the date at which a deputation would proceed to Derby to inspect the localities submitted for their consideration, and to select the most eligible sites for the purposes of the meeting. Mr. Colvile, M.P., Chairman of the Local Derby Committee, reported the following nomination of members:—C. R. Colvile, Esq., M.P., Chairman; Sir H. S. Wilmot, Bart.; J. Strutt, and E. S. Chandos Pole, Esqrs. It was resolved, that this day should terminate the session for the season, until the first Wednesday in November. The sum of 100*l.* was voted for the purchase of books for the library. C. E. Deacon, Esq. transmitted on the part of the corporation of Southampton, an invitation for the society to hold its meeting of 1844 in that borough; replies to the queries as to its capabilities for the purposes of the meeting, and the accommodation of the members; the grant of the use of their Guildhall and Audit-house; and a plan of the town and its neighbourhood.—Prof. Sewell communicated his report on the white Belgian Carrots producing blindness, when given as food to horses; and in his opinion there is not the least reason to believe that the Belgian Carrot has greater tendency to produce blindness than an excess of any other diet.—Mr. Hobbs stated, that it would be too late this year to apprise the competitors for seed-wheat at the Derby meeting, that specimens of the plant (in the state of straw, &c.) would be required, as well as samples of the grain, and he therefore hoped that those conditions would not be rigidly enforced.—The council then adjourned to the 2d of November.

BOTANICAL SOCIETY OF LONDON.

August 5.—John Reynolds, Esq., in the chair. The following donations were awarded:—British Plants from the Rev. T. Butler, Mr. J. Pearson, Mr. A. Henfrey, Miss A. Worsley, and Mr. S. Freeman; American Plants from Mr. O. Rich, and British Mosses from Mr. J. F. Hollings. Specimens of Schistostega pennata, collected in Nottingham Forest, and presented by Mr. J. S. Sulebotham, were exhibited. A note was read from Mr. A. White, stating that he had found specimens of Dentária bulbífera, in Chesham Bois Wood, Buckinghamshire. Mr. T. Sansom (Librarian) exhibited a monstrosity of Rosa centifólia (Linn.), in which a second flower was developed from the centre of the first. Mr. W. H. White communicated a paper, being a report of the Botanical State of the Mauritius, translated from the Eighth Annual Report of the Natural History Society of that island. Mr. T. Twining, jun., exhibited a large collection of cultivated specimens from Twickenham.

FLORICULTURAL SOCIETY.

August 16.—Mr. Groom in the chair. Mr. Alex. Stewart and Mr. F. Smith were elected members. The amount of prizes to be given at the approaching Dahlia show on the 20th of September was fixed, and judges were selected, to decide upon the merits of the White Dahlias, exhibited for the first time at the next evening meeting of the society, for the cup given by Mr. Wildman. The following Dahlias were sent for judgment:—*Mountjoy's Virgil*, 1841, dark crimson, 8 blooms; a first-rate flower. *Brown's Red Gauntlet*, 1841, deep rose, tinged with salmon, 6 blooms; large and round, but slightly sunk in the eye; a good second-rate flower. *Brown's Perpetual Grand*, 1841, deep red, 6 blooms; colour bright and good; a large and first-rate flower. *Smith's Sir R. Sale*, 1841, crimson purple, 6 blooms; first-rate. *Smith's Rainbow*, 1841, primrose tipped with rose, 6 blooms; pretty from its colour for a border variety, but not calculated, on account of the form of its petal, for showing. *Cook's Confidence*, 1841, 6 blooms; from the great inequality of the blooms sent, it will be desirable to see it again. *Wildman's Bianca*, 1841, white, 8 blooms; first-rate. *Steen's Sir R. Chester*, 1842 deep purple, 1 bloom; promises to be a first-rate flower. *Small's Surprise*, 1842, rosy purple, 1 bloom; bad eye, with the petals too long. Three blooms of *Smith's Duke of Wellington* were also exhibited.

ROYAL CALEDONIAN HORTICULTURAL SOCIETY.

Aug. 3.—The prizes at this meeting were awarded as follows: For *Peaches of two sorts*:—1, Mr. J. Gavin, gr. to the Earl of Moray, for Grimwood's Royal George, and Grosse Mignonne; 2, Mr. J. Robertson, gr. to Lord Gray, for Royal George, and French Mignonne; 3, Mr. J. Murray, gr. to A. Fletcher, Esq., for Royal George and Noblesse. For *Nectarines, of two sorts*, to Mr. Gavin, for Newington and Duc de Tello. *Figs*: Mr. P. Wood, gr. to the Earl of Hopetoun, for White Genoa and Black Ischia. Several competitors produced admirable bunches of Black Hamburgh Grapes, and prizes were awarded—1, to Mr. J. Young, gr. to Mrs. Ferguson; and 2nd, to Mr. Murray. The Grizzly Frontignan Grapes were also excellent: prizes were given, 1st to Mr. J. Goodall, gr. to L. Buchan, Esq.; 2d, to Mr. J. Fargie, gr. to Mrs. Gregory. A prize having been offered for the best cluster of any Grape other than Black Hamburgh and Grizzly Frontignan, eleven competitors came forward, and two awards were—1, Mr. Young, for a very fine cluster of Muscat of Alexandria; 2, Mr. W. Macauslan, gr. to Adm. Sir D. Milne, for the White Tokay. Another prize having been offered for the largest cluster of Grapes of any variety, it was voted to Mr. J. Hogg, gr. to W. Bonar, Esq., for white Syrian, and another to Mr. R. Watson, gr. to D. Anderson, Esq., also for the white Syrian. *Melons*: 1, Mr. Alex. Fowlis, gr. to P. C. H. C. Durham; 2, Mr. C. Anderson, gr. to Sir T. B. Hepburn, Bart.; 3, Mr. J. Macnaughton, gr. to J. Wauchope, Esq. *Cucumbers*: 1, Mr. J. Murray, gr. to the Hon. Lord Mackenzie, for Manchester Prize-fighter; 2, Mr. W. Martine, for the Emperor of Russia; 3, Mr. D. Fowlis, for the white Spine. *Elton Pine Strawberries*: 1, Mr. G. Proctor; 2, Mr. J. Brown, gr. to Lady Grant; 3, Mr. W. Thom, gr. to D. Anderson, Esq. *Gooseberries, two different kinds*: 1, Mr. J. Liddel, gr. to A. Thompson, Esq., for Jubilee and Hedgehog; 2, Mr. Addison, for Yellow Sulphur and Hedgehog. For some Peaches and Grapes, from Lord Abercromby's, marked for "exhibition only," an extra premium was assigned to Mr. N. Cathie, gr. there. A box containing various fruits, from Methven Castle, including 16 sorts of Seedling Gooseberries, was considered deserving of an extra premium, which was voted to Mr. Alex. Bisset, the gr. Small awards were likewise made to Mr. R. Saddler, gr. at Moncrieff House, for a dish of the fruit of Passiflora edulis: and to Mr. Aitken, gr. at Pitlour, for a tray of Astrachan Apples and Orleans Plums. *The four finest Shrubbery Exotics*, Mr. J. Young, gr. to T. Oliver, Esq., for Elichrysum proliferum, E. élegans, Twéedia versicolor, and Bouvárdia splendens; *for finest Herbaceous Exotics*, to Mr. R. Watson, gr. to D. Anderson, Esq., for Triptilion spinosum, Gloxínia rubra, Achimenes longiflora, and Angelónia pubescens. *Orchidaceous Plants*, 1, to Mr. R. Middleton, gr. to Dr. Neill, for Acropera Loddigésii var. purp., and Stanhópea insignis; 2, Mr. G. Stirling, gr. to Lord Melville, for Stanhópea oculata, and Miltónia spectábilis. For *Cape Heaths*, the medal was awarded to Mr. Stirling, for Erica prægnans, Eweriana, Shannóniana, and hyacinthoides; and to Mr. J. Addison, gr. to the Earl of Wemyss, for E. inflata, Eweriana, ventricosa var., and jubata; and for a collection of Ericas from Prof. Dunbar's an extra premium was voted to Mr. J. Duncan, gardener there. *Seedling Fuchsias*, Mr. D. Brewster, gr. to Col. Lindsay. Awards were also made to Messrs. Handasyde, for stands of *Dahlias and Pansies*, and specimens of Achimenes longiflora and A. rosea; to Messrs. Sang and Sons, for a stand of splendid *Carnations, China Asters, and Marigolds*; to Mr. T. Douglas, gr. to Sir T. D. Lauder, Bart., for a collection of *German Stocks and China Asters*; to Mr. Alex. Forrester, gr. to Capt. Falconer, for cut specimens of *rare border flowers*: to Mr. J. Downie, gr. to Gen. Robertson, for Cape Ericas; to Mr. A. Cameron, for *Petunias*; to Mr. J. Melrose, gr. to R. Trotter, Esq., for *Celósia cristata*, the heads being 23 inches long by 10 broad. The Royal Botanic Garden contributed several large specimens of Cape Heaths, and other rare plants, densely covered with blossoms:—Among these, Erica tricolor speciosa was exceedingly rich and elegant; also E. Aitónia, E. ovato-umbellata, E. ventricosa, Bánksia média, Státice arbórea, &c. The Horticultural Society's own garden afforded several novelties, which were displayed in the tent:—Of these Oncidium Lanceanum attracted much notice, having three beautiful spikes of flowers; and a plant of Phlox speciosa, recently introduced from America, was particularly admired. Several plants were exhibited to show novel modes of culture; some were suspended in the air, and nourished by means of worsted syphons; others, including Gloxínia caulescens, were growing entirely in balls of hypnum-moss; a fine plant of Mammillária depressa, crowned with its white fruit, was suspended in a rustic basket filled merely with decayed hypnum. Besides fruits and plants, this exhibition presented some other interesting articles. Of these a transplanting machine, invented by Mr. W. M'Nab, attracted attention. It stood upon the lawn in front of the new hall, and supported, ready for transplanting, a handsome variegated Holly tree, fully 20 feet in height, with a huge ball of earth attached, the whole weighing (exclusive of the machine) upwards of a ton. Mr. C. H. J. Smith exhibited an improved conical boiler and hot-water apparatus, fitted up like an Arnott's stove, for heating frames and hothouses. Mr. M'Innes, showed various forms of zinc frames, adapted for striking cuttings of plants; with an elegant and light support for climbing-plants, in the form of a miniature tree. Mr. Smith and Mr. Borthwick, wire-workers, High-street, also exhibited many tasteful designs of trellis-work for training climbing-plants.

COUNTRY SHOWS.

Birmingham and Midland Floral and Horticultural Society, Aug. 4.—CARNATIONS: *Premier*, Game Boy, Mr. Coudrey. *Scarlet Bizarre*, 1, Col. Wainman, Mr. Bunn; 2, Prince Albert, Mr. Bunn; 3, Hepworth's Leader, Mr. Flindell. *Purple Bizarre*, 1, Ely's Lord Milton, Mr. Britten; 2, Gregory's Alfred, Mr. H. Pope; 3, Paul Pry, Mr. Bunn. *Scarlet Flake*, 1, Beauty of Cradley, Mr. Wallace; 2, Beauty of Birmingham, Mr. Coudrey; 3, Taylor's Festival, Mr. Flindell. *Purple Flake*, 1, Squire Meynell, Mr. Coudrey; 2, Malpas's Mary Ann, Mr. Bunn; 3, Squire Clarke, Mr. Fletcher. *Rose Flake*, 1, Lady Hood, Mr. Coudrey; 2, Elliott's Catherine, Mr. Bunn; 3, Duchess of Gloucester, Mr. Coudrey. *Seedlings*, 1, Mr. Britten; 2, Mr. Wallace. *Best 5 Carnations, 1 of a class*, Mr. Coudrey. PICOTEES: *Premier*, Nulli secundus, Mr. Flindell. *Purple edge*, 1, Crask's Diana, Mr. Haines; 2, Nulli secundus, Mr. Flindell; 3, Miss Hancox, Mr. Bunn. *Yellow edge*, 1, Martin's Victoria, Mr. Coudrey; 2, Lady of the Lake, Mr. Coudrey. *Red edge*, 1, Boothman's Victoria, Mr. Coudrey; 2, Wells' Duke, Mr. Wallace, 3, Mrs. Horner, Mr. Wallace. *Best 4 Picotees, 2 purple and 2 red-edged*, Mr. Wallace. DAHLIAS: *Premier*, Climax, Mr. C. Kimberly. *Buff*, Nicholas Nickleby, Mr. C. Kimberly. *Crimson*, Marquis of Lothian, Mr. Earl. *Purple*, Conservative, Mr. Earl. *Puce*, Rouge et Noir, Mr. E. Phillips. *Rose*, Catleugh's Eclipse, Mr. Earl. *Striped*, Beauty of the Plain, Mr. Kimberly. *Scarlet*, Lee's Bloomsbury, Mr. J. Moore. *Yellow*, Widnall's Argo, Mr. Davies. *Blush*, Marchioness of Lansdowne, Mr. Kimberly. *Orange*, Seedling, J. Mason, Esq. *Dark*, Seedling, Mr. Earl. *White*, Lewisham Rival, Mr. Kimberly. *Shaded*, Fanny Keynes, Mr. Earl. GOOSEBERRIES: *Premier*, Thumper, 24dwts. 12grs., Mr. Fairfield. *Red*, 1, Young Wonderful, 21dwts. 23grs., Mr. Wallace; 2, Companion, 20dwts. 16grs., Mr. Wallace; 3, Freeholder, 20dwts. 15grs., Mr. Fairfield; 4, London, 20dwts. 10grs., Mr. Wallace. *Yellow*, 1, Leader, 18dwts. 12grs., Mr. Fairfield; 2, Bunker's Hill, 17dwts. 17grs., Mr. Fairfield; 3, China Orange, 17dwts. 16grs., Mr. Fairfield; 4, Pilot, 16dwts. 19grs., Mr. Wallace. *Green*, 1, Overall, 20dwts. 17grs., Mr. Fairfield; 2, Peacock, 20dwts. 3grs., Mr. Fairfield; 3, Thumper, 19dwts. 16grs., Mr. Fairfield; 4, Bumper, 17dwts. 21grs., Mr. Fairfield. *White*, 1, Seedling, 19dwts. 12grs., Mr. Fairfield; 2, Eagle, 18dwts. 10grs., Mr. Fairfield; 3, White Swan, 17dwts. 12grs., Mr. Fairfield; 4, Tally Ho! 15dwts. 8grs., Mr. Baker. *Dish of 24 sorts*, 1, Mr. Fairfield; 2, do. *Dish of best-flavoured*, 1, Rough Reds, Mr. Moore; 2, Whitesmith, Mr. Brewer. ORCHIDACEÆ: 1, Cattleya Harrisónii, A. Kenrick, Esq.; 2, Mormodes citrina, do. STOVE PLANTS: 1, Æschynanthus parasíticus, A. Kenrick, Esq.; 2, Gesnera Coóperi splendens, A. Kenrick, Esq. GREENHOUSE PLANTS: 1, Crássula coccinea, J. Mason, Esq.; 2, Clethra arbórea, Mr. Moore. ERICAS: 1, E. Hartnelli, Messrs. Pope and Sons; 2, E. Irbyana, A. Kenrick, Esq. PELARGONIUM: Sylph, Miss Bellamy. ROSES IN POTS: 1, Rosa Devoniensis, Miss Bellamy; 2, Lyonnais, Messrs. Pope and Sons. SWEEPSTAKES FOR ROSES: Messrs. Pope and Sons. CALCEOLARIAS: 1 and 2, A. Kenrick, Esq. HARDY SHRUBS: 1, Lavatera Thuringíaca, Messrs. Pope and Sons; 2, Spiræa tomentosa, Messrs. Pope and Sons. HERBACEOUS OR FRAME PLANTS: Lilium lancifólium punctatum, Messrs. Pope and Sons. 2, Tigrídia Pavónia, Mr. Earl. SIX VARIETIES OF ANNUALS (Cut Specimens): Mr. Wright. FUCHSIA: Corymbiflora, Mr. Kellett. COCKSCOMB: Mr. Yates. ORANGE OR LEMON: Citrus aurántium, Mr. Moore. GRAPES: Black Hamburgh, R. L. Chance, Esq. MELONS: 1, *Green Flesh*, E. Bower, Esq.; 2, *Cassabar Gold Flesh*, do. CURRANTS: Mr. Fairfield. CUCUMBERS: 1, *Improved Manchester*, A. Kenrick, Esq.; 2, *Matchless*, Mr. Chinn. STRAWBERRIES: *Elton Pine*, Mr. Coudrey. RASPBERRIES: *Globe*, Mr. Rodway. APPLES: 1, *Beauty of Kent*, Mr. Baker; 2, *Early Margaret*, Mr. Rodway. PEARS: 1, *Chaser*, R. L. Chance, Esq.; 2, *Green Chisel*, Mr. Walthew. PEAS: *Imperial Scimitar*, Mr. Baker; 2, *Milford Marrow*, do. BEANS: 1, *Johnson's Wonderful*, Mr. Coudrey; 2, *Taylor's Windsor*, do. FRENCH BEANS; 1, *Scarlet Runner*, J. Mason, Esq.; 2, *Dwarf*, Mr. Baker. CELERY: 1, *Manchester Red*, J. Mason, Esq.; 2, *Giant*, Mr. Chinn. RHUBARB: 1, *Green Giant*, Mr. Gold; 2, *Victoria*, Mr Rodway. POTATOES: *Blue Ash-leaved*, Mr. Rodway; 2, *Auberry Kidney*, Mr. Davies. ONIONS: 1, *Tripoli*, Mr. Rodway; 2, *Globe*, do. CARROTS: 1, *Altringham*, Mr. Baker; 2, *Early Horn*, Mr. Davies. TURNIPS: 2, *White Stone*, R. L. Chance, Esq.; 2, do., Mr. Chinn. Various Cottagers' prizes were also distributed.

Cheltenham Horticultural Society, July 26.—The fourth exhibition took place at the Montpelier Rotunda. The display of flowers and fruit was highly gratifying to those congregated on the occasion. The following were the prizes awarded:—*Amateurs*: CARNATIONS, Mr. W. Bryan. PICOTEES, Mr. W. Bryan. COCKSCOMBS, 1, J. Webster, Esq.; 2, Mrs. Blackman. BALSAMS, 1, Mr. Heath; 2, J. Webster, Esq. STOVE OR GREENHOUSE PLANTS, 1, Lady Cromie; 2, Sir R. Wolesley, Bart. PELARGONIUMS, 1, Mr. Heath, gr. to Dr. Irvin; 2, Mr. W. Bryan. HARDY PLANTS, 1, Sir R. Wolesley, Bart; 2, Mr. Heath. HARDY HERBACEOUS PLANTS, 1, Mr. W. Bryan; 2, Sir R. Wolesley, Bart. HARDY ANNUALS, 1, Mr. W. Bryan; 2, Lady Prinn. PLANTS: *Collection of six*, 1, Mr. Heath; 2, J. Webster, Esq. *Ornamental basket*, 1, Mr. Heath; 2, Lady Prinn. *Device*, Miss Tunno. *Wild flowers*, C. T. Cook, Esq. *Collection*, Miss Wallace. DAHLIAS, Mr. Heath. PINE APPLE, *Queen*, J. Taylor, Esq. MELONS, 1, *Black Rock*, J. Taylor, Esq.; 2, *Scarlet fleshed*, J. Webster, Esq. GRAPES, *dark*, 1, J. Taylor, Esq.; 2, Sir R. Wolesley, Bart. *Light*, 1, J. Taylor, Esq.; 2, Sir R. Wolesley, Bart. APRICOTS, 1, J. Webster, Esq.; 2, J. Taylor, Esq. CHERRIES, 1, J. Taylor, Esq.; 2, J. Taylor, Esq. APPLES, *dessert*, 1, W. J. Agg, Esq.; 2, J. Taylor, Esq. *Culinary*, 1, J. Webster, Esq.; 2, J. Taylor, Esq. PEARS, *dessert*, 1, W. J. Agg, Esq.; 2, Lady Prinn. RASPBERRIES, 1, Lady Prinn; 2, W. J. Agg, Esq. CURRANTS, *Red*, 1, Mrs. Blackman; 2, W. J. Agg, Esq. *White*, 1, Lady Prinn; 2, J. Taylor, Esq. GOOSEBERRIES, *Red*, 1, J. Taylor, Esq.; 2, Lady Prinn. *Green*, 1, J. Taylor, Esq.; 2, W. J. Agg, Esq. *Yellow*, 1, J. Taylor, Esq.; 2, W. J. Agg, Esq. *White*, 1, J. Taylor, Esq. CELERY, 1, W. J. Agg, Esq.; 2, W. J. Agg, Esq. CUCUMBERS, 1, J. Webster, Esq.; 2, Lady Prinn. PEAS, 1, Lady Prinn; 2, J. Webster, Esq. TURNIPS, 1, Lady Prinn; 2, J. Webster, Esq. CARROTS, 1, J. Webster, Esq.; 2, Lady Prinn. BROAD BEANS, 1, W. J. Agg, Esq.; 2, J. Webster, Esq. KIDNEY BEANS, 1, J. Webster, Esq.; 2, J. Taylor, Esq. *Dwarfs*, 1, J. Taylor, Esq.; 2, J. Webster, Esq. EXTRA PRIZES: *Figs*, Mrs. Blackman. *Nurserymen, commercial gardeners, and cottagers*: CARNATIONS, *twelve blooms*, 1, Mr. Hodges. *Five blooms*, 1, Mr. Hodges; 2, Mr. Ryder. PICOTEES, *twelve blooms*, 1, Mr. Hodges; 2, Mr. Pipe. *Five blooms*, 1, Mr. Hodges; 2, Mr. Pipe. PANSIES, 1, Mr. Hopwood; 2, Mr. Pipe. PLANTS, *collection of twelve*, 1, Mr. Hodges; 2, Mr. Pipe. *Collection of six*, 1, Mr. Hodges; 2, Mr. Pipe. *Ornamental basket*, 1, Mr. Hodges; 2, Mr. Pipe. *Single Plant*, 1, Mr. Hodges; 2, Mr. Meggs. ROSES, Mr. Hodges. FUCHSIAS, Mr. Evans. GLOXINIAS, Mr. Hodges. PICOTEES, Mr. Hodges. CARNATIONS, Mr. Hodges. DAHLIAS, Mr. Hodges. MELONS, 1, Mr. Middlemiss; 2, Mr. Hurlston. GRAPES, *dark*, Mr. Pipe. *Light*, 1, Mr. Hurlston; 2, Mr. Hodges. APRICOTS, 1, Mr. Middlemiss; 2, Mr. Pipe. CHERRIES, 1, Mr. Coull; 2, Mr. Middlemiss. APPLES, *dessert*, 1, Mr. Middlemiss; 2, Mr. Coull. *Culinary*, 1, Mr. Coull; 2, Mr. Pipe. PEARS, *dessert*, 1, Mr. Pipe; 2, Mr. Dovey. RASPBERRIES, 1, Mr. Hurlston; 2, Mr. Pipe. CURRANTS, *red*, 1, Mr. Dovey; 2, Mr. Coull. *White*, 1, Mr. Dovey; 2, Mr. Ryder. *Black*, 1, Mr. Dovey; 2, Mr. Hurlston. GOOSEBERRIES, *red*, 1, Mr. Ryder; 2, Mr. Middlemiss. *Green*, 1, 2, Mr. Dale. *Yellow*, 1, Mr. Dale; 2, Mr. Ryder. *White*, 1, Mr. Ryder; 2, Mr. Hurlston. CELERY, 1, Mr. Middlemiss; 2, Mr. Hurlston. CUCUMBERS, 1, Mr. Hurlston; 2, Mr. Dovey. PEAS, 1, Mr. Dale; 2, Mr. Hurlston. TURNIPS, 1, Mr. Dale; 2, Mr. Dovey. CARROTS, 1, Mr. Middlemiss; 2, Mr. Dovey. BROAD BEANS, 1, Mr. Ryder; 2, Mr. Dovey. KIDNEY BEANS, *Scarlet runners*, 1, Mr. Ryder; 2, Mr. Dale. *Dwarfs*, 1, Mr. Ryder; 2, Mr. Dale. EXTRA PRIZE: ONIONS, Mr. Dale.

Norwich Horticultural Society, July 27.—This exhibition was not so numerously attended as usual. The following prizes were awarded: FRUITS, PINES: *Queen*, Mr. C. Butcher. GRAPES: *Grizzley Frontignan*, &c., C. K. Tompson, Esq. *Black Prince*, W. Rippingale, gr. to G. Morse, Esq. MELONS: W. Burt, Esq. APRICOTS: 1, Mr. Cockburn, gr. to J. T. Mott, Esq.; 2, W. Warner, gr. to W. Robinson, Esq. PLUMS: Mr. Cockburn. GOOSEBERRIES: W. Scarlett. *Champagne*, W. Kemp, gr. to Sir E. Stracey. CURRANTS: *Red*, 1, J. Gordon, Esq.; 2, W. Gale, gr. to H. N. Burroughes, Esq., M.P. *White*, 1, W. Gale; 2, W. Kemp. *Black*, S. Short. RASPBERRIES: 1, Rev. J. Burroughes; 2, W. Kemp. CHERRIES: *Black Eagle and White Florence*, 1, Mr. Cockburn; 2, May Duke, S. Short. BEST ELTON STRAWBERRIES Mr. Cockburn. *Carolina*, W. Gale. VEGETABLES, LETTUCES, *Cove Coss*, Mrs. Burroughes. PEAS: *Victoria*, 1, S. Short; 2, *Green Marrowfat*, S. Short. BEANS: *Windsor*, W. Scarlett. *Kidney*, 1, Mrs. Thomson; 2, H. S. Patteson, Esq. ONIONS: W. Gale. BEST BASKET OF SALAD: 1, W. Gale; 2, S. Short. BROCCOLI: *Walcheren*, Rev. J. Burroughes. BASKET OF DESSERT FRUIT: Mr. Wigton, gr. to Lord Stafford. FLOWERS: PICOTEES, 30 *varieties*, Rev. J. Burroughes; 24 *do.*, Rev. J. Burroughes; 18 *do.*, Rev. J. Burroughes; 12 *Yellow*, F. Catton, gr. to the Rev. C. Fellowes. CARNATIONS: 24 *varieties*, equal, Rev. J. Burroughes and G. Dover; 18 *do.*, J. Catton; 12 *do.*, Rev. J. Burroughes. PICOTEES: 12 *seedlings*, Rev. J. Burroughes; *Seedling*, Mr. G. Thurtell. POTS OF CARNATIONS AND PICOTEES: Geo. Dover. CUT FLOWERS: 1, J. Catton; 2, J. N. Waite, jun., Esq. COLLECTION OF POPPIES: J. Gordon, Esq. COLLECTION OF DAHLIAS: 1, Mrs. Burroughes; 2, Mr. G. Thurtell. *Seedling*, 1, Rev. J. Burroughes; 2, Mr. G. Thurtell. MARIGOLDS: J. Boughton, gr. to the Rev. — Brewer. SEEDLING PETUNIAS: J. Barkaway. GERMAN STOCKS, equal, Rev. J. Burroughes and Edward Kemp. HOLLYHOCKS: W. Blaza. GLADIOLI: C. Middleton, Esq. COLLECTION OF HYBRID FUCHSIAS, *for Messrs. Youell's Prize of* 2*l.*: Chandleri, Invincible, grandis, blanda, conspícua, arbórea, arbórea magnífica, Standishi, Dalstoni, mirábilis, globosa, cárnea—Mrs. Burroughes. FUCHSIAS: C. Middleton, Esq. *Seedlings*, C. Middleton, Esq. MYRTLE: S. Short. COCKSCOMBS: J. Gordon, Esq. COLLECTION OF GREENHOUSE PLANTS: J. Longe, Esq.; *do.*, S. Short; *do.*, W. Rippingale. BEST HONEY: 1, Rev. T. Burney; 2, W. Herring, Esq.; 3, J. Matchett, Esq.

NOTICES OF NEW PLANTS WHICH ARE EITHER USEFUL OR ORNAMENTAL.

AE'RIDES BROÓKII. Sir W. Brook's Air-plant. (*Stove Epiphyte.*) Orchidaceæ. Gynándria Monándria.—This lovely plant was imported from the East Indies by C. Horsfall, Esq., some time since, in whose valuable collection it flowered during the month of May last. This species is one of the most peculiar and handsome which has yet been introduced. It is of vigorous habits, and produces a long tortuous stem, with luxuriant leaves, on which there are singular patches of a decidedly glaucous nature. The raceme of flowers issues from near the top of the stem, and is from a foot to 18 inches long, drooping, and bearing several side branches. The column may be compared to the beak of a bird; while the broadly-expansive form of the lip, with its reflexed, undulated, and jagged edges, and the rich purplish tints of its extremity, are quite novel. The fragrance of the flowers is likewise superior to that of A. odoratum, and they last for an extraordinary length of time in a cool place; remaining perfect when detached, and kept out of water, nearly a week. For cultivating this charming plant, a block of wood, to which it can be attached, should be chosen; or it should be planted in sphagnum moss, in an open wooden basket. In either case it must be suspended from the roof of a warm Orchidaceous house, and planted near the sources of atmospheric moisture in summer. A position at a slight distance from a cistern, or immediately over it, should be preferred. It must be watered assiduously during the summer months, and kept rather dry in winter. In propagating the plant, the young branches should not be cut off till they have formed roots; and perhaps it will be desirable partially to sever them from the old plant some time previously to removing them altogether. They ought not to receive much water after their removal, until they begin to grow.—*Paxton's Mag. of Botany.*

ALSTRŒME'RIA NEMOROSA. Woodland Alstrœméria. (*Hardy Herbaceous Plant.*) Amaryllidáceæ. Hexándria Monogýnia.—This showy species first flowered in the winter of 1841-42, in the greenhouse of Messrs. Veitch and Son, of Exeter. The roots were found on the Organ mountains of Brazil, at an elevation of about 3,000 ft. It is distinguished from A. aurea, which it greatly resembles, by the appearance of the seeds, which are less round and tuberculated, by the greater breadth of the leaves, and shorter flowers; by a freckle or two on the lowest petal; and by the undulation and more dense ciliation of the base of the segments of the perianth, especially the sepals.—*Curtis's Bot. Mag.*

BIGNÓNIA PICTA. Painted Bignonia. (*Half-hardy Climber.*)

Bignoniáceæ. Didynámia Angiospérmia.—The large violet flowers of this species, with deep rich purple veins, have a fine appearance, while its slender habit renders the plant particularly well suited for trellising in a pot. For such purposes, indeed, a large part of this beautiful genus is perfectly adapted. People have no notion of the rich and varied colours, or of the graceful forms, that are to be had among its many species, not to speak of the magnitude of their flowers. All the tropics contain them, and the attention of travellers in those countries should be particularly directed to sending home their seeds, which soon come up. Bignonia picta itself is a handsome creeper, and is said to be as hardy as B. capreolata, requiring the same treatment. Like all Bignonias, it should have a strong rich loamy soil; for although they grow vigorously in light sandy or peaty soils, they never flower freely under such treatment, and occupy much more room both for their tops and roots to grow in. It is increased from seeds or cuttings of the half-ripened slender shoots, put in sand, and treated in the ordinary way.—*Bot. Reg.*

MISCELLANEOUS.

The Turnip-Fly.—From a letter, signed "A Tanner," in the "Mark Lane Express," we copy the following simple and, as is said, efficacious remedy for checking the ravages of this destructive insect:—"In my constant intercourse with farmers, I have frequently heard their lamentations on the destructive ravages of the turnip-fly. A small patch of turnip-seed was sown in my garden some weeks since, and thought no more about for a considerable time; till one day chancing to pass by it, I discovered, on closer inspection, that the young plants were swarming with fly, and already half destroyed. I lost no time in applying what I hoped would be a remedy for the mischief; this consisted of some stale liquid from a lime-pit, scattered over the plants with a watering-pot. On revisiting the patch next day, I observed that the enemy was gone, and scarcely a fly was to be seen, except one solitary little wretch that was perched on a plant just unfolding; but not one could be seen on any plant that had received a sprinkling from the contents of the watering-pot. The next apprehension was, that the sprinkling might have injured the plants; a few days, however, removed all doubt, for rain came and washed the sprinkling (of lime and animal matter in combination) from the plants down to the roots, and they have since grown away in rank luxuriance, have been thinned once, and require the same operation again. Thus, by this sprinkling, the plants received protection from the fly *first*, and then, when the rain fell, were nourished by a highly-stimulating manure. It will, however, be said, but of what avail is this information? Farmers have not access to the lime-pits of the tanner; and if they had, the quantity to be procured would be so small as not to be of any material benefit; which is very true, and therefore the writer would recommend every farmer to have his own lime-pit in his farm-yard,—if so situated as to take the drainings of the yard, all the better; or where water may be obtained, a bricked pit or tank, into which should be thrown a few quarters of lime, with a sufficiency of water; and, when it can be procured, all manner of refuse animal matter, cut in pieces—such as a dead sheep, horse, &c., and the entrails of what may be slaughtered. Sometimes, on the coast, a load of worthless fish may be obtained. Farmers are little aware what an amount of rich liquid manure may be obtained at a very trifling cost. Although not one myself, I know, from the effects produced at various times on a small scale in my garden, that animal matter, in solution with lime, is an active and powerful manure; and what induced me to think it might be a preventive to the fly was, that I had observed, however stale and fœtid, *animal life* cannot exist in it."

Cambridge Botanic Garden, Massachusetts.—We are happy to hear that Dr. A. Gray, the author of several valuable works upon the Flora of the United States, has accepted the Botanical Chair of the Haward University, Cambridge, Massachusetts, with the direction of the Botanic Garden, the only one at present established in that country. It is his intention to renovate the Garden, and to introduce into it as many of the hardy and half-hardy plants of the United States as he can possibly obtain. We are also informed that Dr. Gray would willingly communicate with Botanists of other countries for such plants as are not in his possession, and would supply them in return with such American plants as they might desire to cultivate.

Gardener's and Botanist's Foreign Library.—The following new works are expected shortly to appear.—Seidel, C. A., gardener at the court of Dresden:—Anweisung (Detailed Instruction on the Proper Care and Management of large Orangeries, from an experience of many years). Dresden, 8vo.——Für Freunde des Obstbaues (The Friend of the Fruit-grower)—A periodical under the superintendence of the Arboricultural Society of the Oberlausnitz. Hamburg, 8vo.——Hoffman, J. P.:—Laboratorium (Description of the Chemical Laboratory at Giessen, with a Preface by Prof. Liebig.) Heidelberg, folio.——Fischer, F. F.:—Verwehntung (The Highest Advantage to be derived from Potatoes, by making thereof a wholesome, strong, and well-flavoured beer; also to obtain from them the greatest amount of Alcohol). Leipzig, 8vo.——Prestele, J.:—Giftpflanzen (The most Noxious, Poisonous Plants of the middle part of Germany, in figures of natural size; Text by C. Soldau). Friedberg, 4to.——Reider, J. E. von:—Das Bienenbüchlein (The Little Book on Bees, according to a Thirty Years' Experience). Leipzig, 8vo.

To destroy Moles.—A correspondent gives the following recipe to destroy Moles: Take a small quantity of the carbonate of barytes, put it into a pan, then put some worms in upon it, and allow them to remain some time. Then find out the track of the mole, and put the worms into it, after which close up the run again. Continue this as long as the worms are carried away.—*Mark Lane Express.*

GARDEN MEMORANDA.

Pencarrow, the seat of Sir W. Molesworth, Bart.—This mansion is delightfully situated in the neighbourhood of Bodmin, between that town and Wadebridge, surrounded by some beautiful wooded scenery, and very large and handsome specimens of forest trees. This place of late years has undergone extensive alterations, and many thousand pounds have been expended by the spirited proprietor in various decorations of the flower garden, shrubberies, drives, &c. It is now generally considered to be one of the first places in the West of England. The flower garden is of large dimensions, situated in front of the mansion, surrounded by raised terraces, and beautifully laid out in beds of various forms and devices. The centre of the garden is ornamented by a large and superb fountain, built of granite, and elegantly carved. Around it were some beds of the newest sorts of Dahlias, and of the choicest Pansies, Verbenas, Petunias, and Alstrœmerias. One of the principal attractions of this place is the large and extensive mass of rockwork, which forms one side of the flower garden, and which is very naturally arranged. Before the garden was made, there was a hill facing many of the windows of the mansion, which had a very unsightly appearance; and Mr. Corbett, the gardener, in order to do away with this object, formed this rockery of it, which is very attractive, and is one of the best specimens of rockwork which we have seen. The stone is brought from the adjoining hills; some of the pieces weigh as much as two or three tons,—but the great ornament that this rockery is to the place fully compensates for every additional trouble. The stones were not dug out of a quarry, but were lying on the surface of the soil, with the lichen, moss, &c., growing about them; consequently they have a more natural effect than if they were taken out of the earth. In this rockery are planted most of the best varieties of rock plants. The different species of Mahonia seem to thrive here remarkably well. In one part an artificial bog is formed, which has every appearance of being natural; it is supplied from the reservoir by a small pipe, and a stream of water is constantly running into it. In this bog we found, to our astonishment, that singular little plant the Dionæa muscípula, or Venus's fly-trap, thriving in great luxuriance, and throwing up its flower-spikes. This plant, we were informed by Mr. Corbett, stood through last winter, and was frozen hard, the only protection it had being a bell-glass. Here also we found the Pinguícula grandiflora, and Parnássia Caroliniana, in most vigorous growth. At the foot of the rockery is a fine and healthy specimen of Araucária imbricata, about 5½ ft. in height; and a vigorous plant of the Cedrus Deodara, about 10 ft. high. The greenhouse is well filled with some healthy specimens of various plants. The Ericas are doing well, and we observed the following in fine bloom, viz.:—E. exímia, ampullácea, and trícolor, three of the best sorts in cultivation. The Fuchsias were in great perfection, including all the newest sorts, amongst which the following were loaded with their beautiful bright blossoms:—cárnea, formosa, élegans, Youellii, magnífica, insignis, Dalstónia, multiflora, Chandlerii, conspícua, mirábilis, arbórea, and Standishii. In this house we found also some fine specimens of Roella ciliata, Rondelétia speciosa, and Pavetta Caffra, as well as one of the largest specimens which we have yet observed of the New Zealand spruce, Dacrýdium cupressinum, a plant of great rarity. In the stove were some good Orchidaceous and other tropical plants, particularly Echites suberecta, one of the best stove creepers, covered with a quantity of large bright yellow blossoms; fine specimens of the Pitcher-plant (Nepenthes distillatória), and of Oncidium Lanceanum. This house is heated with Corbett's hygrothermanic apparatus, which answers well, as the plants appear to grow in great luxuriance. In front of the greenhouse a piece of ground has been prepared, in which is planted a very interesting collection of New Zealand plants, lately sent home by the brother of Sir W. Molesworth. From the present appearance of the foliage, there seem to be many new plants amongst them; and we have every reason to expect that they will be of great benefit to our shrubberies and ornamental plantations if they will stand over winter, which we have no doubt will be the case. Near this was a fine bed of Gladioluses, in a soil composed of peat and sand, blooming most abundantly; the most conspicuous amongst them was a fine truss of flowers of the G. insignis. In the fruit garden were some large Peach and Nectarine trees, with scarcely any fruit on them; which is generally the case this season throughout the west of England. Of Pears and Apples there was a fair crop. In the Peach-house the trees were looking remarkably clean and healthy, with a fair quantity of nearly ripe fruit. Sir W. Molesworth is about to form an arboretum, which will have a good effect.—*W. E. R.*

Broughton, near Manchester.—In the very extensive collection of Orchidaceous plants cultivated in these gardens, there are, at the present time, considerably more than a hundred either in bloom or throwing up their flower-scapes. Amongst the former are the rare and sweet-scented Brassavola cucullata; the beautiful Maxillária Skínneri; and, for the first time in this country, Oncidium microchilum, with a scape two feet in length, and four lateral branches.—*Aug.* 10.

CALENDAR OF OPERATIONS *for the ensuing week.*

In most gardens Turnips, Spinach, and Onions, the two first for early spring, and the last for summer use, are sown about this season of the year. The capability of the young plants to stand the winter depends in a considerable degree upon their size, and their increase depends less upon the exact time of sowing, than upon the weather during the autumn months being more or less favourable to growth. It is, therefore, a safer course to make two sowings, at intervals of a week or ten days, of all plants that are intended to stand till spring without artificial protection, or with merely the shelter of hand-glasses, than to depend for a supply upon seeds sown on any particular day. Independently of shelter, a dry situation should always be chosen for winter crops: for the destructive power of frost upon plants is greatly aggravated by moisture, besides the direct injury they sustain by being almost constantly wet. This precaution is more than usually necessary now, because it may be presumed, that after so long a drought, we shall be visited by a corresponding excess of rain during the winter months.

I.—KITCHEN-GARDEN AND ORCHARD.

In-door Department.

PINERY.—Every precaution must be taken to prevent the roots of the plants from being injured by the violent heat, which the excessive warmth of the weather has probably generated in the bark-bed. The safest method is to draw the bark quite away from the pots, and to keep the houses as cool as possible by means of shading, watering the floors, and a free admission of air. Some persons water the bed, which merely cools it for the moment, and by supplying one of the elements necessary to fermentation, often causes the bark to heat still more violently after a short time. If the bottom-heat does not exceed 90°, the pots might continue half plunged with advantage; but in every case, the plants should be shaded, and a moist atmosphere maintained, while the weather is so bright and warm. Give water at the roots as often as required, but not a great quantity at one time.

VINERY.—Some of the sashes might remain open all night while the hot weather continues. Ripe Grapes, especially the Frontignans, will soon shrivel, if exposed to the burning sun; such ought therefore to be shaded with nets or canvas, if wanted to be kept; and with the same view, the laterals need not be so closely taken off as formerly.

PEACH-HOUSE.—Where Vines are trained to the rafters of the late Peach-houses, the treatment of the houses, after the Peaches are gathered, must be regulated to suit the ripening Grapes. Houses in which there are no Vines should have all the air possible, and be attended to in watering, &c., as we have formerly directed.

CUCUMBERS AND MELONS.—The late crops of Melons will require regular attention in dressing and impregnating. When the frames are closed in the evenings, sprinkle those plants upon which a sufficiency of fruit is set: it will refresh them, and assist in keeping the Red Spider under. Air might be left all night to Melons that are full swelled, and to Cucumber frames. Repot young Cucumber plants as they require it, and do not stop those which are intended for training to wires.

MUSHROOM-HOUSE.—Continue the preparation of droppings and short dung, for making beds for winter produce. Exhausted beds can sometimes be resuscitated by taking off the old soil, and covering them with a mixture of loam and sheep-dung.

Out-door Department.

Weeds blossom and ripen seed in a very short time now; and to prevent it, extra vigilance in hoeing and weeding will be necessary. This, with watering, and the clearing away of unproductive crops, will be the principal business to be attended to in the Kitchen-Garden, until a change of weather occurs. Take advantage of the first rain to plant and sow everything that is required, and to earth up advancing crops.

BEANS.—The late ones would be greatly benefited by a copious watering, and an after-mulching of dung.

CARDOONS.—The first crop should be banded and earthed up.

CAULIFLOWERS.—Sow, if not yet done, and afterwards water and shade the beds.

LETTUCE.—Tie up the open sorts of Cos to blanch them. Water successional crops, and gather seed as it ripens.

ONIONS.—If any of those sown in spring are sufficiently ripe, let them be pulled up; bend down the necks of all that are not inclined to bulb. A second sowing might be made at the end of the week.

PARSLEY.—Gather seed of the best, and cut off a portion close to the ground of that which is now in use; it will put up young leaves again before winter.

RAMPIONS.—These must be well supplied with water, or their roots will become hard and stringy, and consequently unfit to be used in salads.

SPINACH.—The sowing of this should not be longer delayed; give the ground a copious watering, and afterwards cover it with Pea-straw, or other litter, till the plants come up.

SUCCORY might still be sown if the first crop is likely to be insufficient. Although late for sowing, it will still grow large enough to be useful.

Orchard.—The following is a good method of destroying wasps, which are now numerous and troublesome:—Mix gunpowder and flowers of sulphur, adding water enough to make it capable of being formed into small rolls. If, upon trial, it is found not to burn quickly, add more gunpowder and remix it. Having previously made a mark by which the nests can readily be found at night, proceed to take them as here directed. Some of the composition must be ignited at one end, and put into the hole leading to the nest, which must immediately be covered with a piece of turf to prevent the escape of the smoke. As soon as the squib has ceased burning, the nest should be dug out as expeditiously as possible, when the wasps will be found quite stupified, and may easily be killed by beating them with a spade and mashing them up with the earth in the hole, which should then be filled up. In warm weather many of the wasps remain out all night, and to take these a glass-bottle, partly filled with sweetened beer, or some other attractive liquid, should be buried in the place the nest occupied, leaving the mouth of the bottle level with the surface of the ground, in imitation of the entrance to the nest. When the outlying wasps return to the nest, they will find their way into the bottle and be drowned in the liquid.

Gather early Apples and Pears as they ripen, and hang nets before wall Plums to break the force of the scorching sun.

II.—FLOWER-GARDEN AND SHRUBBERY.

In-door Department.

STOVE.—Keep down the temperature during these warm days, by giving all the air possible, and by sprinkling the paths and shelves frequently with water. Shut up about five o'clock in the afternoon, that the house may be warmed for the evening. Such plants as Achimenes coccínea, and Euphórbia jacquiniflora, which are intended to make flowering specimens in autumn and winter, must have good situations, and ought to be carefully attended to.

GREENHOUSE AND CONSERVATORY.—Look over all plants, in the houses and out, twice a-day, for they will need water very frequently now. Shade wherever practicable, or the bloom will soon lose its beauty. The disrooting and repotting of Pelargoniums ought to be set about immediately, if from any cause it has been delayed. Although not strictly Greenhouse plants, Gloxínias and Gesneras are generally treated as such in the summer months, and therefore may properly be noticed here. As soon as they have done growing and blooming, diminish the supply of water for a time, and then withhold it altogether. Alstrœmerias, and many other Amaryllidaceous plants, should be similarly treated.

PITS AND FRAMES.—As soon as time permits, put in cuttings of Anagallises, Senécios, Heliotropes, Verbenas, and other plants of a like character. A vacant Melon-frame is well suited to contain them, as no bottom-heat is required for such plants. A thirty-two pot filled with each variety will furnish a good stock to propagate from next spring, without occupying much space in winter. Pot Double Wallflowers, Neapolitan Violets, Pinks, and other Herbaceous plants for forcing next spring. Alyssum saxátile is well adapted for this purpose.

Out-door Department.

Examine Earwig-traps daily; if flowers are wanted for exhibition, the plants should be shaded, and liberally watered at the root. In such a season as the present, blanks in the flower-borders are unavoidable; this might be partially remedied by turning out any pot-plants that are not of much value, such as seedling Pelargoniums which have not blossomed. Water at every opportunity. While the dry weather continues, prepare beds for the finer kinds of bulbs.

NURSERY AND FOREST DEPARTMENT.

NURSERY.—Prepare ground for autumn planting, and keep down weeds, as before recommended. Loosen the ties of budded fruit-trees, Roses, &c., that require it. Roses may yet be budded, if the bark rises freely. Collect seeds of Plums and Apricots for the purpose of raising stocks. The Moorpark Apricot thrives best when worked upon an Apricot stock; therefore some should be raised for that purpose.

FOREST AND COPPICE WOODS.—See late Calendars.—*J. B. Whiting, The Deepdene.*

State of the Weather near London for the Week ending August 18, 1842, as observed at the Horticultural Garden, Chiswick.

August		Barometer.		Thermometer.			Wind.	Rain.
		Max.	Min.	Max.	Min.	Mean.		
Friday	12	30.257	30.200	78	55	66.5	S.W.	—
Saturday	13	30.299	30.279	73	56	64.5	S.W.	
Sunday	14	30.259	30.214	85	48	66.5	N.E.	
Monday	15	30.204	30.153	92	52	72.0	E.

Average		30.204	30.148	84.1	55.4	69.8		0.01

Aug. 12. Clear and very fine throughout, with deep blue sky.
13. Hazy in the morning; overcast; clear and fine at night.
14. Fine; very sultry; clear and fine at night.
15. Fine, with slight haze; cloudless and excessively hot; clear and fine.
16. Slight haze; very hot and dry; clear and fine.
17. Dry easterly haze; very hot; clear and fine.
18. Heavy dew and slight haze; excessively hot and sultry; sky assuming a dusky appearance in afternoon; lightning, with some heavy drops of rain in the evening.

Mean temperature of the week 7½° above the average.

State of the Weather at Chiswick during the last 16 years, for the ensuing Week ending August 27, 1842.

August	Aver. Highest Temp.	Aver. Lowest Temp.	Mean Temp.	No. of Years in which it Rained.	Greatest quantity of Rain.	Prevailing Winds. N.	N.E.	E.	S.E.	S.	S.W.	W.	N.W.

The highest temperature during the above period occurred on the 21st, in 1835—thermometer 88°; and the lowest on the 26th, in 1837—thermometer 39°.

REPORT ON COVENT GARDEN MARKET,

For the week ending August 19, 1842.

From a paragraph in one of the Morning Papers we learn that, in Clare Market, ripe Gooseberries have been selling at 1*d.* per quart; well-flavoured mellow Pears, 100 for 2*d.*; fine fresh-gathered Cherries 8 lbs. for 6*d.*; Orleans Plums, 3*d.* per gallon; good cooking Apples at ½*d.* per dozen; fair-sized Cucumbers, two for ½*d.*; and sugar-loaf Cabbages, four for 1*d.* This statement was briefly discussed at a late meeting of the Market Gardeners' Association at the Rainbow Hotel, King street, Covent Garden; when the members gave it as their opinion, that fraudulent weights and measures were used in the sale of the fruit, and that otherwise it could not pay at such reduced prices. An instance was cited where a low-priced fruiterer weighed with a half-pound weight instead of a pound; by which means he was enabled to rob his unsuspecting customers. At Covent Garden Market the supplies of fruit have been considerably greater than the demand; and trade has been proportionately dull. *Fruit.*—Pines have settled to 3*s.* and 6*s.* per lb.; amongst them we noticed some handsome Queens. Black Hamburgh Grapes are from 1*s.* to 3*s.* per lb., and Muscats from 2*s.* to 4*s.* Melons are somewhat cheaper than in our last report. Peaches and Nectarines are good, and a few samples of fruit from the open walls have appeared, from 1*s.* to 3*s.* per doz.; the forced fruit being from 6*s.* to 12*s.* per doz. Dessert Plums fetch from 1*s.* to 1*s.* 6*d.* per punnet, and Green Gages from 1*s.* 6*d.* to 2*s.* per punnet. Morello Cherries are the only kind obtainable, and sell from 6*d.* to 1*s.* 6*d.* per lb. A small quantity of red and white Currants may be procured; the former at 4*s.* per quart, the latter from. 1*s.* to 1*s.* 6*d.* per quart. Pears and Apples are exceedingly abundant: the best samples among the former consist of Jargonelles and Windsors, with a few of Williams's Bon chrétien, which fetches from 1*s.* to 2*s.* 6*d.* per half sieve. Amongst the Apples are some good samples of the Kerry Pippin, Devonshire Quarrenden, and the Duchess of Oldenburg; but the prices remain nearly the same as last week. Filberts are abundant, from 50*s.* to 75*s.* per 100 lbs. *Vegetables:* The long-continued dry weather has considerably impaired the quality of many kinds of Vegetables. Cauliflowers, in particular, are little worth; the few procurable fetching from 2*s.* 6*d.* to 4*s.* per dozen. Very few Peas can be obtained, and those only at a high price. Scarlet Runners are plentiful from 1*s.* to 1*s.* 6*d.* per half-sieve. Onions are of good quality from 3*s.* to 4*s.* per dozen bunches. Lettuces are somewhat dearer than during the previous week, the Cabbage fetching 1*s.* 6*d.* per score, and the Cos from 1*s.* 6*d.* to 1*s.* 9*d.* per score. A small quantity of Endive may be procured from 1*s.* 6*d.* to 1*s.* 9*d.* per score Tomatoes are plentiful, and remarkably fine, from 3*s.* 6*d.* to 4*s.* per half-sieve. Mushrooms continue scarce, and fetch from 2*s.* 6*d.* to 3*s.* 6*d.* per pottle. *Flowers:* Amongst the Cut Flowers we observed Allamanda cathártica, Agapanthus umbellatus, several Orchidaceæ, Camellias, Alstrœmérias, and Yellow Roses.

PRICES, Saturday, August 20, 1842.—FRUITS:—

Pine Apple, per lb. 3*s* to 6*s*
Grapes, per pound, 1*s* to 3*s*
— Muscats, per pound, 2*s* to 4*s*
Melons, English, each, 1*s* to 3*s*
— Dutch, 6*d* to 1*s* 6*d*
Peaches, per doz. 1*s* to 12*s*
Nectarines, per doz., 1*s* to 12*s*
Apricots, per doz., 1*s* to 3*s*
Figs, per doz., 3*s* to 5*s*
Plums, dessert, per punnet, 1*s*
Greengages, per punnet, 1*s* 6*d* to 2*s*
— Baking, per hf.-sv., 3*s* to 6*s*
Apples, dessert, per bush., 2*s* 6*d* to 6*s*
Pears, dessert, per hf. sieve, 1*s* 6*d* to 6*s*
Cherries, Morello, per lb. 6*d* to 1*s* 6*d*
Mulberries, per gallon, [illegible] to 1*s*

Currants, Red, per pun., 4*s*
— White per pun., 1*s* to 1*s* 6*d*
Cucumbers, per doz., 1*s* to 4*s*
— Gherkins, per 1000, 6*s* to 8*s*
Oranges, per doz., 1*s* to 2*s*
— per 100, 6*s* to 16*s*
Lemons, per doz. 1*s* 3*d* to 2*s* 6*d*
— per 100, 6*s* to 16*s*
Almonds, per peck, 7*s*
Sweet Almonds, per pound, 3*s*
Filberts, English, per 100 lbs. 50*s* to 60*s*
Walnuts, per bushel, 8*s*
Nuts, per bushel—
— Brazil, 20*s*
— Barcelona, 20*s* to 24*s*

VEGETABLES.

Cabbage, per doz. 10*d* to 1*s* 6*d*
— plants, per doz. 1*s* to 2*s* 6*d*
Cauliflowers, per doz., 2*s* to 4*s*
Peas, per sieve, 1*s* 6*d* to 3*s* 6*d*
Beans, Kidney, per hf. sv., 1*s* 6*d* to 2*s* 6*d*
— Scarlet, per hf. sv. 1*s* to 1*s* 6*d*
Potatoes, per ton, 50*s* to 80*s*
— per cwt. 2*s* 6*d* to 4*s*
— per bushel, 2*s* to 3*s*
— Kidney, per bush., 3*s* to 4*s*
Artichokes, per doz., 2*s* to 3*s*
Turnips, per doz bun., 2*s* to 2*s* 6*d*
Carrots, per doz. bunch, 3*s* to 4*s*
Red Beet, per dozen, 9*d* to 1*s*
Horse Radish, per bundle, 1*s* 6*d* to 5*s*
Radish, per doz. hands (24 to 30 each) 6*d* to 1*s* 6*d*
— Turnip, p. doz. bch., 1*s* to 1*s* 6*d*
Onions, per doz. bch., 3*s* to 4*s*
— Green, per doz. bun. 2*s* to 3*s* 6*d*

Spinach, per sieve, 1*s* 6*d*
Chives, per bunch, 3*d*
Leeks, per doz. bun., 3*s* to 4*s*
Garlic, per lb. 4*d* to 6*d*
Shallots, per lb., 9*d* to 1*s*
Lettuce, Cabbage, p. score, 1*s* 6*d*
— Cos, 1*s* 6*d* to 1*s* 9*d*
Endive, per score, 1*s* 6*d* to 1*s* 9*d*
Celery, per bd., (12 to 15), 1*s* 6*d* to 1*s* 9*d*
Small Salads, per punnet, 2*d* to 3*d*
Watercress, per doz. sm. bun. 4*d* to 6*d*
Parsley, per half sieve, 2*s* to 2*s* 6*d*
Tarragon, per doz. bun., 2*s* to 3*s*
Basil, per doz. bunches, 2*s* to 3*s*
Vegetable Marrow, per doz., 8*d* to 9*d*
Tomatoes, per hf. sv. 3*s* 6*d* to 4*s*
Capsicums, green, per 100, 1*s* to 2*s* 6*d*
— Ripe, per doz., 6*d* to 1*s* 3*d*
Mushrooms, per pottle, 2*s* 6*d* to 3*s* 6*d*

Notices to Correspondents.

Mr. PAXTON'S COTTAGER'S CALENDAR is now reprinted in the form of a small volume, for general distribution, price 3*d.* each copy; it may be ordered of all Booksellers. Gentlemen wishing to distribute copies among their cottage tenantry may have them *delivered in any part of London* by remitting a Post-office order to this Office, at the rate of 5*s.* for every 25 copies required.

Ignoramus.—We have not an idea why your Macartney Rose does not expand its flowers. Usually it does so well enough when not exposed to too much rain.—†

An Amateur.—There is not the least probability that a Blue Dahlia will ever be obtained.—‡

Adam.—We would on no account advise you to stop the shoots of your Chrysanthemums so late as this; as many of the varieties, if stopped now, will not bloom at all this season. You had better wait until your Calycanthus præcox has bloomed before you prune it, otherwise you will remove many of the shoots, which, if allowed to remain, would in due season be covered with flowers. It is possible that the small Caterpillar, marked with dull orange and dark brown rings, with which your Cinerárias in the open border have been infested, is the larva of the Pink Underwing Moth, which feeds principally upon the flowers of the different species of Groundsel. Both in the larva and imago state it is one of the prettiest of our native insects. You neglected to state whether the Caterpillar consumed the leaves or the flowers of the Cinerárias.—‡

A Cottager, Perthshire.—We are sorry to say that your seedling Dahlia arrived in such a mutilated state that it was totally impossible to form any opinion of its merits.—‡

A Subscriber.—For the best period to prune Common and Portugal Laurels, we must refer you to a leading article upon that subject at p. 467 of this year's *Chronicle.*—‡

An Amateur Gardener's plant is the Candleberry Myrtle.—†

J. C.—Such articles do not suit us.—†

J. D. Parks.—Your seedling Verbena appears to be a good one, but it was so crushed in the packing that its beauty was almost defaced.—†

Mrs. C.—The specimen sent, which was raised from Cabul seed, is some Trefoil, perhaps Trifólium giganteum, the Giant Clover of that country.—†

Messrs. Mountjoy.—We cannot perceive the slightest difference between your flowers of Achimenes longiflora and those grown by other persons; neither does your seedling Verbena differ materially from others already in cultivation.—‡

W. J. E.—Your seedling Fuchsia is a fine one, but bears a striking resemblance to the new F. Lanell: the principal difference appears to be in the petals of your seedling being less distinctly shaded with purple than in that variety.—‡

X. Y. Z. asks if we or any of our correspondents can inform him what is the best sort of covering for a conservatory wall, which is fourteen feet high, with a four-feet border in front, which must also be protected—likewise the best way of fixing the covering. His present intention is to erect a skeleton frame, in the way of a lean-to, and to make canvas sashes to slide up and down, or to be folded over each other. He inquires if asphalte would answer better—Or what would be a better plan.

E. E.—You cannot preserve the Apricot-trees against the wall about to be used as the back of a conservatory; because, as the house *must* be kept warm in winter, the Apricots will be deprived of their natural season of rest, which is as indispensable to them as sleep to animals. Or, supposing the conservatory were a mere hybernatory, in which no fire is used during winter, still it would be useless to leave the trees, because, being so far from the light and from currents of air, they would never produce any fruit. You cannot transplant them at this season with much prospect of success: if, however, you wish to try that experiment rather than destroy the trees, you must deprive them of all their leaves, and fill the holes, into which their roots are transferred, with fine light soil, consolidated by water only, without trampling, so that their roots may be immersed in a mass of puddle. After that, mulch the puddle with three or four inches of old cowdung, or other rotten dung, and leave them to their fate. You will, however, find it difficult to get their roots out of the ground, in this hot dry weather, without their being broken to pieces or dried up. It is important that the leaves should be stripped off before the roots are disturbed, and that the latter should be kept constantly moist by some means or other.—†

Quæso.—The article on the Sting of a Wasp was taken from our columns, *without acknowledgment,* by the "Mark Lane Express."

J. O.—A hedgehog will destroy Crickets, says *H. O.*

W. B.—Your bottle barometer is not a very bad contrivance. The effects you have observed in it are owing to atmospheric pressure, and are of exactly the same nature as those in the barometer. It has the merit of costing nothing; but it is too well known to be worth publishing.—†

Oddity.—The shrivelling of Grapes has been ascribed to so many different causes, that it is difficult to assign the true one. Some ascribe it to cold draughts of air; others to the stalks of the bunches having been scalded by the rays of the sun falling powerfully upon them before air has been admitted to the house; while a third party contends that the too deep immersion of the roots of the Vines is the real cause. With the latter we feel most disposed to coincide; and we have little doubt that the great difference of temperature between the roots and branches is the principal reason of Grapes becoming shrivelled.—‡

A Young Cabbage.—Your plants are, 1, Lapsana pusilla; 2, Tormentilla reptans; 3, Epilóbium montanum; 4, Verónica officinalis. Fu'chsia seeds may be cleansed from the pulp either by washing them in water or by mixing them with sand, to absorb the moisture; they had better be sown immediately.—‡

J. R. J.—To drive away the Ants which infest your plant of Clerodendrum fragrans, we would recommend you to try what effect a thorough soaking of water would have upon them. It is well known that Ants always choose dry places for their nests. Lime-water has been recommended for the purpose; but it is highly probable that the moisture has done more than the strength of the lime towards removing them from the pots. It is singular that sulphur had not the desired effect, if you really used flowers of sulphur; but if you tried the common brimstone, that will at once account for your failure.—‡

E. D.—The plant is Astrágalus glycyphyllus.—†

Robert le Diable.—The only thing which you can at present do with the bulbs of Gladioli, Ixias, &c., which you have received from the Cape of Good Hope, is to keep them in a cool and tolerably dry place until the season for potting them arrives, which will be about the beginning of November. The soil best adapted for them is sandy peat, and a slight portion of loam. They must be kept after potting in a cool and airy situation, and as soon as they begin to form roots they must be freely watered.—‡

An Inquirer.—The pod sent is a transformation of the nature of the Wheatear Carnation.—‡

A Regular Subscriber.—Birch and Alder seed may be sown as soon as ripe, or in the spring, if kept in a dry, airy room. Pinus Mugho, Pinaster, &c., are quite hardy. We do not apprehend that the alteration in Timber Duties will affect the planting of forest trees.—†

Catechist.—The Pitol is a plant called Sóphora secundiflora; it is too tender for the open air. When it flowers, it is rather handsome, with racemes of blue flowers, as is reported.—†

C. G.—Céreus latifrons.—†

Hortulanus.—There are two reasons why it is inadvisable to bury hot-water pipes in a Vine border. In the first place, that plant does not require so much bottom-heat as the pipes would give; and, secondly, they would dry the earth, and in that way do more harm than they would do service in warming it. If a border is to be heated by hot-water pipes, they must be enclosed in a hollow chamber, so that their drying action may be prevented. It is desirable to guard the roots of Vines from frost; but that should be done by a covering to the border which keeps off cold rain and snow, and prevents the escape of heat.—†

Henry's plants are, 3, Bupleurum fruticosum; 2, a Jasmine, resembling J. Sambac: nothing can be made of the others. Indeed, single leaves of unknown plants, especially when covered with scale, are not very good evidence of anything, except bad gardening. Rhododendrons do not like the sea air. Treat your Cereus truncatus like others of its race.—†

Berkshire.—In both cases you have been cheated. The Ipomœa sold for I. rubro-cerulea is too imperfect to be determined, but it is not that; is it different from Convolvulus major? What you bought for Gesnera Suttoni is Ruéllia formosa.—†

W. B.—None but the Fellows of the Horticultural Society are allowed to obtain plants and seeds from the Society's Garden; nor can any other persons have free admission to the Garden Meetings, or obtain cheap tickets. If you wish for these things, you must become a Fellow in the usual way.—†

H. H. Nix.—The flower of your Seedling Dahlia is not only too small, but there is also a deficiency of petals; and the large disk in the centre leaves no hope of its ever filling up; the colour is good.—*

T. Cross.—The white Pansy named Village Maid is the best of your seedlings, and is a fine flower of good form and substance, having a large dark blue eye: Mulatto, deep rich purple, with thick velvety petals, is rather small—and the lower petal is not sufficiently large in proportion to the others: the Favourite is a fine large flower of good colours and properties; but the eye is unfortunately of a striated character, which gives the centre a weak, and the flower rather a coarse, appearance.—*

R. Oakley.—We have received a remarkably fine bloom of a tipped Dahlia, called Oakley's Surprise; this flower, as we before noticed, is a rich crimson, tipped with white, and combines good general form with a finely-tipped petal; the bloom is large, round, with great depth of petals, and well up in the crown; it is tipped with great regularity, and far surpasses every variety of the kind that hitherto has appeared.—*

J. R. Pearson.—Your Seedling Pansies arrived in good condition; we hope that the white variety, with a deep blue eye, called Zelica, will come larger; the bloom sent is undersized, but the white is pure, and the eye good: Hinda, delicate yellow, has a remarkably fine eye: Sobieski is a finely-formed flower of good substance, with the centre pure white, and a fine eye: a broad band of bright blue surrounds the lower petals, and the upper ones are rich purple: Milton, a large flower of good form, singular in colour and forming a distinct variety: centre white, eye light purple with dark lines; the lower petals have a margin of light blue, and the upper are of a light clouded purple, of the same colour as the eye: Magrath is remarkable for its clear and bright colours, with a yellow centre and a fine eye; the upper petals and the margin round the under petals are of a deep rich purple: Pliny somewhat resembles the latter flower, but is not so deep in colour, and the margin round the side petals is rather imperfect. These Pansies are well-formed flowers, of good substance, and all of them have fine eyes.—*

W. Ab.—Your Cratægus is the true C. Crus-galli; from which the variety pyracanthifólia differs in having longer and much attenuated leaves, and also in the branches being devoid of the long spines with which those of the common Crus-galli are armed.—¶

L. G.—The leaves you sent are those of the Roseberry Strawberry: they are more glaucous beneath than any other. No variety is more easily cultivated. In common with the class of Scarlet Strawberries, to which it belongs, it requires that a fresh plantation be made every three years. It will thrive in any tolerably good soil: but if the latter is well trenched and manured, so much the better.—†

A. F.—Next week. Many thanks.—†

Mandrake.—The plant is Cicer arietinum, or the Chick Pea.—†

A Subscriber.—Seedling Flowers intended to be judged by the Floricultural Society are requested to be addressed to Mr. Wildman, at the Crown and Anchor Tavern, Strand.—‡

G. N.—Your seedling Verbenas are both pretty, but they are not sufficiently distinct from other varieties lately raised.—‡

J. A. J.—Your plants are Commelina cœlestis and Heliánthemum formosum.—‡

W. R.—Apply to Mr. Henderson, Pineapple-place.—‡

A Country Vicar.—Nitrate of Soda may be procured of Mr. Chatwin, in Hungerford-market. †

W. B.—Your Pea is the Egg, or Patagonian.—¶

R. O.—Raisers of Seedlings are seldom good judges of their own productions. You should bear in mind, that it is the duty of judges, in forming their decisions upon Seedlings sent for that purpose, to do so from the flowers actually before them. If they were to speculate upon what a flower might become by alteration of treatment, or a more favourable season—and embody those speculations in their judgment—such a system could lead only to error and misconception.—*

P. R. W. is right. His plants are Chenopódium ólidum, Sonchus palustris, and A'triplex pátula.—‡

As usual, many letters have arrived too late for answers this week.

Erratum.—We beg to correct the following error in our report of the last show of the South London Floricultural Society. In our notices of the Seedling Picotees, it was stated, that "No. 5, a very pretty rose-edged Picotee, was from Mr. Gaines"—whereas it was exhibited by the Rev. A. H. Matthews, of Weston-on-the-Green, near Oxford.

NEWS OF THE WEEK.

Our Paper of this day contains long accounts of the lamentable riots which have prevailed during the week throughout the manufacturing districts. Happily the crisis may now be considered to have passed; but it is impossible to read the details of the late events, without appreciating to its full extent the alarm into which they have thrown the country for the last ten days. The disturbances commenced, as our readers will perceive, in the cotton districts; large masses of workmen invaded the great towns, and compelled the owners of mills to turn out their hands, and close their factories; miners, colliers, and mechanics of different trades, joined the movement, and the contagion spread with unexampled rapidity from Lancashire and Cheshire into Yorkshire, Warwickshire, and other adjoining counties. The confederated workmen of Staffordshire sent their contingents to the rioters, and great excesses were committed in all the towns they visited. Mills were burned down; the houses of clergymen and magistrates were destroyed; the prisons were broken open, and the police stations ransacked for the sake of the arms which they contained; shops were openly plundered, and attempts were made to stop the railways and cut off the gas-works. As might have been expected, several collisions have taken place between the misguided workmen and the military, who were collected in large bodies on different points of the disturbed districts. Blood has been shed in three or four places, but no instance has occurred where the troops have fired upon the people, until they were compelled to do so in self-defence. The authorities have now succeeded in re-establishing the law, and the workmen begin to discover that the large majority have submitted to the movement, rather from dictation than from any spontaneous determination to attain a common object. The Chartists for a time succeeded in giving a political character to the outbreak, but those who have struck for wages are anxious to confine the excitement to their personal grievances, and evident disunion has shown itself on these points. In the meantime, large bodies of artillery and infantry continue to be concentrated in the great towns; and there seems to be good reason for believing that the worst is already over. The presence of the military, and the firmness with which they executed their painful duty in those instances where they were called upon to act has evidently arrested the progress of a movement which threatened the lives and property of thousands; the latest accounts state that the workmen are gradually returning, and we trust that next week we shall be able to congratulate our readers on the restoration of tranquillity. The Metropolis has been unaffected by these movements; some Chartist meetings have been held, but no serious breach of the peace has occurred, and the authorities have been fully prepared to put down any appearance of an outbreak.

These important events throw the interest of our foreign news into the shade. In France, the Report on the Regency Bill has been presented to the Chambers. The Bill has been modified in committee, but it is expected to pass in its amended form by a large majority.—In Spain, some contradictory rumours prevail respecting the projects of the Spanish refugees in France; the Government, however, is on its guard, and is fully prepared for any contingency.—In the Levant, the differences between Turkey and Persia still occupy attention, to the exclusion of all other topics; the Porte continues to make preparations for war, but the affair is expected to be arranged by the mediation of the English and Russian Governments.—From the United States we have the confirmation of the accounts announced by us last week, respecting the completion of the treaty for the settlement of the Boundary question. There is little doubt that the convention will receive the approbation of the Senate, and the prospect of an amicable termination of the various questions at issue between this country and America is hailed with satisfaction in all parts of the Union.

Home News.

COURT.—The Queen and Prince Albert returned to Windsor immediately after the prorogation of Parliament, where they still remain. The Prince of Wales and the Princess Royal continue well. On Saturday Her Majesty held a Privy Council at the Castle which was attended by most of the Ministers, when a proclamation was ordered to be issued on the subject of the riots. On Sunday the Queen and Court attended Divine Service in the chapel at Cumberland Lodge. The Hereditary Prince and Princess of Saxe-Coburg left the Castle on Monday, on their return to Germany. On the same day, the Duke of Saxe-Coburg, who arrived last week from the Continent, visited the Reform Club, and was conducted through the different apartments. On Wednesday, the anniversary of the birth-day of the Duchess of Kent, Her Majesty and Prince Albert breakfasted with Her Royal Highness, at Frogmore Lodge, and in the evening the Royal Party and suite went to Virginia Water, where they dined. The frigate on the lake was decorated at night with coloured lamps, and the town of Windsor was illuminated. The Duchess of Norfolk has succeeded Viscountess Jocelyn, as the lady-in-waiting; and Capt. Meynell has succeeded Capt. Hood, as the groom-in-waiting on Her Majesty. On Saturday, being the birth-day of the Queen Dowager, several of Her Majesty's tradesmen illuminated their shops. In consequence of the disturbances in the provinces, the Queen Dowager has given up her intended visit to Worcester and Malvern. Her Majesty took her departure on Thursday morning from Gopsall Hall, the seat of Earl Howe, and came to town by a special train on the London and Birmingham Railway. Her Majesty immediately proceeded to Bushy Park.

Gazette Announcements.—In Tuesday's Gazette it was announced that the Queen has been pleased to direct letters-patent to be passed under the Great Seal, appointing the Duke of Wellington Commander-in-Chief of all her Majesty's Land Forces in the United Kingdom. In connexion with this subject a General Order has been issued by Lord Hill on retiring from office, stating that his resignation has been rendered necessary by his present state of health; that the conduct of the troops both in the field and in quarters has furnished, during his Lordship's command, an example of discipline, regularity, and general efficiency, not to be surpassed, and that the officers have by their devotion to their duty, enabled his Lordship to maintain the army in its present creditable state. The Duke of Wellington has also issued the following General Order on entering on the duties of his office:—" In obedience to her Majesty's command, Field Marshal the Duke of Wellington assumes the command of the army, and earnestly requests the assistance and support of the general and other officers of the army to maintain the discipline, good order, and high character, for which it has so long been conspicuous, and which have been maintained to a degree so deserving of praise during the long period of the command of his respected predecessor, General Lord Hill. The Duke of Wellington sincerely regrets that the state of his Lordship's health should have rendered it necessary for him to desire to discontinue his active services; and he anxiously hopes that the army will not suffer in consequence of the change."

University Appointments.—Among the recent Government appointments, it has been officially announced that the Rev. John Antony Cramer, D.D., has been appointed Professor of Modern History in the University of Oxford, in the room of the late Dr. Arnold.

Parliamentary Movements.—Mr. Mildmay and Mr. Hope have been gazetted as the new members for Southampton. The election for Ipswich has terminated in the return of Capt. Gladstone and Mr. Fox; the official announcement of the poll gave the following results:—Capt. Gladstone, 651; Mr. Fox, 641; Mr. Thornbury, 548; Mr. H. Vincent, 473; Mr. Nicholson, 2. Lord Charles Wellesley is the candidate for the representation of South Hants., in the room of Mr. Fleming, who has accepted the Chiltern Hundreds. The election for Belfast is expected to terminate in the return of Mr. E. Tennent and Mr. Ross.

Foreign.

FRANCE.—*The Regency.*—The Regency Bill is the great topic of discussion in the Paris papers. Those of Friday were exclusively occupied with the discussion of the draught of the Bill in the standing committee, and the appointment of a committee to report upon it. Of the nine deputies composing that commission, seven were Ministerialists. The other two, MM. Dufaure and Lacrosse, can hardly be deemed hostile to the Ministry; so that, in fact, the opposition had not been able to carry the election of even one of their body. On the same day, however, and in spite of the utmost exertions of Ministers, another committee was appointed to investigate a matter of some importance, namely, the manner in which certain elections had been brought about; this committee of nine members was composed of four decided oppositionists, including M. Odillon Barrot. On Sunday M. Dupin, who had been unanimously chosen reporter of the Regency Bill, read his report on the Bill to the committee, by whom it was unanimously approved. It appears that two amendments only have been introduced in the Bill. The Chambers are to be convoked, not in three months, but in 40 days after the demise of the King. The guardianship of the infant Prince is given to his Grandmother in default of his Mother. The discussion on the Bill began on Thursday; the chief feature of the debate was the attack of M. Larochejacquelin, the Royalist, on the reigning dynasty; he was loudly called to order, and not allowed to conclude his speech. M. Lamartine followed, advocating the right of the Duchess of Orleans to be Regent. The prompt passing of the Bill is attributed to M. Thiers, who has given his full adhesion to the views of the King, expecting, it is said, to become the Minister of the Regency. The first remarkable incident which occurred during the progress of the Bill, was the motion of M. Lherbette, a Member of the Opposition, for the insertion in the orders of the day, that permission would be granted to him to put certain questions to the Ministry, supposed to refer to the Portendic affair. M. Guizot declared at the tribune, that he was quite ready to reply to any questions which might be put to him, as the Cabinet had maintained the honour and dignity of the country. The House, however, twice negatived M. Lherbette's motion by large majorities, all parties seeming anxious to postpone the Ministerial question till the December session, and to confine the business of the present one to the Regency Bill.

The Capital.—The Duchess of Orleans appeared on Thursday at the Tuileries for the first time since the death of her husband. She desired to be left alone in the private apartments of the Prince in the Pavilion Marsan. After having been there half an hour, the Duchess of Mecklenburg, her mother, who had gone with her to the Tuileries, hearing her sobs, entered with one of her ladies. She found the unhappy duchess leaning upon a desk where the duke used to write, bathing it with her tears. The duchess, however, yielded to her mother's solicitations, and returned with her to Neuilly. The health of the duchess is good, as is that of the Royal Family.—The editor of the "Gazette de France" was sentenced on Friday to one year's imprisonment and 12,000f. fine for a seditious article, published on the occasion of the death of the Duke of Orleans.—The ratification of the commercial convention of the 16th July has been exchanged between the Cabinets of Paris and Brussels; consequently the spun threads of Belgium, after the 15th inst., were admitted into France on payment of the import duties existing previously to the Royal ordinance of 26th June.—The Paris journals, with scarcely an exception, are filled with the speeches of Lord Palmerston and Sir R. Peel in the House of Commons on the 10th instant, the speech of Her Majesty on closing the session of Parliament, the details of the disorders that have taken place in our manufacturing and mining districts, and with comments upon those matters respectively. To the speech of Sir Robert Peel the Paris press does ample justice:—"It is impossible," remarks the 'Ministerial Débats,' "to meet with more honourable sentiments than those expressed by Sir Robert Peel concerning France, and we cannot refrain from expressing the belief that such language, and the testimonials of such sincere sympathy for all that relates to the grandeur, happiness, and even grief of France, will powerfully contribute to calm and extinguish the sentiments whose revival we shall always so deeply deplore." On that of the Queen, the same paper observes, that its expression of confidence in the return of tranquillity was strangely contrasted with the accounts received from the disturbed districts. The papers of every party regard the state of our affairs abroad and at home as menacing in the last degree.—The weather continued very fine in Paris, but extremely warm, 94° Fahrenheit in the shade on Thursday.

The Navy.—The Labrador steamer, of 450 horse power, was launched at Toulon on the 7th inst. On the same day, the squadron under Admiral Hugon, consisting of 8 sail of the line, and 2 frigates, sailed from Toulon for the Island of Hyeres. Another steam frigate, of 450 horse power, the Ulloa, was launched at Cherbourg on the 10th inst.

SPAIN.—Our accounts from Madrid are of the 10th instant, but they are wholly destitute of political interest. The Ministry was engaged in preparing a number of projects of law, which are to be submitted to the Cortes at the opening of the next session. Some movements of troops had taken place at Valladolid. General Aleson had marched from that city in the direction of Leon, with several battalions of infantry, but for what object was not known. Some said that orders to concentrate a considerable force on that part of the frontier of Portugal had been forwarded from Madrid, and others that the factious contemplated making a demonstration in the Asturias. The Barcelona journals state that a party of 45 rebels, who had remained concealed for some time in the forest of Baerdellat, had been compelled by the Queen's troops to seek refuge in France, where 29 had fallen into the hands of the French troops. Another was killed in the pursuit, and the 15 others dispersed in various directions. This intelligence is confirmed by the French papers, which mention, that this armed band had been pursued by a detachment of French light infantry, which had captured 24 soldiers and 5 officers, with 27 muskets and other arms. The gendarmerie, aided by another detachment of the same regiment, arrested at Villeraja 11 Carlists, amongst whom were Planas, their chief, and three brothers and a nephew of Felip. The most contradictory rumours continue to be circulated respecting the projects of the Spanish refugees in France. The Government, however, was on its guard, and fully prepared to baffle the subversive designs of the anarchists. General Zurbano had published a *bando* against smugglers, whom he assimilated to highwaymen, and as such were to be shot without trial. Some officers of the regiment of Guadalaxara had been arrested as partisans of Queen Christina.

PORTUGAL.—The Ministry continues still unchanged, though it was reported that Senhor Costa Cabral had tendered his resignation, in consequence of the personal opposition made to him; but that the Queen had refused to accept it. A measure for the suppression of secret societies had been introduced by Senhor Mousinho d'Albuquerque, and admitted for discussion by 49 against 33 votes. The Ministers did not vote on this occasion. The Chamber of Peers had finished the debates on the Address to the Throne, which was carried; and that of Deputies was about to commence the discussion on the same subject. The Opposition papers were striving to cry down the treaties with England by misrepresentations. The tariff question had made little progress. An address from the English woollen importers at Oporto had been forwarded to Lisbon for presentation to Lord Howard de Walden, in which the parties urged their claims to a reduction of the present prohibitive duties, by which both the Portuguese Government and the British merchants suffer from a falling off of imports, and consequently of duties, while the native manufacturers gain nothing, the Spanish smugglers being the only parties who do gain, unless where the Portuguese manufacturers themselves pass off Spanish cloths for native ones. A petition signed by 29 Portuguese firms in the woollen trade at Oporto, was also about to be forwarded for presentation to the Queen, praying for a diminution of duties. The arrival of Count Stroganoff, the new Russian Minister, late Secretary of the embassy in London, was anxiously expected.

BELGIUM.—The last American papers mention that some members of a Belgian Commission, after choosing a place for a colonial settlement in Central America, had arrived at New York on their return to Europe. It appears from the Belgian papers that the Chief Commissioner, Colonel de Puydt has just returned to Brussels. It is said that the mission has been completely successful. Colonel Pudyt has obtained from the Guatemala Government the transfer of the district of St. Thomas, which includes a fine bay entering from the Gulf of Honduras. The Belgians begin already to boast of the noble commercial port which they will possess, and of the great city they intend to build. A series of extraordinary robberies has been committed in different parts of the country; the robbers carrying off whole fields of agricultural produce. A few days since they threshed cole seed, rye, and wheat, in the open fields in several communes of the district of Turnhout. The quantities carried off were considerable. The villagers are in despair at seeing their harvest carried off, and are in great fear for the wheat, the oats, the potatoes, &c., which are still to be got in. A journal of Bruges seriously announces that the Belgian pigeons are threatened by the directors of the French Post-office. Regular communications between Paris, London, Brussels, Antwerp, Ghent, Bruges, and other cities, by means of pigeons, are now established, and some of these aërial couriers are daily despatched in different directions after the closing of the Exchange. They state that the French Post-office authorities intend to prosecute these pigeons as the bearers of letters, contrary to the law which gives to the Post-office the monopoly of the conveyance of letters less than one kilogramme (2lbs.) in weight.

GERMANY.—One of the German papers gives us the first tidings of a new addition to the powers of the Daguerrotype, that of producing natural colour, as well as form and *chiaro scuro*. The discoverer is a M. Tsearing, of Munich; and although there may be some doubt as to the fact of a reproduction of colour on the plate to the extent asserted, there can be none as to the importance of such an addition to the powers of the process.—A recent statistical return states the population of Berlin to be 350,000, without including strangers.—We learn from Osnabruck, in the kingdom of Hanover, that temperance societies have increased there to such an extent, that the revenue derived from the duty upon brandy, for the last year, is 56,000 crowns less than in the preceding year.—The papers give detailed accounts of serious fires in considerable towns of Germany, Styria, and Hungary. On the 5th instant, a letter from Camenz stated that the town was then in flames; and, of 500 houses, scarcely 100 remained standing. The town-hall, the Gothic church, all the hotels, &c., were already burnt to the ground. Several persons were missing. The town of Knittelfeld, in Styria, was so dreadfully ravaged by a fire on the 26th ult., that 56 houses and 60 farm buildings were entirely consumed, and six persons lost their lives. A fire took place at Lugos, in Hungary, on the 21st ult., which destroyed the town-hall, the church, and more than 300 houses. On the 11th inst., the small town of Tambach, near Gotha, was almost entirely consumed; 50 only of the 500 houses of the place were left standing. The village of Bechtof, in Wurtemberg, had been likewise visited by a destructive fire.

ITALY.—Letters from Naples mention that Vesuvius has lately been exhibiting greater activity, from which it is supposed that there will be an eruption, if not immediately, at least within a few months: it is now nearly four years since the last eruption.—The railroad between Naples and Castellamare is now finished. It is conducted all the way on the sea-shore, and commands the finest views of Naples, Resina, Torre del Greco, Torre del'Annunziata, and Castellamare, forming, in regard to scenery, the most picturesque railway in the world.—The English church at Naples is reduced to a very low ebb, in consequence of the high rent, and the withdrawal of the Government allowance; and the managers, after having in vain attempted to meet the difficulty by raising the pew-rents, have been compelled to give notice to their clergyman that they can no longer make any addition to the stipend allowed him by the Foreign-office.

MALTA.—Malta letters of a recent date state that the officers of the navy would, by order of Admiral Owen, go into mourning for three days, as a tribute of respect for the late Duke of Orleans. During the same period the colours of the fleet were to be hoisted half-mast high, the yards to be "topped on end," the peaks to be pointed downwards, and the Grand March in Saul to be substituted for the national anthem.—The Malta papers publish a very curious document, the excommunication pronounced by the Roman Catholic Archbishop of Smyrna on Mrs. Whittal, a young Englishwoman, for having embraced Protestantism, the religion of her husband.—The friends of the abolition of slavery met at Malta on the 30th ult., and formed a society called the Anglo-Maltese Auxiliary Association. The Governor, Sir H. Bouverie, was in the chair, and several Maltese of rank have joined the association.

RUSSIA.—The quarrel between the Pope and the Russian Government is likely to become more serious. The Bishop of Podlachia has been taken from his diocese and shut up in a cloister. The late public address of the Pope against the Emperor has been received; but the Emperor persists in his order that no Catholic dignitary shall correspond with Rome.—New recruiting orders have been issued in Western Russia. The defeat of the Russians in South Daghestan is said to be true, but their loss did not exceed 40 officers and 600 soldiers. Prince Dolgoroucki has been reduced to the rank of common soldier, for killing Prince Jaschwill in a duel.

SWITZERLAND.—Letters from Berne mention that the country is filled with English travellers, who are enjoying the present season among the lakes and mountains. The Annual Federal Shooting Match has gone off with great effect, and with unusual interest to English visitors, since the most successful shots were fired by Lord Vernon, who has thereby acquired great celebrity among the Swiss marksmen.

GREECE.—Recent letters from Athens inform us that great confusion prevailed in the Councils of King Otho, one portion of the Cabinet supporting Russian interests, and the other those of France. The Government had drained the Treasury, in order to forward 250,000 drachmas to Baron de Rothschild, to pay the interest of the loan, relying on France to advance the additional million necessary to complete the sum required for that purpose. Another earthquake was felt at Calamata on the 12th ult., which was more violent than the shock experienced there in April last. The church of St. George, which was remarkable for its beauty and solidity, was destroyed, and two others, with 40 or 50 houses, were more or less damaged.—Long accounts are given of the funeral of Major Meech and Lieutenant Burton, of the Monarch, 84, who died of fever caught while embarking the Lycian Marbles for the British Museum. The funeral took place at Athens, in the presence Sir E. Lyons and General Church. The whole crew seem to have suffered severely from the malaria fever which rages at this season on the coast of Asia Minor. Upwards of 90 men were at the same time in the hands of the doctors, and five lieutenants out of six, as well as three marine officers out of four, were rendered incapable of performing their duty. The crew of the Medea, steamer, which accompanied the Monarch to the river Xanthus, have also suffered very seriously from the fever.—Lieut. Holman, the blind traveller, was at Athens on the 31st, and had been presented to their Majesties.

TURKEY AND PERSIA.—Letters from Constantinople of the 27th ult. state that the differences which had arisen between Turkey and Persia continued still to occupy public attention, to the exclusion of all other questions. No intelligence of a more recent date than our last had arrived from the southern frontiers of the empire. The Austrian steamer from Trebizond had brought no news, beyond a report that Riza Khauli Khan, the Persian commander, had been worsted in a skirmish with the Governor of Sulimania. The English and Russian governments had offered their mediation. On the 27th the division of troops intended for the frontiers of Persia commenced its march. All the Ministers, and most of the Pachas, proceeded to Scutari, to be present at their departure. A frigate and a brig of war, having on board ammunition, artillery, and some troops, had sailed for Trebizond. Mehemet Khan, the Persian Minister, being obliged to retire from Constantinople, in consequence of the hostilities which appeared imminent between his country and Turkey, the interests of the Persian residents would be placed under the protection of the Russian Ambassador. The total change expected to take place in the Turkish Ministry is considered to be near at hand. The venerable Kosrew Pacha, who has held office under four successive Sultans, and who is in his 82d year, will probably be appointed Grand Vizier. The return of Reschid Pacha to office is also considered highly probable. No progress has been made in the Grecian or Syrian questions. Sir S. Canning gave a fête, at Buyukdere, on the 25th ult., in honour of Prince Frederic, of Hesse Cassel. The whole of the chiefs of diplomatic missions, and several Turks of high rank, were invited to dinner; and the healths of the Sovereigns of Europe, and especially of our Queen, were proposed by Riza Pacha, Lord Steward of the Sultan's household, and by Sarim Effendi, Minister for Foreign Affairs.—Private letters from Beyrout of the 24th ult. mention that the British Vice-Consul at Tarsus, Mr. Clapperton, had been ill-treated by some Spahis, but that immediate satisfaction for the offence had been afforded by the Governor. The British Vice-Consul in Jerusalem had quarrelled with the authorities, and the works of the Protestant Church had been consequently suspended. Bishop Alexander was confined to his bed from fever. A letter in the "Augsburg Gazette" states, that since the arrival of the Bishop, several Jews have embraced the Protestant religion.

EGYPT.—Accounts from Alexandria of the 26th ult. state that the Pacha had ordered that every facility be afforded to English travellers in their passage between Alexandria and Suez. All passengers and their baggage arriving by the Peninsular and Oriental steamers are to be hereafter landed at the Mahmoudieh Canal, without going through Alexandria, and neither their persons nor trunks are to be visited by the Customs' officers. The Pacha had likewise permitted station-houses and stores to be erected at Suez. The new French Consul had commenced his duties by protesting against the transport of goods to Suez being committed to an English company. The fleet under Said, the Pacha's son, was getting ready for sea. Recruits are daily arriving from the interior. The new French line of direct steamers between Alexandria and Marseilles will commence next January, and it is projected to reduce the quarantine of passengers from Egypt by these steamers to only three days, if with clean bills of health. Capt. Casolani, the inspector of the Malta Lazaretto, and his nephew the Canon, who had been obliged to leave Malta, as mentioned in a former Number, from being implicated in some conspiracy of the Jesuits, arrived from Syria on the 16th, and received pratique on the 22d. On the 24th the Canon performed Mass to a crowded audience in the Latin Convent. In consequence of the slow rising of the Nile, no Government sales will take place. In Cairo it has risen only twelve carats, and ships are detained from the inability of bringing down their produce.—Advices from Aden of the 10th July state that all was quiet, but from the warlike preparations of the Arab tribes an attack on the British garrison was expected towards the end of the month.

UNITED STATES.—The Royal mail steamer Acadia arrived at Liverpool on Saturday, from Boston and Halifax. She sailed from Boston on the afternoon of the 1st, and from Halifax, where she stopped six hours, on that of the 3d inst., and made the passage in the remarkably short space of 11 days and 16 hours. The semi-official journals of Washington confirm the accounts received by the Roscius, of the completion of the treaty for the settlement of the North-Eastern boundary question. The treaty having been negotiated by the Secretary of State, the President, there was no doubt, approved of it. It awaited the approval of the Senate, and, though there were some sinister rumours to the contrary, that body would, it was deemed all but certain, confirm the convention. The near prospect of the amicable settlement of the disputes between England and America was viewed with general approbation in the United States. In the House of Representatives on the 27th ult., Mr. Adams, from the Committee on Foreign Affairs, reported a resolution, calling on the Secretary of State and the Secretary of the Navy to prepare jointly a plan for the establishment of a line of weekly steamers between New York and Havre by the United States Government, in connexion with the French Government, the report to be furnished at the next session of Congress, with statements of the probable expense and other details. The resolution was passed, and the report was read and ordered to be printed.—The Great Western arrived at New York on the morning of the 30th, after a very quick voyage of $12\frac{1}{2}$ days from Bristol.

CITY.

Money Market, Friday.—The accounts from the disturbed districts having become more favourable, the depression of the public funds, which had fallen considerably during the week, has been removed, and prices have improved to-day about $\frac{3}{8}$ per cent.; Consols for money and account being quoted $91\frac{1}{4}$ to 92; Three per Cents. Reduced, $92\frac{3}{8}$ to $\frac{1}{2}$; Three-and-a-Half per Cents. Reduced, $100\frac{7}{8}$ to 1; New Three-and-a-Half per Cents., $100\frac{1}{8}$ to $\frac{1}{4}$; Exchequer Bills, 51s. to 53s. prem.; Bank Stock, 170 to 1; India Stock, 250 to 1.

Metropolis and its Vicinity.

Departure of Troops.—During the afternoon of Saturday great excitement prevailed in the neighbourhood of the terminus of the London and Birmingham Railway, in consequence of information having been sent to the railway authorities to prepare two special trains for the conveyance of troops to Manchester and the other disturbed districts. It was soon rumoured in the neighbourhood that above a thousand soldiers were going to Manchester by the six-o'clock train, and a great crowd began to assemble in front of the station. The crowd continued to increase, and fears were entertained, from their threatening manner, that a riot would take place. About half-past eight the tramp of heavy cavalry was heard approaching, and in a few minutes after a troop of Horse Artillery, heavily accoutred, having with them four field-pieces, made their appearance in front of the station, having left Woolwich shortly after six o'clock. The mob at this time consisted of between 1,000 and 2,000 persons, and hissed and groaned at the soldiers. The troop consisted of about 150 men, with one waggon of ammunition, besides four pieces of artillery. About nine o'clock the marching of Foot Guards and the hootings of the mob announced the approach of more soldiers. Shortly after they came in front of the station, and were received in a manner even worse than the artillery, the mob shouting and groaning. These troops consisted of the third battalion of the first regiment of Foot Guards, from St. George's Barracks, under the command of Colonel Sir O. Honeyman, numbering 7,000 men, with three waggons laden with ammunition. The mob at this time was very great, the soldiers having been followed from their barracks by several hundred persons, who saluted them with groans all the way. So bent on mischief was the mob, that when the troops entered Regent-street the men were ordered to fix bayonets. The artillery and horses were sent off in two trains, after the others had left. The bridges between the Euston station and Chalk-farm were lined with people, and numerous policemen were doing duty upon them, it having been rumoured that large stones would be thrown on the carriages as they passed. On Sunday morning, as early as nine o'clock, another troop of Horse Artillery arrived from Woolwich at the station, with three field-pieces and ammunition. Being unexpected by the inhabitants, very few persons were present, and they were allowed to take their departure without any expression of feeling, as on the previous night. It being rumoured after their departure that other troops would arrive in the course of the day, the station was surrounded in the afternoon by a mob of between 4,000 and 5,000 persons, who were addressed by several Chartists. About 5 P.M. two waggons, laden with ammunition, and guarded by several soldiers of the 34th, came up, and were shortly after followed by the regiment, under the command of Lieut.-Col. Airey, consisting of 600 men. On their arrival they were greeted with the most discordant yells by the mob, and the police had great difficulty in preventing them from forcing an entry into the railway yard. The officers appeared to be the particular mark at which the spleen of the mob was directed, and on three or four of them riding up abreast they were groaned at in such a manner that an order was given to fix bayonets for the purpose of intimidating them. This caused the mob to shout louder, and when the whole had got inside the gates, a loud groan was set up. The train was unusually lengthy, consisting of nearly 20 carriages. The crowd had not in the least diminished when it left at 7 P.M. In consequence of these special trains, nearly 200 policemen have been doing duty when they started, a considerable number being stationed at Chalk-farm, from the apprehension that an attack might be made on that part of the line. The number of persons waiting at this place to see the train pass with the 34th was upwards of 2,000. On Monday morning, about 11 o'clock, the remaining portion of the 34th, amounting to 200 men, with their families, arrived at the railway from Portsmouth, and left in half an hour for Manchester. The crowd was not so great as on the preceding day, but it was deemed advisable to have an additional number of police on duty. No expression of feeling on the part of the people was given on this occasion.—On Thursday morning the 73rd Regiment arrived in town from Woolwich, under the command of Col. Love, and started by the Birmingham Railway, in two trains for Leeds. The crowd was very great, and a strong body of police was necessary to prevent a riot. In the afternoon, the 32d Regiment arrived by the South Western Railway from Portsmouth, under the command of Lieut.-Col. Markham, and were immediately billeted on different publicans in the parish of St. Pancras for the night. They left town yesterday morning by the Birmingham Railway for Bradford; great crowds were assembled to witness their departure.

Chartist Meetings.—In the early part of the week some apprehensions were excited in the metropolis, by the rumour that the leaders of the working classes in London and the environs had determined on holding simultaneous meetings in various parts of the metropolis, to consider how far and in what manner their interests stand affected by the "turn-outs," and suspension of labour in the manufacturing districts. It appears that information to that effect was received at the head-office of the police, in Great Scotland-yard, on Tuesday morning, and also that large bills, headed "Awful State of the Country," had been, at an early hour of the morning, extensively posted at the eastern part of the town, calling a meeting of the working classes for that evening, on Stepney-green, and a second meeting for Wednesday, on Islington-green. Information of the intended meetings was immediately conveyed to Sir James Graham, and orders were immediately despatched by mounted expresses to every division of police, particularly in the suburbs, to report at 5 o'clock, at Scotland-yard, whether any assemblage of persons had taken place in any part of the district, and also to remove, as quickly as possible, any inflammatory bills that might be already posted on the walls, and that all persons sticking such bills should be immediately taken into custody and conveyed to Bow-street, and the bills sent to the Commissioners. During the afternoon the Commissioners were in constant communication with the Home-office, and at 6 o'clock on Tuesday evening orders were issued to each of the divisions, for 100 men to be in readiness at the principal station of each division, ready for instant service, should they be required; and at that hour 1,600 constables were ready to act at any point where their presence might be requisite. The battalions of the Guards still in town, the Life Guards, and 8th Hussars at Hounslow, were also ordered within barracks, and those at the Tower were kept under arms. Happily, however, no disturbance has occurred. The following are the particulars of the Chartist meetings which have taken place:—On Monday morning a large body, about 1,000 in number, composed of both male and female Chartists, entered the town of Watford, through the railway arch, walking in procession, carrying flags and banners, and preceded by a band of music. They had arrived from London, whence they had been conveyed in about 80 vans, some drawn by two and others by four horses, in which they would have entered the town, had they not been stopped about a mile off, by order of the magistrates, and told that the vans would not be allowed to go into Watford, unless the banners were taken off. The whole in consequence descended, and determined to walk and carry the banners, &c., leaving the vans behind. They proceeded to the inns and had refreshments, after which the whole body marched off to a field at the back of the town, whither they were followed by several agricultural labourers, and by several farmers of the neighbourhood. A hustings having been erected, Mr. Savage and others addressed the meeting, urging the working men to join the Association, in order to obtain the Charter as the only means by which they might expect to get a fair day's pay for a day's work. Three cheers were given for Mr. O'Connor and Mr. T. Duncombe, whose colours were carried at the head of the procession, and at the conclusion three cheers for the Charter. The distressed state of the country was much commented on, but scarcely any allusion was made to the present disturbances. No outbreak occurred, but a body of police was stationed in the town in case of emergency. The procession was formed in Circus-street, New-road, and thence proceeded to their destination; and to this circumstance may be attributed the rumour which prevailed throughout the metropolis on Monday, that 2,000 Chartists had marched from London to Manchester and the disturbed districts.—On Tuesday, in various parts of the metropolis, large placards were exhibited, calling upon the Chartists to assemble at Stepney-green, for the purpose of taking into consideration the state of the country, and the conduct of the authorities at Manchester. About 7 o'clock the committee arrived, and took their stations in the van, by which time between 3,000 and 4,000 persons had assembled. There were many females present. A person named Don was called to the chair, when it was recommended by a person in the van that the crowd should remove from the high road, so that no plea should be alleged that they caused an obstruction. The chairman stated that the object of their meeting was, that as labour was the source of all property, so it should therefore have the first protection of the law, and that it was only by the adoption of the principles of the Charter that protection could be afforded. He then exhorted that they should be peaceable. While he was proceeding, a shout was raised that the police had arrived to disperse the mob. A rush took place, when some men and women were knocked down. It was, however soon found that it was the sound of the approach of a cart which had been mistaken for the approach of a body of police. When order was restored, a resolution was proposed, that a memorial be presented to the Queen, praying that she would order the troops to be withdrawn from the disturbed districts, and that the Charter might be adopted as the law of the land. Several Chartists addressed the meeting in support of the resolution, which was agreed to unanimously. The proceedings concluded a little before nine o'clock, at which time there were between 8,000 and 10,000 persons present.—On Monday evening a numerous meeting of Chartists took place in the open space fronting the Session House, Clerkenwell-green. There could not have been fewer than 2,000 persons present, and among the crowd were many women and children. Several police were about the green, but there was no interference on their part, and the mob did not attempt to molest them. The speeches and the resolutions embraced the usual topics. The meeting separated quietly, without any attempt to disturb the peace.—On Thursday evening there was another meeting on Islington Green; a Dr. Webb in the chair. At half-past six, about 800 persons had assembled, but before seven, they increased to nearly 3,000. Several speeches were delivered, and the meeting dispersed without any disturbance. They then proceeded arm in arm, about four abreast, to Lincoln's Inn Fields, increasing in numbers as they passed along. Many tradesmen in the streets through which they passed closed their shops. The procession was headed by a cart, containing about 6 men dressed as mechanics and some women. At intervals, they gave three cheers for "the charter," the "patriot soldiers," and the "turn-outs in the north." The principal speakers called upon the people to join their hands if they were disturbed by the police or military, and to stand firm. Last night the police were assembled at their stations in large bodies, and the military were under arms, expecting that there would be an attempt to hold a large meeting. The mob tried to get up a meeting at Clerkenwell and in Lincoln's Inn Fields, but were prevented by the police. At the top of Bow-street they attacked the police with brickbats, but were at length dispersed before any serious disturbance had taken place. In all the streets through which they passed, the shops were closed. The Lord Mayor and Aldermen were at Guildhall during the early part of the night, in anticipation of a tumult; and great alarm prevailed in all parts of the city. The magistrates have issued a proclamation, prohibiting any further meetings in the metropolis.

Bartholomew Fair.—On Saturday Mr. Hicks, the Chairman of the Market Committee of the corporation, appeared at the Mansion House, where Alderman Wilson was sitting for the Lord Mayor, and stated that he had been deputed to wait upon his Lordship or the alderman who represented the chief magistrate, to confer with him upon the subject of Bartholomew Fair, and to request his concurrence in the resolutions of the committee. The resolutions recommended among other things, that Bartholomew Fair in future be not proclaimed till the afternoon of the eve of St. Bartholomew, instead of half-past twelve o'clock on the preceding night, as heretofore; that it be proclaimed without any state or civic formalities; that the fair be permitted to continue only during the remainder of that day and the two following days; that booths for the exhibition of plays, interludes, pantomimes, and other theatrical representations, be henceforth entirely excluded; that during the fair no part of the pavement of Smithfield be permitted to be taken up or disturbed for the placing or fixing of any booth, stall or other building, or under any pretence preparatory to or during the fair; that no swing, roundabout, flying vehicle, or other machinery of a like nature, be permitted in any part of Smithfield market; and that exhibitions of wild beasts be prohibited altogether. The Alderman said, that as the subject was one of very great importance, he had sent for the City Solicitor, who recommended the gradual abolition of the fair, which had been diverted from its original purpose, and had become a most intolerable nuisance, demanding the active exertions of the magistracy and the police for the preservation of the peace and the suppression of the most open vice. The present Lord Mayor is warmly in favour of the abolition of the fair, and no doubt is entertained that it will cease to have any attractions for the ordinary attendants on such occasions, and be merely kept up for trading purposes.

Metropolitan Improvements.—The repairing of London Bridge commenced on Monday, when upwards of 200 men commenced taking up the right-hand side of the carriage-way. To prevent confusion, the carriages, carts, and other vehicles, were only allowed to pass over the bridge from the City side; those coming from the Borough and the southern counties were obliged to go over Southwark-bridge. Only one side of the carriage-way will be done at a time, so that the other may be open to the public vehicles crossing from the City to Southwark. That as little inconvenience may be caused to the public as can possibly be avoided, a great number of labourers have been engaged to expedite the necessary repairs. It is expected that the bridge will be re-opened, newly paved, in less than a fortnight.—The church of St. Thomas Charterhouse, in the Goswell-road, as we announced in our last, was consecrated by the Bishop of London on Saturday, when his Lordship preached to a numerous congregation, among whom were most of the City clergy. It is intended that the services of the church shall be twice on Sunday, and on the usual festivals. The Rev. Dr. James has been appointed incumbent minister.—The new church of All Saints, St. Pancras, near Gordon Square, the first stone of which was laid by Sir R. H. Inglis, in November last, is now completed and ready for consecration. It is built in the Grecian style. The parish in which it is situated contains, according to the recent census, 130,000 inhabitants, but with church accommodation, including proprietary chapels, for only 16,000 of that number. In order to meet this deficiency, the Church of All Saints has been erected at considerable cost, under the immediate direction of the Bishop of London, in whom the patronage is vested. It is proposed to establish schools in the more destitute sections of the district, which in itself contains upwards of 7,000 persons. The church is provided with 1,200 sittings, one-third of which are free. Among the donations may be enumerated 1,500*l.* from the committee of the Metropolis Churches Fund, 500*l.* from his Grace the Duke of Bedford, 300*l.* from Mr. Waller, and a communion service from Mr. J. Greaves, of Irlam Hall, Lancashire.—The repairs of St. Martin's-in-the-Fields are rapidly advancing. The church will necessarily remain closed for some time longer, and during the repairs the congregation attend divine service at St. Michael's Church, in Burleigh-street, Strand.

The Model Prison.—The new prison at Pentonville is now completed, and will shortly be brought into operation. The plan was determined on after a laborious and careful inquiry into the discipline practised in most of the prisons in Europe, the West Indies, and North America, as well as those in Great Britain and Ireland. The construction of the prison is considered to be an improvement over all similar buildings, particularly as regards the separate or silent system of discipline. The expenses incurred in carrying the scheme to completion, it is stated, have exceeded 20,000*l.*, independent of the cost of the buildings. It is understood that it will be opened for the reception of prisoners early next month. The applications for the principal situations have been very numerous, and there were upwards of 100 candidates for the office of Governor. The Commissioners have announced the following appointments:—Governor, Mr. Robert Hoskins; Chaplain, Rev. James Ralph; Physician, Dr. G. O. Rees; Secretary and Accountant, Mr. W. H. Weaver; Steward and Manufacturer, Mr. Gallop.

Police.—On Tuesday two weavers and a baker were placed at the bar, charged with unlawfully carrying through the streets placards of an inflammatory character. These placards were headed "Awful State of the Country!" and called upon the people to attend the meetings at Stepney and Islington, "for the purpose of taking into consideration the conduct of the authorities in violently massacreing unarmed persons, whose only crime was want of food." They concluded by the following paragraph:—"Englishmen, attend in your thousands, and show your sympathy with your brethren in the north, and your detestation of tyranny." After the evidence of the police had been received, the prisoners said that being out of work, they accepted the job offered to them, but were not able to read, and therefore knew nothing of the contents of the placards. The magistrate said that he was willing to admit that the prisoners were not aware of the nature of such language, but were made the innocent instruments in the hands of designing persons; and in order to prevent a repetition of such a proceeding, they should each enter into their own recognizances in the sum of 10*l.* to be of good behaviour for the next two months. The prisoners applied to have the boards delivered up, which was granted, but the placards were ordered to be kept by the police. In consequence of the several summonses that were granted and made returnable forthwith, for similar offences, a number of persons were in attendance during Thursday to answer complaints preferred against them by the police, for having inflammatory placards posted at their doors in different parts of the metropolis, some of which were dismissed upon the parties satisfying the Court that the offence would not be repeated, and that the circumstance took place without their sanction or knowledge.

The Monument.—Another suicide was committed yesterday morning from the Monument, notwithstanding the appointment of special keepers to prevent a recurrence of those catastrophes which had already given it notoriety. A female servant, named Jane Cooper, living with a family at Homerton, threw herself from the summit near the flag-staff, while the attention of the keeper was attracted by something on the opposite side. She nearly fell on a cart passing at the time, and was of course killed upon the spot.

Woolwich.—Great excitement prevailed here on Saturday, in consequence of the report that an order had been received by Lord Bloomfield, the Commandant of the Garrison, to forward to the London and Birmingham Railway, with all possible despatch, a park of artillery. Shortly after the arrival of the messenger, instructions were issued for the assembling of the officers and men, who, with four pieces of cannon, were promptly equipped, under the command of Lieut.-Colonel Smith. An ammunition waggon was immediately prepared, and supplied with munitions of war, consisting of a large quantity of powder, ball, grape, and canister shot. The number of men, with their officers, amounted to about 150. Several waggons belonging to the inhabitants were pressed on the occasion. A little before six the space in front of the gates, by which the troop of artillery had to pass, was occupied by a dense mob of persons. About six o'clock the body left the barracks. Each cannon was drawn by four horses, and nearly the whole of the men were on horseback. The passage of such an unusual cavalcade along the road congregated a crowd, which became very large as it approached the Metropolis.

Provincial News.

WE regret to say that the hopes entertained last week that the disorderly workmen in the cotton districts would return to a sense of their true interest and duty, have not been realised. The movement has spread into Yorkshire and Warwickshire; and the confederated workmen in the Staffordshire Potteries, encouraged by these insurgents, have committed greater excesses than any which were recorded in their former outbreak. It has been found necessary to move detachments of infantry and artillery into the disturbed districts: blood has been shed in several places, and the daily papers have been filled throughout the week with detailed accounts of these melancholy proceedings.

Manchester.—The riots in this town assumed a very serious aspect during the early part of the week; and the greatest alarm prevailed throughout the district. The following is a condensed summary of all that has transpired since our last:—On Friday the Queen's proclamation was issued, calling upon the authorities to use their utmost endeavours to bring the rioters to justice, and offering a free pardon and a reward of 50*l.* for each person convicted. On Saturday morning, as early as half-past 7, a mob, of the usual character, made an attack on the bricklayers and labourers employed at the new buildings in Pool Fold, and compelled them to cease work. A meeting of trades' delegates was held at the Socialists' hall at 11. There was a very crowded attendance. A great deal of wrangling took place in the course of the proceedings; but ultimately a resolution, pledging the men not to return to work till the People's Charter was obtained, was carried by about three-fourths of the meeting. Though there was much quarrelling, no breach of the peace occurred. At an early hour information was received at the Town-hall that a large mob had gone to turn out the hands at the engine manufactory of the Leeds railway, close to the terminus at the Oldham road. A large body of police and special constables were immediately despatched, who succeeded in preventing any further outrage, although the hands did not return to work. About noon a strong force of mounted police, with 100 police constables on foot, and about an equal number of special constables, was despatched to Little Ireland, in the township of Chorlton-on-Medlock, where they succeeded in dispersing a large crowd, and seized large quantities of stones and brickbats. None of the mills, except those of Messrs. Birley and Messrs. Kennedy, had commenced work. The suburbs of the town were crowded with gangs of marauders on the pretence of seeking alms. About noon a daring attack was made on a mill at Quarry-bank, near Willastow, belonging to Mr. Greg, late Member for Manchester, by about 500 men, who, after demanding admission, which was refused, forced open the door, the whole body marching into the lower part of the mill and effecting considerable damage before they could be ejected. After this they went to the village shops and bakehouses, seizing all the bread they could find. At three o'clock intelligence was received of another attempt on the Leeds railway, for the purpose of seizing the mail train. A large mob ascended the inclined plane from St. George's-fields, and threw the guard down the embankment. They then let the water out of the boiler, leaving the fire burning, expecting that an explosion would be the consequence. Prompt aid was sent by a strong detachment of Rifles, police and special constables, but on their arrival the crowd had dispersed. Seeing that their attempt had not been effectual, and had not rendered the engines unfit for work, the mob were about to renew the attack when they dispersed. An attempt was also made to throw the express engine off the road by several obstructions being thrown in its way. Up to 5 o'clock, the arrival of all the down-trains from Leeds had been regular, although large crowds of persons were reported by passengers as having been seen at Hebden-bridge, and several other places, where all the works had been stopped. On Sunday the town was remarkably quiet. No patrols through the streets were required, not a single mob having collected. Many believed that it was a lull which preceded a gathering storm; but it was attributed by others to the habitual respect which the working classes of Lancashire pay to the Sabbath. The intelligence of the rioting and loss of life at Preston on Saturday, and some further disturbances and injury of property at Staley-bridge, where the turn-out had its origin, had caused considerable alarm among the authorities. A despatch was sent to London on Saturday for more troops, and such was the promptitude with which the demand was met, that by three on Sunday morning a force of 600 of the Coldstream Guards had left the terminus at Euston-square. They arrived at Manchester about eleven in twenty-one carriages by two special trains, and were immediately marched to barracks. It is said to be sixteen years since the Guards were sent to Manchester on a similar errand. In the course of the day, the magistrates held a meeting which lasted some hours, at which they agreed to issue a proclamation, making known that all assemblages of persons in considerable numbers, having under present circumstances a manifest tendency to endanger the public peace and to excite the fears of her Majesty's peaceable subjects, were illegal—whatever might be their avowed object and wherever held, and notwithstanding they might not at the time be attended with acts of open violence; at the same time declaring their full determination to use all the means in their power to prevent and repress, and, if necessary, forcibly to put down the same. Towards evening groups of operatives collected at the corners of the streets in the more populous parts of the town; but simply in order to talk over the momentous events of the week, and the best method of future proceeding. The universal topic of surprise was how 100,000 persons had been able to subsist without their usual week's wages. On Monday afternoon, in consequence of information received that an open-air meeting was to be held in the Granby-row Fields, there was an imposing array of military force collected opposite St. Peter's Church. It consisted of two troops of dragoons, a company of the Coldstream Guards, and a large detachment of Rifles, and the 58th Regiment. They went through the disturbed districts and made a powerful display; but there was no attempt at a meeting. It was feared that another attempt would be made, and at four o'clock a much more imposing force, consisting, in addition to the above, of four hundred police and special constables, went down to Granby-row Fields, but there being no opposition they marched onwards through Ancoats to their destination. Some factories in Ancoats had been taken as barracks, of which a large party of the Fusilier Guards had taken possession. A large detachment of the 12th Lancers arrived during the morning from Liverpool by special trains, having just come to that port from Dublin. In defiance of the proclamation issued by the magistrates, many meetings were held in different parts of the town, but in private places and rooms. There was nothing, however, which otherwise could come within the cognizance of the civil power. On Tuesday, being the anniversary of Peterloo, the deepest anxiety prevailed at the Town-hall. The mounted patrol, who had just arrived, brought intelligence from all their districts, that large bodies of strangers were entering the town in every direction, particularly along the Ashton-road, who were armed with bludgeons. They had, however, conducted themselves peaceably, and the special constables had retained their posts. A large concentration of constables had taken place at the Town-hall. Alarm-bells were placed in most of the wards to call the special constables of those districts to their post at the first appearance of danger. Although this was the chief market-day, there was not the slightest semblance of business, the merchants being at their several posts, and the manufacturers being kept at home in their own localities from the dread of consequences. A meeting had been announced to take place in the burial-ground of Mr. Scholfield's chapel, to celebrate the completion of Hunt's monument. On the appearance of the placard, the authorities gave notice that if such a meeting took place, it would be dispersed by the military. The delegates then decided that the procession and meeting should not take place, but that a tea-party should be held in the evening. The delegates passed the following resolutions:—1. That this meeting pledges itself to discontinue all illegal proceedings, and further that they will endeavour to preserve the public peace. 2. That they could not exist with the present rate of wages, and that they are determined not to go work until they obtained the wages of 1839. 3. That each master do pay the same for the same fabric of cloth throughout the whole of the manufacturing districts. 4. That it is the opinion of the meeting that their political rights are imperatively necessary for the preservation of their rights when they gain them. They therefore pledge themselves to act with their other friends and trades generally in gaining the People's Charter as the only means of having the said rights. Dr. M'Douall had been addressing the workmen of Eccles, proposing that the treasurers of all benefit-societies, Odd Fellows, Foresters, Ancient Shepherds, and sick and burial-clubs of every description, should obtain the permission of their members instantly to withdraw their money from the various banks in Manchester, in order to keep it out of circulation. On Wednesday, a large mob assembled at Medlock Vale, and forced the hands of Messrs. Holmes and Co. to discontinue work. Another held a meeting at Eccles, and afterwards went to the Victoria Mills and demanded the turn-out of the hands, but a strong resistance was offered and the rioters were dispersed. In the afternoon a printer was seized, with the press and types from which a seditious placard had been printed; two boys on the premises were also arrested; they stated that the proof of the placard had been carried to Dr. M'Douall, and the corrected proof was seized with the other papers.—The placard printed at the press which was seized on Wednesday has been published. It calls upon the people not to lose the present opportunity, but to "resolve never to resume labour until labour's grievances are destroyed, and protection secured for themselves, their suffering wives, and helpless children, by the enactment of the People's Charter." It intimates that the turn-outs can afford to remain idle for an indefinite period, and refers with great violence of language on the late events at Preston and Blackburn. On Thursday warrants were issued for the apprehension of Dr. M'Douall, the supposed author of this placard, and a well-known Chartist orator and bookseller named Leech, calling himself "President of the Executive Council of the National Charter Association," at whose shop it was distributed. The latter was arrested in the course of the day and lodged in the Town Hall. Dr. M'Douall is said to have left the town, but most of his papers have been seized. Several warrants have since been issued against persons known to have taken an active part as agitators during the recent disturbances. In the course of the day a mob from Ashton attempted to turn out the hands from the Bankbridge print-works, about three miles from this town; but the hands successfully defended the premises, and after a severe fight, during which the military came up, the rioters were compelled to retire.

Preston.—We regret to state that the riots in this town assumed so serious an aspect on Saturday, that the military found it necessary to fire upon the people. For some days previously the town had become greatly excited, and some apprehension was caused by the number of hands out of work, grouped in various parts of the town. On Friday the town was thrown into a state of commotion by the compulsory turning-out and stoppage of most of the mills. A party of some hundred men met on that day, and went to Messrs. Paley's factory, in the first instance, demanding that the hands should be turned out, which was eventually complied with. They then proceeded to all the mills, foundries, and loom shops in the town, successively, compelling them to discharge their hands, and, in some instances, where they met with resistance, breaking windows and doing other damage. A meeting of the malcontents afterwards took place, to the number of about 3,000. The assemblage was addressed by two Chartists, who spoke strongly against the Anti-Corn Law League and the masters. The movement was altogether unexpected by the authorities, nor was it known whether it was preconcerted by the disaffected in other towns, though it was suspected that some delegates from Manchester had been at work on the previous day. On Saturday morning the mob proceeded to the factories of Mr. F. Sleddon and Messrs. Cathcall; the former resisted the demands of the assemblage. Soon after eight o'clock the number increased, and it was found requisite for the Riot Act to be read two or three times over. In the middle of Lane-street there was no possibility of obtaining order, nor could all the advice given by the magistracy prevail upon the mob to retire, instead of which they commenced a fire of stones, with determined resolution, the women bringing aprons and bags full of ammunition. The consequence was that order was given to fire, when ten of the rioters were wounded, some of them mortally. Five were taken to the Hospital, and in the course of the morning one of them had his leg amputated above the knee, being completely splintered by the ball. Many of the others were severely injured, and two have since died. The factories, with the exception of two, resumed work on Monday under the protection of the military force, and have continued to work during the week, the authorities having determined to repulse them with the soldiers if they again entered the town. The 72d Highlanders and the Wigan troop of Lancashire Yeomanry Cavalry, commanded by Lord Francis Egerton, and a company of Rifles, still remain in the town. The Queen's proclamation, offering 50*l.* reward for the conviction of any of the authors of the outrages has aided the authorities in bringing the guilty parties to justice. An inquest has been held on the bodies of the rioters who were killed by the fire of the troops; several witnesses were examined, and a verdict of "Justifiable homicide" returned. On Wednesday the mob made another attempt to enter the town, but they fled at the first appearance of the troops. The factories resumed work on Thursday, and the town continues tranquil.

Bolton.—In consequence of a meeting having been announced for Friday night in the market-place, great crowds of persons congregated together; the police attempted to disperse them, but their force was inefficient; the Highlanders were called out, and the mob were dispersed. Several skirmishes took place, and stones were thrown, but nothing more material than one of the soldiers and one or two of the police being slightly wounded occurred. During the night all was quiet and orderly, and up to noon on Saturday there appeared no indication of a disturbance. However, at twelve o'clock, the mob, consisting of at least 5,000 persons, armed with bludgeons, staves, and bars of iron, entered the town, flourishing their weapons, and giving loud huzzas. The mob proceeded through the market to the mills, which they immediately stopped, together with several foundries; and on their return again, passed through the market-place and into Little Bolton, where they visited the different mills. Several members of the mob entered different shops, and asked for bread, which was given them; in some instances they demanded money from persons of respectable appearance in the street. The mob presented a formidable appearance, and the weapons they carried were of a most deadly description. The language used by them on many occasions was exceedingly violent, levelled principally against the police, whom they threatened to murder before they left the town. The Highlanders and Cavalry were under arms and stationed before the police-office. The Riot Act had been read, and the magistrates had made arrangements for the town to be lighted at night. The mob left the town the next morning for Hindley, Wigan, &c., and returned in the evening; they were armed as before, and immediately proceeded to clear the streets of passengers. On Thursday a mob arrived from Bury, where they had again succeeded in turning out all the hands, in consequence of the magistrates not having given the manufacturers the protection they promised. On arriving at this town, the mob stopped the works at Haulgh; they also attempted to turn out the hands at Ladyshaw collieries, but the arrival of the Yeomanry put them to flight, and left 80 prisoners in the hands of the authorities.

Wigan.—The mob which had left Bolton on Monday entered this town on the same day, armed with bludgeons. They immediately proceeded to the various mills, collieries and factories, stopped the engines, and turned upwards of 3,000 persons out of employment. Having effected this outrage, they marched towards the seat of the Earl of Balcarres, at Hay, in which neighbourhood there are a great number of collieries. On their passage through the town, they committed no other violence to property than demanding provisions from the shopkeepers, which were at once given to them. One of the curates of the town, the Rev. Mr. Bessell, on endeavouring to remonstrate with them, was struck on the head, but suffered no material injury. The town was guarded by a company of the 72d Highlanders. The inhabitants closed their shops, warehouses, &c., and business was totally suspended. Upon the shutters of several of the closed shops, the Chartists posted copies of resolutions entered into at Manchester, stating that the workmen there had resolved not again to resume work until the People's Charter became the law of the land. After turning out the workmen, the mob stayed for some time near the station of the North Union Railway, watching the arrival and departure of the several trains, the passengers in which were alarmed at their shouts, and the threatening manner in which they brandished the bludgeons over their heads.

Blackburn.—On Monday there was a general turn-out of hands in this town. On coming before Messrs. Livesey and Hodgett's mill, a stout defence was made, and the crowd was beaten back by the military, consisting of two companies of the 72d Highlanders. The constabulary present, aided by the military, proceeded to arrest some of the leaders in the attack, and a number of the prisoners were sent off to gaol under a strong escort of soldiers. Some stones were thrown at the military, when the officer in command remonstrated, and cautioned the multitude to abstain from acts of violence, or the authorities would be compelled to retort violence in self-defence. The caution was unhappily unheeded; a great many in the crowd hurled stones at the soldiers, and ultimately the position of the military was one of such peril that the officer deemed it necessary to give the command to fire. The discharge took effect: two persons fell dead on the spot, and several were wounded. The people instantly dispersed, and the soldiers succeeded in carrying off their prisoners. On Tuesday, notwithstanding the melancholy affair of the previous night, the turn-outs again assembled in great force, and attempted to turn Mr. Forrest's hands out. They were met, however, by the military, and prevented, without any resort to violent measures. Further accounts state, that about 40 prisoners had been taken into custody, and that four other individuals have been mortally wounded. After turning out the hands in the town, the mob proceeded towards Darwen, and turned out the hands there. In the course of Tuesday morning many of the factories resumed work, and have continued at their labour during the rest of the week.

Todmorden.—This place was visited on Friday by the turn-outs. They arrived in the morning; one party from Rochdale, Littleborough, and the neighbourhood; the other from Facit, Whitworth, Bacup, and the Forest of Rossendale: the two, when united at Gauxholme, constituted a most formidable force, numbering nearly 10,000, composed of men and women, the men being well armed with clubs or stakes. Each of the mills in Todmorden and its vicinity was visited, the plugs from the steam-boilers were drawn, the fires slaked out, and the hands in the various manufactories, machine-shops, sizing-houses, &c., ordered off the premises, with directions not to commence work until the whole of the masters had agreed to pay the wages of 1840 for ten hours' labour in the mills. No injury or violence was done, excepting that one bread-baker's shop was emptied of its stock and contents by the hungry multitude, the proprietor not having closed previously to their arrival.

Oldham.—On Friday the mob visited the factories in this place, and compelled all the hands to turn out. They were from 5,000 to 6,000 strong. Masons, bricklayers, joiners, mechanics, and every kind of operatives, struck work and joined the mass of the people as they passed from mill to mill. Several of the provision shops handed loaves of bread to the mob in the streets, which they eagerly devoured. Other shopkeepers collected money and gave to the ringleaders, who immediately went and purchased bread, which they divided amongst their followers. In one or two instances loaves were taken without leave by some young lads: but this conduct was not tolerated by the leaders. Several gentlemen gave them money liberally, which, in all cases, was spent in bread for those who had come a great distance. A large meeting was then held on Cronkeyshaw Moor. Delegates were sent thence to various parts in Yorkshire; also to Colne, Padiham, &c. A procession of 6,000 individuals went to Bacup, where the hands in the cotton and woollen mills and various workshops were compelled to give up work. After holding another meeting, the procession marched to Todmorden, where the hands in most of the mills had ceased working, and the others were then stopped.

Stockport.—In consequence of the apprehensions entertained last week respecting the rumoured visit of the rioters, four troops of the Cheshire Yeomanry were marched into this town, under the command of Colonel Egerton. At an early hour in the day the turn-outs assembled at Hyde, and proceeded in a body of nearly thirty thousand persons to this place, where they arrived about noon, and stopped the various mills, compelling the men, in some instances, to retire without stopping to put on their clothes. The mills being stopped, they next held a meeting on Waterloo-road, and resolved not to return to work till they obtained the prices paid in January 1840. While this was going on, a portion of the turn-outs attacked the Union Workhouse on Shaw Heath, and took away 672 loaves, and seven pounds in copper. Information of this proceeding having been conveyed to the police office, a number of yeomanry cavalry and infantry were despatched to the place, and they succeeded in capturing about thirty or forty of the rioters. A great number of persons then left the meeting to go to the rescue; but finding the place well guarded, they did not make the attempt:—many of them were, however, seen loading pistols, and others were observed to have daggers under their coats. Seventeen of the prisoners were examined, committed for trial, and sent to Knutsford the same evening. All the shops and public-houses in the town were closed. On Monday morning a numerous meeting of the turn-outs was held in Waterloo-road. The speakers were chiefly Chartists, with whose proceedings the bulk of the turn-outs begin to be dissatisfied, as they mix up the question of wages with the Charter. A resolution to the effect that the operatives remain out till they obtain the wages paid in January 1840, and the Charter, was proposed; to which an amendment was brought forward, in the words of the resolution so far as the wages were concerned, but declining to demand the Charter at the present time, and pledging themselves to preserve the peace of the borough. The amendment was carried, much to the disappointment of the Chartists. The men continued out on Thursday, but no breach of the peace has been committed in the town; the men, however, have visited the seats of the country gentlemen round Knutsford in alarming bodies. The troops are still out, and the authorities are prepared to resist any attack.

Leeds.—On Saturday the Lancashire turn-outs started from Manchester, Oldham, &c., and entered Yorkshire. They marched into Huddersfield in numbers amounting to several thousands, stopping every mill and factory in their way. On Sunday the magistrates of that town swore in some hundreds as special constables; a troop of Lancers was sent from this town, and orders were despatched to the military at York to lose no time in coming to their assistance. Prince George of Cambridge, who is at present here as colonel of the 17th Hussars, with the other military commanders, had a long conference with the magistrates on Sunday night, when the troops were dispersed to different parts of the country, to be ready in case of any new outbreak. The troops in garrison at York and Hull have also marched to the disturbed districts. There are only a few men left in charge of the barracks, and the police in attendance on the York courts during the day are despatched to Leeds for night duty, and return to York in the morning. On Monday all was quiet at Leeds, but there was a very uneasy feeling in the town. At Halifax all the mills were standing but two, and these were under the protection of the magistrates and the military. Some rioting had taken place, and five or six of the most active of the mob had been apprehended and committed to Wakefield House of Correction. A meeting of coal-miners, amounting to from 4,000 to 5,000, took place at Wakefield on Monday morning; it went off peaceably. The resolutions and speeches were temperate, the men merely asking their employers to endeavour to raise their wages. An attempt was made by a knot of Chartists to introduce a political discussion, but it totally failed. At Huddersfield every mill was stopped. The Riot Act was read three times; and as the disaffected refused to leave the town, a charge was made upon them by a troop of the 17th Lancers and a body of 400 special constables. Several of the mob were wounded in the affray, but none seriously, and seventeen men and one woman were taken into custody. Among the prisoners taken were the ringleaders. The town was in the greatest commotion the whole of the day. The whole of the shops were shut up, and no business done. The streets were effectually cleared about seven in the evening; but it was feared that an attempt would be made during the night to rescue the prisoners. The operatives of the mills stopped were most of them willing to leave their work, and seemed to have confidence in the movements of the leaders, and to anticipate good from the issue of events. The colliers in the whole of the West Riding, or nearly so, have struck work. At Dewsbury, Cooper's-bridge, Brighouse, Elland, Sowerby-bridge, Hebden-bridge, Todmorden, and Rochdale, the thickly-populated manufacturing districts along the course of the railway from Leeds to Manchester, the mills are all stopped, and the workmen congregated in groups along the road-sides and in the streets. All trades are included in the general turn-out, and in some places even the schools are deserted. On Tuesday, the mob resorted to extreme violence in the immediate neighbourhood of Leeds. They attacked the manufactories of Messrs. Ellis, at Bountcliffethorn, and of Messrs. Hagues and Cook, at Dewsbury, and turned out their hands. They also attacked a detachment of the 17th Lancers near the railway station at Elland. The troops had just conveyed from Halifax to Elland a number of prisoners, who had been committed to Wakefield House of Correction. Two of the Lancers were severely beaten, one of them having his eye completely knocked out, and the lives of both are despaired of. The sword of the commanding officer was broken in such a manner as to be entirely useless. The town became quiet towards night, but serious apprehensions were entertained for the continuance of tranquillity. Prince George of Cambridge continues in hourly communication with the magistrates, and is to be seen very frequently riding between the barracks and the Court-house, and at the railway station. On Wednesday the mob assembled at Stanningley and Holbeck Moor; they attempted to stop the mills at Holbeck, and had succeeded in four or five, when they were dispersed by the troops. They then proceeded to Bramley, Dewsbury-road, and Fulneck, and went on towards Bradford, stopping all the mills in the way. On Thursday the town was free from crowds, and the last advices state that it continued tranquil yesterday.

Stafford.—The Potteries in this country are in the utmost state of excitement. As soon as the troops stationed in Burslem had marched out of the town for Manchester, a large body of colliers from Longton entered the place, and broke open the jail, releasing several prisoners from confinement. They then attacked several respectable private houses, and demolished the windows; after which they proceeded to the Town-hall, smashed all the windows, and destroyed the clock. They attacked the house of the sergeant of police, and riddled his premises, not leaving a pane of glass, or a whole shutter. The soldiers did not arrive till three o'clock in the morning, from Newcastle, by which time the rioters had decamped, and have not yet been arrested. The George Inn has been damaged to the extent of more than 100*l.* value. The authorities issued a notice offering a reward for the discovery of the ringleaders; but a counter notice has been issued by the rioters, offering 100*l.* for the head of any person who shall dare to inform of the parties who broke the clock, or Town-hall windows. On Monday morning a large mob, consisting of many thousands, assembled at Hanley, the centre town, and after being addressed by Cooper, the Leicester Chartist, commenced the work of devastation by destroying the Police-office, and damaging other public buildings. Thence they proceeded to Stoke-upon-Trent, where they renewed their work of violence, destroying the house of Mr. Rose, the stipendiary magistrate. Afterwards they pursued their course to Longton, a town situated at the extremity of the district, containing upwards of 12,000 inhabitants. On their way thither they attacked the house of Mr. Allen, of Great Fenton, which they plundered and almost gutted, stealing and destroying a vast amount of property. At Longton, after breaking into and gutting the Police-office, the furniture of which they totally consumed by fire, they smashed the windows of the Town-hall, and did other damage to the property. They set fire to the Police-office, but fortunately the flames were extinguished before they had destroyed much of the fabric. The mob then went to the rectory, the house of the Reverend Dr. Vale, which they totally ransacked, and afterwards fired the building, which ended in the house and property being totally destroyed. They then proceeded to still greater acts of violence. On Tuesday morning it was ascertained that they had destroyed the Rev. Mr. Atkins's house, and burned it down. The house of Mr. Perkins, magistrate, was also burned down to the ground. Mr. Forrester's house, of Cobbridge, agent to Lord Granville, was gutted. The high-road was filled with thousands marching to Burslem, in a line of road occupying two miles in length. The whole country was in the utmost terror. The seat of the Duke of Sutherland, at Trentham, and Mr. Copeland's house, were considered in great danger. At Stafford, in consequence of a rumour having reached the magistrates, of an intended invasion of the town by colliers and other disaffected persons to the number of some ten or twenty thousand, considerable alarm was entertained for the security of the county gaol, as it was generally understood that the objects of their visit was to liberate those colliers and Chartists who have been recently committed from the neighbourhood of Bilston and Wednesbury. On Tuesday, a mob of 5,000 men entered Burslem armed with stones and bludgeons, and almost immediately came into collision with the military, who remained passive until they were attacked by stones and other missiles. They were at length obliged to fire in self-defence. About 50 persons are supposed to have been wounded, many mortally; but as the mob carried off the bodies, the exact number is not known. On Wednesday and Thursday the whole district became more tranquil, and though the men continue out, no fresh disturbance has occurred.

Coventry.—On Saturday night the colliers' strike spread into Warwickshire; the first outbreak occurring at Bedworth, about five miles from this place. The delegates arrived from Lancashire and Staffordshire, and immediately proceeded to the coal pits near and around Bedworth to the Charity-Wyken, Victoria, and Wheildon pits, visiting all the pits in this district, and making all the men turn out. There were no exhibitions of violence except the cutting of the ropes that conduct the baskets down into the pit. All the men were requested to sign a declaration not to work any more until they had attained their object; but the declaration also bound them not to use unlawful means. On Saturday, Mr. O'Neill, the Chartist lecturer, from Birmingham, addressed a large meeting of the colliers, dwelling on the rights of labour, and the necessity of the men of Warwickshire co-operating with those of Staffordshire 'for an improvement in their condition. He advised them to obey the law, and not to force their fellow-labourers to quit work, but to reason them into compliance, as the struggle then going on was to be conducted by moral means alone. Some of the deputation also addressed the men, and explained the nature of the strike; after which the meeting was adjourned to ten o'clock, when they again met, and the turn-out was forthwith declared. The result was communicated to the colliery bailiffs, and in a short time six boats which had come from Oldbury, in Staffordshire, and were lying in the adjoining canal, were started back to their owners empty, amidst the cheers of the turn-outs. A number of armed policemen from Coventry were on the spot, but all things having been conducted peaceably, they did not interfere. The ground of complaint among the men in Bedworth consists more in the number of hours they are required to work, than their wages. They have at present 3*s.* a-day for getting their coal, but work fourteen hours a-day. It is said that the strike there cannot last long, unless prolonged by some other object than that contained in the resolutions. The quantity of water in the mines is so great, that six hours' cessation is sufficient to drown them, and the masters, to prevent immense loss, must submit. Indeed, so convinced are the men of the ruin they would entail by a final stoppage, that they have consented to procure sufficient slack to enable the masters to work the pump-engine. On Thursday, a great meeting of colliers was held, at which resolutions were entered into for raising subscriptions; but the speeches were conciliatory, and the town is now perfectly quiet.

Birmingham.—On Thursday evening, at a late hour, the streets of this town were in a state of considerable commotion, in consequence of accounts having arrived of a contemplated attack upon the residence of Sir Robert Peel, at Drayton Manor, near Tamworth. The colliers, in the course of the morning, had visited Beaudesert, the seat of the Marquis of Anglesea, and Ingestrie, the seat of Earl Talbot, and, it was stated, were proceeding from thence to Drayton Manor. A troop of the 3d Dragoon Guards were immediately sent to Fazeley, and detachments of police were despatched to Tamworth during the night. These prompt measures, however, prevented any attack on the part of the rioters.

Nottingham.—On Monday the working people of this town and neighbourhood met on the open space fronting the Mansfield-road, known by the name of the "Burton Legs;" to hear read the news relative to the strike in Manchester, and other places. The town is said to be at the height of political excitement, and impatient for the strike. The people are suffering the greatest privations, in consequence of the badness of trade, and during the whole of Monday they paraded the streets in thousands. Nothing has occurred during the week except some Chartist meetings, and the town is perfectly quiet.

Derby.—On Monday the magistrates received two or three expresses, announcing that a large body of the turn-outs had reached Leek, with the avowed determination of proceeding to this city, and the manufacturing towns in the Midland Circuit. They entered Leek towards noon, and proceeded thence to Ashbourne, only 12 miles distant. The Uttoxeter troop of Yeomanry was despatched to meet them. The magistrates of Derby had taken every precaution. The local troops of Yeomanry had received orders to be in readiness; and measures were taken to swear in the inhabitants, and the pensioners, as special constables. No outbreak however has taken place; but the glove makers and men of the hosiery manufactures have refused to work.

Leicester.—The colliers at the Whitwick coal-pits, situated about 14 or 15 miles from this town, turned out in great numbers on Saturday, but had not, up to Sunday, proceeded to any acts of violence. They had given some reason to apprehend that such would be their conduct, and information was consequently forwarded to the chief constable of the county, who immediately despatched two of his force to keep a watch upon their conduct. On Monday a meeting of pitmen was held at Pegg's-green, but there was a strong body of police assembled in the neighbourhood, with the Leicester troop of Yeomanry, under the command of Earl Howe. Prior to the meeting, the mob pulled up part of the rails of the Swannington-line, and sunk four boats loaded with Derbyshire coals in the canal, somewhere between Leicester and Derby. These measures were intended to shorten the supply of coals at Leicester, where the daily consumption for the manufactories is immense. The mob continued to parade the streets on Thursday, but the authorities were prepared to resist an outbreak. The Riot Act, however, was read, and a collision took place in the course of the day between the people and the police. The mob assembled again yesterday in large numbers on Belgrave Common, but the police dispersed them, and took several ringleaders into custody.

Liverpool.—Some alarm was caused in this town in the middle of the week, by the appearance of large bodies of workmen, but the affair ended in some Chartist meetings, which passed off quietly, and no disturbance has since occurred. — The following is mentioned in the local papers as one of the most remarkable instances of the rapidity of Steam Navigation. The Royal Mail steamer Columbia sailed from this port on the evening of the 19th ult., and arrived at Boston on the morning of the 1st inst. The Acadia left Boston on the afternoon of the 1st, and reached the Mersey in the forenoon of the 13th inst., bringing replies to letters dated Liverpool, July 19. The interval between sending the letters and receiving the replies to them was a few hours more than 24 days! This is the most rapid conveyance of letters between the Old and New World ever known.

Portsmouth.—We noticed in our last the rumour that it was Her Majesty's intention to take an excursion in the Royal yacht in the course of the summer. Orders were received at this port last week to get the Royal George yacht ready for sea immediately. Her Captain, Lord Adolphus Fitzclarence, has also arrived here; and it is now known that Her Majesty has signified her intention of visiting Scotland in the yacht. By the activity of her officers and crew she was ataunt and fully rigged, with all her running gear rove and her sails bent, on Friday, having in the mean time been into dock and had her copper cleaned. A Commander (said to be Commander Lowe, of the Excellent) and an additional mate are appointed to her for the trip. It was thought not improbable that Her Majesty would embark at this port; but, according to the present arrangement, this will not be the case, as Her Majesty will either embark at Woolwich, or be conveyed to the yacht by one of the steamers from that place to some suitable point lower down the river. The Pique, 36, and the Salamander steam-frigate, now lying at Spithead, are named as the ships which are to attend Her Majesty. The yacht left for Woolwich on Thursday.

Windsor.—This town was thrown into a state of considerable alarm at a late hour on Monday night, by the report that a man, said to be connected with the Chartists, had been discovered in the vicinity of the private apartments connected with the Royal nursery. Other rumours were rife, some of which were of course greatly exaggerated as they passed through the town, until at length it was currently reported that a man had been found secreted in her Majesty's dressing-room, completely armed. The real facts, however, as far as they have been ascertained, appear to be as follows:—On Monday night, between nine and ten, shortly after the Royal dinner, a strange man was discovered seated upon a bench in the footmen's waiting-hall, within a few yards of the Queen's entrance from the Quadrangle to the Castle, and only a short distance from her Majesty's private staircase leading to the Royal nursery. The man, to have reached this part of the Castle, must have gained admittance at the servants' entrance, and have traversed several passages of the Castle, between two and three hundred yards in length. He is about forty years of age. His appearance was that of a journeyman mechanic; he wore a velveteen jacket and trousers, and a black glazed hat, and carried a small bundle and a thick walking-stick. Upon his being discovered, he was taken before the Earl of Liverpool, the Lord Steward of the Household, when, in reply to the questions put to him by his Lordship, he stated that he had walked that day thirty miles, and that he had gone to Windsor to get his pension. He subsequently stated that he had arrived from Woolwich, and that he had walked into the Castle, through the servants' entrance, while nobody was there. There is very little doubt that if he managed to enter in that manner, he walked in with some of the workmen employed at the Castle, for one of whom he was mistaken by the porter on duty. On Tuesday he was removed to London to undergo further examination. He was examined at the Home Office before Mr. Hall, the chief magistrate of Bow-street. His name is said to be Thomas Quested. In answer to questions put to him, he stated that he was a native of Maidstone, Kent; that he was 40 years of age, and a labouring man. It appears that Monday evening was not the first time the prisoner has visited the Castle; for on Saturday he was found asleep in one of the out-offices, and ordered off. From the manner in which he answered the questions put to him, it was supposed that he is suffering under some aberration of intellect; and there was not the slightest reason to suppose that he was in any manner connected or acting in concert with other individuals. On the conclusion of the inquiry he was remanded to Tothill-fields prison. On Thursday the prisoner was again examined, when it was clearly proved that he is insane, and believes himself to be Lord Godolphin D'Arcy. An order was then made out and signed by Sir James Graham for his removal to Bethlehem Hospital.

Railways.—The following are the receipts of the principal railways for the past week:—Birmingham, 20,672*l.*; Great Western, 16,219*l.*; Edinburgh and Glasgow, 3,245*l.*; Northern and Eastern, 1,551*l.*; Greenwich, 895*l.*; Birmingham and Gloucester, 2,037*l.*; Hull and Selby, 1,316*l.*; Midland Counties, 5,091*l.*; Eastern Counties, 1,183*l.*; South-Western, 8,314*l.*; Birmingham and Derby, 1,549*l.*; Grand Junction, 9,126*l.*; Manchester and Leeds, 5,170*l.*; Blackwall, 1,378*l.*; Great North of England, 1,797*l.*; York and North Midland, 2,237*l.*—At the recent half-yearly meeting of the Northern and Eastern Railway, the gross receipts for the half-year ending 30th June were stated at 28,985*l.* 13*s.* 5*d.*, which, with the balance of 162*l.* 16*s.* 8*d.*, left undivided the previous half-year, gave 29,148*l.* 10*s.* 1*d.* The expenses, including toll to the Eastern Counties, amounted to 15,626*l.* 4*s.* 2*d.*, leaving a balance of 13,522*l.* 5*s.* 11*d.*; and a dividend was accordingly declared thereon of 20*s.* per share, amounting to 9,072*l.*, leaving a balance of 4,450*l.* to be applied for the payment of rent to the Eastern Counties.—On Monday the half-yearly meeting of the proprietors of the London Grand Junction Railway was held. After the reading of the report, which showed the Company to be *in statu quo*, the accounts were submitted, from which it appeared that the expenditure during the half-year was 543*l.*, and the balance in hand 3,565*l.* 17*s.* 10*d.* The Company's Act expires next July. After the business of the meeting, a vote of thanks was passed to the directors.—The receipts upon the London and Birmingham Railway amounted last week to the extraordinary sum of 20,672*l.*—a sum said to be unequalled upon any railway in the world during the same length of time.—The Essex papers announce that the advantages conferred upon the county by the Eastern Counties Railway are about to be extended by the formation of a branch line from the seaport town of Maldon to the town of Braintree, with a junction at Witham, which will afford to a rich and populous district the benefits resulting from railway communication. Mr. Braithwaite, the engineer of the Eastern Counties Railway, has inspected the line, and the necessary surveys are already in progress.

IRELAND.

Dublin.—The death of Lord Rossmore, which had been anticipated for some days, owing to his Lordship having received a severe attack of paralysis, took place on the 10th inst. His Lordship was elevated to the British Peerage on the 23d of June, 1833. His demise causes a vacancy in the representation of the county of Monaghan, by the elevation of his eldest son, the Hon. H. R. Westenra, to the House of Lords. Mr. Leslie, of Glassleugh, is mentioned as a candidate for the vacant seat.—At the Dublin Commission Court last week, Mr. John Pasley, senior coroner of the county of Dublin, and R. B. Shanahan, surgeon, were arraigned and found guilty on an indictment charging them with intent to defraud the ratepayers and treasurer of the county of Dublin—the former by giving the latter an order upon the treasurer for 3*l.* 10*s.*, as if he had given evidence before the corner's jury—the latter for receiving the same, knowing that he had not discharged the duty for which the money was stated to be a remuneration. The Court took time to consider their verdict, and on Monday sentenced Mr. Pasley to twelve, and Mr. Shanahan to six months' imprisonment.—The Court was then occupied with the trial of Mr. H. Bailey, arising out of the unsettled state of the law respecting Presbyterian marriages. Mr. Bailey was married to his first wife, in 1831, at Lisburn, in the north of Ireland, by a Presbyterian minister; to his second in April last, in Dublin, by a clergyman of the Church of England. He had calculated on the invalidity of his first marriage; but the Court held that as he was then a Presbyterian, and had induced his intended wife to conform to that form of worship before marriage, the new "point" could not avail him—for then both the parties were dissenters, and the marriage became lawful. He was consequently found Guilty, and sentenced to be transported for seven years. The County grand jury were then summoned into court, and informed by their Lordships that the Crown had just sent in bills of indictment against Mrs. Ellen Byrne, charging her with the murder of her husband, Augustine Byrne. Chief Justice Doherty begged of the Jury to examine the various witnesses with as little delay as possible, and to avoid the tedious and reprehensible mode of putting irrelevant questions which had been adopted in another place. The Grand Jury soon after returned a true bill against Mrs. Byrne, whose trial commenced on Monday. Shortly after ten o'clock on that day, Chief-Justice Doherty and Baron Pennefather entered the court, when the Clerk of the Crown ordered Mrs. Byrne to be sent forward. She then came to the front of the dock, attired in deep mourning, and appeared to be perfectly composed, nor did she exhibit any feeling of terror at her situation. The Court was densely crowded. Mr. Brewster, Q.C., appeared on behalf of the Crown, and addressed the jury at considerable length. He said that, under ordinary cases, he was not in the habit of stating the case against the accused, but this was one of very considerahle difficulty. The prisoner stood indicted for the murder of her husband. Prior to the death of her late husband, the prisoner was the widow of a Mr. Wall, a man who died possessed of considerable wealth. Shortly after the union between the prisoner and her late husband, they had many serious quarrels, and they might be said to have lived most unhappily together. At the time of the death of Mr. Byrne, there were three of the sons of Mrs. Byrne in the house; and it was really a deplorable fact, that these children would be here examined as witnesses against their mother. There were two servants in the house who would also be examined. There were several medical gentlemen also to be examined, whose evidence he would not detail. It would appear in evidence that Mr. Byrne was fond of field sports, and having been at the Bellewstown races, which occurred at the end of June, on his return he complained of cold, and he adopted the habit of warming himself by taking a glass of whiskey, and went to bed. From the unhappy differences which existed between the prisoner and Mr. Byrne, they did not sleep together, and he had his bed-room door secured in such a way as to lock from the inside, and there was no handle from the outside by which it could be opened. This plan he adopted for the purpose of excluding his wife. Mr. Byrne was seen alive on the 1st July, the day after the Bellewstown races, and also on Saturday, the 3d July, but no human eye, with the exception of that of the prisoner, was laid upon him until the 10th, when his dead body was found. It would appear that for the entire of that week she never left the bed-room in which the body was found. When it was discovered, it was in a very advanced state of decomposition, leading to the inference that it must have been at least three days dead. The fact of concealing the death of Mr. Byrne so long might also have been designed, to allow decomposition to set in, and obliterate marks that would ensue from strangulation. The medical men to be examined would also detail to the jury the fact of the right eye of Mr. Byrne protruding considerably beyond its place. He (Mr. Brewster) conceived it a remarkable fact that, when the body was at first found, the prisoner expressed a doubt of the death, and afterwards, when questioned as to her extraordinary conduct in stopping in the room with it so long, she said the body presented all the appearances of decomposition in an hour after he died. The learned counsel then drew the attention of the jury to a number of remarkable facts elicited from the witnesses on the inquest, and which would, he had little doubt, satisfy the jury that the prisoner was guilty of murder. There was nothing to be advanced that was calculated to reduce this crime to manslaughter. There was no quarrel alleged, by either word or deed, out of which a deadly blow might have been given in a moment of anger. He called on the jury not to be swayed by the habits of the prisoner to acquit her of murder if they believed she killed him, even while in a state of intoxication; on the other hand, they should not allow themselves to be influenced against her by the knowledge of her habits. The Court was occupied with the defence till half-past three on Tuesday. It rested chiefly on the presumption that Mr. Byrne died in a fit of apoplexy or epilepsy, produced by intoxication; and on the discrepancy of the medical evidence respecting the appearances which might have been considered to indicate the cause of death. The jury, after a short deliberation, returned a verdict of *Not Guilty*. Mrs. Byrne, who manifested the greatest indifference during the whole trial, was then of course discharged.

SCOTLAND.

Edinburgh.—The papers give accounts of the preparations for the reception of Her Majesty and Prince Albert, on their approaching visit to Scotland. Communications have taken place between the Commissioners of Woods and Forests and the authorities of this city, with reference to immediately placing the palace of Holyrood in a condition to receive the Court. Preparations have also commenced at Dalkeith Palace for the reception of the Royal Family, where the Duke and Duchess of Buccleugh are immediately expected.—It is currently reported, that if Sir W. Rae resign the office of Lord Advocate, of which there is every probability, owing to his delicate state of health, Mr. Duncan M'Neill, the present Solicitor-General, will be appointed Lord Advocate, and Mr. Adam Anderson, formerly Sheriff of Perthshire, Solicitor-General. It is expected that Mr. M'Neill will, in that event, offer himself as a candidate for the representation of Buteshire, as soon as Parliament re-assembles.—Father Mathew, the great promoter of the Temperance movement in Ireland, landed at Greenock, from Dublin, on Saturday, and is now residing in this city.

Dunbar.—The local papers state that the herring fishery, which is of so much importance to this part of Scotland, has latterly become irregular, owing to the unsettled state of the weather. At the close of last week the take was general, but not heavy. From the high wind that had prevailed, fewer boats were out; but the average of their crews have been amply rewarded. Some have delivered as high as 30 crans, and none under 16. The harbour is now crowded with boats and vessels; 17 French luggers are curing in the harbour, and three in the bay.

Dunfermline.—We regret to state that serious riots have taken place among the weavers of this place. It appears that a week or two ago, the proprietors of some of the large shops containing 20 or 30 looms had seen cause to reduce the wages of their workmen. The men were much dissatisfied, but no serious outbreak took place till Monday week, when a large party assembled late at night, paraded the principal streets of the town, extinguished the lamps, and broke the windows of those who were obnoxious to them. Thence they proceeded to the factories, and set on fire the looms in one or two factories, which were consumed, though the flames were extinguished before they extended to the buildings. On the following day Mr. Sheriff Monteith went over to Dunfermline, and exerted himself to preserve the peace of the town by swearing in special constables; but at night the riotous assemblage again appeared, broke more windows, set on fire more looms, and broke into a spirit shop, belonging to a partner in one of the factories, and threw its contents into the street. When the Sheriff was conducting one of the prisoners to gaol, the mob set upon the constables, wounded several, and rescued the prisoner. The Sheriff immediately made application for a military force, and half a troop of the Enniskillen Dragoons proceeded across the Frith; and as a report was spread that the mob intended to force the gaol, to rescue several of the rioters who were confined there, they were drawn up to protect it. The 42d Highlanders were also marched into the town from Stirling Castle, to preserve the peace. Business is entirely suspended, and great distress prevails in all classes.—The weavers, according to the latest accounts, appear pacified for the time; but the colliers are only deterred from further acts of violence by fear of the military. The town is regularly patrolled by troops, and the magistrates and constabulary are in hourly communication to prevent any additional disturbance.

Dundee.—On Friday last a large concourse of individuals assembled in the High-street, carrying a banner indicative of their purpose. Considerable alarm having been felt for the preservation of the peace of the town, every precaution was taken to suppress a riot, should one take place; and with this view, the military and a large force of police were in readiness. The multitude, however, dispersed quietly after the lapse of two hours.

Glasgow.—The dispute between the miners and their employers is still as far from a settlement as ever. The yeomanry were called out on Saturday. Nothing of particular interest has occurred in the districts of Airdrie and Coatbridge. The towns are still crowded with the unemployed, although all is quiet. A few of the masters offered their workers 4*s.* a day to return to their employment; but the men refused, unless those terms were adopted by the rest of their brethren in all the districts. This, added to other circumstances, is considered to imply that their union is very extensive. On Saturday morning, about two o'clock, a potato-field on the farm of Mr. Wallace, West Greenlees, was entered by a body of about 200 men, supposed to be the struck colliers connected with Cambuslang, and stripped of about an acre of potatoes. The depredators seemed to be well furnished with the implements for digging. They had bags, which they filled with potatoes, and then walked off as soon as they had supplied themselves. The farmers in the neighbourhood being apprised of the event, assembled in considerable force, but for some time the formidable number of the diggers prevented them attempting a capture. As the colliers who had served themselves, however, continued to walk off, the numbers left on the field gradually diminished, until only about a dozen remained. By this time the force of the farmers and their dependents was considerably augmented, and a serious affray ensued, when the farmers captured one of the party, and conveyed him to this city to take his trial. The effects of the strike, commenced as it was without warning, have been to throw many iron furnaces out of blast: all the furnaces at Calder are extinguished, five at Dundyvan, eight at Gartsherrie, and two at Chapelhall; and a few days more must add considerably to the number, and, consequently to the amount of idle people and of their dependents, who must, from their total absence of preparation, live on the public. At the commencement of the strike, the females and children levied a species of black mail on the farmers; this practice is still continued. It appears, however, that attention to the females during the day is in some respects a safety to the houses during the night; the men respecting the houses and grounds of those who acknowledge the claims of the females during their progress. The miners are said to be perfectly reckless, and quite determined not to starve with the means of subsistence within their reach. The presence of the police, and watchers with firearms, would seem to have offered no check to the depredators, while it was altogether impossible to bring the military to act against them. The terror of the farmers is extreme, and the excitement of the town-people is greatly increased.

Law.

HOUSE OF LORDS.—APPEALS.—*Phipps* v. *Ackers.*—Prior to the prorogation, the House, among other important causes, disposed of the present case, for which we could not find room in our last Number. It involved an important question arising out of the construction of a will. It originated in the Court of Chancery by the filing of a bill for the purpose of having it declared that the plaintiff (the appellant), as heiress at law, was entitled to very large estates in Cheshire, left by Mr. James Ackers, who died in 1824. The will was of a singular character, and from the phraseology not very easy to comprehend. Having made provision for his wife, the testator bequeathed "unto my godson, George Holland Ackers, eldest son of my nephew, George Ackers, when and so soon as he shall attain his age of 21 years, all my messuage, lands, and premises, situate, lying, and being in Wheelock, in the county of Chester;" and also directed 7,000*l.* to be given him on attaining his majority. But in the event of his dying before that period without leaving issue, then the estate should sink into and become part of the residue of his real and personal estate, and go according to the disposition which he had mentioned in his will. But, with respect "to the rest, residue, and remainder, of the personal estate not by his will specifically disposed of," he directed his trustees, after payment of his just debts, funeral and testamentary charges, to invest the overplus in the Parliamentary stocks or public funds of Great Britain, or at interest upon Government securities, that they might be accumulated by way of compound interest, "until James Corps, son of Ann Corps (some time ago residing in Salford), who was born on or about the 4th of August, 1811, shall arrive at and attain the age of 24 years." He then directed his trustees to convey to James Corps "all the legal estate and interest of and in all my said freehold, copyhold, and leasehold messuages, lands, tenements, &c., being in the United Kingdom of Great Britain, and all my other real and personal estates and effects, whatsoever and wheresoever, not hereinbefore given, devised, and bequeathed." He next made provision for the education of James Corps at school and the university, by allowing a yearly income of 800*l.* towards his maintenance and education, and proceeded thus:—"And it is my will and mind, and I do hereby direct, that the said James Corps, from and immediately after my decease, shall take, use, and bear the surname of Ackers only in addition to his Christian name." Directions were next given, in the event of his dying without lawful issue before he attained the age of 24, to the trustees to transfer certain property to his nephew George Ackers exclusive of what he had given to George Holland Ackers, his godson). It appeared that the wife of the testator died when he was living. To the bill George Holland Ackers, and others interested in the destination of the property, demurred on the ground of want of equity. These demurrers were argued before the Vice-Chancellor in December 1831, altogether, upon the construction of the will as disposing or not disposing of the rents which the appellant, as heiress at law, claimed. That demurrer was overruled, but the demurrer of George Holland Ackers was allowed, his Honour being of opinion that the intermediate rents of the rest of the devised freehold estates from the testator's death until the attainment of the age of 24 by James Corps were not disposed of. The case was subsequently taken to the House of Lords, and argued several sessions ago, but their Lordships came to no decision. Directions were then given to have it reargued before the learned judges by one counsel a side, which course was adopted during the present session, when three questions were propounded for the opinions of the judges; and their lordships, after a few days' consideration, delivered their unanimous opinion, through the instrumentality of the Lord Chief Justice of the Common Pleas. The result of that opinion is thus given at the close of their remarks, it being unnecessary here to state their opinions on the classes of cases cited at the bar:—"It is sufficient to say, that it clearly has been established and recognised as a settled rule of construction, not only in the courts below, but also in your Lordships' House, and that rule appears to us clearly to govern this case put to us by your Lordships; in conformity with which rule, therefore, we beg leave to state, that on the question put to us, we are of opinion that George Holland Ackers, on the decease of the testator, took an estate in fee simple in the lands and hereditaments at Wheelock, subject to be divested in the event of his dying under 21, and without issue." The Lord Chancellor, in advising the judgment that he thought ought to be given, went very minutely into the facts, which are stated above, and observed that as this was an equitable estate, the learned judges had a question put as if it were a real estate, such, their Lordships were aware, being the practice of that House as regarded equitable estates. And the question now was, whether that made any difference. He was of opinion that it made no difference whatever. He was perfectly satisfied with the decision of the learned judges, the consequences of which would be that the judgment of the Vice-Chancellor must be affirmed, and that George Holland Ackers took under the will a vested equitable estate.—Lord Brougham, having reduced his opinions to writing, read them to the House. They were very elaborate, and many cases were noticed (among which was that of "Stanley v. Stanley") bearing upon the present question. He had recommended that the opinions of the learned judges should be taken, considering the question one of such importance. In conclusion, the noble and learned Lord expressed his entire concurrence in the view taken of the case by his noble and learned friend.—Lord Campbell said that the case had been so elaborately discussed by his noble and learned friends, he should not offer many remarks. He fully agreed in the opinions they had expressed, and he was of opinion that George Holland Ackers took an equitable estate. —Judgment affirmed with costs.

ASSIZE INTELLIGENCE.—MIDLAND CIRCUIT, WARWICK.—*Merry, suing in formâ pauperis,* v. *Green and another.*—This was an action to recover compensation in damages for an assault and false imprisonment. Mr. Hill stated the case to the jury. He said that he appeared on behalf of a man now in very poor circumstances, for he had made an affidavit that he was not worth 5*l.* in the world: he therefore did what the law permitted him to do; he sued as a pauper, but the case would have no less consideration from them than if he sued in his own right without having availed himself of that law to which he had referred. The plaintiff, William Merry, was a shoemaker, living at Ashby de la Zouch, and it happened in the October of 1839 there was a sale by auction of the effects of two gentlemen of the names of Mammott and Tuncliffe. Merry attended the sale, and bought a bureau, or secretaire, for which he gave 1*l.* 6*s.* At the time of the sale, and while the bureau was being shown to the company, the person who was exhibiting it pointed out a secret drawer or a drawer that was fast. There was some conversation about it, and something was said as to the possibility of its having money in it; upon which the auctioneer said, "Very well, so much the better for the purchaser, for I sell it with or without the contents." The bureau was knocked down to the plaintiff, and shortly after, wishing to have it cleaned or done something to, he sent for a young man named Garland, when a secret drawer was discovered, and in it was found paper, writings, and money to a large amount, and that money, the counsel contended, his client had a right to appropriate to his own use. The circumstance came to the ears of Mr. Mammott, and then a most extraordinary scene took place, for he went to the man's house with the two defendants, Mr. Green and Mr. Dewes, the one being his (Mr. Mammott's) own solicitor, Mr. Dewes being clerk to the magistrates. Merry was desired to account for all the money he had found; he refused, ultimately he gave up a sum of money, but they were not satisfied, and at last arrested him; he was thrown into the common lock-up for the town of Ashby, a place that was at that time in such a state as to be disgraceful to the inhabitants that they should permit such a place to be in existence. He was arrested without a warrant, thrown into this dungeon, having been taken from his home and friends. He was kept in the lock-up all the night of the 22d of Nov., and on the 23d, finding there was no case against him, he was quietly permitted to depart. That was the injury he had sustained, and it was for this invasion of his liberty and the treatment he had undergone that he asked damages at their hands. The facts, with some trifling exceptions, were proved as opened by counsel. For the defence, it was contended, that in what the auctioneer had said in reference to the bureau and its contents being the purchaser's of the said bureau, it could only have been said "jocosely," and that the plaintiff, in acting as he did after he had discovered the property, showed that he did not believe it was his own, or that he had even acquired a colourable title, and that he had been guilty of felony. Three witnesses were called for the defence, who deposed that the plaintiff gave up 35*l.*, and that he was imprisoned under the belief that he had not rendered a true account.—Mr. Baron Parke, in summing up, told the jury the question would be, whether, in their opinion, a felony had been committed by the plaintiff, and that they would gather from the circumstances of the case. There could be no doubt Merry had acted very wrong, nay infamously, for he must have known to whom the property belonged, and it was his duty to have restored it to the rightful owner. There had been some doubt upon the law in matters of this kind; but it was now settled in a decision of this very kind, to which decision he himself had been a party, and that now must be considered to be the law. He thought he could not do better than read part of that judgment to them. The old rule that, "if one lose his goods and another find them, though he convert them *animo furandi* to his own use, it is no larceny," has undergone in more recent times some limitations; one is, that if the finder knows who the owner of the lost chattel is, or if from any mark upon it, or the circumstances under which it is found, the owner could be reasonably ascertained, then the fraudulent conversion, *animo furandi*, constitutes a larceny. Under this head fell the cases where the finder of a pocket-book with bank-notes in it, with a name on them, converts them *animo furandi*: or a hackney-coachman who abstracts the contents of a parcel which has been left in his coach by a passenger whom he could easily ascertain; or a tailor who finds and applies to his own use a pocket-book in a coat sent to him to repair by a customer whom he must know. All these have been held to be cases of larceny. The question for them was, did they believe the plaintiff acted *bonâ fide* throughout. If they thought not, then, in his opinion, a felony had been committed. Upon the other hand, if they thought he had acted *bonâ fide*, then in that case they would give a verdict in his favour, with such damages as they might think fit. The jury retired, and not having agreed after the expiration of six hours, and having declared there was no chance of their agreeing, however long they might be kept, they were discharged from giving a verdict.

WESTERN CIRCUIT, WELLS.—*Hawkins v. Pratt.*—This case and three or four others, all connected with the same transaction, came on to be tried before Mr. Justice Cresswell, who requested that he might have an opportunity of speaking to the plaintiff, Mr. Hawkins, of Sharpham-park, in the county of Somerset, who had declined referring his cases. Upon Mr. Hawkins coming forward, the learned judge stated that he understood he was embarked in four or five actions at law—suits in equity, cross-indictments in the criminal court, and every species of litigation likely to place a man in a continual state of excitement. He therefore suggested to Mr. Hawkins the comfort of arranging the whole matters through the medium of a reference. After Mr. Hawkins had listened attentively to the learned judge, he made a communication to Mr. Erle, his counsel, who stated, that he was instructed by his client to proceed with the cause, which he accordingly opened. The action arose upon the right to certain rooms in Sharpham-park, which Mr. Hawkins had occupied and ornamented as a sub-tenant of Mr. Laver, who occupied the property as a farmer of the Earl of Cavan. The executors of Mr. Laver, upon his death, as was stated and in part proved, had claimed the rooms as belonging to that individual, and in the assertion of that right had knocked about the furniture, pictures, and wine of Mr. Hawkins, which had given rise to every species of action, trespass, riot, trover, and assault. Mr. Justice Cresswell having proceeded with the trial till 8 o'clock at night, stated that he should adjourn the case. The next morning at 9 o'clock, Mr. Erle said he had authority to refer all the cases, provided power was given to regulate the possession of the property. A verdict was then entered for plaintiff, subject to a reference, and a verdict of acquittal of Mr. Hawkins as to assault and riot.

WESTERN CIRCUIT, DEVIZES.—*Margaret Easter* was indicted for the wilful murder of her two children, twins, 2 years of age, by throwing them into a tub of water and drowning them. The details of the case, as given in the evidence, were of a very painful nature; the prisoner and her husband were Irish trampers or beggars, who had arrived in Salisbury to attend the races. The two children were found drowned in a tub in the yard of the house where they were lodging. The case in many respects was peculiar; there was no direct evidence affecting the prisoner, and several witnesses proved that she had always shown herself a kind mother, and was not given to any violence of temper. Mr. Justice Wightman, in summing up, told the jury that this was a case that would demand their most anxious and serious attention. His lordship then went carefully and impartially over the evidence, pointing out to the jury, in the clearest manner, the absence of all direct evidence to prove the prisoner guilty, and urging them to take into their most anxious consideration the possible fact that these children having been sent into the yard by their mother, as stated by her at the time, had in some way climbed to the tub, and so fallen in. The jury requested to withdraw for the purpose of considering their verdict. They were absent about ten minutes, when they returned, and, to the surprise of the whole court, pronounced a verdict of Guilty. The judge, who is said to have been much affected, sentenced her to death.

TATTERSALL'S.—The bets and offers on Thursday would not of themselves justify a quotation; but taken in conjunction with the business transacted at Wolverhampton, the following list of market prices may be submitted:—

ST. LEGER.

6 to 4 agst	Attila (taken)	25 to 1 agst	Rosalind (taken)
12 to 1 „	Fireaway	25 to 1 „	Golden Rule
12 to 1 „	Policy	25 to 1 „	Eboracum

20 to 1 „	Cabrera	33 to 1 „	Master Thomas
20 to 1 „	Cattonite	50 to 1 „	Sir Harry (taken)
20 to 1 „	Artful Dodger		

DERBY.

22 to 1 agst	Philip	39 to 1 agst	Napier
28 to 1 „	Aristides		

MARK LANE, FRIDAY, AUGUST 19.—The arrival of English Wheat since Monday has been trifling, and we have no alteration to notice in the value.—In Foreign there has been very little business doing, and where sales have been effected, less money has been taken.—The quantity of Foreign Wheat, paid duty, during the week is about 608,000 qrs.; upon Flour about 129,000 cwt. —Barley, Beans, and Peas remain the same.—The best descriptions of Oats barely maintain Monday's rates, and secondary descriptions of Irish are almost unsaleable.

GAZETTE OF THE WEEK.

BANKRUPTS.—W. Freeman, 9, Acton-street, Bagnigge-wells-road, Middlesex, builder—H. Oglan, late of Holywell-street, Shoreditch, Middlesex, victualler—T. J. Fehr, Birmingham, draper and dealer in straw bonnets—G. Boyd and W. Boyd, Kingston-upon-Hull, millwrights and engineers—R. N. Munton, jun., Fletland-mills, Greatford, Lincolnshire, miller—J. Baker and E. Swinburne, Birmingham, timber merchants—W. Trubridge, Swindon, Wiltshire, grocer—H. Harwood, Beverley, Yorkshire, linen draper—W. Daniell, Abercarne, Monmouthshire, pyroligneous acid manufacturer—J. Bettomley, Delph, Yorkshire, woollen manufacturer—W. G. Dodds, Howford-buildings, Fenchurch-street, merchant—F. Gautier, Crutched-friars, merchant—T. Mennell, Leeds, cloth merchant—R. J. Wrangham, Great Driffield, Yorkshire, grocer—F. Nurse, Stonehouse, Gloucestershire, coal merchant—J. Adams, George-street, Spitalfields, feather factor—T. Bomford, Cheltenham, hay dealer—J. Jones, Carnarvon, woollen draper—F. Baker, Birmingham, victualler—E. Roberts, Oswestry, Shropshire, draper—W. Nash, Oldbury, Shropshire, grocer—R. Gaulton, Dorchester, licensed victualler—T. Carter, Stafford, builder.

SCOTCH SEQUESTRATIONS.—D. Kinmonth, Dunning, merchant—I. Arthur, Holytown, shoemaker—H. Coll, Glasgow, jeweller—J. Campbell, late of Petershill, but now of Clynder House, Roseneath, potato merchant.

BIRTHS.—On the 14th inst., at North Mymms Park, near Barnet, the lady of the Rev. E. Thompson, Minister of Charlotte Chapel, Pimlico, of a daughter—On the 15th inst., in the Precincts, Canterbury, the lady of W. Deedes, Esq., of a son—On the 16th inst., at Syston Park, the lady of H. R. Yorke, Esq., M.P., of a son—On the 16th inst., Mrs. E. Headland, 32, Guilford-street, Russell-square, of a daughter—On the 17th inst., the wife of R. Dart, Esq., Albion-street, Hyde Park, of a son—On the 17th inst., in Woburn-square, the lady of G. Capes, Esq., of a daughter—On the 17th inst., at Linden hill, Berks, the seat of J. Bulkeley, Esq., Mrs. Charles Bulkeley, of a son—On the 17th inst., at 7, Harley-place, Park-crescent, the lady of G. Gregory, Esq., of a son.

MARRIED.—On the 10th inst., at the British Legation at the Hague, the Rev. H. Mackenzie, M.A., Minister of St. James's, Bermondsey, to Antoinette Margaret Campbell, eldest daughter of Sir J. H. Turing, Bart., of Foveran, Aberdeen—On the 12th inst., at St. George's, Bloomsbury, Captain Cyrus Trapaud, late 8th King's Regiment, to Sarah, daughter of J. Steward, Esq., formerly of Lewisham, Kent—On the 15th inst., at St. George's, Hanover-square, F. Fielding, of Gray's Inn, Esq., Barrister-at-Law, to the Hon. Lady M. Hesilrige, widow of the late Sir T. M. Hesilrige, Bart., and daughter of the late Lord Wodehouse—On the 17th inst., at St. Mary le Bow, E. J. Smith, Esq., of the General Post-office, to Mary Thetis Partridge, only daughter of the late Captain Partridge, of the Hon. East India Company's service.

DIED.—On the 6th of March last, at Geelong, near Melbourne, Australia, Henry, third son of S. Tyssen, Esq., of Narborough—On the 16th inst., near London, in his 70th year, the Lord Evelyn Stuart, third son of the late Marquis of Bute—On the 17th inst., Elizabeth, relict of the late C. W. Collins, Esq., Clapham-rise, in the 72d year of her age—On the 17th inst., at Champion-hill, Camberwell, Henrietta, daughter of R. Ricardo, Esq., aged 21—On the 15th inst., at Highgate lodge, Emily, third daughter of T. M. Waters, Esq.—On the 15th inst., aged 52, Lætitia, wife of Mr. S. F. Yockney, of Gloucester-place, Camden-town, and the youngest daughter of the late Luke Hansard, Esq.

Printed by Messrs. BRADBURY and EVANS, Lombard-street, Fleet-street, in the Precinct of Whitefriars, in the City of London, and Published by them at the OFFICE, 3, CHARLES-STREET, COVENT GARDEN, in the County of Middlesex, where, all Advertisements and Communications are to be addressed to the Editor.—Saturday, August 20, 1842.

THE GARDENERS' CHRONICLE.

A STAMPED NEWSPAPER OF RURAL ECONOMY AND GENERAL NEWS.

THE HORTICULTURAL PART EDITED BY PROFESSOR LINDLEY.

No. 35—1842. SATURDAY, AUGUST 27. PRICE 6*d*.

INDEX OF THE PRINCIPAL HORTICULTURAL SUBJECTS IN THE LAST NUMBER.

Aerides Brookii . . . 559 *c*
Alstrœmeria nemorosa . . . 559 *c*
Amateur's Garden . . . 557 *b*
Ants, to drive away . . . 561 *b*
Apricot-trees, not suited for a Conservatory . . . 561 *b*
Apricots, to plant during summer 561 *b*
Barometer, bottle . . . 561 *b*
Beetles, Black, not injurious to gardens . . . 558 *a*
Bignonia picta . . . 559 *c*
Broughton Gardens, noticed . . 560 *b*
Bryony, described . . . 555 *c*
Carnations, list of the best . . 556 *b*
Chesnut, peculiar growth of . . 557 *c*
Colours of flowers, supposed cause of change in . . . 555 *a*
Cuttings, to prepare for India 558 *b*
Forest-trees, to prune . . . 557 *b*
Fruit, cheap . . . 561 *a*
Gardeners' Foreign Library . 560 *a*
Grapes, cause of shrivelling . 561 *b*
Heliotrope, treatment of . . . 556 *c*
Honey, poisonous . . . 558 *a*
— to take . . . 558 *a*
Hotwater pipes, injurious to the roots of Vines . . . 561 *b*
Ixias, their treatment . . 561 *b*
Laburnum, not injurious to cattle . . . 558 *a*
Lettuces, to produce in winter 557 *a*
Mildew on Peach-trees, to prevent . . . 558 *c*
Moles, to destroy . . . 560 *a*
Nitrate of soda, where procured . . . 561 *c*
Peas, Green, to preserve . . 558 *b*
Peat, beneficial in promoting the growth of seeds . . 558 *c*
Pencarrow, noticed . . . 560 *b*
Salvia patens, dropping its flowers . . . 558 *c*
Scale on Pines, to destroy . 558 *c*
Sulphur, its effects on Ants . 558 *a*
— to apply . . . 557 *c*
Toads, inimical to Bees . . 558 *a*
Turnip-fly, to destroy . . 560 *a*
Vine, its treatment . . . 558 *a*
Wall fruit, to protect from Wasps . . . 558 *a*
Wall trees, to summer prune . 556 *a*
Wasps' Nests, to destroy . . 560 *c*
Weather, statement of . . 558 *c*
Weeds, to extirpate . . . 555 *b*

HORTICULTURAL SOCIETY OF LONDON.

EXHIBITIONS AT THE GARDEN.

All persons interested in these Exhibitions are invited to suggest such improvements as may occur to them. The desire of the Society is to do everything that is calculated to attain the great object for which the Exhibitions were instituted, namely, the promotion of Horticulture; and any suggestions that may be made by letter, addressed to the Vice-Secretary, 21, Regent-street, will be laid before the Exhibition Committee for consideration. The following were the regulations observed during the past season:—

Subjects of Exhibition.—These will be divided into Classes, as explained further on. No articles not of horticultural produce will be allowed to be placed upon the tables. Exhibitors will do well to make themselves acquainted with the arrangements described in the following list, as they will in all cases be required to sign a declaration stating under what letter their plants are to be shown; and they are particularly requested to take notice, that if errors in the awards of the judges should occur, in consequence of mistakes on the part of exhibitors in filling up such declarations, the Society cannot undertake to rectify such errors afterwards. To enable the officers of the Society to attach names to the objects exhibited, it is requested that correct lists may be delivered to the clerk as soon as the exhibitor reaches the Garden.

Class I.—Flowers for which Nurserymen and Private Growers exhibit independently of each other.

A. Greenhouse Azaleas, to be shown in numbers not exceeding 12, GB, LS, SK.
B. Carnations, in pans of 24 blooms, LS, SK, SB.
C. Picotees, in pans of 24 blooms, LS, SK, SB.
D. Pinks, in pans of 24 blooms, SK, SB.
E. Cape Heaths, in collections of 20 species, GK, SG, LS, SK.
F. Cape Heaths, in collections of six species, GB, LS, SK.—*N.B.* No person who shows in E will be allowed to exhibit also in F.
G. Exotic Orchidaceæ, in collections of not fewer than six species, GB, LS, SK.
H. Exotic Orchidaceæ, in single specimens, LS, SK, SB.
I. Pelargoniums, in collections of 12 varieties, in pots, not exceeding 12 to a cast, GB, LS, SK, SB.
K. Pelargoniums, in collections of six varieties, in pots, not exceeding eight to a cast, SG, LS, SB.
L. Rhododendrons, in pots, not fewer than 12 plants, in 12 varieties, LS, SK, SB.
M. Moss Roses, SK, SB.
N. Common Garden Roses, exclusive of all Chinese or Chinese Hybrids, LS, SB, SK.
O. Chinese or Hybrid Roses, such as Bourbon, Noisette, Tea-scented, and similar varieties, LS, SB, SK.—*N.B.* No exhibitor of Roses can be allowed to occupy more than 15 ft. run of tables for all his Roses, which, being double, is equal to 30 ft. of boxes. If any Exhibitor gains the first medals both in M, N, and in O, he will be entitled to a Gold Banksian medal instead of the three Silver ones.
P. Stove or Greenhouse Plants, in collections of from 50 to 60 plants, GK, GB, SG, LS.
Q. Stove or Greenhouse Plants, in collections of from 15 to 20 plants, GB, LS, SK.
R. Stove or Greenhouse Plants, in collections of six distinct species, LS, SK.—*N.B.* Persons exhibiting in P and Q will not be allowed to compete in R also.
S. Herbaceous Calceolarias, in sixes, LS, SK, SB.
T. Shrubby Calceolarias, in sixes, LS, SK, SB.

Class II.—Flowers, for which all persons are admitted to equal competition:—

U. Collections of Stove or Greenhouse Climbers, GK, GB, LS, SK.—*N.B.* The Gold Knightian medal is not to be awarded for fewer than 12 distinct kinds.
V. Tall Cacti in flower, LS, SK.
W. Single specimens of Ornamental Plants, LS, SK, SB, C.
X. Miscellaneous Flowers, SK, SB, C.—*N.B.* Cockscombs, Hydrangeas, and cut flowers, are altogether excluded from prizes.
Y. Seedling Florists' Flowers, SK, SB, C.—*N.B.* Every seedling must be shown singly, and must be marked with the name it is to bear. The same seedling cannot gain a prize more than once in the season. Pelargoniums are to be shown in single trusses, with a single leaf, so far below the flowers as not to support them; and they are not to be dressed with cotton or wool, or any similar substance, but must be shown exactly as they grow on the bush.

Class III.—Fruit, for which market-gardeners, or persons in the habit of regularly supplying the market, and private growers, exhibit independently of each other.—*N.B.* All Fruit must be ripe and well-coloured; if the contrary, it will be disqualified.

Z. Miscellaneous collections of Fruit, consisting of at least three different kinds, Peaches and Nectarines being considered as only one kind, GK, GB, LS.—*N.B.* Cucumbers Tomatoes, Gourds, and similar kitchen-garden produce, are excluded from this letter.
AA. Grapes, SG, LS, SK, SB.
BB. Pine-apples, SG, LS, SK, SB.
CC. Peaches or Nectarines, in dishes of six specimens, SK, SB.
DD. Miscellaneous Fruit, SK, SB, C.

Judges.—The Judges have the power of increasing or diminishing the number and value of the Silver Medals offered by the Society for particular objects, and also of conferring Silver Medals or Certificates in cases not contemplated in these regulations, if they think it necessary to do so.

The judges are also required to bear in mind that the Society's medals are offered, less for new and curious objects, than for fine specimens of Horticultural skill, the design of the council in instituting these meetings being not so much to encourage the collector as to reward the skilful gardener; they are also not to make any award in cases where the objects exhibited do not appear worthy of a medal; otherwise a bad single exhibition might obtain a prize, merely because there is no better exhibition of the same class to oppose it.

A PRIZE of £10, open to all England, will be awarded at the THANET FLORICULTURAL and HORTICULTURAL SOCIETY'S EXHIBITION, to be held September 8th, at the Ranelagh Gardens, St. Peter's (two miles distant from Margate), for the best 24 Dissimilar Dahlias.

J. G. Hodgson, Hon. Sec.

Vicarage, St. Peter's, August 16, 1842.

N.B.—Exhibitors to provide their own Stands.

WINDSOR AND ETON ROYAL HORTICULTURAL SOCIETY.

THE GRAND ANNUAL SHOW of this Society will take place in the Royal Grounds, Frogmore, on Saturday, the 3d of September, when handsome Prizes will be given for every description of Flowers, Fruit, and Vegetables. Printed particulars may be had on application to Mr. J. Cleave, Windsor.

Wm. Wright, Hon. Sec.

WARWICK AND WARWICKSHIRE HORTICULTURAL SOCIETY.

AT the FOURTH EXHIBITION for 1842, which will be held at the County Hall, Warwick, on Wednesday, September 14th, Two Prizes are offered, open to all England, of 5*l.* each, for 24 DAHLIAS—one to Amateurs, and one to Nurserymen. Entrance to Non-subscribers, 2*s.* 6*d.* each.

N.B.—All Specimens for Competition must be delivered into the Hall by Ten o'Clock, properly named, and authenticated as the growth and property of the Exhibitor.

Parties at a distance not wishing to attend may consign their flowers to the Secretaries; carriage paid.

UNDER THE IMMEDIATE PATRONAGE OF HER MOST GRACIOUS MAJESTY AND HIS ROYAL HIGHNESS PRINCE ALBERT.

THE SALT HILL GRAND DAHLIA SHOW will be held in the Grounds of the New Royal Hotel, adjoining the Railway Station at Slough, on Friday, September 16th, on a scale unequalled at any previous Exhibition.

THE PRIZES.

1st Class,	Amateurs, or Gentlemen's Gardeners,		24	Blooms	3	Prizes
2nd	„	„	„	6	„	3	„
3rd	„	Nurserymen		36	„	3	„
4th	„	„		12	„	3	„
5th	„	Seedlings	1841	4	„	8	„
6th	„	„	1842	1	„	4	„

Entrance, to the 1st, 2nd, 3rd, and 4th Classes, 10*s.* 6*d.*
„ „ 5th and 6th, 5*s.* each.

Entrances to be made on or before the 12th September. Exhibitors to provide their own Stands. Seedlings not to be exhibited in the Stands with named Flowers. Each Exhibitor to take a Dinner Ticket.

As the first Train from the West of England, and the Quarter-past Ten from London, arrive at Slough before Eleven o'Clock, advantage may be taken of these Trains for the conveyance of the Blooms, as the time for staging is extended to Half-past Eleven o'Clock. Trains arrive at the Slough Station every hour throughout the day.

A Military Band will be in attendance. Doors to be opened at One o'Clock. Tickets 2*s.* each; after Four o'Clock, 1*s.* each.

All communications to be addressed to

Mr. Thomas Brown, Slough,
Honorary Secretary.

THE THORNBURY GRAND DAHLIA SHOW, open to all England, will take place on Wednesday the 21st September next. The Society will give a Piece of Plate to the best stand of Dahlias, 18 Blooms, various. Entrance, 10*s.*; to Subscribers, 5*s.* And a Piece of Plate for the best Stand of Dahlias, 12 blooms, various. Entrance, 5*s.*; and to Subscribers, 2*s.* 6*d.* All Entries to be forwarded to the Secretary two weeks previous to the Show, or they will be doubled. Exhibitors to provide their own Stands. Admittance to the Show, 1*s.* each.

Thornbury. S. W. Lovegrove, Hon. Sec.

EXHIBITION OF LILIUM LANCIFOLIUM.

H. GROOM, Clapham Rise, London (removed from Walworth), by appointment Florist to Her Majesty, begs to inform the Nobility, Gentry, and Public, that his extensive Collection of LILIUM LANCIFOLIUM is in full flower, and may be viewed any day from nine o'clock until six, Sundays excepted. Admittance *Gratis*.

T. AND C. LOCKHART, Florists and Seedsmen, 156, Cheapside, London, have just published a new and extensive LIST of FLOWER ROOTS and PLANTS, containing all the Novelties of the Season, and which will be forwarded, *Post free*, on application.

ERICAS.

BUCHANAN and Co. have a large stock of healthy PLANTS of the following select kinds, which they can offer at very low prices:—Ampullacea, ditto vittata, arbuscula, Archeria, alata, Beaumontia, bicolor, Boweii, Bonplandia, Blandfordia, carinata, cerinthoides major, colorans, cruenta, cupressina, costata superba, daphneflora, densa, depressa, eximia, echiiflora, Eweriana, ditto superba, exsurgens, formosa, fulgida, grandiflora, grandinosa, hyemalis, Hartnelli, Irbyana, Julyana, Linnæa superba, Linnæoides, melastoma, mirabilis, odorata, Pattersonia, perspicua, picta, princeps, purpurea, propendens, pyramidalis, quadriflora, refulgens, rubens, rubro calyx, sanguinea, splendens, Thunbergia, tricolor, ditto superba, trossula; ventricosa superba, globosa, and carnea; venusta, vernix, verticillata superba, viridiflora, viscaria; vestita rosea, coccinea, and purpurea; Westphalingia, Wilmoriana, suaveolens, intermedia, mollis; also about 100 other free flowering kinds.

Camberwell Nursery.

ALEX. PONTEY begs to call the attention of the Public to the following splendid SEEDLING PELARGONIUMS, which will be sent out this autumn at the prices named under. The COUNTESS OF MORLEY won the Gold Medal at the Royal Devon and Cornwall Horticultural Society's Show at Devonport in 1841, under the name of Beauty's Pride.

The usual allowance to the trade.

Tropæolum tricolorum and brachazerus, 18*s.* per dozen.

The first four are recommended as first-rate, and superb show flowers.—Plymouth, August 24, 1842.

MYATT'S BRITISH QUEEN STRAWBERRY, after two years' competition, still maintains its pre-eminence; and, in returning thanks to their numerous patrons and friends, J. and W. Myatt beg to say they can with confidence recommend it as the most superb fruit yet known.

Also their new Seedling Strawberry Prince Albert, which for productiveness and size cannot be equalled. Price per 100, each, 50*s.*; and their Eliza, 20*s.* Runners are now ready, and may be had on application to them at Manor-Farm, Deptford.

Myatt's famed Victoria Rhubarb, 50*s.* per 100 sets, or 1*s.* 6*d.* per root, will be ready in October.

SUPERB SEEDLING DAHLIAS OF 1841.

F. AND A. SMITH and Co. beg to invite Amateurs and the Trade generally to inspect their SEEDLING DAHLIAS, Bianca, Sir R. Sale, Rainbow, Duke of Wellington, &c., whilst in growth; and they flatter themselves that they will (from their Novelty and superior form) well repay the trouble of a visit, and prevent disappointment. Blooms may also be seen at most of the Seed-shops in London.

The Nursery is situated on the High Road. Omnibuses from the Royal Exchange, and Flower-pot, Bishopsgate-street, pass every quarter-of-an-hour—Fare 6*d.*

Hackney, London.

UNION ROAD NURSERIES, PLYMOUTH.

WILLIAM E. RENDLE, Nurseryman, Seedsman, and Florist, has the pleasure of offering to the Nobility, Amateurs, and the Trade, the following new varieties of PELARGONIUMS, raised by P. E Lyne, Esq., the entire Stock of which he has succeeded in obtaining. The following are faithful descriptions of the sorts, and will be warranted to answer to such:—

Lyne's Sunrise.—Is a very large and bright rosy orange; the petals very round, broad, and firm, forming a complete circle; trusses well, and blooms freely: a new and very distinct variety. The Seedling Plant obtained the Gold Medal at the last May Exhibition of the Devon and Cornwall Horticultural Society; it was also shown at the Spring Meeting of the Exeter Horticultural Society the week following, and was universally admired, in proof of which 50*l.* was offered for it by two individuals. It was not in bloom at either of the Chiswick Shows. *Figured to appear in "Wakeling's Florist and Amateur's Guide" for August*—each 3*l* 3*s.*

Lyne's Duke of Cornwall.—Is a bright crimson scarlet, clear in its grain; petals fine and full-sized, spot large and black; a good bloomer. It was exhibited at the Chiswick May Show, and also at the Surrey Gardens in June, at which places it was greatly admired; and noticed in the periodicals as follows:—In the report of the exhibition, in the *Gardeners' Chronicle*, page 350, (1842),—"Mr. Lyne's Seedlings were seen under great disadvantages; the distance they had to travel caused the petals to flag and reflex. One named the Duke of Cornwall, a flower of extraordinary brilliancy of colour, we trust to see again under more favourable circumstances." Again, in the report in the *Floricultural Cabinet*, page 40,—"Mr. Lyne's Duke of Cornwall is a very attractive flower, being peculiarly brilliant in colour." It is very distinct from any yet offered. Each 3*l.* 3*s.*

Lyne's Lord Ebrington.—Very delicate pink, like Gloria Mundi; large black spot, margined with pink; quite round and compact, and a very true bloomer. Each 2*l.* 2*s.*

Lyne's Princess Royal.—The under petals a delicate rose, with a clear white centre; the upper petals are intensely rich, having a bright velvety maroon spot, with a fiery flash verging off to a delicate pink. It is a very showy and striking variety. *Figured to appear in "Wakeling's Florist and Amateur's Guide" for August.* Each 2*l.* 2*s.*

Lyne's Cynthia.—Ground colour resembles Sylph, but far superior in every respect; quite round, and a decided favourite. 30*s.* each.

Lyne's Modesty.—Very deep peach blossom, distinct black spot, white centre, broad round petals; and a great novelty. 30*s.* each.

Lyne's Hamlet.—Brilliant crimson scarlet; not large, but a very clear flower; the spot is very rich, extending nearly over the top petals, and laced with the ground colour. 30*s.* each.

Basset's Glory of the West.—Colour of a bright rose, approaching to a crimson; the spot is very large, and intensely black, with a rich crimson flame encircling it; first-rate form, and a particularly free bloomer. The Seedling Plant obtained the Gold Medal at the Plymouth Exhibition, in May 1841, beating at least twenty other Seedlings. 2*l.* 2*s.* each.

THE USUAL DISCOUNT TO THE TRADE.

Strong Plants of Princess Royal and Glory of the West are now ready for delivery; the other sorts will be sent out in October.

Agents in London: Messrs. Warner, Seedsmen, Cornhill; and Mr. W. Bristow, Seedsman, Knightsbridge; from whom Plants can be procured, and where drawings of some of the varieties can be seen.

Can be procured also of the following Nurserymen:—Messrs. Henderson, Pine-apple Place; Messrs. Low, Clapton; Mr. Smith, Dalston; Mr. G. H. Bunney, Kingsland; Mr. H. Groom, Walworth; Mr. Willmer, Sunbury; Messrs. Veitch, Exeter; Messrs. Willson and Sadler, Derby; Messrs. W. Rogers and Son, Uttoxeter; Mr. Thos. Appleby, York; Mr. E. H. Fuller, Worthing; Mr. Blachford, Jersey; Mr. W. Kelland, Jersey.

Union-road Nurseries, Plymouth, August 4th, 1842.

TO GROWERS OF HYACINTHS, AND OTHER DUTCH BULBS.

YARMOUTH approximating so closely to Haarlem, the transit between the two places not occupying more than 10 or 12 hours, has induced Messrs. Youell to pay repeated visits, for the purpose of inspecting not only the Blooms, but of ascertaining the best Growers; and having concluded the objects they had in view in this respect, they have now the pleasure of announcing that this Season they will import a large quantity of Hyacinths, and other Bulbs for which Haarlem is so justly celebrated; and they confidently assert that the many causes of complaint so frequently made, and in most cases not without good grounds, of Bulbs proving unsatisfactory when blooming, will now be obviated. The Bulbs, they beg to add, are remarkably fine; and parties at a distance favouring them with their commands will have Bulbs included, to compensate in some degree for carriage.

Catalogues may be had on application.

Great Yarmouth Nursery, August 11th, 1842.

STAPLETON ROAD NURSERIES, near BRISTOL. W. MAULE and CO. beg to call the attention of Horticulturists to a new and desirable FUCHSIA, which they intend sending out by the name of "Racemiflora elegans." Its habit is gracefully elegant; the lateral branches are set at every joint with numerous long deep-red flowers, 1½in. to 2in. long, drooping around the main stem of the plant, forming a complete column of beauty. It is allowed by competent judges to be one of the best varieties in cultivation.—Fine strong plants, in bloom, will be sent, if ordered, at 5*s.* or 7*s.* 6*d.* each.

TO NURSERYMEN, PINE GROWERS AND OTHERS.

MESSRS. PROTHEROE & MORRIS are instructed by the Trustees of Messrs. Adamson and Son, Stoke Newington Common, to submit to public competition, early in Sept. next, the whole of their celebrated Stock of Pine plants, Greenhouses, Hothouses, Graperies, Carts, Waggons, and general Farming and Agricultural Implements, and a considerable quantity of Building Materials. The whole comprise about 35,000 feet of Glass, with Brick and Ironwork and Water Apparatus complete; about 10,000 Pine plants of the first quality, and well-known established Stock; a considerable number of Cucumber, Melon, and other Frames and Lights; the stock of Greenhouse and other Plants. Further particulars will shortly be advertised. The whole of their splendid Nursery and other Stock will be disposed of by public Auction about the third week in October next, of which timely notice and particulars will be given.

American Nursery, Leytonstone.

VALUABLE ORCHIDACEOUS PLANTS.

MESSRS. THOMAS WINSTANLEY AND SONS (of Liverpool) announce to the Admirers of curious and rare plants, that they are instructed to sell by Auction on the Premises, AIGBURTH, near Liverpool, on Monday, the 29th of August next, and following days, at 12 o'clock precisely each day,

THE UNIQUE, WELL-KNOWN, AND JUSTLY-CELEBRATED COLLECTION OF ORCHIDACEOUS PLANTS,

The Property of RICHARD HARRISON, Esq.

In the collection will be found large and rare specimens of the ANGRÆCUM EBURNIUM; CATTLEYAS, including Skinneri, Perrini (fine), Labiata (very fine), Crispa (very large), Mossii, Loddigesi, Guttata, Citrina, Superba, &c. &c. EPIDENDRUMS, all fine; named and several unnamed MAXILLARIAS, ONCIDIUMS, DENDROBIUMS; AERIDES Brookii, cornutum, and odoratum; ODONTOGLOSSUM grande, maculatum. &c.; with about four hundred other varieties of choice PARASITICAL PLANTS, including Fernandesia, Grobya, Gongora, Heterotaxis, Hillia, Lissochilus, Leptotes, Cyrtopodium, Calanthes, Cypripedium, Coryanthes, Cirrhæa, Catasetum, Cœlogyne, Cyrtochilum, Cycnoches, Cymbidium, Neottia, Brasavola, Vanda, Rodriguezia, Myanthus, Mormodes, Miltonia, Phaius, Brassia, Burlingtonia, Bifrenaria, Batemannia, Stanhopea, &c. &c.: LÆLIA anceps, autumnale, and others. Together with a general assortment of Hothouse Plants of an important character, and highly interesting to the lover of Botany.

The above Collection, for its extent, is allowed to be one of the finest in Europe, and is the result of twenty years' formation, by Mr. Harrison, regarding only variety and perfection.

The Plants having been attended to by a skilful gardener, are in excellent condition, and will be sold without reservation.

The whole may be viewed on Friday 26th, Saturday 27th August, and on the mornings of Sale, and Catalogues, which will be ready in a few days, had at the following places:—The Offices of the *Gardeners' Chronicle* and the "Gardeners' Magazine;" Messrs. Winstanleys, Paternoster Row, London; at the place of Sale, and of Thos. Winstanley and Sons, Liverpool.

ECONOMIC LIFE ASSURANCE SOCIETY,
No. 34, BRIDGE-STREET, BLACKFRIARS, LONDON.
Established 1823. Empowered by Act of Parliament, 3 William IV.

LOWER RATES OF PREMIUM THAN THOSE OF ANY OTHER OFFICE, that entitle the assured *to participate in the profits*, as follows:—

Age.	15	20	25	30	35	40	45	50
Annual Premium per cent.	1 10 8	1 14 7	1 19 0	2 4 3	2 10 11	2 19 9	3 11 9	4 8 0

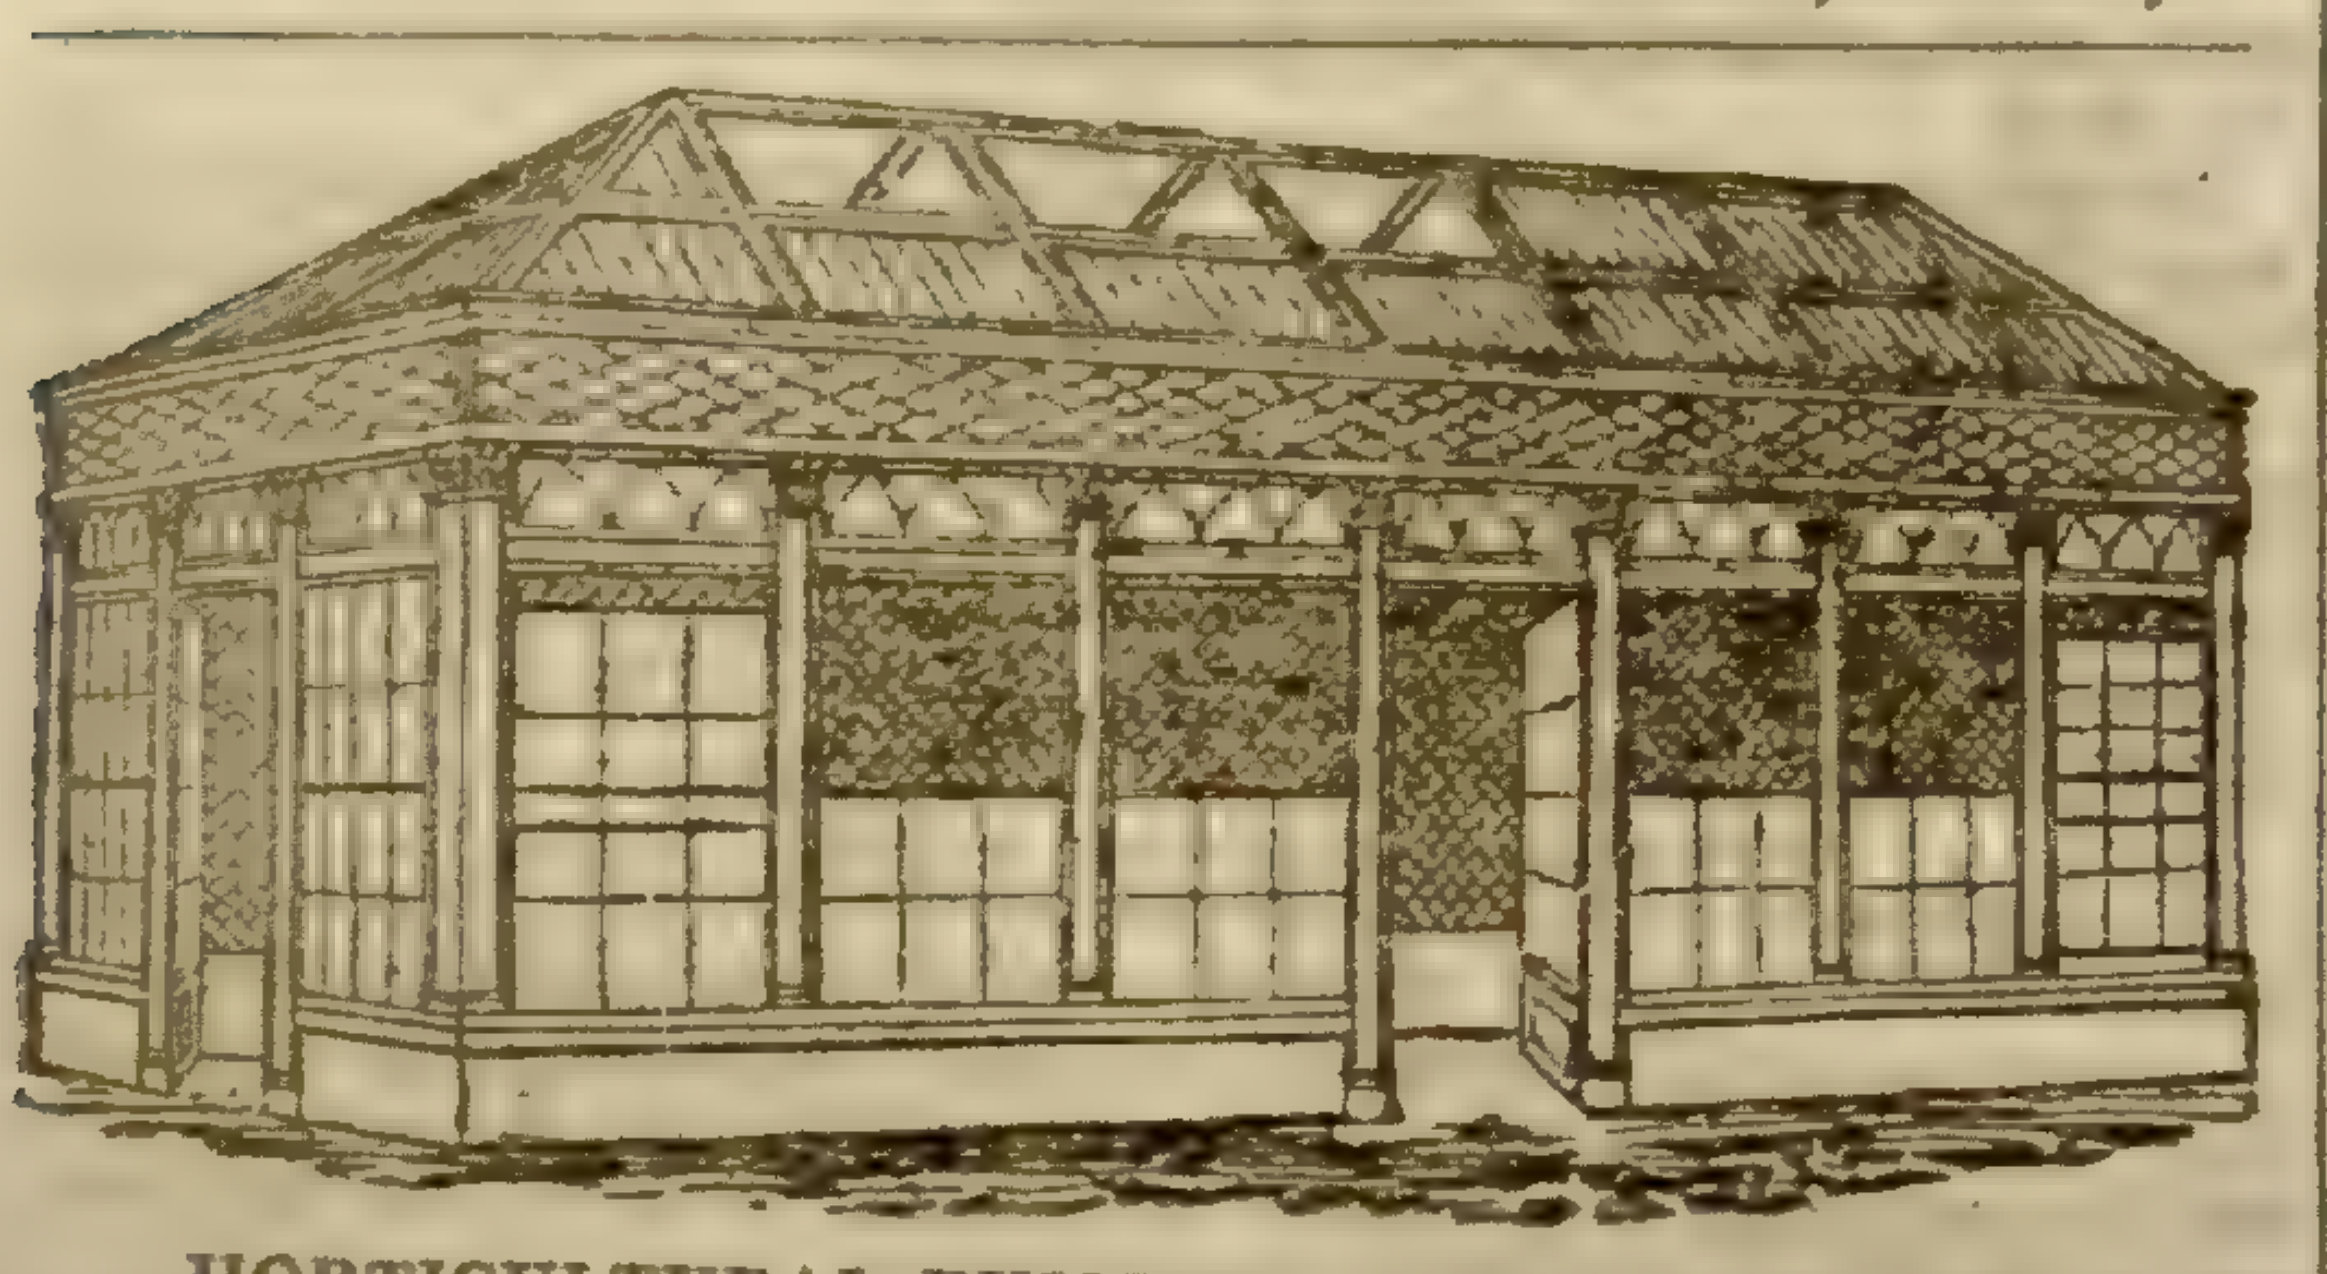
The BONUS declared in 1834 amounted upon an average to 16*l*. per cent. on the premiums then paid; and in 1839 a second BONUS was awarded, amounting on the average to 31*l*. per cent. on the premiums paid during the preceding five years.

No extra charge for residence in any part of Europe, nor for proceeding (in a decked, sailing, or steam vessel) from any one Port thereof to another during peace, to Assurers, not being seafaring men by profession. Licenses are granted to go to any part of the world upon terms proportionate to the risks.

Policies on the lives of persons dying by suicide, duelling, or by the hands of justice, are not void as respects the interests of parties to whom they may have been legally assigned.

Assurances may be effected on any and every day.

By order of the Board of Directors,
CAMPBELL JAMES DOWNER, Secretary.



HORTICULTURAL BUILDING AND HEATING BY HOT WATER.

J. WEEKS and Co., ARCHITECTS, &c., GLOUCESTER-PLACE, KING'S-ROAD, CHELSEA, Hothouse Builders and Hot-water Apparatus Manufacturers, beg leave to inform the Nobility and Gentry that their business, which has been extensive throughout the country for many years, is entirely confined to the BUILDING OF HORTICULTURAL ERECTIONS of every description, and the HEATING of them by HOT WATER.

CONICAL and other BOILERS of all sizes: their largest consumes but a small quantity of fuel, only requiring attention once in 10 hours, and will heat a range of Forcing Houses 300 ft. in length.

Their improved plan of BOTTOM HEAT FOR PITS, by means of an open trough under the bed, is now being universally adopted.

References may be had, and their works seen at most of the Nobility and Gentlemen's Seats in the country, nearly the whole of the London Nurseries, and a great variety of Horticultural Erections and Hot-water Apparatus, Models, Plans, Estimates, &c., at their Horticultural Manufactory, Gloucester-place, Chelsea, near Sloane-square.

HOT-WATER APPARATUS, for Horticultural and other Buildings.—STEPHENSON and Co., Agents for the Old Park Iron-works, and Manufacturers, 61, Gracechurch-street, London, solicit an inspection of their improved Conical Boiler. (See Editor's description, *Gardeners' Chronicle*, March 12, p. 175.) To Amateurs these Boilers will be found invaluable. They are complete without furnaces or setting in brickwork, movable at pleasure, very ornamental in appearance, and require attention only once in 14 or 15 hours, price 5*l*. 5*s*. and upwards. Further particulars, with plans and estimates for heating any description of building, may be obtained as above; where also may be seen the improved Wrought-iron Boiler, as applied with Chanter's Smoke-consuming Furnaces at Chatsworth, and many other of the Nobility's Seats. Iron Fencing, Hurdles, Bedsteads, Ornamental Wire-work, Garden Implements, &c. &c. The trade supplied with Hot-water Socket-pipes.

N.B.—WAYTE's New Patent Land-pressers and Drills.

HEATING BY HOT WATER.

JOHN WALKER, 46, St. John's Square, Clerkenwell, London, having been for many years extensively engaged in Warming Churches, Manufactories, Hospitals, Hothouses, Conservatories, and Private Houses, by means of Hot Water, either in Pipes or Pedestals, can confidently recommend this mode of heating in preference to any other. Numerous references can be given both in town and country, where he has successfully and satisfactorily applied it. Baths fitted up and heated in a superior manner. Orders executed in all parts of the Country with punctuality and despatch.

HEATING BY HOT WATER.

HOTHOUSES, and every description of Horticultural Buildings, Churches, Chapels, Public Buildings, Mansions and large Rooms, fitted up with the above apparatus on the most improved and scientific methods.

W. WALKER and Co. (late of Mosley-street, Manchester) beg to announce that they continue to execute works of the above description, in which they have introduced a variety of important improvements of a satisfactory nature, especially to Horticulturists. They have applied this principle on a more extensive scale than has ever been hitherto adopted at the stupendous Conservatory and Hothouses of his Grace the Duke of Devonshire, and in numerous other extensive establishments, with the most complete success.

They have also successfully applied C. W. Williams' Patent Argand Furnace to their boilers, and have made arrangements with the Patentee for its general adoption. It economises fuel, and removes the nuisance and disfigurement of smoke, so much complained of by Gardeners, and is a new and valuable feature in these Apparatus.

Works executed in every part of the United Kingdom with punctuality and despatch.—33, Brown-street, Manchester.

HOT-WATER APPARATUS FOR HEATING HORTICULTURAL BUILDINGS, DWELLING-HOUSES, CHURCHES, and MANUFACTORIES, upon improved principles, and at very moderate charges, erected by DANIEL and EDWARD BAILEY, 272, HOLBORN.

D. and E. BAILEY having devoted much time to the consideration of this subject, and had much experience in the erection of apparatus for the above-mentioned purposes, have, by improvements suggested in their practice, rendered their mode of heating not only very efficient, but very simple, and have combined durability in the apparatus with economy in the charge. They have erected apparatus in England, Scotland, and Ireland, for many noblemen and gentlemen, and have had the honour to be employed by the Horticultural Society of London, in executing the works of their splendid Conservatory, lately erected at Chiswick.

D. and E. BAILEY also construct in metal all descriptions of Horticultural Buildings and Sashes, and invite noblemen, gentlemen, and the public to an inspection of their various drawings and models, at 272, Holborn, where they have the opportunity of exhibiting, amongst other metal works, an extremely complete and convenient kitchen apparatus, or range, adapted for the continued supply of hot water, and an arrangement of the oven more complete than has hitherto been brought before the public.

D. and E. BAILEY were the first to introduce metallic curvilinear houses to horticulturists, and can refer to the Conservatory attached to the Pantheon as one of their works, besides many others in this country and on the Continent.

D. and E. BAILEY have prepared a quantity of the Galvanic Plant Protectors, which are now ready for immediate delivery; they beg to introduce to public notice a new Trough Pipe, for Orchidaceous or other Houses where vapour is constantly, or at intervals, required, and which may be seen at their manufactory.

EDWARD BECK, MANUFACTURER IN SLATE, Isleworth, Middlesex, respectfully informs Horticulturists, that his IMPROVED SLATE TUBS for Orange Trees and Conservatory Plants, mounted upon rollers, Slate Cisterns, Shelves, and Edgings for garden paths, may be seen in use at his house upon application to the gardener.

On Saturday, Sept. 3, price Threepence 16 pages royal 8vo, ILLUSTRATED WITH ENGRAVINGS.

THE GARDENER AND PRACTICAL FLORIST.—Contents of No. I.:—The Gardening Interests—Properties of Flowers and Plants—The Pansey—Royal Botanical Society—Victoria Park—Public Gardens and Parks—Canvass Houses for Plants—Glossary of Words—Gardening for September—Geranium and Geranium Growers.

London: R. Groombridge, Paternoster-row.

ICONES PLANTARUM, or FIGURES, with brief Descriptive Characters and Remarks, of New and Rare Plants, selected from the Author's Herbarium. By SIR W. J. HOOKER, K.H. LL.D. F.R.A. and L.S., &c., Vice-President of the Linnean Society, and Director of the Royal Botanical Gardens, Kew. New Series. Vol. 1, or Vol. 5 of the entire work. Containing 100 beautiful Plates. Price in boards 1*l*. 8*s*.

Part 2 of the New Series, or Part 10 of the entire work. Containing 50 Plates, illustrating the Flora of Brazil, gathered by Mr. Gardner, and that of Falkland Islands, collected by Mr. Wright. 8vo. London, 1842. Price 14*s*.

Was commenced on the 1st of January, and continued monthly, price 2*s*. 6*d*. 8vo, containing 56 pages of Letter-press and two Plates Engraved:—The LONDON JOURNAL OF BOTANY; by SIR W. J. HOOKER, K.H. LL.D. F.R.A. and L.S., Vice-President of the Linnean Society, and Director of the Royal Botanical Gardens, Kew.

London: H. Baillière, 219, Regent-street.

NEW ACTS OF PARLIAMENT, in 8vo., at 1*s*. each, (or post free, 1*s*. 6*d*.)

1. THE NEW BANKRUPT AND INSOLVENT ACTS, passed Aug. 12. These very important alterations of the Law are here incorporated, in full, with Commentaries and Indexes. By Two Barristers.
2. THE INCOME AND PROPERTY TAX; with a full explanatory Introduction and Examples; the Official Regulations; a Table for calculating the Payments; and a Copious Index. By a Barrister. The whole forming 64 pages, and an essential Guide to this important Act.
3. THE NEW COPYRIGHT ACT, with an explanatory and interesting Introduction, by a Barrister.
4. THE NEW TARIFF, with the Old Duties, and an Index.

London: James Gilbert, 49, Paternoster Row, and sold by all Booksellers.

REPORT OF THE COMMISSIONERS ON THE FINE ARTS.

THE ATHENÆUM of THIS DAY, twenty-four large 4to. pages, price Fourpence, contains the Appendices to this Report, by C. L. Eastlake, R.A., Secretary to the Commission. On the General Objects of the Commission, considered in relation to the State and Prospects of the English School of Painting—The statement of Cornelius relating to the proposed Decoration of the Houses of Parliament—Communications on the Fresco-painting, from Professor Hess, of Munich, and others—Methods of Fresco-painting, described by writers on Art, &c., together with Reviews of Newfoundland, in 1842, by Sir R. H. Bonnycastle, and Excursions in Newfoundland, by J. B. Jukes—A new Volume of Poems, by Wordsworth—Dr. Taylor on the Manufacturing Districts—Life of Heywood, and several other works—Original Poetry—A Day at Knowle—Gossip of the Week, &c.

WANTED by a Young Man, a SITUATION as SHOPMAN, or CLERK to a Nurseryman or Seedsman, who has had considerable experience in the above capacities, having been in one of the first Nurseries in London for many years, and is capable of taking the Journeys, if required.

References can be given as to character and abilities. Apply by letter to A. B., at Messrs. Henderson and Co's., Pineapple-place, Edgware-road, London.

In Monthly Nos., 8vo, with Four beautifully-coloured Plates.
Price 2*s*. 6*d*.

PAXTON'S MAGAZINE OF BOTANY.

The Number for August, 1842, contains highly-finished drawings of *Aérides Broókii, Mímulus Maclainiànus, Oxylòbium Pullenæ'æ,* and *Achimènes longiflòra;* likewise Papers on Gardening as a science; on the Arrangement of Plants in Groups; and Culture of Chorozema cordatum. Floricultural Notices of new and beautiful Plants figured in the leading Botanical Periodicals for July, and of those in flower at the principal Suburban Nurseries and Gardens; together with a complete Calendar of Monthly Operations for the Garden.

This work comprises, monthly, four admirably-coloured plates, and twenty-four pages of interesting and useful letter-press. The admirers of flowers are requested to observe—

1. That all the drawings are taken from nature, and are consequently made from plants which have flowered in Britain.
2. That, with few exceptions, they are all done by one artist, whose abilities are of the highest order, and who travels himself to the places where the plants are in flower.
3. That they are lithographed by the same individual, and, being coloured in a superior manner, have all the spirit and elegance, and much of the finish, of the original drawing.
4. That about one-half of the drawings are from plants which have never before been figured in this country, the rest representing the most popular novelties, as well as the more neglected, though sometimes far handsomer, old species; the majority being such as can be cultivated by every one possessing a flower-border and a greenhouse or frame.

It may, in conclusion, be safely asserted that, both for the beauty of its embellishments, and the utility of its contents, this work is well adapted to the wants of all who delight in gardening; and as the improved system of having the plates lithographed commenced with the present year, and as it is intended that each volume shall now be perfect in itself, the present is a desirable opportunity for those who wish to become subscribers.

London: W. S. Orr and Co., Paternoster-row.

ANIMAL CHEMISTRY, or ORGANIC CHEMISTRY in its APPLICATIONS to PHYSIOLOGY and PATHOLOGY. By JUSTUS LIEBIG, M.D., Professor of Chemistry in the University of Giessen. Edited from the Author's MSS. by WILLIAM GREGORY, M.D., Professor of Chemistry, King's College, Aberdeen. 8vo, 9*s*. 6*d*. cloth.

"While we have given but a very imperfect sketch of this original and profound work, we have endeavoured to convey to the reader some notion of the rich store of interesting matter which it contains. The chemist, the physiologist, the medical man, and the agriculturist, will all find in this volume many new ideas, and many useful practical remarks. It is the first specimen of what modern Organic Chemistry is capable of doing for physiology; and we have no doubt that from its appearance physiology will date a new era in her advance.—*Quarterly Review, No.* 139.

II.

By the same Author (Translated by Dr. Playfair).

CHEMISTRY in its APPLICATIONS to AGRICULTURE and PHYSIOLOGY. Second Edition, much enlarged. Small 8vo, 9*s*. 6*d*. cloth.

"Every page contains a mass of information. I would earnestly advise all practical men, and all interested in cultivation, to have recourse to the book itself. The subject is vastly important, and we cannot estimate how much may be added to the produce of our fields by proceeding on correct principles."—*Loudon's Gard. Mag., March* 1841.

III.

ELEMENTS OF CHEMICAL ANALYSIS, INORGANIC and ORGANIC. By EDWARD ANDREW PARNELL, late Chemical Assistant in University College, London. 8vo, 10*s*. 6*d*. cloth.

Price 7*s*., illustrated with Wood-cuts of Birds, Cages, &c.,
A NEW EDITION OF THE

NATURAL HISTORY OF CAGE BIRDS; their Management, Habits, Food, Diseases, Treatment, Breeding, and the Methods of Catching them. By J. M. Bechstein, M.D.

"A very delightful book of its kind. . . . . . It seems to us an indispensable book for the bird-fancier."—*Spectator.*

"It will be welcome to every gentleman's library or drawing-room table. It is superbly got up, with an immense number of vignettes, and, in fact, rivals the beauty of the Annuals."—*Weekly Dispatch.*

London: W. S. Orr and Co.; and W. R. Chambers, Edinburgh.

TO BE LET.—An extensive Fruit and Kitchen Garden, also an Orchard and five Acres of Tillage Land. The Garden contains extensive ranges of Graperies, Peach-houses; Pine, Melon, and Cucumber Pits. A large Conservatory and Greenhouse, with many other advantages.—For particulars of which, apply (if by letter, post-paid) to Mr. Graham, Nurseryman, &c., Turnham Green, near London.—Aug. 27, 1842.

HODGSON and ABBOTT'S PALE ALE.—The above celebrated Beer, so strongly recommended by the Faculty, is to be procured only from E. ABBOTT, Brewery, Bow, Middlesex. The Trade not being supplied, the Pale Ale cannot be genuine if procured elsewhere.

City Office, 98, Gracechurch-street.

THE "ROYAL ESSENCE OF EGLANTINE" for the Handkerchief is prepared only by Mr. WHITE, Chemist, 24, Cornhill, London, in bottles at 2*s*. 6*d*., 4*s*. 6*d*., and 8*s*. each. Where also may be obtained the "AROMATIC PUNGENT ESSENCE" so useful in Headaches, Fainting, &c., at 3*s*. each.

N.B. Public Offices and Merchants can be supplied with Postage Stamps and Envelopes in any quantity at Government Prices.

SUN-BURNS, FRECKLES, TAN, and other Disfigurements of the Skin, prevalent at this peculiar season, are pleasingly eradicated by that unique preparation, ROWLAND'S KALYDOR, a balmy odoriferous liquid, and now universally admired for its sovereign virtues in completely removing all cutaneous eruptions, and in rendering the complexion delicately clear and fair. It is invaluable as a renovating and refreshing wash during travelling, or exposure to the sun, dust, or harsh winds, and after the heated atmosphere of crowded assemblies. Gentlemen will find it peculiarly grateful after shaving, in allaying the smarting pain.

CAUTION.—Ask for "ROWLAND'S KALYDOR," and see that these words are on the envelope, with their signature and address in red: "A. ROWLAND & SON, 20, HATTON GARDEN, LONDON;" the same are engraven on the Government Stamp affixed over the cork.

Sold by the Proprietors, and by respectable Chemists & Perfumers.

COUNTRY SHOWS.—Aug. 30, Hull. 31, Stonehenge. Sept. 3, Windsor and Eton. 7, High Wycombe. 8, Teddington, Thanet, Canterbury, Dumfries. 9, Spilsby, Maidenhead, Ashford.

WE are told that some very worthy persons have applied to themselves the remarks upon weeds which were made by us last week, and that they regard our observations as personal to themselves. We are glad to hear that their consciences bite so hard; but while it must be confessed that such persons deserve all that was said of slovenly gardeners, we can assure them that they are mistaken in supposing that we alluded to Mr. B. more than to Mr. X. Let us hope that they will take our advice—mend their ways, pull up their weeds when young, and eschew the fatal error of deferring till to-morrow what can possibly be done to-day. By these means, they will soon lose their susceptibility; they will be charmed at finding themselves no longer of the family of the thinskins; and they need feel no alarm lest the name of "Sisypheans" should be fastened on them.

Every sloven is a bad gardener; every really good gardener is neat. These we regard as incontestable truths. They are proved by the experience of every day. We shall name no names—but let any one who knows the best gardens of England only bring to mind their state when he last visited them, and we will engage to say, that in every case, one of the most striking features is their neatness. In such places there are no weeds, no litter, no disarrangement; but everything has its allotted place, and nothing is to be seen but what belongs to the garden business. Neatness, method, and foresight are visible in all things. Even the men themselves who are employed upon the premises are neat and clean at all times, when not occupied by work which renders it impossible. Their faces are clean and well shaved, their clothes brushed, and their whole appearance as decent and respectable as circumstances will permit. In fact, the mind of the master is reflected on his men, and on all things around him.

It is not difficult to see the connexion between neatness and good gardening. The cultivation of plants in great perfection depends, not only upon a knowledge of ordinary routine, and upon an acquaintance with the more common facts of vegetable life, but also upon a constant system of watchfulness and supervision, and the application to every individual plant of just that kind of management which its peculiar constitution requires, and of no other. An hour's neglect will, in many cases, ruin all the results which a twelvemonth's skill has succeeded in obtaining. All this care induces activity of mind, and a great amount of minute industry; it enables the gardener instantly to note whatever may occur to interfere with his plants—whether the enemy be insects, or weeds, or other things offensive. Seen in their first beginning, they are instantly checked, and the issue of such a system is neatness, so far as the plants under actual cultivation are concerned. But the eye that is accustomed to neatness in one respect, cannot remain satisfied without it in all other places, and thus one uniform feature of propriety pervades a whole establishment. Unneatness, on the contrary, is brought about by habitual negligence; the weeds grow because they are not seen when young; the gardener was not looking after his plants. Then when they do grow up, their growth has been so gradual before the slovenly gardener, that he no longer remarks them, and is himself so unconscious of their presence, as to fancy them invisible to everybody else. Weeds, then, are the offspring of habitual negligence; and he who is habitually negligent may be a Sisyphean, but cannot be a good gardener; while, on the other hand, neatness is the offspring of care, and carefulness is one of the great elements of good gardening.

Let it not be supposed, however, that to be neat is to be a good gardener. That is quite another thing. Neither would we be understood as insisting upon dandyism in gardening. We see no great harm in it if people like it, and it is undoubtedly to be preferred a thousand times to slovenliness; but it is better avoided. A gardener should wear clean linen; but he would be a blockhead to scent it with eau de Cologne. The first is neatness; the latter would make him ridiculous.

But it is not merely because neatness is the result of a well-ordered mind that it is to be so strenuously insisted on. In that point of view it is of very great importance, no doubt: but attention to it is no less a first-rate gardening requisite for other reasons. Neatness is one of the habits which produce a smoothness of appearance, and smoothness is one of the great causes of that beauty which renders gardens so peculiarly agreeable to cultivated minds. "Smoothness," says Mr. Burke, "is a quality so essential to beauty, that I do not now recollect anything beautiful that is not smooth. In trees and flowers, smooth leaves are beautiful; smooth slopes of earth in gardens; smooth streams in the landscape; smooth coats of birds and beasts in animal beauties; in fine women, smooth skins; and in several sorts of ornamental furniture, smooth and polished surfaces. *A very considerable part of the effect of beauty is owing to this quality; indeed, the most considerable.* For take any beautiful object, and give it a broken and rugged surface; and however well-formed it may be in other respects, it pleases no longer."

How entirely this is borne out by the effect of weeds in a garden! The smoothness of the lawn is gone when it is studded with tufts of Dandelion; the smoothness of the flower-bed is destroyed when it is defiled by the Groundsel and Sowthistle; and the smoothest of walks is rendered rugged, and therefore unbeauteous, by similar excrescences. The Sisyphean gardener, then, is the natural enemy of beauty; and we surrender him without further comment to the judgment of those who are the fairest in the creation.

"WHO is there," says the same accomplished writer in the *Quarterly* whom we quoted on a recent occasion,—"Who is there that has not some friend or other confined by chronic disease or lingering decline to a single chamber?—one, we will suppose, who a short while ago was among the gayest and the most admired of a large and happy circle, now through sickness dependent, after her One staff and stay, for her minor comforts and amusements on the angel visits of a few kind friends, a little worsted-work, or a new Quarterly, and, in the absence or dulness of these, happy in the possession of some fresh-gathered flower, and in watering and tending a few pots of favourite plants, which are to her as friends, and whose flourishing progress under her tender care offers a melancholy but instructive contrast to her own decaying strength. Some mild autumn-evening her physician makes a later visit than usual—the room is faint from the exhalations of the flowers—the patient is not so well to-day—*he wonders that he never noticed that Mignonette and those Geraniums before, or he never should have allowed them to remain so long—some weighty words on oxygen and hydrogen are spoken—her poor pets are banished for ever at the word of the man of science, and the most innocent and unfailing of her little interests is at an end.* By the next morning the flowers are gone, but the patient is no better; there is less cheerfulness than usual; there is a listless wandering of the eyes after something that is not there; and the good man is too much of a philosopher not to know how the working of the mind will act upon the body, and too much of a Christian not to prevent the rising evil if he can; he hears with a smile her expression of regret for her long-cherished favourites, but he says not a word. In the evening a largish box arrives directed to the fair patient, and superscribed, 'Keep this side upwards—with care.' There is more than the common interest of box-opening in the sick chamber. After a little tender hammering and tiresome knot-loosening, Thompson has removed the lid;—and there lies a large oval bell-glass fixed down to a stand of ebony, some moist sand at the bottom, and here and there over the whole surface some tiny ferns are just pushing their curious little fronds into life, and already promise, from their fresh and healthy appearance, to supply in their growth and increase all the beauty and interest of the discarded flowers, without their injurious effects. It is so. These delicate exotics, for such they are, closely sealed down in an air-tight world of their own, flourish with amazing rapidity, and in time produce seeds which provide a generation to succeed them. Every day witnessing some change, keeps the mind continually interested in their progress, and their very restriction from the open air, while it renders the chamber wholesome to the invalid, provides at the same time an undisturbed atmosphere more suited to the development of their own tender frames. We need scarcely add, that the doctor the next morning finds the wonted cheerful smile restored, and though recovery may be beyond the skill, as it is beyond the ken, of man, he at least has the satisfaction of knowing that he has lightened a heart in affliction, and gained the gratitude of a humble spirit, in restoring, without the poison, a pleasure that was lost."

We give this passage a prominent place, partly for its beauty, and partly for its truth, but more especially for the sake of making a few remarks upon that part of it which we have printed in italics.

If there is one absurdity among popular prejudices greater than another, or leading more to privation of comfort when most wanted, it is that of fancying that growing plants vitiate the atmosphere of an apartment in which they are cultivated. The reasoning on which this is founded is as follows:—1. Growing plants form carbonic acid (fixed air) in their interior, by absorbing oxygen (vital air) from the atmosphere; therefore they rob the air of that which is most necessary to animal life, and therefore they are prejudicial, especially to sick persons. 2. Growing plants also give out carbonic acid or fixed air, a pernicious gas, in which animal life cannot be maintained; again, therefore, they should be expelled from all apartments, especially those occupied by invalids: for how can a physician, careful of the health of his patient, permit the presence of objects which are thus incessantly contaminating the air?

If we must admire the zeal which leads gentlemen to seize upon the poor plants "for a stray, for entering their fee-simple without leave," and who tear them

From the labouring heart,
Which, in the conflict that it holds with death,
Attracts the same for aidance 'gainst the enemy,

we may also be permitted to wish that their zeal was somewhat better directed, than when they misapply the truths of science to the misgovernment of a sick bedroom.

It is doubtless true that plants destroy oxygen gas and produce carbonic acid; but if everything that produces that effect was also to be expelled, the patient herself must be separated from herself, for a human being consumes more oxygen, and gives off more carbonic acid, in five minutes, than all the plants in a sitting-room in twenty-four hours. We cannot but wonder that this notorious fact should not have removed the prejudice about plants deteriorating the air of sitting-rooms. It is still more surprising that the idea should be retained at the present day, at least when it is also well known that plants, in fact, purify instead of vitiating the atmosphere. If it is true that they do a minute amount of harm, by destroying *some* vital air, and producing *some* fixed air, it is equally true that they do a great amount of good by producing a *large quantity* of vital air, and destroying a *large quantity* of fixed air. It is one of the most beautiful provisions we know of in nature, that the deleterious air breathed forth by animals is purified and rendered salubrious by plants; if it were otherwise, the globe would become uninhabitable. But every leaf, every blade of grass—nay, the finest of the green silken threads that float about in pools of water, is incessantly occupied, during daylight, in effecting this most important change of pestilent air into an atmosphere of life.

Whatever advantages, then, the Ward's case may have—and few objects are better suited to the solace of an invalid—it should be regarded as an addition to the comfort of a sitting-room, rather than as a substitute for the fresh plants which are so much more interesting; for who would be satisfied with looking at a garden through a pane of glass, instead of walking in it, and coming in very contact with the flowers? To exclude live plants from the free air of a sitting-room, is as contrary to common sense as it is to good feeling.

One thing, however, is to be observed regarding plants. Although it is false that they contaminate the air of a sitting-room, in the way that is supposed, or in any other way, in the majority of cases, yet it is certain that unpleasant effects are occasionally produced upon peculiar constitutions by their *odour*. The flowers of the glaucous Magnolia are said to bring on sickness and headache; the Jonquil, the Tuberose, and the Lilac, are apt to cause faintness—an effect, indeed, which we have seen produced by a few Violets, even in the open air; and Linnæus mentions a case of death, said to have been occasioned by sleeping in a room where the Oleander was in flower. But this class of effects does not in any way justify the exclusion of all plants from sitting-rooms; it only shows the necessity of avoiding the presence of such as have powerful and oppressive odours, the number of which is very inconsiderable.

CONCRETE FOUNDATIONS.

A country correspondent having requested some information on this subject, we have obtained the following:—

The best mode of forming what are now called concrete foundations is a question on which there exists much difference of opinion; nor is the difference likely to be very soon settled, for this reason—that any mode in which there is the commonest attention to the known principles of calcareous cements will do sufficiently well. Before any processes are explained, it may, however, be useful to remark that there is not, as has been supposed, any magic in a concrete foundation; it is merely a cheap mode of building that portion of a wall which is to be wholly beneath the earth; and nothing can be more absurd than to dig out a good natural foundation of gravel, or even of dry clay, for the sake of burying a mass of artificial materials. I allude now of course to the use of concrete as a base to a wall. When it is spread over the whole site of a building, for the purpose of stopping all connexion with the natural soil, another object is in view, which may be very desirable, but with which we have nothing to do in considering the use of concrete foundations.

In order to understand the principle of forming these, let it be supposed that after the trenches for the walls have been dug as low as the building requires, it is found that the earth at the bottom of the trenches is soft and spongy, yielding easily to a rammer, or suffering an iron crow-bar to be buried in it by merely wriggling about; such ground would certainly be compressed by walls of any considerable weight, and would as certainly cause those very unsettling accidents called "settlements." This soft earth must be removed; the trench must be deepened till a harder or more resisting soil is found; and then the trench might be filled up to its former level with such stones as are fit for Macadamising a road, either larger, smaller, or mixed; and which if trodden or beaten down, in layers of three or four inches each, would of themselves form a much better base than the spongy earth, — a base good enough, indeed, for most purposes. To make a "concrete" foundation it merely requires that all the interstices of these stones should be filled up with a cement of sharp sand and good stone lime, the latter having been ground hot, and not slaked in the usual way. One part of lime, and two or three of clean sand, well beaten up together, will make a very good mixture for this purpose. The great difference among the doctors arises out of the mode in which the lime and sand shall be mixed with the stones, and the whole made compact in the trench. One mode, it is obvious, would have been to pour the lime and sand in a fluid state upon each stratum of broken stones as they were laid in the trench, first ramming down the stones as much as was thought necessary, then pouring on the cement, and afterwards not disturbing that layer. This plan has by some been recommended, and is in my judgment the best mode. The ordinary process is to mix the stones, sand, and lime, with enough of water, and to throw the whole into the foundations from a great height; the object of the fall being to give compactness, which is not, I think, to be so obtained. The fall produces a *scattering* action in the mass, which appears to me unfavourable to compactness.

With these general principles, any one can form and use concrete effectually. Hard clean stones, clean sand mixed with as little clay as possible, and no humus (as we must now call it), well-burnt stone lime, or good chalk lime, and if slaked instead of being ground it will not matter much; these materials packed closely in a trench, and disturbed as little as may be after the lime has begun to set, will make a good concrete foundation. Where good clean gravel, or gravel from which the clay has been washed, can be obtained, that will at once furnish both the stones and the sand, requiring merely the admixture of about one-eighth of lime; the mixture may be laid in the trenches in layers of three or four inches, and rapidly trodden down; or it may be thrown in from a height, according to the London practice, if that be preferred.—*A.*

ON ORGANIC MINERAL MANURES.—No. IV.

By PROFESSOR CHARLES SPRENGEL (translated from the German).

(Continued from page 540.)

THE humus brought into compost-heaps ought never to be too damp, as it is apt to cool too much the dung it is mixed with, and not to undergo decomposition soon enough. It is, generally speaking, of the greatest importance that the compost-heap be never either too damp or too dry, because in either case the rotting of the organic remains will be impossible. As it is mostly likely to be too dry, it should be supplied with the moisture required, which should be either urine or dung-water; or if there be neither at hand, more water may be used instead.

Everything added to the compost-heap, whether turf, humus, marl, loam, &c., ought to be broken into small pieces, because they will then act better on each other, and sooner become substances possessing manuring qualities.

The turning over the heaps, and making them up again, must be done very quickly, because heat has great influence in the decomposition of the substances brought together, and the heap, if worked up slowly, will become too cold. In like manner, too much heating of the mass is to be avoided, for that would cause the loss of ammonia, which, however, is not so much to be apprehended, unless too much dung has been used.

Compost must not be used before it is thoroughly made, which is known by all the organic remains being decomposed, or at least being tender, so that the compost will have the smell of rich garden soil. It may be that more money has been sunk in a compost-heap than one likes to retain unemployed; but we may rely upon it that nothing is saved by employing such a substance before it is thoroughly fit for use.

Making compost is best resorted to at a season when cattle and labourers are least engaged, and when manure is no longer required for the field; consequently, after the sowing of winter and summer crops. To compost prepared in autumn, more dung is to be added than to that which is made in spring, because as the cold of winter interrupts fermentation and the decomposition of organic remains, the fresh dung will counteract this by the heat it gives out. In order to prevent the cold from penetrating the heap, or, to speak more properly, to keep the heat in it, it is as well to cover it all over in winter, either with Potato-haulm, leaves, or similar substances. The decomposition of the organic remains, &c., will then proceed vigorously under this cover; so much so, that the compost—especially if it is worked up once or twice during mild weather—may become fit for use even by the subsequent spring, and may be used for summer crops, which is very important. On the other hand, compost which is prepared in spring will (if properly mixed and treated) be so far decomposed by the autumn, that it may be used as a manure for Rye or similar crops; because, as at that time it will have been from four to six months in a heap, the organic substances contained in it must have been very woody, fibrous, or carbonaceous, if they have not been decomposed. Decomposition can always be hastened by the admixture of lime, ashes, or dung in somewhat larger quantities than usual; in which case, compost may be fit for use in three months.

Whoever is in the habit of making compost, acts rightly if he continues making it during the whole winter and summer, because in every farming establishment there must continually be substances fit for incorporating with the compost-heap; as, for instance, refuse flax, hemp, offal, sawdust, scrapings, ashes, weeds, building rubbish, moss, &c. It is also best to have the compost-heap near the dunghill, so that the superfluous dung-water and urine can be poured upon it, and the dunghills will in this way be kept in the necessary state of dryness. But in this case the addition of plenty of humus must not be neglected, because it has to fix the ammonia which will be developed; this is the more necessary if night-soil has been added to the heap of compost.

If compost is prepared in very large quantities, the substances used in it should be conveyed to the neighbourhood of the field which you wish to manure, and thrown up around a place left open for that purpose. The substances which are at hand are then placed necessarily in layers in the compost-heap. This is to be of a round form, and the sides steep, which will preserve heat best. The height of 6 or 7 ft. will be the most appropriate. At the bottom, a layer of turf or humous earth, 4 or 5 in. thick, is to be placed, to receive and absorb all manuring particles which may run downwards. The layers of different substances must not be too thick, otherwise the inner portion of each will be very little acted upon and decomposed by that of the adjoining substance. The layer of dung is always made thickest, as it will be almost reduced to nothing by decomposition; next follows a layer of humous earth, which may be 3 or 4 in. thick. The layers of marl, lime, and especially peat and wood ashes, must be thinnest; whilst any salts that may be used—for instance, gypsum, common salt, soda, potash, pulverised bones, sulphate of soda, &c.—are to be strewed among the humous earth, in a proportion previously calculated. The intimate mixture of these substances will be still more completely effected by subsequent working up, when everything is to be properly chopped to pieces. It will be still more aided by moistening with common water or dung water. It must never be forgotten, that upon a most intimate mixture of all the substances contained in the heap, the subsequent good effects of compost depends, on which account it is impossible to direct too much attention to that point.

Compost may be also prepared in stables, *below* or *behind* the cattle, but it will turn out to be never so well mixed as that prepared outside; nevertheless the manuring properties of the former may be somewhat superior to those of the latter, for reasons previously stated.

(To be continued.)

A LIST OF SOME OF THE BEST PICOTEES, WITH A SHORT DESCRIPTION OF THEIR LEADING CHARACTERISTICS.

Barraud's Cornelius; very heavy-edged red; petals broad and well formed, white fine, and red very brilliant, but not quite confined to the edging.

Sharp's Duke of Wellington; heavy-edged red, petals well formed, crown good, edging regular, and the colour even and well laid on.

Green's Queen Victoria; heavy-edged rose, fine form, petals firm and well proportioned, white good, and edging regular.

Barnard's Mrs. Barnard; delicate light-edged rose; petals firm, large, and slightly cupped; white very pure, and edging regular.

Kirtland's Princess Augusta; heavy-edged purple, form fine, petals large and of a good shape, white good, and edging regular.

Garratt's Lady Dacre; delicate light-edged rose; petals well formed, the edging regular. This flower is very superior to Wain's Queen Victoria.

Sharp's Hector; light-edged red, petals large and well formed, white very fine, and edging regular.

Dickson's Trip to Cambridge; heavy-edged purple; petals firm, smooth and even, edging sometimes very regular; good white, and colour well laid on.

Kirtland's Duke of Wellington; light-edged red, petals broad and even, edging regular, white a little deficient in clearness.

Barraud's Bride; light-edged rose, petals large and well formed, white very fine, edging regular.

Giddens' Sir Robert Peel; heavy-edged red; petals very large, with fine crown; white good, edging rich but rather irregular.

Brinckler's Purple Perfection; delicate light-edged purple, form very fine; petals firm, smooth, and even; white good, and edging very regular.

Headley's Sarah; light-edged red; petals well formed, with good crown.

Wildman's Isabella; heavy-edged red; petals well formed, smooth, and even on the edges; white very fine, with a deep regular edging of cherry red.

Sharp's Invincible; light-edged purple, petals well formed, white good, and edging regular.

Giddens' Vespasian; delicate light-edged purple, petals very fine and well formed, edging very regular.

Crask's Queen Victoria; heavy-edged purple, petals broad and sometimes slightly serrated, white good, and edging regular. This flower is rather too thin for London showing.

Sharp's Gem; light-edged red; guard-petals very firm, smooth and even, crown well formed; white good, and edging very regular.

Giddens' Teaser; heavy-edged red; petals very fine, with perfect crown; good white, but the edging irregular.

Wilson's Fanny Irby; light-edged rose; petals well formed, smooth, and not serrated; white good, with very regular edging.

Brinckler's Duchess; light-edged red, petals well formed, white fine, and edging regular.

Brinckler's Masterpiece; heavy-edged red, petals fine, and white good, but the edging irregular.

Giddens' Mrs. Hennel; heavy-edged purple; large, bold flower; petals of good substance, filling well up in the centre; white good, but the edging irregular.

Purpúrea élegans; light-edged purple, petals well formed; white good, edging regular but rather serrated.

Sharp's Red Rover; heavy-edged red, petals fine; white pure, edging perfect, but the flower rather small.—*John Dickson, Acre-lane, Brixton.*

SUMMER PRUNING OF WALL-TREES.

(Continued from p. 556.)

THE development of every branch calls forth a corresponding development of roots, and hence, if great care be not taken in the summer dressing of the trees —that is, if we do not gradually and regularly reduce the gross productions of the tree, are we not fostering the production of roots, and working for the very end we wish to avoid? To answer these questions satisfactorily, would be to enter into the whole theory and practice of border-making and planting; but that would take up more space than I dare solicit at this time, and therefore I must defer my remarks on that head until a more fitting opportunity. I may, however, observe, that were trees properly planted, early disbudding, so as to prevent the formation of a quantity of roots, would be the most likely to effect the purpose; but where trees are very luxuriant, transplanting, root-pruning, and early disbudding, or a heavy crop of fruit, appear the most likely means to moderate the growth of trees. If trees were planted in shallow, well-drained, and moderately rich borders; if peat earth, brick rubbish, or porous stones, were substituted for the gross materials frequently put into borders, and if we were satisfied with taking small crops of fruit, until the trees were fully established; we should then find very little necessity for the cutting and maiming of which Mr. Bowers seems to have so much dread, and still less for the more dangerous concomitant of fruitfulness, root-pruning. We are, however, frequently in too great a hurry to get our walls covered, and thus use materials which, by inducing luxuriant growth, lay the foundation of canker, mildew, and "all the ills that trees are heir to." As for summer pruning hastening decay, it is a mere fallacy. Robust growth is no index of health; on the contrary, every garden and orchard shows us that the most prolific trees are those which produce little or no breast-wood; on walls it will be found the same, but we do not consider them unhealthy in consequence. Having now met the leading principles of Mr. Bower's system, and shown that however successful the plan may be, it is not the one that physiology would point out as the best, I shall next detail my own system, which, whatever may be its faults—and I dare not arrogate to it perfection—is at least free from the objections which must ever militate against the adoption of the plan laid down by Mr. Bower. I wish it, however, to be understood that I do not call in question Mr. B.'s success in producing a crop of fruit; all I wish to establish is, that it is possible to achieve the same end by less objectionable means than those which he has recommended to our notice. Having made myself acquainted with the constitutional peculiarities of each tree; that is, having ascertained whether it is in a luxuriant, medium, or declining state of health; I direct my operations accordingly. If it is luxuriant, and makes a quantity of strong breast-wood, I begin by removing with a sharp chisel three or four of the strongest and most perpendicular roots. This is done about the middle of October; and as soon as the tree begins to grow in the following spring, I remove as many of the buds that are likely to produce strong breast wood as I possibly can. This prevents the formation of many young roots, brings to an equiponderance the head and the root, and generally induces a moderate and healthy growth; but if that has not the desired effect, and the tree sets a tolerable crop of fruit, I allow it all to remain on, so as to check the growth as much as is necessary; but if there is no crop, I remove a few more roots in the following autumn, and repeat the disbudding. This will generally bring the tree into a healthy and fruitful state, which will be indicated by its producing breast-wood, not more than eight inches or a foot long, with short joints and prominent buds. I commence the summer dressing by shortening back the strongest and most forward shoots to five or six leaves as soon as they are a foot long; or in fact, before they become unsightly. This operation is generally commenced at the end of May, or in the beginning of June, and is repeated every week or ten days, until the whole of the foreright shoots are stopped, taking care to commence with the most vertical branches, and not to remove too many shoots at one time. In this way there is no danger of starting the embryo fruit-buds into growth, neither does the flow of the sap receive any severe or sudden check; while the tree does not expend itself in useless growth, and every encouragement is given by proper exposure to light, for the maturation of the future fruit-buds, and also for accelerating the growth of the fruit. About the middle of July, or from that to the end of the first week in August, I again go over the trees, and shorten the shoots, that at the previous dressings were left with five or six leaves, to one, or at most two leaves ; and if there is not a leaf within one inch of the base, the shoot is cut close out, and the embryo-buds at the base encouraged into growth. The buds on the short spurs, retained at this dressing, are generally converted into embryo fruit-buds before the close of the season, and many of the natural spurs, from the accumulation of elaborated sap in the branches, are converted into fruit-buds also, somewhat on the same principle as in ringing ; fruit-buds are formed from the descent of the sap being intercepted, and its consequent accumulation in the branch. After this dressing I have little cause for winter pruning ; indeed, none at all, only for the purpose of thinning the fruit-spurs where they are too thick, and shortening or cutting out any spurs that have produced fruit in the preceding season. The above observations are directed principally to the management of Pears. Plums and Cherries I would keep as much as possible on the young wood, as in the Peach ; but where they are spurred, I deem it indispensable to neatness not to allow the spurs to exceed two inches in length, and to keep them shorter if possible. By this system of summer management, the trees are never allowed to run so wild as to have a neglected appearance, which must be the case by breaking down the branches, or by leaving the shoots unpruned until Michaelmas, as is practised with very good success in some gardens. All that I contend for, is superior neatness, and that the most natural way of bringing a tree into a fruitful state is, by an early removal of the redundancies of the tree, so as to prevent the formation of roots, and consequently prevent luxuriant growth ; for with the fact before us, that by the simple removal of the leaves in the growing season we can reduce a tree to the point of starvation, it must be wrong to allow luxuriant trees to make a great quantity of wood, and as a matter of course roots, when that wood has to be removed in the winter pruning, and the tree has consequently double the quantity of roots necessary for fruitful existence. This is what renders root pruning necessary, and there can be little doubt which is the better plan, viz. to put a stop to the cause, or to persist in an unnatural practice.—*W. P. Ayres, Chicksands Priory, Bedfordshire.*

† ENTOMOLOGY.—No. XXXII.

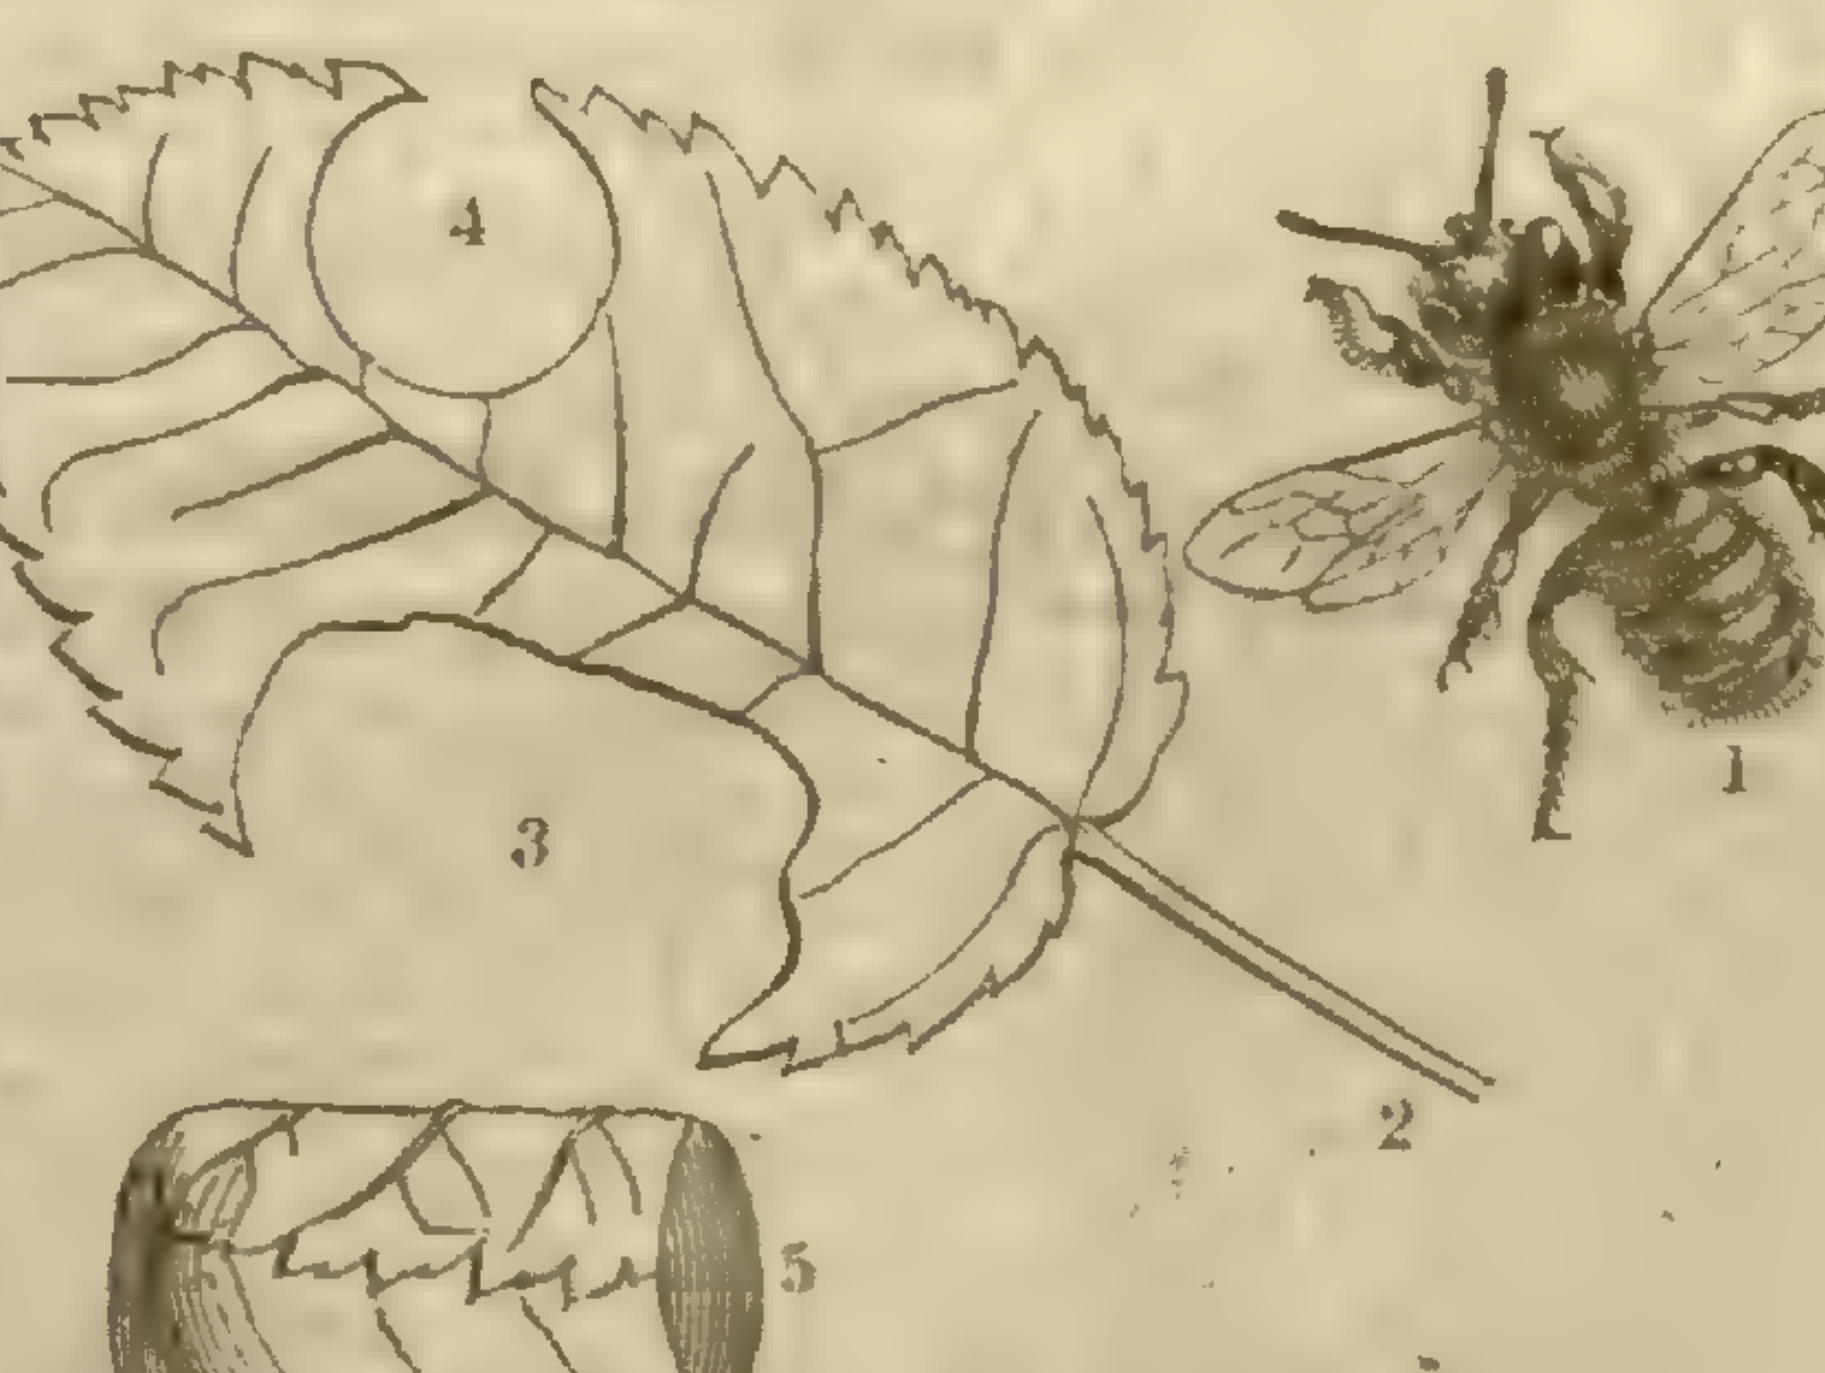
The Willow or Leaf-cutter Bee, *Megachile Willughbiella.*—There are few, if any, insects which exhibit a greater degree of sagacity than this Bee; and its history forms one of the most interesting and surprising narratives amongst this curious class of beings. It not unfrequently happens that one sees ovals and circles cut out of the Rose-leaves in gardens, figs. 3 and 4 ; sometimes the Laburnum and the Acacia exhibit the same strange appearances, and even the petals of the Pelargonium have been taxed this summer to supply ornamental tapestry for these hidden mansions. If we devote sufficient time and attention, at the proper season, a certain wild Bee will be seen flying about the mutilated leaves, as if to ascertain which was best suited to its purpose; and, speedily alighting on the edge, it begins cutting a portion out of the leaf with its jaws or mandibles, just as we should with a pair of scissors, and with as great ease, and in as short a space of time. If it be a circular piece, it is simply suspended under the body, and held fast by the feet in that position ; but if it be a larger and oval piece, it is folded together in the operation, it is then placed vertically beneath the abdomen, so that, the final cut separating it from the leaf, the Bee spreads her wings and flies off with her materials. By tracing her flight we may sometimes ascertain the destination of the Bee, which, arriving at home, hovers a few seconds round a post or rail, enters a hole with her burden in order to construct her nest (which we will now describe), and again sallies forth to repeat the operation.

A dead Willow post, which is dry and soft, being found, a cylindrical channel is formed, sometimes 3 or 4 feet in length, and the débris is removed so that it is free from dust ; then the female cuts some oval pieces of leaves and carries them down to the extremity of the cylinder, and being green, they take its curved form, with the assistance, no doubt, of the architect. This operation is continued until 10 or 12 pieces are thus united, one within the other, forming a green cylinder, one end or the bottom being rounded like a thimble, and the edges wrapping over a circular piece, as neatly as in the crown of a straw bonnet (fig. 5). The cell being so far completed, some Bee-bread is deposited of a considerable thickness, and Réaumur ascertained that liquid honey sometimes fills the cells ; an egg is then deposited, and finally the end is closed by a lid composed of five circular pieces, forming a concave surface to admit the end of the next thimble-formed cell to fit into it: and thus does this little animal labour for its progeny until many cells are perfected. Without a rule to measure the length of the pieces, or compasses to draw a circle of the accurate dimensions, man would be at a loss to fit the pieces with such accuracy as to hold liquid honey ; but such is the perfection of the incomprehensible instinct of these Bees, combining memory with an evident discrimination to determine the form and size required, that they accomplish all, guided by the Creator, who is wonderful in the least as well as in the greatest of His works.

The arduous undertaking of constructing the cells is the duty of the female Bee ; but I imagine, from the curious structure of the fore legs in the male (fig. 1), that it is his province to excavate the cylindrical gallery in the wood, for the reception of the cells. Réaumur, I see, thought they might be to convey wax, or for some purpose which was unknown ; but I think this formation will separate the species nidificating in wood from the one which construct their nests in the earth.

In less than half an hour, one Bee that was watched by the celebrated French naturalist, made more than a dozen journeys for portions of leaves ; at which rate a nest might be built in a day or two, only that each cell has to be filled with the necessaries of life for the embryo young. The egg when hatched produces a maggot, which when full-grown resembles that of the Hive-bee ; and it then spins a silken cocoon, thick and solid in texture, the inside being fine and shining like white satin, but the outside is coarse, and the colour of coffee. This, however, is Réaumur's account of another species, *M. circumcincta?* which makes its nest in a gallery formed in the earth ; but the structure of the nest is very similar, only that these, not being so well secured from external intruders, first line the whole cylinder with large portions of the leaves, forming one continuous and entire lining,—but I find that this precaution is omitted by the Willow-bee. Careful as these Bees are to secure their young, and provide them with food, there are idlers on the look-out to take advantage of their industry, and thus, during the absence of the Leaf-cutter Bee, a dipterous fly lays her eggs in the cells, which hatch, and feed upon the maggots, and thus destroy the rightful owner of the habitation ; and it is suggested by Réaumur, that if the honey deposited for the young larvæ was not protected in some way, hosts of Ants would soon carry off the sweet treasure, larvæ and all. A nest transmitted to us by Mr. W. Smith was composed of Birch and Acacia leaves, as he intimated, and not of Rose-leaves, as we at first supposed. The outer layer of each thimble-shaped cell (fig. 5) was formed of two or three portions of Birch-leaves, the inner ones of eight pieces of Acacia ; the convex end had an internal and external circle of the latter leaf, and the concave end was closed by five circular lids, the internal one of Acacia, and the others of Birch ; the outside one was the largest, and smeared externally with honey, probably, and bits of the Willow-wood, as well as with atoms of the outside lid, of which a considerable portion of the middle was eaten away,—and I observed that these round lids are cut a trifle too large, that they may be forced in ; and thus the edges are closed, and this end becomes concave outside.

Megachile Willughbiella is pitchy, clothed with fulvous down, excepting at the apex of the abdomen, which is black. In the *male* the face is covered with yellow silky hairs, and the fore legs are dilated and yellowish, excepting the tips of the thighs and the outside of the tibiæ; the three basal joints of the foot are concavo-convex, dilated, and densely fringed with stiff hairs ; the body is oblong, and notched at the apex. The *female* has a black face ; the abdomen is ovate-conic, the under side is densely clothed with silky hairs, black at the base and apex, and deep orange in the middle. Those who wish to be better acquainted with the structure of this interesting group, as well as with the economy of the other species, may consult Kirby's Mon. Ap. Ang., and Curtis's Brit. Ent., pl. and fol. 218.—*Ruricola.*



AMATEUR'S GARDEN.—No. XXXV.

Much of the success which attends all gardening operations, depends upon having at command a good selection of soils. A small corner out of sight should always be set apart for their reception, in which they can be turned over and mixed together, before it is necessary to use them. Without recommending all those ingredients which florists of the old school considered indispensable to the growth of their favourite flowers, I still think there are a few kinds of soil which are actually necessary to form different mixtures for the different kinds of plants. These are peat or bog-earth, loam, leaf-mould, dung, and sand. The best peat is usually found in plantations or commons, where the Heath and other things are growing most luxuriantly. It is of a rich brown colour, mixed with a quantity of vegetable matter, apparently of recent decomposition. Never choose your peat from a place where the Heath or Grass scarcely grows, for there it is poor and will not answer your purpose well. There are various kinds of loam, and the different names which are given to them are so indefinite, that the amateur is often at a loss to understand them. He is frequently, for example, told to use yellow loam, or maiden loam, or sandy loam, or rich loam, or some other kind, different from any of these. The practical gardener or farmer understands these terms perfectly, and a very little experience will enable the amateur to do so too. The colour, of course, determines the first. Maiden loam is that which is taken from the surface of pasture-land; but it may be brown, or yellow, or sandy, or rich, or poor ; so that many of these terms are almost synonymous. Friable loam is that kind which does not set hard, but when pressed in the hand when damp readily crumbles down again. This should always be preferred to that stiff kind, which, as it resembles grafting clay, or mortar, is very injurious to plants, particularly to such as are grown in pots. Leaf-mould is very useful for mixing either with peat or loam, and not only enriches the compost, but also keeps it free and open. This can easily be obtained at this season of the year in any old plantation, when the leaves of former years had been swept together, and are now in a state of decay. Most persons have the means within themselves for making this, if they have a place where they can put the leaves which fall from their own trees. Dung which has been used for frames is also very useful for mixing with other soils when it is nearly decomposed. For this purpose it should be laid in a close heap in the compost-yard, and it will be fit for use in about two years, or for some things even before that time. Cow-dung and several other kinds, such as that of sheep and pigeons, are excellent for making liquid manure for strong-growing plants ; but all these things cannot be kept, unless there is some small place set apart for their reception. This is the laboratory, where the causes are arranged which produce the effects on the garden ; the "behind the scenes," which although not very pleasant to look upon, is still necessary to the success of the performance. The prophecies of those scientific men, who imagine that the day will come when the agriculturist will be independent of the manure of his dunghill, because he will carry in his pocket all that his soil requires, has not yet been fulfilled ; nor is it likely to be, for this simple reason—mechanical effects are as necessary as chemical to the growth of plants.

Commence the propagation of half-hardy plants, for turning out in the flower-beds next year. Verbenas, Heliotropes, Pelargóniums, Anagallises, Fúchsias, and many other things, will all strike readily now, and form good strong plants for the winter. I will next week furnish a list and description of some of the better sorts of things of this kind, which the amateur can procure if he does not possess them.—*R. F.*

HOME CORRESPONDENCE.

Arnott's Stoves.—When I consulted you last year on the subject of heating greenhouses with Dr. Arnott's stoves, your opinion was not favourable to the plan, and I should most probably not have tried it had I not soon after received an assurance of their complete success from Mr. Rivers, of Sawbridgeworth, who described to me his method of using them. As these stoves, if successful, afford by far the most economical method of heating small greenhouses, I am anxious to state, for the sake of some of your readers, the success which I have met with by following closely Mr. Rivers's directions. The secret mainly consists in the complete prevention of any escape of gas. For this purpose the stove should be placed near to the chimney, which must be a brick one ; the nearer the better, certainly never more than six feet from it. The pipe between the stove and flue should be hermetically sealed, and there should be some kind of cowl on the top of the chimney, to prevent any beating down of the smoke or gas. The top light under the chimney I always kept shut. I found this stove answer perfectly well ; the heat from it, although placed in a corner of the house, was very equally diffused over the whole of it. I did not lose a plant last winter, and my Pelargoniums have turned out fine and healthy, and not in the least drawn up. To prevent the heat being too dry, there should always be a zinc pan filled with water on the top of the stove, of the same size as the square of the stove, and about three inches deep. It is a good plan also to keep water standing in a watering-pot on the other side of the house. The fire in the stove should not be suffered to go out, at least as seldom as possible, as it produces too great a change of temperature. The expense of heating with these stoves is so trifling, that I cannot help thinking many of your readers may be glad to know how well they answer when properly attended to.—*J. W.* [Exactly so—when properly attended to. We, personally, think very highly of them, and use them continually; but we do not recommend them—because people will *not* attend to them properly.]

Iris fimbriata or *Chinensis.*—Never having seen this plant cultivated in the manner which renders it one of the most delightful flowers that it is possible to have through the winter months, both as regards splendour, agreeable fragrance, and long continuance in bloom, I beg to communicate to you my method of cultivation. It is well known to every one who has had it for a short time in his collection, that it sends up suckers from the root in very great abundance, if suffered to do so. This is what has always kept it in the background in most collections of plants ; although it has been an inhabitant of our stoves for the last fifty years : but we have not a plant that possesses greater attractions when judiciously treated. I treat my plants as I do Pine-suckers, but without bottom-heat ; and although they will grow in the temperature of the common greenhouse, they do better in that of a Pine-stove. It is of the utmost importance to make the best use of the summer and autumnal months, so as to get the plants as sturdy and vigorous as possible before they show for blossom—the same as in growing the Pine-apple. If I have a stock of young plants which I had kept through the winter (the greenhouse is the best for the purpose of hybernating, as it keeps them more dormant, and they are excited more vigorously when required), I shake them out of the soil, and trim the roots very close, as I do my Pines, examining them carefully so as to clear them of all the small excrescences, or suckers in embryo. I then repot them in good, rich compost, first into small pots, so as to keep the roots always close to or near the side of the pot, and place them in the stove, or into a warm pit or frame, as near the glass as possible, watering them with the same care as Pines. Before the plants get any check, by the roots becoming too much matted for want of pot-room, I shift them into larger pots, being careful never to *over-pot* them. Almost every time I repot them, I find it necessary to shake the soil from them which has become exhausted of the plant's peculiar food ; as well as on account of the disposition which they have to throw up suckers from the root, and of which they should be entirely divested. If the plant appears to require it, I shift it into a larger pot; if not, I repot it into the same in fresh food, which will compensate much better than an over-sized pot. I approve of the *common* flower-pot, being neither *under* nor *over* burnt, for most plants that it is desirable to grow in a pot; for if the compost be judiciously selected, and the plants are watered according to their nature, with a proper temperature, they will not fail to prosper. As I find it needful to push my plants on, I repot them four or five times in the season; and they will send up a branch a yard high, with a long succession of very superior blossom to what they usually produce. The stock may be kept in a greenhouse, and if the temperature be not too low they will bloom there in the winter; but to keep them in longer succession, some should be placed in the stove early in autumn, and as they come into flower they should be removed where most agreeable, and others replaced in the stove, in succession for blooming. Whilst those, by the divestment of all suckers, &c., are preparing for the blooming season, it is better that a few pots should be left, and encouraged to produce their suckers, which they will do abundantly, so as to be the more certain of a supply of good plants by the middle of February,—the proper season to start them for their summer growth. The old plants should be cast away when they have done flowering, or else headed down, and repotted into fresh compost, if required to produce suckers or plants for next season.—*J. Mearns, F. H. S., Leeds Bot. Garden.*

On the Summer Management of Heaths.—My Heaths are all placed in a pit facing south, on a slate platform or stage. The plants are sufficiently distant not to touch one another; but the chief point is, having the pots all plunged in moss. The lights have been off since June last, so that they have the full influence of the sun and air; and the plants are very healthy and bushy, and flower freely. Heaths, being natives of the Cape of Good Hope, would not suffer from the heat of the sun in this climate, if the roots are protected: and this the Moss does effectually, and keeps them cool and moist also.—*W. G. Bradford, Cork.*

Fuchsia fulgens.—In addition to the notices respecting this plant contained in your 32d Number, I beg to inform you that I turned a plant out of a pot two months ago, when nearly coming into blossom, into a border under a western wall, without any special preparation. It has blossomed beautifully ever since, and still displays a fine bloom.—*P. L., Brecon.*

Prices of Orchidaceous Plants.—At Mr. Skinner's last sale I observe that a little Notylia, one of the most insignificant of its race, was knocked down to some happy gardener, at the *small* price of three pounds fifteen shillings. It was described in the catalogue as follows:—"This *splendid* plant bears a *small* beautiful *little white* flower, exceedingly fragrant, and, as will be seen by the flower-stem, in number exceeding hundreds; in high health, and supposed for the first time alive in Europe."—*Caveat emptor.*

Carnations.—An assertion has been publicly made, which, if not contradicted, may pass as truth, "that Martin's splendid Scarlet Bizarre beat 12 blooms of Don John at the Floricultural Society's Show in July last." I was the only person who exhibited 12 blooms of the Don, "but not for competition," having set them up for Mr. Twitchett "for exhibition only." I showed one bloom only for the Society's prize, for the best Carnation.—*R. Headly, Stapleford.*

To preserve Seeds.—In a late Number of the *Chronicle,* there is an article on the vitality of seeds, in which it is mentioned that porous jars are used for the purpose of preserving them. I would suggest the use of wooden bottles instead of earthenware jars; because I know from experience that deliquescent salts will keep better in well-made wooden boxes than in either stoppered glass bottles or jars. The two last, being cold bodies, have a tendency to condense any moisture which may exist in the air, contained in the vessel in which the seeds are preserved; wood being a non-conductor of heat, is also on that account a more suitable material than either stone or glass, as it would preserve a more equable temperature in the vessel throughout the year. Turned bottles, about two inches long by one inch deep, might be procured in quantity for something like twopence each, which I should imagine would be large enough for experimental purposes. Such paper (made of woollen substances) as the Dutch toys are wrapped up in would be very proper for tying over the mouth of them; being porous, it would not obstruct evaporation from the interior of the bottle; and it would at the same time prevent any damp air from entering it.—*H. L., Hull.*

Extraordinary Crop of Strawberries.—In a garden at Hawkshed, occupied by Mr. J. Baisbrown, gardener and seedsman, there is a patch of ground which was last August planted with Strawberries, the plants being then three years old, and the ground measuring about ten yards square. The crop of Strawberries has been immense, not less than ninety-five quarts of this delicious fruit, of excellent quality, having this year been gathered from these plants.—*M. Saul.*

Fondness for Indigenous Plants.—A patriotic Englishman declared himself to be so attached to his native Flora, that he would willingly sacrifice the rarest foreign production for the plant of Barclay and Perkins's brewery. This last-mentioned specimen is considered to be nearly unique; it is Exogenous and Polyœcious, has overspread two-thirds of the borough of Southwark, and is worth half-a-million of money. For the information of the unlearned, Exogenous means that which is constantly growing on the outside, and Polyœcious that which has many houses.

Extraordinary Growth of a Scotch Fir.—A Scotch Fir, about 8 years old, began growing in the spring, like others in the same plantation; but when the leading shoot had grown about 6 or 7 inches, the buds on the top of the young shoot, which, in most cases, would have remained buds until the spring of 1843, burst forth into side branches, and another leading shoot began to grow, with a new set of buds upon it. An old man, who has worked many days of his life in young plantations, says that he never recollects to have seen anything of the kind before. Can any explanation be given of such a circumstance, or must it be set down as one of the freaks of nature?—*Peter Mackenzie.* [This is probably caused by the heat and dryness of the season, which, when rain has fallen, forces vegetation almost as much as if in a hotbed.]

Larch Fence.—Captain A. recommends those who travel from Dolgellen to Bala to notice a Larch fence between the four and five mile stone.

The Portugal Laurel.—I thank your correspondents who have replied to my question, as to the injurious effects of the Laburnum seeds on cattle; and I would venture to follow up the inquiry by asking, whether the leaf of the Portugal Laurel contains any principle, existing in it in sufficient force or quantity, to prove injurious to sheep or cattle? and also whether they would feed upon the leaves, if allowed access to them? I have considerable doubt on the latter point, having witnessed an instance where sheep were allowed to range through a shrubbery of evergreens which skirted a lawn or paddock, and where the greatest ravages were committed by them on the Laurustinus, without, as I could perceive, any attack on the Portugal Laurel, although abounding on the spot, and even reached with greater ease than the Laurustinus, from the branches in many instances trailing on the ground. It would save me some beautiful specimens of Portugal Laurel, to be assured that they were themselves not subject to be fed upon by animals, nor destructive to them if so liable.—*Omikron.*

Russian Method of Preserving Green Peas.—Shell, scald, and dry them in the manner recommended last week; put them on tins or earthen dishes in a cool oven, to harden; and keep them in paper bags hung up in the kitchen. When required for use, let them lie an hour in water, set them on the fire in cold water, with a bit of butter and a sprig of Mint, and let them boil until ready for table.—*Muscipula.*

To preserve Green Peas.—I have used the following plan of preserving Green Peas till Christmas with success for many years. Gather Peas (varieties which are green when ripe) when fit for the table, lay them to dry in the pods over the hothouse flues, or on any place where they can have a continual gentle warmth. When perfectly dry, put them away in a dry drawer till wanted, and whether it be at Christmas, or even the following spring, if steeped in cold water for 24, 30, or 36 hours before boiling, they will be found nearly equal in every respect to Peas fresh gathered.—*P. Green.*

Boxes for the Preservation of Gooseberries.—Sweet sir,—With every deference, I think you are wrong in your estimate of the expense that might attend the adoption of the plan of a "*Journeyman Gardener*" to mature Gooseberries *under boxes open at three sides*, and of course, without *bottoms.* If your "journeyman gardener" would only take a journey to that garden of the west, sweet Connaught, he might obtain numbers of them at little cost: the pisantry of that amiable country keep their shoes and stockings in them—and the hinges and locks being on the *wanting* parts render these boxes particularly secure. To be sure, the three absent sides are to be superseded by canvas, which is to let in air and light—still, I suppose, in the Irish fashion, by having all the canvas cut out; as the Dublin fishing-boats reef their sails (with large holes to let the wind through).—In fine weather, when all the sail is required, they fill the holes up with their bedding, *i. e.*, straw. Let a "journeyman gardener" take a hint from these sons of St. Peter. You are no doubt aware that a Connaught stocking is thus described, "a footless stocking without a leg to it." Consequently a box with three sides, and a bottom absent, would be an appropriate garde-robe.—Yours, sweet sir, *Woodend.*

To prevent the Destruction of Turnips by the Flea.—During my short experience as an amateur gardener, I have been, like my neighbours, dreadfully annoyed by those mischievous little insects, the Turnip-fleas; and all sovereign remedies having failed in destroying the marauders, I determined to try experiments in sowing the seed at different periods, so as to insure a good winter crop. I have at last come to the conclusion, that getting the plants up in rough leaf by the 1st of August is the most satisfactory way of avoiding the enemy. Should the weather prove dry, when I wish to put my seed in, I soak the soil well overnight, and keep it moist till my plants are safe, which they will be, if the seed is perfect, in the course of a few days. I consider the flea to be in the embryo state between the 15th of July and the 1st of Aug., which will, if I am correct, account for the escape of the Turnip crop. Perhaps some of your readers can enlighten me on this point; and I hope they will next year adopt my suggestions as to sowing, &c., and report the result *pro bono publico.* I imagine it would be too late to sow field Turnips at the time above mentioned. I find soap-suds, saved from the laundry, improve all vegetable crops amazingly. I allow them to stand three or four days in a large tub before using.—*W. W.*

To destroy Wasps.—I see that the Wasps are beginning to excite attention. A nest was effectually destroyed here by firing a gun into the aperture, and then pouring down some tar, which would fix (as Jonathan would say) both the insects at home, as well as the out-lyers on their return.—*Samuel Buckland, Belmont, Faversham.*

Effects of Turpentine upon the Red Spider.—A neighbouring medical gentleman had a greenhouse sadly infested with red spider and the green-fly, so much so, that the whole stock was nearly eaten up. Knowing the effects of turpentine on insect life in his medical practice, the idea struck him that he might turn it to account in this case. Accordingly, the floor of the house being laid with flag stones, he sprinkled on the stone-floor from two to three ounces of turpentine, in the morning of what turned out to be a very warm day; and as the sun got strong, the effluvia from the turpentine was so powerful, that it was with difficulty he could breathe in it. The dose has completely killed the spider and most of the fly, without the slightest apparent injury to the plants. He has only tried it once, but he considers, that as turpentine is a vegetable production, and can be used in large doses in the human system without injury to the patient, and that if it is found to be as effectual and harmless in after applications as in the first trial, that it will be the safest and cheapest remedy hitherto used. He will be glad to know whether any one else has ever tried it, and if they have, what have been the results?—*A. Brander, Gardener, Dalvey, Torres.*

The Onion Grub.—I am induced, from some observations in a late Number of your Paper, to mention the total failure of the following expedients in destroying the Onion Grub:—namely, sowing Onions after Turnips, as recommended by a correspondent last year; a copious soaking with sea-water; and lastly, a plentiful sprinkling with common salt. Spirits of tar, applied both in a liquid state and mixed with sand, I have also found of no benefit to Carrots. The Onion crop in the north of Ireland has completely failed this year, which proves that a dry season is favourable to these pests.—*E. F. L.*

Preservation of Filberts.—Having a great crop of Filberts this year, I should very much like to know how to preserve them with the husks on. I have tried various ways, but never could manage to make them look like those sold by the fruiterers.—*A Gardener.*

PROCEEDINGS OF SOCIETIES.

BOTANICAL AND HORTICULTURAL SOCIETY OF NEWCASTLE-UPON-TYNE.

THE annual meeting of the Botanical and Horticultural Society for the counties of Durham and Northumberland, and Newcastle-upon-Tyne, was held at the Queen's Head, in Newcastle, on the 19th inst., and was rather numerously attended. Jas. Archbold, Esq., took the chair, and called upon the Secretary, Geo. Wailes, Esq., to read the report for the past year, which, we are sorry to say, contained no very flourishing statement of the affairs of this important and interesting Society; but as it suggested some improvements in its management likely to be conducive to the interests of the Society, we hope a more favourable report of its operations will have to be made next year. The chairman then distributed to the successful competitors during the past year the numerous medals which had been awarded as prizes, and a ballot took place for the Officers for the ensuing year. Geo. Silvertop, Esq., of Minster Acres, was elected president, and the other officers were re-elected almost unanimously. The chairman stated that the prize of three guineas to the gardener who could produce the best testimonials of his abilities, and of the greatest length of servitude in one family, had been awarded by the committee to Mr. Thos. Wallis, gr. to Christopher Blackett, Esq., Wylam Oakwood, in whose service he had been twelve years, and a testimonial was read, highly creditable to the skill of Mr. Wallis, as a practical and scientific gardener. Mr. Wailes, the Secretary, then addressed some valuable remarks to the meeting, on the subjects of the new manures, Guano, Nitrate of Soda, &c.; the management of fruit-trees; the nature of composts; and recommended the members of the Society to make experiments, and communicate to the Society the results, as it was only by the test of experiment, improvement in the science of Horticulture could be attained. Mr. Wailes concluded his observations by recommending the members of the Society carefully to read the *Gardeners' Chronicle*, as they would find in that valuable publication much interesting information, and all that was really new and important, both in plants and the management of the garden.—The August show of fruits and flowers was afterwards held in the Music Hall, Nelson-street; the fruits were much finer than were ever seen at any previous show, but there was a very scanty display of flowers. How is this? It ought not to be, with such a splendid season, at this time of the year! The list of prizes speaks for the successful competitors, but we must not omit to notice the very fine Grapes, Peaches, and Jargonelle Pears, from Mr. Hedley, gr. to Sir J. Trevelyan, Bart.; the Grapes from Mr. Wallis and Mr. Kelly; the Melons from Mr. Cook, Mr. Kelly, Mr. Hedley, and Mr. Foreman; the Peaches from Mr. Clarke and Mr. Wallis; the Apricots from Mr. Kelly and Mr. Wallis; the Jargonelle Pears from Mr. Strother, gr. to — Johnson, Esq., Mr. Kelly, and Mr. Wallis; the Plums from Mr. Clarke; and the Gooseberries from Mr. Reid. Mr. Hedley also sent some of the largest and finest Celery that has ever been seen in the North, beautifully blanched to a great length, for which an honorary medal was deservedly awarded. The Carnations and Picotees were much admired, particularly those belonging to Mr. Cook, Mr. Wilson, Mr. Rawlings, and Mr. Buckham. The Dahlias of Mr. Deans, gr. to Miss Cuthbert, particularly the self-coloured, and also the variegated ones of Mr. Cook, were most splendid flowers. Among the greenhouse plants we noticed fine specimens of Gloxinia rubra, from Mrs. Surtees, and Erica refulgens and Salvia patens, from Mr. Deans. An unusually fine bouquet of Russian Stocks was shown by Mr. Strother, which certainly merited an honorary medal. It is of no use for the Society to reserve its prize for Russian Stocks till September or October, as at that season there are no blooms fit to bring to the show-room. The seedling Dahlias shown by Mr. Cook were very beautiful, particularly the French white finely tipped with carmine; this promises to be a first-rate and very choice flower. Mr. R. Charlton, of Wall, exhibited (but not for competition) some fine specimens of Dahlias, Carnations, and Picotees; and, as an encouragement for the production of such splendid blooms, an honorary medal was very properly awarded to him.

The prizes were awarded as follows:—PINES: The best-flavoured Pine, the silver medal to Mr. G. Foreman, gr. to J. Lamb, Esq.; the second best, the 2d silver medal to Mr. W. Kelly, gr. to A. Donkin, Esq. GRAPES: The best dish, Black Hamburgh, Black Emperor of Morocco, Black Lombardy, Black Damascus, Muscat of Alexandria, White and Grizzly Frontignan, the silver medal to Mr. J. Reid, gr. to W. Losh, Esq.; the second best Black Hamburgh, Muscat, White Frontignan and Aleppo, the bronze medal to Mr. J. Reid. MELONS: The best-flavoured, Egyptian improved Green-flesh, the second silver medal to Mr. J. Reid. PEACHES: The best dish, from an open wall, the silver medal to Mr. N. Billau, gr. to the Rev. J. Cook. NECTARINES: The best dish, from an open wall, the silver medal to Mr. N. Billau. APRICOTS: The best dish, the second silver medal to Mr. J. Scott, gr. to H. Lamb, Esq. PEARS: Jargonelle, the second silver medal to Mr. J. Scott. PLUMS: The best dish, the second silver medal to Mr. J. Clark, gr. to Mrs. Bewicke. GOOSEBERRIES:

The dish of best-flavoured, the bronze medal to Mr. J. Moderill, gr. to T. Taylor, Esq. Currants: The best dish, the bronze medal to Mr. G. Foreman. Basket of Fruits: The best ornamental basket, the silver medal to Mr. T. Wallis, gr. to C. Blackett, Esq.; the second best, to Mr. T. Watson, gr. to Mrs. Kirsopp. Carnations: The best Corinthus, the silver medal to Mr. I. Scott; the second best, Lord Rodney, the second silver medal to Mr. J. Cook, gr. to E. J. Collingwood, Esq.; the best bouquet of six sorts, Lord Rodney, Lady Kay, Corinthus, Lady Ridley, the second bronze medal to Mr. I. Scott. Picotees: The best Yellow, Master Campbell, the second silver medal to Mr. I. Scott; the best other double Picotee, Rosella de Rohan, the second silver medal to Mr. I. Scott; the best bouquet of six, Master Campbell, Miss Campbell, Ely's Elizabeth, Will Stoutly, Beauty of Bailey, Fair Flora, the bronze medal to Mr. I. Scott. Greenhouse Plants: The best Salvia (S. patens), the second bronze medal, to M. W. Dunn, Esq., Hedgefield House. The best Fuchsia (F. fulgens), the second bronze medal to Mr. Jas. Reid. The best Exotic (Roella ciliata), the second silver medal to Mr. W. Kelly. The second-best Exotic (Strelitzia Regina), the bronze medal to Mr. Jas. Charlton, gr. to C. Allhusen, Esq. Dahlias: The best six (Maid of Bath, Whales' Phenomenon, Beauty of the Plain, Conqueror of the World, Duchess of Richmond, and Egyptian King), the second silver medal to Mr. J. Watson, gr. to M. Anderson, Esq. The best six Self-coloured (Pickwick, Rouge et Noir, Maresfield Rival, Springfield Rival, Marquess of Lansdowne, and President of the West), the bronze medal to Mr. J. Watson. Bouquets of Flowers: The best Bouquet, the silver medal to Mr. Thos. Watson; the third best, the second bronze medal to Mr. Geo. Foreman. Honorary Prizes: A bronze medal to Mr. Thos. Charlton, gr. to Mrs. Atkinson, for a Bouquet of French Marigolds; a bronze medal to Mr. R. Charlton, gr., for beautiful collections of Dahlias, Carnations, and Picotees; and a bronze medal to Mr. A. Hedley, gr. to Sir J. Trevelyan, Bart., for six extraordinary large heads of Celery. The next exhibition of the Society will be held on the 26th Sept., when there will be a grand show of Dahlias.

COUNTRY SHOWS.

Bath Royal United Horticultural Society, July 21.—The fourth exhibition took place in the Victoria Park. The following is a list of the prizes:—Florists' Flowers and Cut Flowers. *Class* 1, *for Nurserymen.* Carnations and Picotees: 1, Mr. Sealey; 2, Mr. Miller; 3, Mr. Walters. Roses: Mr. Cole. Ornamental basket of Cut Flowers: 1, Mr. Lidiard; 2, Mr. Kitley. *Class* 2, *for Amateurs.* Carnations: 1, W. S. Jacques, Esq.; 2, G. C. Tugwell, Esq.; 3, Mr. Nias. Picotees: 1, W. S. Jacques, Esq.; 2, Mr. Parker; 3, G. C. Tugwell, Esq. Roses: 1, Miss Bayley. Ornamental Basket of Cut Flowers: 2, Mr. Ford. Flowering Plants in Pots. *Class* 1, *for Nurserymen.* Stove Plants, 1, Messrs. Salter and Co. Greenhouse Plants, 1, do. Calceolarias, *Shrubby*, 1, do. *Herbaceous*, 1, do. Cape Ericas, 1, do. Balsams, 1, do. Cockscombs, 1, Mr. Minty. Ornamental Basket of Plants: 1, Messrs. Salter and Co.; 2, Mr. Drummond. *Class* 2, *for Amateurs.* Orchidaceæ, J. Jarrett, Esq. Stove Plants: 1, do.; 2, Miss Bayley. Ericas, 1, J. M. Yeeles, Esq. Greenhouse Plants: 1, do.; 2, J. Jarrett, Esq. Alstrœmerias, 1, Mr. G. Shaw. Amaryllis, 1, J. Jarrett, Esq. Balsams, 1, J. M. Yeeles, Esq. Cockscombs, 1, do. Tender Annuals, 1, J. Jarrett, Esq. Herbaceous Plants, 1, Miss Bayley. Ornamental Basket of Plants: 1, J. M. Yeeles, Esq.; 2, Mr. G. Shaw. Indigenous Specimens, 2, Mr. Kitley. Fruit. Pine-apples: *Queen*, 1 and 2, Mr. Richardson; *Black*, 1 and 2, Mr. Spencer, gr. to the Marquis of Lansdowne. Grapes: *Black*, 1, Mr. Spencer; 2, W. Miles, Esq., M.P.; *White*, 1, G. C. Tugwell, Esq.; 2, W. Miles, Esq., M.P.; *best bunch of any sort*, 1, Mr. Spencer. Melons: 1, W. S. Jacques, Esq.; 2, Miss Whitehead. Peaches: 1, Miss Hooper; 2, Mr. Spencer. Nectarines: 1, Mr. Spencer; 2, W. P. Jilliard, Esq. Apricots: 1, Mr. W. Salter; 2, J. Wiltshire, Esq. Cherries: 1, Hon. Capt. Howard; 2, Mr. Piatt. Plums: 1, W. Miles, Esq.; 2, Mr. Ford. Strawberries: 1, R. Cruttwell, Esq. Apples: 1, Mr. J. Cook; 2, Rev. J. B. Doveton. Raspberries: *Red*, R. S. Cruttwell, Esq.; *White*, 1, Mr. Piatt. Currants: *Red*, 1, Mr. Lidiard; 2, Hon. Capt. Howard; *White*, 1, R. S. Cruttwell, Esq.; 2, Mr. Salter; *Black*, 1, R. S. Cruttwell, Esq.; 2, Mr. Lidiard. Gooseberries: *Red*, 1, G. C. Tugwell, Esq.; 2, Mr. Piatt; *Green*, 1, Mr. G. D. Fisher; 2, Miss Bayley; *Yellow*, 1, Mr. Rogers; 2, Mr. Piatt. Vegetables.—Collection of Peas, Tomatoes, Artichokes, Vegetable Marrow, Scarlet Runners: 1, Mr. J. Cook; 2, Mr. Sparks; 3, G. C. Tugwell, Esq. Collection of Celery, Lettuces, Garden Turnips, Carrots, Onions: 1, Mr. J. Cook; 2, Mr. Lidiard; 3, Miss Bayley. Salad: 1, T. Emerson, Esq.; 2, Mr. Cooper. Sweet Herbs: 1, Mr. Sparks. Extra Prizes.—*Picotees*, Mr. Cole; *German Stocks*, Mr. Minty; *Salad*, Mr. J. Cook; *Seedling Fuchsias*, Miss Bayley; *Collection of ditto*, J. M. Yeeles, Esq.; *Ornamental Basket of Plants*, Miss Bayley; *Specimen of Fuchsia*, Mr. Ford; *Sollya linearis*, J. M. Yeeles, Esq.; *Statice puberula*, Miss Bayley; *Balsams*, J. Jarrett, Esq.; *Pine*, Mr. Richardson, gr. to R. J. Blewett, Esq., M.P.; *Grapes*, Miss Bayley; *Pine*, Mr. Richardson; *Grapes*, Mr. Murray, gr. to the Marquis of Bath.—*Bath Herald.*

Cambridgeshire Horticultural Society, July 20.—The July exhibition was held in the large room, at the Hoop Hotel. There was a good supply of fruit and flowers. The following was the award of prizes:—*Pine:* Queen, Mr. R. Headly. *Melon:* 1, Persian Green-flesh, Mrs. R. Foster; 2, Hampton Court, Mr. Newman. *Bunch of Black Grapes:* 1, Black Hamburgh, Mr. Catling; 2, Black Cluster, Mr. R. Headly. *Bunch of White:* Willmott's New Muscat, Mr. R. Headly. *Peaches* (six best): Noblesse, Mr. R. Headly. *Cherries for flavour:* 1, May Duke, Mr. Giddens; 2, May Duke, Mr. R. Headly. *Raspberries*, 1, Mr. J. Taylor; 2, Mr. Wood, of Huntingdon. *Red Gooseberries*, 1, Mr. Giddens; 2, Companion and Roaring Lion, Mr. Green. *White*, 1, Mr. Giddens; 2, Mr. Wood. *Yellow*, 1, Mr. Giddens; 2, Mr. J. Taylor. *Green:* 1, Champagne, Mr. Newman; 2, Mr. Giddens. *Heaviest:* 1, Companion, Mr. H. Green; 2, Mr. Giddens. *Gooseberries for flavour:* 1, Champagne, Mr. H. Green; 2, Messrs. Hudson. *Red Currants*, 1, Mr. Giddens; 2, Red Grape, Mr. Gimson. *White:* 1, White Grape, Mr. Green; 2, Mr. Potter. *Five Carnations: Medal*—Don John, Paul Pry, Empress of Purples, Queen of Scarlets, and Lady Ely, Mr. Headly; 2 (classed *ad meritum*), do.; 3, Don John, Ely's Lord Milton, Twitchett's Queen of Scarlets, Headly's Incognita, and Wilson's Harriet, Mr. Twitchett; 4, Lascelles's Queen of Sheba, Addenbrooke's Lydia, Pearson's Sir George Crew, Earl Fitzwilliam, and Wakefield's Paul Pry, Mr. Wood. *Seedling Carnation*, 1, Mr. R. Headly; 2, do.; 3, Mr. J. E. Marshall. Six *Picotees:* Vespasian, Sarah, Green's Victoria, Invincible, Hector, and Lord Althorp, Mr. R. Headly; 2, Wood's Queen, Green's Queen, Giddens' Vespasian, and three Seedlings, Mr. Giddens; 3, Mr. R. Headly. *Seedling Picotee:* 1, Nannette, Mr. R. Headly; 2, Mr. Giddens. Six *Dahlias:* Widnall's Argo, Widnall's Majestic, Rouge et Noir, Andrew Hofer, Ruby, and Seedling, Mr. Widnall; 2, Beauty of the Plain, Ruby, Unique, Nicholas Nickleby, Rival Sussex, and Lewisham Rival, Mr. Ready. Three *Balsams*, Mr. Ready. *Cockscomb*, 1, Mr. Newman; 2, Mrs. R. Foster. *Plant in a pot*, 1, Mr. Widnall; 2, Mr. Green. *Collection of Plants in pots* (exceeding 40), Mr. Widnall. *Collection of Plants in pots* (not exceeding 40), Messrs. Hudson. *Collection of Cut Flowers*, 1, Mr. Ready; 2, Mr. Newman. Two *Lettuces*, 1, Mr. Green; 2, Mr. R. Headly.—Extra Prizes. *Strawberries:* Elton Pine, Mr. Newman. *Basket of Vegetables*, Mr. Newman. *Onions:* Tripoli, Mr. Green.—Cottagers' Prizes were likewise liberally distributed. —*Cambridge Chronicle.*

Devon and Exeter Horticultural Society, July 25.—This exhibition took place in a department of the Higher Market, Queen Street. The following is the list of prizes:—Fruit.—*Best dish of mixed Grapes, a silver medal*, Mr. Mason, gr. to Sir J. Kennaway. *Best dish of Black Grapes*, Mr. Griffin. *Ditto White*, Mr. Bray. *Melons*, 1, Rev. J. Dornford; 2, T. Porter, Esq. *Best dish of six Apricots*, F. Cross, Esq. *Six Peaches*, T. Porter, Esq. *Purple Plums*, Mr. Mason. *White Cherries*, Sir J. Kennaway. *Black do. (not Morellos)*, Mrs. Wyatt. *Red Gooseberries*, L. Ponsford, Esq. *White do.*, Sir T. D. Acland. *Amber do.*, T. Porter Esq. *Green do.*, J. W. Buller, Esq. *Champagne Currants*, Sir T. D. Acland. *Red Currants*, F. Cross, Esq. *White and Black, do.*, Sir T. D. Acland. *Raspberries, Red and finest flavoured*, J. W. Buller, Esq. *Ripe dessert Apples, the growth of the present year*, F. Cross, Esq. *Ripe dessert Pears, not less than six*, W. Hooper, Esq. Extra Fruit.—*Pine Apple*, 2¼lbs., Sir T. D. Acland. *2lbs. 2oz.*, Mr. Bray. *White Cherries*, J. W. Buller, Esq. *Pears and Royal Guinea Gooseberries*, H. Porter, Esq. Vegetables.—*Best Brace of Cucumbers*, W. Hooper, Esq. *Best dish of Peas, Dwarf Kidney Beans*, Sir J. Kennaway. *Scarlet Runners*, H. Porter, Esq. *Artichokes*, Mrs. Wyatt. *Cabbages*, Mrs. Mitchell. *Cauliflowers* Sir, J. Kennaway. *Cos Lettuces*, Sir T. D. Acland. *Cabbage do.*, L. Ponsford, Esq. *Dish of Red Potatoes*, Mrs. Mitchell. *White*, Sir J. Kennaway. *Kidney Seedling, raised by the exhibitor*, J. W. Buller, Esq. *Dish of Onions, growth of* 1842, H. Porter, Esq. *Shallots*, J. W. Buller, Esq. *Bunch of* 12 *Turnips*, Sir J. Kennaway. *Carrots*, T. Porter, Esq. *Celery*, J. Huxham, Esq. *Collection of Vegetables* (90 *sorts*), Sir J. Kennaway. Extra Vegetables.—*Cucumbers*, T. Porter, Esq. *Onions*, J. Ponsford, Esq. Flowers and Plants.—*Orchidaceæ, best group of* 6, Mrs. Wells; 2, J. W. Buller, Esq. *The newest and best specimen*, 1, Mrs. Wells; 2, J. W. Buller, Esq. Stove Plants (*not Orchidaceæ*).—6 *best Specimens*, 1, J. W. Buller, Esq.; 2, Mrs. Wells. *Newest and best do.*, 1, Mrs. Wells; 2, J. W. Buller, Esq. Greenhouse Plants.—*Best group of* 12, 1, Mrs. Wells; 2, J. W. Buller, Esq. 12 *best Cape Heaths and* 6 *best do.*, Mrs. Wells. 6 *best new Fuchsias*, 1, J. W. Buller, Esq.; 2, Mrs. Wells. *Best Seedling Pelargonium, silver medal*, J. B. Swete, Esq. Herbaceous Plants.—*Best* 12 *Hardy Plants*, 1, Mr. J. Clark; 2, Sir T. D. Acland. *Newest and best Single Specimen*, Mrs. Granger. 6 *best Verbenas*, 1, J. W. Buller, Esq. Roses.—*Best Collection of any kind*, 1, H. Porter, Esq.; 2, F. Cross, Esq. Carnations and Picotees.—*Best stand of* 12 *Carnations and* 12 *White Ground Picotees, silver medal, and* 6 *best Bizarres*, 1, Mr. Colson; 2, Mrs. Wells. 6 *best Flakes*, 1, Mr. Colson; 2, Mr. J. Clark. 12 *best Picotees*, Mrs. Wells. 6 *best Yellow*, 1, Mr. Gray; 2, Mrs. Wells. Heartsease.—*Best* 24 *sorts*, 1, F. Cross, Esq.; 2, T. Porter, Esq. 12 *newest and best sorts*, 1, J. Couche, Esq.; 2, Mr. Clark. Tender Annuals.—6 *best Cockscombs in pots, do. Balsams*, J. W. Buller, Esq. *Newest and best of any kind*, T. Porter, Esq. Extra Flowers. —*For* 12 *Carnations and* 12 *Picotees*, Mr. J. Clark. *Collection of Heartsease*, J. Couch, Esq. *Stove Plant*, Mrs. Wells. *Herbaceous Plants*, J. W. Buller, Esq. *Coffee Plant, Myrtle, Orange, and Sago Palm*, J. Milford, Esq. Numerous Cottagers' Prizes were likewise distributed.—*Exeter and Plymouth Gazette.*

Guernsey Horticultural Society.—The following prizes were awarded at this exhibition:—Large Medal: 6 *Seedling Pelargoniums*, Mr. Cockburn. 6 *Seedling yellow Picotees*, Mr. J. Vidamour. Sweepstakes' Large Medal: 6 *Seedling Pelargoniums*, Mr. Hoyle. Small Medal: *Ipomæa Learii and other Plants*, Mr. Hoyle. Premium Cards: *Bouquet*, Mrs. Ram. *Carnations and other Plants*, Mr. H. Dobree, jun. *Miscellaneous collection of Plants*, Mr. Cockburn. Honorary Prizes—Flowers: *Seedling Yellow Picotee*, Mr. Cockburn. 6 *Seedling do.*, Mr. Cockburn. *Named do.*, 1, Mr. H. Dobree, jun.; 2, Mr. J. Vidamour. 6 *Named*, 1, Mr. H. Dobree, jun.; 2, Mr. J. Vidamour. *Seedling, white ground*, Mr. Cockburn. 6 *Seedling White Picotees*, Mr. Cockburn. *Purple edge*, 1 and 2, Mr. H. Dobree, jun. *Red edge*, 1, do.; 2, Mr. Cockburn. *Seedling Rose or Pink*, do. *Seedling Scarlet Bizarre Carnation*, 1 and 2, do. *Scarlet Flake Carnation*, Mr. H. Dobree, jun. *Purple Flake*, do. *Rose or Pink Flake*, Mr. J. Vidamour. *Crimson Bizarre*, do. *Purple and Pink Bizarre*, Mr. H. Dobree, jun. *Scarlet Bizarre*, do. 6 *Carnations*, do. *Collection of Cut Flowers*, Mr. J. Vidamour. *Stove Plant* (Achimenes longiflora), Mr. Hoyle. *Greenhouse do.*, (Lílium lancifólium punctatum), Mr. H. Dobree, jun. *Collection of Greenhouse Plants*, do. *Calceolaria*, Mr. Hoyle. *Pelargonium*, Mr. Cockburn. 6 *do.*, do. *Best Heath*, do. *Collection of Heaths*, do. *Best Dahlia*, Mr. J. Vidamour. *Collection of Dahlias*, 1, do.; 2, Mr. Cockburn. *Collection of Seedling Gladíoli*, Mr. J. Vidamour. *Alstrœméria*, 1 and 2, Capt. Appleton. *Balsam*, 1, Mr. Cockburn; 2, Mr. J. Vidamour. *Collection of Balsams*, 1, Mr. Cockburn; 2, Mr. J. Vidamour. *French Marigolds*, do. *African do.*, do. *Pansies, seedlings and others*, Mr. H. Dobree, jun. *Bouquet*, 1, Mrs. Ram; 2, Capt. Appleton. *Petúnias*, Mr. C. De Jersey. *Verbenas*, Mr. Cockburn. *Sálvia patens*, do. Fruits.—*Bunch of White or Yellow Grapes* (*Hothouse*), Sir O. Carey. *Bunch of Red or Purple do.*, Mr. G. W. Hoyle. *Melon, green-fleshed*, Sir O. Carey. *Do., not green-fleshed*, do. *Peaches*, Mr. T. Andros. *Apricots*, Sir O. Carey. *Apples of* 1842, 1, Mr. J. Vidamour; 2, Sir O. Carey. *Plums*, Mr. J. Vidamour. *May-duke Cherries*, Mr. T. Andros. *Morello*, do. *Red Antwerp Raspberries*, Mrs. Ram. *Other Red*, Mr. H. Dobree, jun. *White Antwerp*, Mr. T. Andros. *Seedling Gooseberries*, Mr. J. Vidamour. *Hairy Red*, Mr. Cockburn. *Smooth Red*, Sir O. Carey. *Smooth Green*, Mr. Cockburn. *White*, Mr. H. Dobree, jun. *Hairy Yellow*, Mr. Cockburn. *Red Dutch Currants*, Capt. Appleton. *White*, do. *Black*, Mr. H. Dobree, jun. Vegetables. —*Basket*, Sir O. Carey. *Vegetable Marrow*, Capt. Appleton. *Artichokes*, Sir O. Carey. *Cucumbers*, Capt. Appleton. *Green Peas*, Mr. J. Vidamour. *Broad Beans*, do. *French Beans*, Mrs. A. Laine. *Carrots*, Mr. J. Vidamour. *Parsneps*, Mr. P. Martin. *Cabbages*, Mrs. Ram. *Round Potatoes*, Sir O. Carey. *White Onions*, do. *Portugal*, Mr. P. Martin. A great number of Cottagers' Prizes were also awarded.

NOTICES OF NEW PLANTS WHICH ARE EITHER USEFUL OR ORNAMENTAL.

Mormodes lineatum. Streaked Mormodes. (*Stove Epiphyte.*) Orchidáceæ, § Vándeæ. Gynándria Monándria.—This curious species is a native of Guatemala, whence it has been sent by both Mr. Skinner and Mr. Hartweg, who were attracted to its seat among the almost inaccessible branches of trees overhanging a deep stream, by its delicious fragrance. The flowers, when they first appear, are dull olive green, and by no means handsome. They afterwards acquire a bright warm tint, and the markings upon them increase in intensity until they become quite ornamental. This is one of the species which ought not to be cultivated in a high temperature, but which succeeds admirably in a house kept between a greenhouse and stove. In such a situation it grows and flowers freely with very little care, if planted amongst turfy peat in a well-drained pot, or suspended from the rafters in a basket or forked block of wood. Great care must be taken of the young shoots, as they are very easily rotted with too much water, when they commence their growth. It is easily multiplied, as it forms numerous pseudo-bulbs on the sides and top of the old ones, as well as at their base.—*Bot. Reg.*

MISCELLANEOUS.

Rhubarb.—A vegetable product of much interest, both in a scientific and commercial point of view, and which is met with in great abundance in Ladakh, is Rhubarb. It is found indeed in many places on the southern, as well as the northern face of the Himalaya, but nowhere in greater abundance than in this part of Thibet, where it approaches the line of country from which all Europe is supplied. On the present occasion, it was procured at Kangra, near Shujanpur, on the Ritanka pass, at Tandi, at Darcha, and almost every where in Ladakh. It grows in some places in such quantities, that two men may dig up in a couple of hours more than three men can carry. Almost all the roots that have come under my inspection, have been found either completely rotten in the middle or in a state of decay; yet even from roots which present little more than a crust of bark, the crown throws out leaves and flower-stems of such luxuriance, as to indicate no sign of rottenness at the root. Indeed, the defect of the principal root is more than compensated by the fibres which it throws out annually, and which supply its place, till they in their turn become large and diseased. The medicinal virtues of the root do not, however, seem to be impaired by this disease, and in various trials which we instituted, the Ladakh Rhubarb was found to be equally as efficacious as that from China, with a much less nauseous flavour. The facility which is thus offered to the supply of Rhubarb, either from the British Himalayan Provinces or from Thibet, would probably soon transfer the trade in this article to British enterprise, if it were once directed to the subject. If inferior in quality to the Chinese or the so-called Turkey Rhubarb, this inferiority, which is by no means established, might very possibly be remedied by care in the cultivation, in the preparation, and in the packing.—*Moorcroft's Travels*, vol. i., p. 300.

Whale Oil Soap.—From the report of the proceedings of the Massachusett's Horticultural Society, we learn that this substance, dissolved at the rate of two pounds to fifteen gallons of water, has proved very efficacious in destroying the Rose slug, aphis, thrips, red spider, and various other insects. The following is the manner in which it is prepared:—Take whatever quantity of soap you wish to prepare, and dissolve it in boiling water, about one quart to a pound; in this state strain it through a fine wire or hair sieve, which takes out the dirt, and prevents its stopping the valves of the engine, or the rose of the syringe; then add cold water to make it the proper strength. Apply it to the plant with a hand-engine or syringe with as much force as practicable, and be sure that every part of the leaves is well saturated with the liquid. Whatever falls to the ground in the application will do good in destroying worms and enriching the soil; and from its trifling cost, it can be used with profusion. Early in the morning, or in the evening, is the proper time to apply it.

Gardener's and Farmer's Foreign Library.—The following works are expected shortly to appear.—Hartig, G. L. Dr.:—Versuch. Essay on the Duration of the different sorts of Wood. Stuttgart, 8vo., with a plate.—Conversations Lexicon for the Forester, and of Forest Natural History, containing the Knowledge of the Soil, Natural History of Forest Plants, &c. Stuttgart, 8vo., second edit.——Sailer, F. S.:—Flora. Flora of Austria Superior. Linz, large 8vo., 51 sheets of impression.——Bayer and Pratz:—Ceres. Ceres, an Agricultural Quarterly publication. Leipzig, 4to.——Abbildungen:—Figures of the most remarkable Varieties of Cattle, Sheep and Swine. Stuttgart, fol.——Schweitzer, A. Dr.:—Lehrbuch. Short Manual of Farming. Augsburg, 8vo., second edit.——Duchesne, E. A.:—Répertoire. Repertory of the Useful and Venomous Plants of the Globe. Paris, 8vo. Also an Atlas to the Repertory, containing 128 plates and a table. Paris, 8vo.

GARDEN MEMORANDA.

Whitmore Lodge, Sunning-hill.—Mr. Mangles has shown, in the laying out of his garden, how much can be done in a place which is not very extensive. The pleasure-ground covers little more than two acres, but it is made to harmonise so well with the beautiful scenery of Virginia Water, and the surrounding country, that the whole has the appearance of being connected with the garden. The way in which this is managed is by a judicious arrangement of the trees, and more particularly of the boundary line. Mr. Mangles pointed out one part, which had been much improved in this respect, by the kindness of a neighbour, who had consented to have one of his trees taken down; the view was thus opened, and the boundary line disappeared. This style of gardening is particularly well suited for such a place as Sunning-hill, removed from the noise and bustle of a large town, and situated in the midst of a rich and beautiful country. The object Mr. Mangles has in view, is not only to have his house surrounded with fine scenery, but also to have his garden almost always gay with flowers. In the earlier part of the year the beds of Erica herbácea or cárnea, and the varieties of Crocus, which are planted in different parts of the garden, and a fine clump of Andrómeda floribunda, must produce a striking contrast with the surrounding scenery. Then the Tree Pæonies, of which there are a considerable number of fine plants; the pretty little Daphne Cneorum, which surrounds clumps of Azáleas and Rhododendrons, and numerous fine specimens of Kálmia latifólia, combine to enliven the garden with flowers of all hues in the early part of summer. There is, in particular, a beautiful bank of Rhododendron ferrugineum, which every visitor must admire. At this season, when early-flowering things have gone by, the garden is particularly gay with clumps of all the best varieties of Pelargoniums, including a fine scarlet kind called Compactum, Smith's Scarlet, Pullen's Victoria, and several varieties of the variegated-leaved, such as Mangles', the gold-edged, &c. We were informed by Mr. Noble, Mr. Mangles' gardener, that there are generally from 5000 to 6000 propagated annually for turning out. This will give a good idea of the effect which is now produced by them. Besides these, there are Lobélias, Calceolárias, Verbenas, and many other autumn flowering plants in full bloom. On the lawn, as single specimens, there are several which are particularly worthy of being noticed. The Abies Deodara is at least 14ft. high, and the Araucária imbricata about the same height: both of these are fine healthy spreading trees. There are also good specimens of Pinus insignis and Sabiniana, as well as several others of this ornamental tribe. Rhododendron Altaclerense and Russellianum are also worthy of notice. Paulównia imperialis, the new hardy tree of which so much has been lately said, is also growing upon the lawn; as well as a fine old specimen of the common Hawthorn, which is very ornamental. In one part of the ground, from which a plant of Berberis repens had been removed, there were a number of young ones springing up all round, which gives a very good hint as to an easy way of propagating them: all that is necessary, is simply to run the spade round the roots, at a little distance from the stems; when the outer fibres, being separated from the parents, form independent plants themselves. In one corner of the grounds, called Mrs. Mangles' garden, there is a fine specimen of Solanum crispum, which stands the winter without protection, and is really a handsome plant. Besides the Heathery and Pelargonium house, which are situated in the flower-garden, there are several houses and pits in the kitchen-garden, which are used for propagating. One of the latter, now filled with

Orchidaceous plants and Melons, is heated in a very simple and efficient manner: the pipes are in a chamber below the bed, and the lower one is carried along a gutter, which can be filled with water at pleasure; the heat and moisture are allowed to come into the upper part by openings in the front, and the plants, by their healthy appearance, plainly show that they like such treatment. This part of the garden, although connected with the pleasure-grounds, is skilfully kept out of view; which is most essential to the general harmony and beauty of such a place as Mr. Mangles's. —*R. F.*

G. Barker's Esq., Springfield, near Birmingham.—In this place there is now in flower a magnificent specimen of Cattleya superba, in which the colours are much brighter than they are represented in the Sertum Orchidaceum. The labellum is more extended, of a deep and brilliant purple; the part which surrounds the column, moreover, exposes the latter to view, and is itself of a deep purple, gradually diminishing in intensity until it disappears towards the base; the edge of the same part is strongly marked with a purple line; the flower is quite flat, and is a splendid object. Besides the above, Cycnoches maculatum, and a fine variety of Stanhopea oculata, are blooming luxuriantly; with Miltónia spectábilis, Mormodes citrina, Galeandra Baueri, several species of Brássia and Cycnoches, and many others.

Glasgow Botanic Garden.—Several plants of the exceedingly rare Oncídium barbatum are now in flower in this garden, with a new Fuchsia, introduced from the Organ Mountains, and perfectly distinct from the F. affinis described by Mr. Miers.—*Aug.* 15.

Rebiews.

Doyle's Cyclopædia of Practical Husbandry.

THE fourth number is before us, and the articles continue to merit the high character we have formerly given of them. We cannot resist the temptation of extracting a part of the author's article on Cottage Husbandry.

"The time was, when the peasantry of England were the pride of their country—a hardy, self-respecting race, depending on their own efforts, maintaining each man his own cow, and spurning at the notion of charity. But a variety of causes, the consolidation of small farms in particular, has nearly destroyed the English peasantry.

"In many parts of England, within thirty or forty years, several small farms of four or five acres, which supported large families in comfort, have been cleared of cottages and incorporated with the large holdings of a much higher and wealthier (though not more useful) class of persons, and the ejected labourers have been long reduced to the degradation of receiving weekly alms; and he who once, in the full consciousness of honest pride, would have blushed at the acceptance of parochial charity, now claims relief, not as an act of gratuitous mercy, but as a right. He loses, consequently, all feelings of self-respect and moral energy, and becomes dissolute, and degraded indeed. The agricultural labourer is a very valuable subject of the state, and the poor fellow, if thrown out of his own line of employment, has rarely any other to which he can turn himself. Tradesmen can save from their wages and purchase materials, and manufacture various matters for the support of their families, but he who has been bred to the spade cannot rise in the scale; he cannot obtain, under ordinary circumstances, even a patch of land for the employment of his time, even if he have saved any wages for the renting of it: to the cottager a bit of land is the raw material of his labour; yet where, at the present day, and under the present system of the great majority of landlords and land-holders, can he supply himself?

"The Labourers' Friend Society has done, and is doing much in England. May God give a blessing to its efforts, and put it into the hearts of the influential gentlemen of Ireland to act upon the same or a similar plan!

"In Ireland (potatoes being so generally the food of the population), a larger space may be advantageously afforded than is recommended by the patrons of the allotment system in England, where the use of the spade and hoe is so well known; in all cases a fair proportion of the allotment should have garden vegetables, and green food for the cow and pig, and accumulation of manure; but it is most injudicious to give as much land as will make the occupier fancy himself a farmer, and tempt him to marry too soon, on the prospect of three or four score barrels of potatoes. The quantum of land should be subsidiary, not, as it too frequently is with us, the only resource of the labourer, who, if his potato-crop fails, "is poor indeed." The condition of England, in the beginning of the seventeenth century, was then critically what it is now in some parts of Ireland. An old writer thus describes it:—

"'The golden vale in Herefordshire being ye pride of al that country, yet (for want of employment) the plentifullest place of poore in the kingdom; yielding two or three hundred folde; the number so increasing—beggary will carry such reputation in my quarter of the country, as if it had the whole by *halves*.'

"Who among us does not compare this with the present condition of the labouring poor in the golden vale of Limerick? Herefordshire is now perhaps the most lovely and the most highly improved portion of England, full of gardens and orchards, the farmer's paradise. *Perhaps* the county of Limerick may, in future ages, be somewhat like it; but what would one of the Limerick *boys* now-a days say to a proposal that he should cultivate Carrots and French Beans for his own table? What would he think of Pear, and Apple, and Cherry trees in an unfenced garden? Dine on French Beans and three cubic inches of fat bacon! He could understand a bellyful of pork and Potatoes, but two ounces of bacon and French Beans! He would certainly, first taking his pipe out of his mouth to give fair play to his feelings, laugh immoderately at the notion, and then doubt the reality of the picture presented to him.

"The necessity of rejecting the urgently-pressed labour of the poor who surround a gentleman's demesne must be truly painful to a benevolent man, and if he possibly can, he ought, by appropriating little patches of land, to make those comfortable who have been born perhaps on his estate.

"The poor man asks humane attention to his condition, and leave to work. Burns has remarked, that 'he could not conceive a more mortifying picture of human life than a man seeking work and finding none.'

"'He begs a brother of the earth
To give him leave to toil;'

and who, with ample space and means for the accommodation, can refuse the application, and lie down on his pillow with an easy mind? To a very numerous portion of our land proprietary the same poet's rebuke is not applicable:

"'——our gentry care but little
For delvers, ditchers, and sic cattle.'

On the contrary, a mistaken humanity has injured the real interests of the labourer, by elevating him too much above his proper condition, contrary to the principle of the Labourers' Friend Society, which has more than once been referred to as a just one. The following instance will tend to prove our assertion. The late Duke of Buccleuch, with the most benevolent intentions, built cottages for a portion of the poor on one of his great estates, and feued the land to them, in lots of three roods to each; but he was disappointed, because they were made entirely independent. To accommodate a certain class above these, the same noble proprietor feued out lots from five to fifteen acres, on a very long term of years, the tenants undertaking to build cottages. The first generation was respectable in conduct and industrious, but their successors became idle and poor; being landowners, they were careless about extraneous employment, and acquired idle habits, such as those of poaching, attending fairs where they had no business, &c.; and we know that in one instance a gentleman having adjacent land gave about 150*l.* to get rid of one of those occupants altogether.

"As mere farmers, we would not recommend minute subdivision of the land for the support of the poor, where there is no actual necessity for such appropriation; but where the pauper population does exist, no landlord, who regards the rights of humanity, should forcibly send adrift upon the world, to beg, or thieve, or die, those whom, by means of a little land cultivated by the spade, under the superintendence of an intelligent eye, he might render happy and comfortable."

Hooker's Icones Plantarum, New Series, Vol. I. has just appeared. It contains 100 excellent plates of rare and curious plants, among which are many from the expeditions of Mr. Colenso in New Zealand, of Drummond at Swan River, Prof. Gardner in Brazil, and Mr. Wright to the Falklands. The nature of the work precludes all extract. We can only say that it is indispensable to Botanists.

CALENDAR OF OPERATIONS *for the ensuing week.*

A FEW weeks ago, our readers were reminded to take advantage of the dry weather to paint and repair the plant-houses, &c., that they might be in readiness to receive their inhabitants whenever a change of weather may make shelter necessary. If these preparations have not yet been made, they ought to be no longer delayed; because it is likely that at the breaking up of the present unusually fine season we may be deluged with rain for a time; and as the plants would then require to be immediately housed, repairs could not be executed without great inconvenience and confusion. Composts should also be turned and mixed while the materials are dry; and loam, peat, and other soils, procured for next season's use, stacking each kind in a separate heap in some open place. Soil ought never to be removed when wet.

I.—KITCHEN-GARDEN AND ORCHARD.

In-door Department.

PINERY.—Attend particularly to the regulation of the bottom-heat, for if the roots of the plants are injured now, all the care hitherto bestowed upon them will be rendered of no avail, by their premature fruiting. Plants that are now swelling their fruit will thrive in a very high temperature, if combined with a moist atmosphere. Give these plenty of nutriment, either by means of liquid manure, or by top-dressing. Any remaining suckers should be taken off and potted, that they might make good roots before winter.

VINERY.—Give abundance of air while the dry weather continues. Late Grapes are sometimes retarded too long: they ought to be perfectly matured by the autumnal equinox, after which period the sun rapidly declines in power, and the autumn rains make the atmosphere too damp and chill for Grapes to acquire a high flavour. It is quite a mistaken notion that the later Grapes are ripened, the longer they will keep. Use every precaution to guard the ripe fruit from wasps and flies.

PEACH-HOUSE.—Continue all necessary attention to the late houses, in order to procure sound and well-ripened wood. The trees being now clear of fruit, the engine should be put in requisition every day, if the foliage is at all infested with insects: and, in addition, the borders will likewise require water occasionally.

CUCUMBERS AND MELONS.—Attend daily to the late crops of Melons in dressing, stopping, setting, &c., and maintain a moist atmosphere in the frames; not, however, where there are ripening fruit. In case the warm weather brings the fruit forward faster than they are wanted for table, let them be cut before quite ripe, and suspended in a cool and airy place, where they will keep a week or longer. Plants from which the crop has been taken should be pulled up, the soil taken out of the pits (unless they are wanted for some other purpose), and the walls white-washed, by which precautions the eggs or larvæ of insects will be in a great measure destroyed. If the Cucumber plants under glass were made away with, when those on the ridges came into bearing, it will be advisable to replant two or three lights with some of the young plants which have been raised for late use. These will soon produce fruit, if kept warm, and will furnish a temporary supply till the main winter crop comes in. A little more seed may also be sown.

Out-door Department.

ARTICHOKES.—Suffer no stalks or useless heads to exhaust the plants.

CARROTS.—Make another small sowing to stand the winter, in case the first should get too forward. Some persons sow at this time of the year on an old Cucumber bed, and forward the plants in spring by linings of hot dung.

CELERY.—Any of the plants which require earthing up should be thoroughly watered on the previous day.

ENDIVE.—When the plants are large enough, put out a good quantity from the sowing made in the beginning of the present month. If a little seed is sown now, its produce, planted at the foot of a south wall, will stand till a late period next spring, and probably be useful.

KIDNEY BEANS.—Gather for seed as the pods ripen.

LETTUCE.—Plant on a sheltered border, for late use, some of those sown in the beginning of the month. The smallest plants may be removed, when fit, to vacant Cucumber or Melon frames; they will be valuable when those in the open ground are over.

POTATOES.—As the tops wither, take up and store away the second early sorts.

RADISHES.—Both the small kinds and the Spanish should again be sown, together with Mustard and Cress, and other small salading.

TOMATOES.—Gather the ripe fruit when it is quite dry.

TURNIPS.—Thin the young plants. If the flea-beetle is troublesome, water, and dust the plants while wet with soot, which, by adhering to the leaves, will in some degree preserve them. Water from a tanner's lime-pit is said to be an effectual preventive.

Orchard.—The summer having been so much warmer than common, wall-Grapes may be expected to attain a higher degree of excellence than usual; a little extra care should therefore be bestowed upon them. When the fruit begins to colour, expose it freely to light by removing laterals. To prevent the attacks of wasps, hang up bottles containing some sweet liquid, such as treacle and water, on various parts of the walls. A great number can be destroyed in this way if the dead insects are occasionally taken out by straining the liquid. Greengages and all the finer Plums should be protected by very coarse canvas. Earwigs and Woodlice often damage wall-fruit. These should be entrapped by placing pieces of Bean, or any other hollow stalks, among the branches of the trees. Continue to wash Peach and Nectarine trees until the fruit begins to ripen, after which time it must be discontinued. If the trees continue to grow, nail in the young shoots; but very little labour of this kind will be required now.

II.—FLOWER-GARDEN AND SHRUBBERY.

In-door Department.

STOVE.—Go on with the top-dressing of Orchidaceous plants, at the same time shifting any of them which may require larger pots. Look over those which hang on blocks or in baskets from the roof of the house; pull out the weeds, and add fresh turf or sphagnum where it may be required. Shade during bright days, removing the shade about 4 or 5 in the afternoon; syringe well at the same time, and shut up the house for the evening, leaving it hot and damp.

GREENHOUSE AND CONSERVATORY.—Prune and tie in rambling creepers which are trained to the rafters, that they may not obstruct the light in the winter months. Let all tender plants be housed without delay when a change of weather occurs, but previously clean and top-dress them, and take especial care that the drainage of the pots is not obstructed. Gather Thunbérgia seed as it ripens. We have seen five distinct colours of T. alata; and many more might doubtless be originated by a little attention in hybridising and raising seedlings. Many Stove and Greenhouse plants will probably produce seeds this season.

PITS AND FRAMES.—Pot off young Prímulas and Cinerárias for spring flowering, and shift the older plants as they require it. Thin the annuals which were sown in pots, and if large specimens are desired, leave only one plant in each. Another sowing should be made about this time, in pots, of Nemóphila insignis, Collínsia bícolor, Schizanthus pinnatus, and other favourite hardy annuals, to bloom in the houses after those sown in the beginning of August. Rhodanthe Manglésii, Ipomopsis picta, Schizanthus retusus, Salpiglossis, Petunia, &c., should also be sown for the same purpose. The trailing herbaceous species of Lobélia, such as L. Erinus and L. bellidifólia, with Campánula gargánica, and C. frágilis, which have done blooming, should be repotted, after cutting off the tops and reducing the balls.

Out-door Department.

Autumnal-flowering herbaceous plants cannot bloom in perfection unless well supplied with water. Attend to the directions formerly given to remove all plants as soon as they cease to be ornamental, and, with the same object, cut off all fading Dahlia blooms. Mark the best China Asters, for seed. Crocuses, Snowdrops, Martagons, Narcissi, and any other hardy bulbs that may require division, ought now to be taken up for that purpose if not previously done. Take off and pot layers of the finest Picotees and Carnations; the commoner sorts might be planted in a nursery-bed for removal to the flower-borders next spring.

NURSERY AND FOREST DEPARTMENT.

NURSERY.—The ensuing month is a good time to plant cuttings of many evergreen shrubs, and also to put down layers of those species which do not readily strike root from cuttings. The present state of the weather, however, is by no means favourable for these operations, which should therefore be deferred till after rain; and all that can now be done towards it, is to get the ground well prepared.

FOREST AND COPPICE WOODS.—Proceed with the work pointed out in late Calendars.—*J. B. Whiting, The Deepdene.*

State of the Weather near London for the Week ending August 25, 1842, as observed at the Horticultural Garden, Chiswick.

	Barometer.		Thermometer.			Wind.	Rain.
August	Max.	Min.	Max.	Min.	Mean.		
Friday 19	29.901	29.859	73	61	67.0	S.W.	.61

The highest temperature during the above period occurred on the 30th of August, 1826, and 3d of September, 1835—thermometer 83°; and the lowest on the 1st of September, 1841—thermometer 36°.

REPORT ON COVENT GARDEN MARKET,

For the week ending August 26, 1842.

ABUNDANCE of Fruit of every description has been supplied during the past week; but trade still continues very dull. *Fruit:* There are many handsome Pines offered; but these, as well as Grapes, have not varied from last week's prices. Peaches and Nectarines are exceedingly fine, and are considerably reduced in price, the best being obtainable for 4*s*. per doz. Apricots are much dearer, and have risen to 2*s*. and 5*s*. per doz. Plums of all kinds are plentiful at last week's prices; the white Magnum Bonum fetches from 2*s*. to 3*s*. per half-sieve. The best dessert Pears are selling at 1*s*. per dozen, and consist principally of the sorts mentioned in our last report. Apples also remain the same. A few red Currants may still be procured, from 5*s*. to 7*s*. per hf.-sve. Filberts are plentiful, and are somewhat cheaper, being from 40*s*. to

60*s*. per 100 lbs. Natural Cucumbers fetch from 8*d*. to 1*s*. per doz.; the frame fruit from 2*s*. to 4*s*. per dozen. *Vegetables:* Cauliflowers have rather advanced in price, and fetch from 3*s*. to 5*s*. per dozen. A few Peas are still to be met with, and sell, when shelled, from 9*d*. to 1*s*. per quart. French Beans are from 1*s*. 6*d*. to 2*s*. 6*d*. per half-sieve, and Scarlet Runners from 1*s*. 6*d*. to 2*s*. per half-sieve. Celery has become much cheaper, but continues small, from want of rain; the white is selling from 9*d*. to 1*s*. per bundle; the red, from 1*s*. 6*d*. to 1*s*. 9*d*. per bundle. Tomatoes are plentifully supplied from 2*s*. to 3*s*. per half-sieve. Capsicums are also abundant at last week's prices. Mushrooms continue very scarce, and can with difficulty be obtained at 3*s*. 6*d*. and 4*s*. per pottle. *Flowers:* The cut flowers consist chiefly of Allamanda cathártica, Nérium splendens, Bignónias, Amaryllises, Gladíoli, Ericas, and Dahlias.

PRICES, SATURDAY, AUGUST 27, 1842.—FRUITS:—

Pine Apple, per lb. 8*s* to 6*s*
Grapes, per pound, 1*s* to 3*s*
— Muscats, per pound, 2*s* to 4*s*
Melons, English, each, 1*s* to 3*s*
— Dutch, 6*d* to 1*s* 6*d*
Peaches, per doz. 1*s* to 4*s*
Nectarines, per doz., 1*s* to 4*s*
Apricots, per doz., 2*s* to 5*s*
Figs, per doz., 2*s* 6*d* to 4*s*
Plums, dessert, per punnet, 1*s*
Damsons, per sieve, 2*s* 6*d* to 3*s*
Greengages, per punnet, 1*s* 6*d* to 2*s*
— Baking, per hf.-sv., 3*s* to 4*s*
Pears, dessert, per hf. sieve, 2*s* to 8*s*
Apples, dessert, per bush., 3*s* to 6*s*
Crabs, Siberian, per hf.-siv., 2*s* to 2*s* 6*d*

Cherries, Morello, per lb. 6*d* to 1*s* 6*d*
Mulberries, per gallon, 8*d* to 9*d*
Raspberries, per gall. 8*d* to 10*d*
Currants, Red, per half-sieve, 5*s* to 7*s*
Cucumbers, per doz., 1*s* to 4*s*
Oranges, per doz., 1*s* to 2*s*
— per 100, 4*s* to 16*s*
Lemons, per doz. 1*s* to 3*s*
— per 100, 8*s* to 18*s*
Almonds, perpeck, 7*s*
Sweet Almonds, per pound, 3*s*
Filberts, English, per 100 lbs. 40*s* to 60*s*
Walnuts, per bushel, 5*s* to 7*s*
Nuts, per bushel—
— Brazil, 20*s*
— Barcelona, 24*s*

VEGETABLES.

Cabbage, per doz. 10*d* to 1*s* 6*d*
— plants, per doz. 2*s* to 2*s* 6*d*
Cauliflowers, per doz., 3*s* to 5*s*
Beans, Kidney, per hf. sv., 2*s* to 2*s* 6*d*
— Scarlet, per hf.-sv. 1*s* 6*d* to 2*s*
Potatoes, per ton, 50*s* to 70*s*
— per cwt. 2*s* to 4*s*
— per bushel, 1*s* 6*d* to 2*s* 6*d*
— Kidney, per bush., 2*s* 6*d* to 3*s*
Artichokes, per doz., 3*s* to 4*s*
Turnips, per doz bun., 2*s* to 3*s*
Carrots, per doz. bunch, 4*s* to 5*s*
Red Beet, per dozen, 6*d* to 1*s* 6*d*
Horse Radish, per bundle, 1*s* 6*d* to 5*s*
Radish, per doz. hands (24 to 30 each) 9*d* to 1*s* 6*d*
— Turnip, p. doz. bch., 9*d* to 1*s* 6*d*
Onions, Cooking, per doz. bch., 3*s* to 4*s*
— Green, p. doz. bun. 2*s* 6*d* to 3*s* 6*d*
— Spanish, per doz. 2*s* to 6*s*

Spinach, per sieve, 1*s* 6*d* to 2*s*
Chives, per bunch, 3*d* to 4*d*
Leeks, per doz. bun., 4*s*
Garlic, per lb. 4*d* to 6*d*
Shallots, per lb., 9*d* to 1*s*
Lettuce, Cabbage, p. sc., 1*s* 3*d* to 1*s* 6*d*
— Cos, 1*s* 6*d* to 1*s* 9*d*
Endive, per score, 1*s* 6*d* to 1*s* 9*d*
Celery, per bd., (12 to 15), 1*s* to 1*s* 9*d*
Small Salads, per punnet, 2*d* to 3*d*
Watercress, per doz. sm. bun. 4*d* to 6*d*
Parsley, per half sieve, 2*s*
Tarragon, per doz. bun., 2*s* to 3*s*
Basil, per doz. bunches, 2*s* to 3*s*
Vegetable Marrow, per doz., 8*d* to 1*s*
Tomatoes, per hf. sv. 2*s* to 3*s*
Capsicums, green, per 100, 1*s* to 2*s* 6*d*
— Ripe, per doz., 6*d* to 1*s* 3*d*
Mushrooms, per pottle, 3*s* 6*d* to 4*s*

Notices to Correspondents.

MR. PAXTON'S COTTAGER'S CALENDAR is now reprinted in the form of a small volume, for general distribution, price 3*d*. each copy; it may be ordered of all Booksellers. Gentlemen wishing to distribute copies among their cottage tenantry may have them *delivered in any part of London* by remitting a Post-office order to this Office, at the rate of 5*s*. for every 25 copies required.

A Lady, North Devon.—CACTI should be repotted as soon as they have done flowering, if they require it, into a soil composed principally of lime-rubbish and loam, with a small proportion of cow-dung, taking care that the pots are well drained. They should, after potting, be plunged into a gentle bottom-heat, which will make them grow vigorously; and when they have made firm root hold, they should be placed where they are fully exposed to the sun's rays during the hottest part of the day. From October to March water should be entirely withheld from them, but after the latter period they may be watered freely. To preserve plants of FUCHSIA FULGENS through the winter, they must be taken up from the open border, and potted in the same manner as other half-hardy plants. You will find a good plan for making a COLD FRAME FOR THE PROTECTION OF HALF-HARDY PLANTS during winter, at p. 659 of last year's *Chronicle*.—‡

A Country Vicar says, "I frequently see some remarkably fine BALSAMS in glazed china pots, in a public-house window. The pots are not more than half the usual size in proportion to the plants. If tobacco be so injurious to Balsams, as is usually supposed, how is it that my parishioners, who are certainly a generation of smokers, manage to grow them so fine in their little close stocking-frame shops? I have a VARIEGATED PELARGONIUM (the old Bath scarlet); one branch has been almost severed from the plant. All the leaves on that branch have lost their variegated character, and are pure green. I do not ask, Is this common? for I believe it is; but can any account be given of it, and can the converse effect, that of producing variegation, be brought about? I have had a YELLOW BANKSIAN ROSE for five years, and have never yet seen a blossom. It is in a pot about nine inches across. The plant is four feet high, and stands by my greenhouse door, trained to wires. How am I to produce bloom? Lastly, I can never bloom the WATSO'NIA COCCI'NEA; whereas, I succeed well with Gladioli of all sorts." [A close atmosphere is very beneficial to the growth of the Balsam, and tobacco-smoke, if not carried to too great an excess, will not injure them, but preserve them from the attacks of the green-fly. The late warm summer has been peculiarly favourable to the growth of the Balsam, where water has been plentifully supplied. You would, no doubt, succeed in flowering your Banksian Rose, if you were to repot it into moderately rich soil, and instead of pruning it early in the spring, as is customary, treat it in the manner described at p. 419 of this year's *Chronicle*. It is too late, however, to put this plan in practice this season. We never heard of such a plant as Watso'nia coccínea. If you mean Antholyza cunónia, you will find no difficulty in blooming it if planted in a warm south border, fully exposed to the sun; or potted in a mixture of sandy peat and loam, and treated in the same manner as Ixias. We cannot account for the phenomenon relating to your varigated Pelargonium.—‡

A Subscriber says that he has seen in some parts of England very good cottage floors, made of a mixture of lime and coal ashes, but that he does not know the proportions of the mixture. Can any of our readers furnish us with the necessary information?—‡

K.—We will endeavour to comply with your request by inserting the dates of LOCAL AND OTHER MEETINGS a fortnight previous to their taking place; that is, if we are furnished with the necessary information.—‡

R. D.—If by the ROYAL VICTORIA GRAPE, which is said to be superior to the Black Hamburgh, both in quality and fruitfulness, you mean Willmot's New Hamburgh, you have not been misinformed. To the firmness and solidity of the Portugal Grape its berries unite a flavour and size superior to those of the Black Hamburgh. The bunches are, moreover, rounder and more loose than those of the latter variety, and the berries possess a more rugged appearance. We are unacquainted with any Grape under the name of "Prolific."—‡

Winton is probably not aware of the length of time which it takes to make out the names of a score plants so closely allied as many of the Verónicas and Phloxes are. Amongst the Verónicas, 1 is V. incana; 2, V. austríaca; 3 and 5, V. maritima; and 7, V. cárnea: for the names of the others we must refer him to those books where they are described. No. 1 of the Aconites is A. versícolor; 4, A. lycóctonum; 5, A. paniculatum. His Apples are—1, Wormsley Pippin; 2, Court of Wick; 3, Margil; 4, White Crab.—‡ ‖

R. R.—If you wish to dispose of the DESIGNS FOR LAYING OUT FLOWER-GARDENS, which you have prepared, you should advertise them. We cannot say much in favour of some of the devices.—‡

S. M. has sent us a newly-invented WIRE PROTECTOR for preserving Peaches and other valuable wall-fruit from the ravages of Wasps. It is semi-globular, and composed of fine wire closely worked, and is secured over the fruit by means of nails and string; the interstices between the wall and the protector being filled with moss. We doubt not but the contrivance is good, provided that persons could afford to pay 7*d*. each for them.—‡

A. F.—The two ASPARAGUS BEDS which you planted in February 1840, according to the directions given in M'Intosh's valuable work, must be in excellent condition, if, as you say, you have cut 800 heads this season, and many of the remaining shoots are 8 ft. high, and 2½ in. in circumference at the base. Your plan of taking off the surface-soil, and of renewing it with a load and a half of sods from an old sheep-pasture, and the same quantity of unfermented pig-manure, well mixed together, is a good one. If you use NIGHT-SOIL for the same purpose, you must add either gypsum or weakly-diluted green vitriol to the mass, until its unpleasant smell is no longer discernible. The night-soil should then be mixed with the compost before mentioned, and the whole laid on together. SALT *is* an excellent manure for Asparagus, and may be applied in large quantities, as stated at p. 435 of this year's *Chronicle*; but it should not be spread on before the early part of the spring. We should imagine that both MYATT'S PINE AND THE BRITISH QUEEN STRAWBERRIES would thrive in equal parts of light loam and vegetable manure from the bottom of an old wood, provided they are well incorporated together. As an improvement to your plan, we would suggest that the bed should have a gentle slope towards the south.—‡

L. M. M.—NITRATE OF SODA is the most likely manure to force your Cedars of Lebanon into vigorous growth: it is too late, however, to try the experiment this season. It should be applied in March, at the rate of 1 lb. to the square rod; and care must be taken that it comes not in contact with the foliage. When used to trees of large size, it should be spread at some distance round the stem, or as far as the roots are supposed to have penetrated.—‡

J. R. W.—If by GENTIANA you mean G. acaulis, your failure in obtaining a good bloom has probably been owing to the soil of your garden being of too light a texture. This species succeeds best in very stiff land. If your question refers to other sorts, you must let us know which you are asking about.—‡

A Constant Reader must have been misinformed: there is no such plant as Sóllya capitata.—‡

An Admirer.—THE SCARLET-FLOWERING CURRANT is not a hybrid variety, but was introduced many years ago from North-west America.—‡

L. L. will find the necessary information for preparing DRIED SPECIMENS of plants at p. 527 of this year's *Chronicle*.—‡

D. G.—The following LIST OF ROSES will include a variety of colours of the different classes, and afford a succession of bloom during the summer and autumn:—*Moss*, Blush or Carnée, Rouge de Luxembourg, Unique; *Provence*, Blush, Crested, Striped Unique, Reine de Provence; *Gallica*, Aurélie Lamare, Boula de Nanteuil, Letitia, Madame Dubarry, Reboul, La tour d'Auvergne, Kean, and La Dominante; *Alba*, Blanche-fleur, La Séduisante, Queen of Denmark, and Achille; *Hybrid Provence*, Duchesse d'Angoulême, La Ville de Londres, Reine des Belges, and La Volupté. *Hybrid China*, Brennus, Céline, Coupe d'Amour, La Grandeur, Triomphe dé Laffay, Ne plus ultra, Hortensia, and Triomphe de la Queue; *Damask*, La Ville de Bruxelles, Madame Hardy, Pulchérie; *Climbing*, Bennet's Seedling, Boursault, Elegans, Donna Maria, Félicité perpétuelle, and Astrolabe; *Perpetual*, Bernard, Crimson Perpetual, Striped do., La Mienne; *Hybrid Perpetual*, Fulgorie, Madame Laffay, Comte de Paris, and Prince Albert; *China*, Cramoisie supérieure, L'Infidélité de Lisette, Fabvier, and Thérésia Stravius; *Bourbon*, Emilie Courtier, Splendens, Augustine Lelieur, Bouquet de Flore; *Tea-scented*, Bougère, Bride of Abydos, Goubault, Le Pactole, and Le Silène; *Noisette*, Aimée Vibert, La Biche, Cuisse de Nymphe, and Madame Jouvain. The Tea Roses require protection in winter.—‡

Robertson.—Donna Maria is a handsome evergreen climbing Rose, well adapted for training over lattice-work, or round pillars. The following plants will answer admirably for TRAINING ON A VERANDA: Jasminum officinale, Tropæ'olum peregrinum, Clematis flámmula, Bignónia radicans, Clématis azúrea grandiflora, Caprifólium gratum and C. sempervirens.—‡

R.L.M.—You can obtain "MILLS'S TREATISE UPON CUCUMBERS" by applying for it to Mr. Mills, at Gunnersbury Park, Acton, Middlesex. We are obliged for your communication upon the best plan for TAKING WASPS' NESTS, but it differs not from the one given by Mr. Whiting, in last week's Calendar, except in recommending them to be taken in the middle of the day; a period when, we must confess, we should feel little inclination to disturb them.—‡

Phlox.—"LINDLEY'S SYNOPSIS OF THE BRITISH FLORA" and "HOOKER'S BRITISH FLORA" are both excellent works upon Indigenous plants. A small book, entitled "TRIMMER'S CHEMISTRY FOR FARMERS," will be found extremely useful by those who wish to become acquainted with the rudiments of Chemistry. The science of HYDRAULICS is quite out of our latitude, but we believe that the Society for the Diffusion of Useful Knowledge published a few numbers upon that subject some time since. To state the price of these works would be an advertisement.—‡

T. M.—Six of the best varieties of PEARS that will come in for use from December till March, are the Glout Morceau, Passe Colmar, Hacon's Incomparable, Knight's Monarch, Easter Beurré, and Beurré Rance. The London nurserymen propagate these sorts. If your subsoil is bad, you will do well to adopt such means as will prevent the roots of your trees from entering it, either by paving it with stones, tiles, or slates; or by making a substratum of concrete two or three inches thick. If tiles or slates are used, those nearest the centre where the tree is placed should overlap those next and outside of them; or in other words, they should be so disposed as if water were intended to be carried outwards in the direction in which the roots proceed; for if the latter in progressing had the imbrications opposed to them, they would insinuate themselves between the tiles, and the paving would ultimately be found above the roots.—‖

P. O. B.—We would recommend you to remove the suckers which your ALOES are throwing up; by so doing you will strengthen the plants and probably throw them into bloom.—‡

H. B. E. is referred to an Entomological article in another column for the information he requires.—*R.*

B.—Your Dendróbium is not D. cærulescens; it bears more resemblance to D. aduncum; but it is impossible to determine it from such a fragment.—†

A Constant Reader, Tenby, shall be attended to shortly.—‡

A Practitioner, as soon as we can find room.—‡

B. C.—The ARTICHOKE-LEAVED LETTUCE appears to be cultivated at present only on the Continent: but seed of it will no doubt be procurable in England next spring.—‡

Caleb.—If you attempt to grow MUSHROOMS under the stage of your Greenhouse, you must cover the bed in on all sides. You will find some account of their treatment at p. 672 of last year's *Chronicle*. If the soil in which your ORANGES are potted is not sufficiently rich, you should form some rich manure for them of blood and charcoal; but this must be applied *only* when the plants are beginning to grow.—‡

W. B.—The white flower is Calonýction Bona nox; the other is Clitoria Ternátea.—†

S. B.—Your plant is Cárthamus tinctórius. Erythrina is the botanical name of the Coral-slip of Bermuda. We know of no such plant as the Bendle-tree from the neighbourhood of Bombay.—†

W. A. B.—Your plants are Laurus Sássafras and Celastrus scandens.—†

A Constant Reader.—We should imagine your plant to be a species of Cineraria from the appearance of the leaf; but it is seldom possible to answer such questions without flowers as well as leaves.—†

A Gardener.—The SUGAR PEA may be obtained by the Fellows from the Horticultural Society. We do not know by what particular treatment BIGNONIA VENUSTA, which has been noticed for several weeks in our Covent Garden Report, is induced to flower at so early a period; but we understand that the plant from which those flowers are obtained blooms nearly all the year round.—‡

T. W.—You have been duped. The sample sent is not Guano.—†

A Berkshire Subscriber.—If you subjected your ORANGE-TREES, after they were newly potted, to a warm and dry atmosphere, that will at once account for the leaves falling off. An oversupply of water, with a deficiency of drainage, would probably produce the same effect. To restore them, you must, if the soil in which they are potted is unsuitable, repot them, and keep them in a temperature of between 55° and 70°, with a damp atmosphere; and water sparingly until they begin to form fresh roots. The reason why APRICOTS frequently fail in bearing fruit, when Peaches and Nectarines upon the same border are in fine bearing, is because the former bloom at a much earlier season than the latter, when the weather is frequently anything but favourable for the fertilisation of their flowers, and they are cut off by night frosts.—‡

F. M.—You may increase the AIMÉE VIBERT ROSE by cuttings, which should be done immediately; they will require a little bottom-heat. The PROLIFIC HAUTBOIS STRAWBERRY may be obtained of any respectable nurseryman: some of the plants *are* liable to run blind. If you wish to see your FUCHSIA CORYMBIFLORA which is 3½ feet high flower this season, you must on no account pinch off the top; but if such is not your object, then remove the tip of the leading shoot, which will improve the plant hereafter by causing it to assume a more bushy appearance. By referring weekly to our "Notices of New Plants," you will see when the Cirrhopétalum sinense is figured in the "Botanical Register," a work which can be procured by any bookseller. In the September number of "Harrison's Cabinet" for 1837, which you mention, the names of Lobélia propinqua and cærúlea are misplaced; they may both be obtained of nurserymen at a moderate price.—‡

Hastings.—Your plant is Argemone Mexicana, and is an annual.—‡

Hibernicus.—The following are the dimensions of the different sizes of garden-pots made in England; but different potteries have different sizes, and generally a small and large size to each number:—

2's are	18 in. in diameter at top, and	14 in. deep
4 ,,	15 ,,	13 ,,
6 ,,	13 ,,	12 ,,
8 ,,	12 ,,	11 ,,
12 ,,	11½ ,,	10 ,,
16 ,,	9½ ,,	9 ,,
24 ,,	8½ ,,	8 ,,
32 ,,	6 ,,	6 ,,
48 ,,	5 ,,	5 ,,
60 ,,	3½ ,,	3½ ,,
Thumbs ,,	2½ ,,	2½ ,,

If VITRIOL acts as a manure, it is supposed to do so either by combining with the ammonia it finds in the earth, and forming a sulphate of ammonia, or with lime, when it forms gypsum. Its action is, however, not clearly made out. We do not advise you to employ it as manure, except experimentally; for which purpose you had better use it mixed with 20 parts of water, and pour it on the ground a few days before seeds are sown. If you add it to compost heaps, or to manure, it is then sure to be useful, by its fixing ammonia; in that case we still advise you to employ it very weak.—§ †

F. Y.—We have no present intention of reprinting the Horticultural part of the *Chronicle* of last year.—†

J. Linton.—The bloom of your seedling Pansy is not only too small, but there is a want of substance in the petals, and it is deficient in that indispensable requisite—a good eye. Dahlia blooms can be sent in a box—those that we receive in the best condition are packed thus: a tube is fixed in the box, filled with water, to which a cork is fitted; the flower-stalk is passed through the cork, and secured with a peg underneath. If this is properly managed, they will travel any reasonable distance.—*

K.—There are two Pansies under the title of King of Crimsons: one raised by King, the other by Thompson. You probably possess King's, which is a small flower; Thompson's is much larger, and can be obtained of any respectable Florist.—*

S. Girling.—Your fancy Dahlia, rich purple crimson and white, is a large flower, and will make a showy border variety.—*

T. S. P.—Your ground is in a proper state to receive a crop of STRAWBERRIES; but you had better mulch it with rotten dung next spring. The plant you sent was certainly the Rhamnus Frángula, *commonly* called the Black Alder, although *not* an Alder. Berry-bearing Alder is only an alias of it. Buckthorn is Rhamnus cathárticus; but that name is sometimes applied to any species of Rhamnus. Alnús glutinosa is the "common" Alder, quite another thing.—†

H. Moyle & Co.—We regret very much that your Seedling Dahlias did not arrive in better condition; they were so shaken that a few petals only were left on each flower, which renders it impossible to form an opinion of them—the dark variety appeared to promise well—we shall be happy to receive blooms again when the weather is more favourable.—*

J. Edwards, York.—The blooms of your Seedling Dahlias, white slightly tipped with purple, arrived in good condition; the flower is of a good size, round, with well-formed petals of considerable depth; the centre is very slightly depressed, but we fear this part of the flower will never rise sufficiently to perfect its form before the back petals have fallen. It is a desirable flower, and we recommend you to send blooms to the Floricultural Society of London.—*

Mary.—No doubt your curious ROSE BRANCH, looking like a ball of moss, from the sides of which leaves are growing, is brought to this condition by the operation of some insect like a Cynips. We presume it to be a large specimen of that curious appearance called the Robin's Pincushion. Oak-apples are also of the same nature. Your HYDRANGEA cuttings ought to be rooted in a month. To make the flowers blue, add alum to the soil.—†

E. M.—Mr. Thaxter informs us, in answer to your question, "Whether there is any way to save the bees after they leave the hive, which has been placed in a dark shed,"—that only one part of the hive is removed there; as, for instance, one end of Nutt's box, or the cap of a straw skep. The bees, on leaving this, immediately fly home to that part of the hive which remains.—‡

"*Subscriber*" is informed that the *Gardeners' Chronicle* is supplied to the trade in *sheets*, and that, therefore, the defect of which he complains cannot be remedied at the office. He can, however damp and refold the paper when it reaches him.

As usual, many letters have arrived too late for answers this week.

NEWS OF THE WEEK.

As we anticipated in our last, the manufacturing districts are gradually returning to tranquillity and order. In Manchester, and many of the towns which were first affected, the hands, with few exceptions, have resumed their work; and in those districts where they still hold out, their proceedings are happily unaccompanied by the violent outrages which marked their movements last week. In some of the most important inland towns all the attempts of the delegates to produce an outbreak have been entirely ineffectual. Chartist meetings have been held, but the public peace has not been broken. In the beginning of the week a turn-out took place at Merthyr; the movement spread rapidly over the Welsh mountains, and for some time apprehensions were entertained that the strike might eventually lead to the suspension of all the iron works. The men, however, have now returned, and no further danger is apprehended. The troops are still quartered in different parts of the disturbed districts, and the special constables and Yeomanry are on duty, in order to be prepared for any unexpected rising. At Manchester a Government commissioner is actively employed in collecting evidence on the subject of the riots, and measures are adopting in various quarters to bring the ringleaders to justice. On the whole, the state of the disturbed districts, though not yet completely settled, is satisfactory, and the country appears to be secure from any repetition of a general outbreak.—The next subject of interest in our Home News is the Queen's visit to Scotland. Her Majesty embarks at Woolwich on Monday, and proceeds to Leith in the royal yacht, attended by a numerous fleet. Great preparations have been made to do honour to the occasion, and there is no doubt that her Majesty's first visit to her Scottish capital will be marked by every demonstration of loyalty and attachment on the part of her faithful subjects in the North.

In France, the Regency Bill, the great question of interest at the present moment, has passed the Chamber of Deputies by an immense majority. All amendments have been negatived, and the Bill has been adopted without modification. The principal feature of the debate was the accession of M. Thiers to the Conservative party, not merely as a supporter of the present measure, but as an ally of the Government. His announcement that he had abandoned that party of the Opposition to which he had been so long attached, took the Chambers by surprise, and the journals do not yet appear to have recovered from their astonishment. M. Thiers denounced the Legitimists as quite unworthy of confidence, and declared that the Ultra-liberals are incapable of either governing themselves or governing the country. He praised the consolidated character of English institutions, and astounded his former allies by calling himself a subject of the monarchy. M. Lamartine has also deserted his party, and has quitted the Conservative for the Opposition ranks. These events completely absorb public attention in Paris; and the approaching dissolution, which takes place, it is said, on Thursday, is hardly thought of in the midst of the political speculations which are now afloat.—From Spain and Portugal there is no news of any interest; the anticipated changes in the Portuguese Ministry have not taken place, and the proceedings of the Chambers present no subject which calls for observation.—The intelligence from the United States is highly important and satisfactory. There is no longer any doubt of the complete settlement of all questions at issue with this country. Everything is honourably adjusted; and it is even said that arrangements have been made in regard to the suppression of the Slave Trade. It appears that each point of dispute is made the subject of a separate treaty; and the New York papers unanimously express their conviction that the measures agreed upon will receive the entire approbation of the Senate.

Home News.

Court.—Her Majesty, Prince Albert, the Prince of Wales, and the Princess Royal, are at Windsor Castle, and continue in excellent health. Yesterday being the 23rd birthday of Prince Albert, the day was kept at Windsor and in town with the usual honours. The Duke of Saxe Coburg Gotha is still on a visit at the Castle. The Queen will hold a Privy Council this afternoon. On Monday her Majesty and Prince Albert with the Court will come to town at an early hour by the Great Western Railway, and proceed direct to Woolwich, where they will embark in the royal yacht for Scotland. The Prince of Wales and Princess Royal will remain at Windsor until her Majesty's return. The Marquis of Ormonde has succeeded Lord Byron, as the Lord in Waiting on her Majesty. On Monday the Prince of Leiningen left Frogmore, where his Serene Highness had been on a visit to the Duchess of Kent, and proceeded by the Great Western Railway to town, to embark for Antwerp.

The Archbishop of Canterbury.—On Saturday evening letters were received in town, stating that the Archbishop and Mrs. Howley were indisposed at their Palace at Addington. Symptoms of illness were first manifested in Mrs. Howley as early as four o'clock on that day, when medical assistance was immediately called in. At that time his Grace was in the enjoyment of his usual health, but late in the afternoon of the same day his Grace was seized with a sudden attack of spasmodic cholera. On Sunday and Monday the inquiries at Lambeth Palace were extremely numerous, and daily bulletins have been exhibited there during the week. We are happy to say that the malady is completely subdued; but the Archbishop is suffering from the bodily weakness consequent upon the nature of the attack. The following is a copy of the bulletin issued yesterday morning:—"His Grace has had a comfortable night, and is this morning refreshed and better.—Addington Park, Aug. 26."

Gazette Announcements.—The Queen has been pleased to appoint Mr. Fergus James Graham, to be Her Majesty's Consul at Bayonne; Mr. Robert Falconer Corbett, to be Consul at Maranham; Mr. William Kennedy, to be Consul at Galveston; and Mr. Thomas Ussher, some time Vice-Consul at Port-au-Prince, to be Consul at Haiti.

Foreign Office.—A notification has been gazetted by the Foreign Office, stating that the Lords of the Admiralty have received a despatch, dated June 19th, from Sir Charles Adam, Commander-in-Chief of her Majesty's Naval Forces in North America, stating that on the 17th of that month he had placed the Port of San Juan de Nicaragua in a state of blockade, and had issued a declaration to that effect.

Parliamentary Movements.—As anticipated in our last, the Belfast Election has terminated in the return of of Mr. Emerson Tennent, Conservative, and Mr. Ross, Liberal. The following were the gross numbers at the close of the poll:—Mr. Ross, 886; Mr. Tennent, 859; Lord Chichester, 500.—The Nomination and Election of a Member for South Hampshire, in the room of Mr. Fleming, who has accepted the Chiltern Hundreds, took place on Tuesday. Lord Charles Wellesley was proposed with the usual forms, and, as there was no other candidate, the High Sheriff declared his lordship duly elected.

Fine Arts Commission.—The Commissioners for inquiring whether advantage may not be taken of the rebuilding the new Houses of Parliament for the purpose of promoting the fine arts, have issued their report. They state that after hearing the evidence of competent persons, they are of opinion that advantage should be taken of the new building for the promotion and encouragement of art; that they have not yet been able to satisfy themselves that Fresco-painting has hitherto been sufficiently cultivated in this country to justify them in at once recommending its employment; but that in order to assist their judgment, they have offered premiums for a competition in Cartoons. They conclude by stating that they do not intend to recommend the exclusive adoption of Fresco, but that their future attention will be directed to the best mode of selecting artists skilled in Oil-painting and Sculpture. The report is signed by Prince Albert and the other Commissioners, and is accompanied by a valuable Appendix, containing information on the subjects mentioned in the Report.

The Income Tax.—It has been decided by the Commissioners of Taxes, that the carriage and horses of a medical man, although required for the exercise of his profession, if occasionally used by him or his family for pleasure, cannot be deducted from his profits, nor will any deduction be made for the assessed taxes on them.—The following returns from the Accountant-General of the Bank of England have just been published, showing the annual amount of dividends upon stock and annuities from which the property or income-tax has been stopped or deducted at the Bank for the half-year ending the 5th July, 1842:—Three per Cent. Consols, 10,799,875*l.* 13*s.*; New Three-and-Half per Cents., 4,831,113*l.* 15*s.* 10*d.*; Three per Cents., 1726, 24,579*l.* 1*s.* 2*d.*; New Five per Cents., 21,469*l.* 16*s.* 10*d.*; Annuities for terms of years, 808,116*l.* 15*s.* 8*d.* The total amount of such dividends payable upon individual or separate accounts arising from dividends of 2*l.* 10*s.* and under 150*l.* per annum, is as follows:—Three per Cent. Consols, 3,761,519*l.* 5*s.*; New Three-and-a-Half per Cents., 2,233,243*l.* 17*s.* 10*d.*; Three per Cents., 1727, 10,672*l.* 12*s.* 10*d.*; New Five per Cents., 7,868*l.* 16*s.*; Annuities for terms of years, 106,380*l.* 7*s.* 2*d.* Total number of such individual accounts:—Three per Cent. Consols, 70,264; New Three-and-Half per Cents., 63,665; Three per Cents., 1726, 273; New Five per Cents., 156; Annuities for terms of years, 2,846.

Foreign.

France.—*The Regency Bill.*—On Saturday evening the Chamber of Deputies voted the Regency Bill by an immense majority, the numbers being 310 for it, and 94 against it. The first amendment, which was in favour of the Duchess of Orleans' regency, was negatived at once. The next was M. de Sade's amendment, proposing that the law should be applicable solely to the present occasion, and to princes now living. On the presentation of the amendment, M. Dufaure adjured the Left to give up its opposition and vote the law unanimously. M. Barrot insisted on a division, and about eighty members voted for M. de Sade's amendment, and about as many for one of M. Barrot's, obliging the Regent to be twenty-five years of age. The entire law was then put to the vote in a house of 404 members, and passed, as we stated above. The vote of the regency law, as presented by the government, important as it is, is thrown into the shade by the circumstance of the schisms which, on this occasion, have sprung up between some of the leading men and their parties. The first of these incidents was developed by M. Lamartine. His address in favour of the regency of the Duchess of Orleans created an extraordinary sensation, and produced a diversion in the Chamber. M. Guizot replied to M. de Lamartine in a very argumentative address, successfully demolishing the notion of a National Convention, and stating with great skill the reasons for preferring a regency by right to an elective regency. He concluded by demanding that the bill should be regarded, not as a ministerial one, but as one for the advantage of the country at large. M. de Tocqueville was the next orator, but his speech was not remarkable, his principal point being confined to the denial of the right of the present Parliament to bind future Chambers, and that consequently the regency ought to be named specially to appertain to the uncles of the Count of Paris. The next day M. Berryer ascended the tribune. He is very popular in the Chamber, admired and respected by all parties; and his oratorical resources are such, that he never exceeds the parliamentary limits of discussion, and yet manages always to make the House thoroughly comprehen his meaning. Even the "Débats" admits the "marvellous power of his speaking—his powerful and rich voice, and skilful and appropriate action." The finest part of his address was the exordium, in which he claimed the right of the Legitimists to take their share loyally in the debate as they had done since the year 1830, being bound not by vassalage, or personal attachment, but by the interests of their country. M. Berryer demolished the principle of the people's sovereignty, and indignantly disclaimed the notion that because the Royalists were a beaten party in France, it was necessary for them to adopt revolutionary dogmas—a sentiment that was loudly cheered by the whole house. M. Berryer then stated his objections to the Bill, because it embraced the hereditary Regency, which was an innovation in the history of France—because it made the Regent inviolable, which was dangerous when he stood next to the throne—and lastly, because it excluded the mother from the Regency. After the sensation which M. Berryer's speech has created had subsided, M. Villemain, the Minister of Public Instruction, ascended the tribune, and replied in defence of the Bill, but was unfortunate, having called the Duchess of Orleans a foreigner, and, therefore, unfit to assume the Regency, which called down an explosion. M. Odilon Barrot, the leader of the Left, then rose and made, as admitted by all parties, a splendid speech, declaring against any immutable law for the hereditary succession of Regents. He consented to the Regency of the Duke of Nemours, but he protested against a general law, regulating that in all cases the male presumptive heir should be Regent. The country, the Prince himself, should be left greater latitude and power in the selection of a Regent. On Saturday M. Thiers made the remarkable speech which has created such surprise in political circles. It was at once Conservative and Monarchic. He first awoke the murmurs of the Left by styling himself a *subject* of the Monarchy, and surprised everybody by his praise of England and her institutions. After describing the Legitimist or counter-revolution party as quite unworthy of the confidence of the French, he said, "I see behind us counter-revolution. I am not the dupe of its language. It tells us that it has been corrected. It pretends that it required the experience that the result of the ordonnances of July taught. It declares itself liberal now, and that it leans on no foreign party for support. But counter-revolution deceived the country once, and would do so again. It gave the charter of 1815, promising to observe it; and when that charter became serious and efficient, it violated it. It pretended to be patriotic, and called Massena the pet of victory; but it shot Marshal Ney. I would never, as I never was, be deceived by their promises; that party must lean on the foreigner, because it has no support in the country, and because there are no hopes for its returning, but by the same way it came in first. I am as much afraid of that party, as I was in 1830; and therefore I now give my utmost support to the reigning dynasty. So much for the party behind us, and now for what is before us. The ultra-liberals are incapable of either governing themselves or governing the country. There is nothing but anarchy in them, they are men incapable of coming to any understanding as to the formation of a government. They are incapable of keeping order in a country, or of doing anything except repeating the revolutions of forty years ago, without the glory that then attended them. Such was the party in 1830, and such is it now. Honest men are obliged to separate themselves from those who attack the first principles of society. Beyond even the anarchists, there are, further still, men professing the most abominable principles. If the counter-revolution is behind us, there is an abyss before. Let us stand where we are, then, on the ground where the Charter has placed us. Our labour shall be to build, not to destroy." His speech was often interrupted by murmurs of astonishment from his recent allies of the Left, and thunders of applause and cries of "Vive le Roi" from the Centres. The Chamber then divided, passing the bill as above stated by an immense majority. The bill was presented to the Chamber of Peers on Saturday afternoon by Marshal Soult. The Chamber re-assembled on Tuesday, and chose the Commission, of which the Duke de Broglie was named reporter. The Duke presents his report this day, and the debate will then commence. The prorogation is expected to take place on Thursday, when the Chamber will be adjourned to the 9th Jan.

The Capital.—Nothing is talked of but the rupture between the Left Centre and Left sides of the Chamber of Deputies—the grand split between MM. Thiers and Odilon Barrot, the leaders of the dynastic Opposition Liberals, and the service rendered to Ministers and the Court by M. Thiers in supporting the Regency. The recent scene in the Chambers will no doubt continue to supply French journalists with ample themes for speculation during the recess.—M. Thiers left Paris with his family, on Saturday night, on a visit, it is said, to Boulogne, and probably to London.—The weather was still close and warm. The thermometer (Fahrenheit) marked nearly 82 in the shade at 3 o'clock on Monday.—The Royal Family left Neuilly on the 23d for Eu. The King will return this day, to conclude Parliamentary business, and to prorogue the Chamber on Monday. The Duke de Nemours had left town for Strasburgh, and will return in a few days to review the troops in the camp of Luneville.

The Navy.—It was recently announced in the Ministerial papers that Rear-Admiral Dupetit Thouars had sailed for the South Seas, and that the object of his mission, which had been carefully kept secret, was to establish a colony in the Marquesa Islands in the Pacific. The "National" of Monday states that the voyage has no such object, and that the Admiral is gone for the sake of selecting a site for the transportation of political offenders. Other accounts state that the Government is determined to gain an additional footing in the Pacific, as the settlement in New Zealand has hitherto failed to satisfy their expectations. Another account, however, asserts that the expedition was bound for New Zealand only.

SPAIN.—Our accounts from Madrid come down to the 13th inst. inclusive, but they are destitute of interest. It was generally believed that the Cortes would not be again convened before the close of November, notwithstanding the promise made by the Ministry to bring forward the budget in time to admit of its being voted before the 1st of January. The Minister of Justice was engaged in preparing a number of bills, which were intended to constitute a new civil code. The Regent had conferred the Grand Cross of Isabella on Gen. Zurbano, for having pacified Catalonia, and intended to create him Marquis of Gerona.—Some disorders had taken place at Alicant, and the assailants had succeeded in carrying off a large quantity of salt, but the ringleader was arrested. —Some Portuguese banditti having arrested a Senator named Saens, from whom they required a ransom of 30,000 piastres, the Spanish Government addressed a very energetic note to the Cabinet of Lisbon, threatening to march troops into Portugal in pursuit of the robbers, if similar outrages recurred. The reply of the Portuguese Government was satisfactory. It authorised the Spanish troops to enter its territory, should such acts again come to pass, and forwarded orders to that effect to the frontier authorities.

PORTUGAL.—We have received Lisbon news to the 15th inst. The debates on the Speech from the Throne were proceeding in the Chamber of Deputies. The Ministry remained without alteration, and no change was expected till after the adjournment of the Cortes. Costa Cabral was considered to be more popular at Court, and had evidently strengthened his position.—The papers contain long accounts of the endeavours made by the Spanish Minister, at Lisbon, to get out of the Tagus a slaver belonging to a Spaniard named Vinent, which had been taken at Mosambique two years ago, under the Portuguese flag, and sent to Lisbon. This vessel was then called the Gloria, but General Marinho, who seized her, gave her his own name. The efforts of the owner, backed by the Spanish authorities, prevailed in obtaining her release, and she was fitted up at Lisbon for another expedition, intending to go first to Cadiz, and then to the coast of Africa. She was made over to a Portuguese, but in consequence of the interference of the British Ambassador, her papers were taken from her; she subsequently obtained Spanish papers, and took the name of "Grande Antille." However, on the repeated remonstrances of the British authorities, the voyage has been stopped. She had seven carronades on board, beside staves for 30 water-pipes. Some of the Portuguese subordinate authorities were supposed to be implicated in this business, and a strict inquiry was to be instituted.—The commercial treaty had been published in Lisbon, and even the opposition papers could not find much to say against it. —All the Portuguese authorities at Benguela had been found guilty of conniving at the slave trade, and sentenced to various punishments.

GERMANY.—Letters from Berlin allude to the mysterious silence which has been observed respecting the King's visit to St. Petersburg, and hint at a coolness with the Emperor on the subject of Poland. For some weeks they have had oppressively hot weather at Berlin, which, being accompanied by a dry wind, has done much injury to the fruits, and has caused the leaves of the trees to wither and fall off, as in the autumn. Though the city lies so low, the springs which supply many mills are already dried up, and this evil is still more severely felt in the neighbouring villages, which are situated on higher ground. On account of the scarcity of water, the grand annual review will not take place.—Letters from Cologne of the 23d state that a telegraphic despatch from Berlin had been that day received, announcing that their Majesties the King and Queen of Prussia set out that afternoon by the iron railway to Magdeburg, on their journey to the Rhenish provinces. Their Majesties are expected, on the 28th, at Dusseldorf, where they will remain till the 3d of September, to be present at the review of the seventh corps of the Prussian army. On the 4th they will go to Cologne, where the first stone of the addition to the cathedral will be laid. On the 12th there will be a grand review of the eighth corps of the army, assembled at Bruhl. The troops on the Rhine are said to suffer severely from the heat.—The Papers continue to give accounts of destructive fires in various parts of Germany and Transylvania; the town of Moekein, near Magdeburg, has been reduced to ashes. Not more than 15 houses were left standing, and upwards of 100 families were left without shelter, and reduced to the utmost misery.—Accounts from Vienna of the 10th inst. state that numerous fires had of late broken out in Transylvania. On the 22d ult. the town of Beretzk was almost entirely consumed, and upwards of 400 families left without an abode. Eight of the inhabitants perished in the flames. The small town of Szent Kalonow was also partly destroyed by fire on the 28th, 180 houses having been reduced to ashes.

ITALY.—Letters from Rome inform us that the publication of the allocution recently addressed by the Pope to the Conclave, relative to the religious affairs of Russia, had created a great sensation at the Russian embassy, where it was not expected that his Holiness would make known the documents which had passed between the two Courts on the occasion to the whole of Christendom. It was even said that the Russian legation would be recalled, and that all diplomatic intercourse would be suspended between the two countries.—According to the last accounts from Naples, fresh disturbances had taken place at Aquila, in the Abruzzi. The nature of the movement was not known, but it was said that M. del Caretto, the Minister of Police, had deemed it sufficiently serious to render his presence at Aquila necessary for its repression.—We learn from "Galignani's Messenger" that Count Pillet Will, a corresponding member of the Royal Academy of Sciences of Turin, has sent a donation to the Academy of 10,000 fr., to be distributed in prizes to authors of works best calculated to promote a taste for the positive sciences. Consequently the Academy has announced four prizes of 2,500 fr. each, for the best introductions to the study of physics, chemistry, mechanics, and astronomy. Each work is to contain a concise summary of the principles, history, important facts, and chief applications of the science treated upon, so as to be used as an elementary book in the colleges. The competition is open to men of all nations. The manuscripts must be sent to the Secretary of the Academy (post free) before the 1st July, 1846. The successful works will be printed at the Count's expense. — Letters from Messina state that the authorities were anxiously looking out for the arrival of the King and Court, who had left Naples, attended by the whole fleet, to be present at the festa of the Madonna della Lettera. The approaching festival had drawn an immense concourse of visitors to that city; the steamers from Naples and Malta have been full of passengers, and the number of Calabrese who have crossed the straights is said to be incredible. A few days before, a strange rumour had been spread in the city, that during the approaching festival a torrent of blood would be shed, and such a panic had come over the entire population, that the police traced the matter to the authors of it, who were found to be a couple of French nuns passing through Messina. On being questioned, they admitted having made the assertion, and declared that they did so by divine inspiration; whereupon the commissary of police put them into a carriage and conducted them to the House of Correction, by way of more effectually providing against their taking any measures for making good their prophecy.—The King and Court will return to Naples immediately after the ceremonies, in order to be present at the festa of La Madonna di Piedi-grotta.

IONIAN ISLANDS.—Some excitement has been caused at Corfu by the discovery of another case of slavery in the Mediterranean. The master of a small Ionian vessel belonging to Cerigo was chartered at Candia to convey a Turkish Aga, six other Ottoman males, and three females, described as servants, to Previsa; but having, during his passage, discovered that he was unknowingly carrying slaves, he revealed the circumstance to the British consul as soon as he reached his destination. The Consul immediately forwarded information thereof to the Ionian Government, which forthwith despatched a public *scampavia* to capture the vessel. She returned to Corfu on the 7th August, bringing the vessel, one Turkish passenger and the three females slaves, the Aga and the five other passengers being ashore at the time of the seizure, but their fire-arms were found on board. The unfortunate women, who are natives of Upper Egypt, were in the most miserable state. It is said that the owner had been already in treaty for the sale of them for 2,000 piastres (or about 18*l*.), but whether at this rate per head, or all three together, is not clearly understood. It is feared that much of this trade is at present carried on in the Mediterranean, and ship-loads of Arabs are frequently met with, having papers describing them as pilgrims, going to or returning from Mecca, which has become a common means of eluding suspicion. Letters from Malta, in reference to the same subject, state that Admiral Sir Edward Owen has ordered the ship L'Aigle, 24, to prepare for sea immediately. She is destined for the Ionian Islands station, where the presence of a row-guard is considered necessary to put a stop to the acts of barratry and piracy which have been frequent thereabouts of late; and it is reported that it is in contemplation to build and fit out some gunboats at Malta, to cruise in the same sea for a like purpose, as well as to look out for slavers.

TURKEY AND PERSIA.—Recent advices from Constantinople tend to strengthen the belief that the quarrel of Persia with the Porte will be amicably adjusted. A tatar reached the British Embassy from Persia on the 31st ult., with despatches from Teheran of the 15th, and from Erzeroum of the 25th July. The death of Kamran, the Prince of Herat, is reported, but no confirmation of the rumour has been received. The English and Russian Ministers at the Court of Teheran had protested against the pretensions of Persia with regard to Turkey, and somewhat calmed the warlike dispositions of the Schah. Some reinforcements had nevertheless been marched from the Persian capital to the frontier of Bagdad, and the caravans were still forbidden to enter the Ottoman territory. The Porte was ready to make any reasonable concessions, and had despatched to Persia one of its officers, who, previously to his departure, received instructions and despatches from Sir Stratford Canning. The Porte had also forbidden the Persian merchants to leave Constantinople, some having done so without paying their debts. The French Commercial Commission addressed, on the 19th, to Baron le Bourqueney, a strong remonstrance against the undue advantages possessed by Russia under her present tariff. Sir S. Canning had also addressed a remonstrance to the Porte, respecting the aggressions of the Albanians on the subjects of the Ionian Government. The Porte immediately agreed to send a naval force to prevent the repetition of the grievance.—Accounts from Beyrout, dated the 30th ult., state that a considerable quantity of arms had been landed there of late, but for what purpose was unknown. Selim Pacha was expected at Beyrout in a few days from Lebanon, having, it was said, accomplished to his satisfaction the mission committed to him by the Sultan. The last advices from Aleppo received in Beyrout mentioned that the efforts hitherto made by the English expedition to open a communication by the Euphrates had failed, and that they would probably be obliged to abandon the undertaking.

EGYPT.—Accounts from Alexandria of the 7th inst. state that the Nile continued to rise very slowly, and caused great anxiety for the crops. A board of twelve physicians had been appointed to devise measures against the plague in Lower Egypt. The number of cases in Alexandria did not exceed two or three a day.

UNITED STATES.—The British Queen, Belgian steamer, arrived at Cowes on Monday, and the Great Western at Liverpool on Wednesday, from New York. The latter left that city on the 11th, with letters and papers to that date inclusive. The intelligence she brings is interesting and satisfactory. Although nothing official has transpired respecting the arrangements concluded and in progress between Lord Ashburton and the American Government in their present negotiation, yet it is well known that everything is amicably settled. The negotiation was conducted on the part of the American Government by the Secretary for Foreign Affairs, Mr. Webster, and on the part of the British Government by Lord Ashburton, who had both full powers to settle every point, and who were both instructed by their respective Governments to bring the matter to a peaceful conclusion. According to the New York papers, the North-Eastern Boundary question is already arranged to the satisfaction of both parties. The Creole case is also settled, without money, but by stipulations for the future; and the case of the Caroline is adjusted by apology on the part of Great Britain. It is rumoured that the Right of Search question has also been amicably disposed of, by an agreement for the suppression of the Slave Trade, and the renunciation on the part of England of the practice of impressment on board American ships. The North-Western Boundary question will not be entered into in the present negotiation, as the necessary surveys will be a long time before they are completed. It is stated that the treaties have been submitted to the Senate simultaneously, and it is fully expected that as a whole they will not meet with any opposition, as the majority of that body is also predisposed to terminate the matter amicably if possible. In addition to the above, it is stated that Governor Kent of Maine, who is still in Washington, has written letters home, expressing his full conviction that the boundary treaty will be confirmed by the United States Senate. Lord Ashburton was expected to reach New York a few days after the sailing of the Great Western, where he would be entertained at a grand banquet, in celebration of the successful termination of his mission. A terrible riot, in which about 3,000 people were engaged, and which was attended with considerable bloodshed and the destruction of property by fire, commenced in Philadelphia on the 1st inst., and continued the following day. It appears that a procession of 1,200 coloured people had formed in the city, and were proceeding towards the Schuylkill for the purpose of celebrating, on the opposite side of the river, the abolition of slavery in the West India Islands, when some idle boys offered some annoyance to them. The boys were put out of the way without the use of undue violence, but the circumstance was seized as an excuse for raising a great excitement against the procession, and a large force of whites speedily assembled. A general conflict soon ensued. All the houses in the vicinity occupied by black persons were attacked, and in a few moments thousands of brickbats were hurled through the air with the greatest violence. A large number of white and black persons were seriously injured; one white man was stabbed in the eye, and had one of his arms broken; another was cut in the body; others, of both colours, were knocked down with clubs and stones, and cut and mangled. The houses and stores in the vicinity were closed, and the inmates sought refuge within-doors. Smith's Beneficial Hall, a handsome building, intended for the use of coloured people, was burned to the ground, as also a brick church for coloured Presbyterians. During the conflagration of these buildings the mob would not permit the firemen to extinguish the flames. The ringleaders have been arrested, and are in prison to await their trial.—The Senate had passed the new Tariff Bill, but the President vetoed it immediately. He had addressed a message to the House explaining his reasons; but the affair, although anticipated, had caused great excitement.

CAPE OF GOOD HOPE.—Cape Papers of the 18th June arrived in town on Tuesday, bringing intelligence of the defeat of the British troops by the insurgent boers, or Dutch farmers, of Port Natal. Capt. J. C. Smith, of the 27th reg., in his despatch to the Lieut.-Governor, states that he attacked the camp of the insurgents at Congella on the 23d May. Some of the preliminary arrangements unfortunately failed, and through the neglect of the officer in charge, a howitzer, on which the commander mainly relied, was not brought up as he expected. The emigrant boers lay in ambush, and met the advance of the troops by a heavy and well-directed fire. The troops were obliged to retire, as their muskets could do no execution compared with the long pieces of the boers. The loss was severe. Lieut. Wyatt, of the Royal Artillery, was killed early in the action; Capt. Lonsdale and Lieut. Lunnard, of the 27th, were severely wounded; several privates were killed, and a considerable number wounded. Capt. Smith concludes his despatch by adverting to the difficulty of maintaining his present position, and by urging the necessity of a speedy reinforcement, as the number of the troops is insufficient for the performance of the duty to which they have been assigned. From Cape Town we learn that reinforcements have already been sent to Natal, and that great dissatisfaction has been caused by Lord Stanley's despatch to the Governor, directing him to make preparations for the reception of fifty juvenile offenders, about to be sent out as convicts, to be transformed into apprentices and labourers. The Governor had previously represented that the measure was likely to prove injurious to the interests of the colony; and on the receipt of the present despatch, the Attorney-General and the whole Privy Council, with one exception, had protested strongly against Lord Stanley's resolution as an "injury and positive offence committed against all classes of society in the colony."

MAURITIUS.—Mauritius papers, to the 5th May, have been received. They state the weight of sugar shipped from the beginning of the season to the end of April at 74,309,179 lbs., which may be accepted as evidence that the condition of the colony is not altogether unsatisfactory. A despatch of Lord Stanley had been received, in which it was directed that the prohibition then existing against the importation and application of the Hill Coolies of India for the purposes of agricultural industry and sugar cultivation should be rescinded, and that henceforth the free ingress of Indian labourers should be permitted, under certain regulations, for the superintendence of which, and for the protection of the Indian labourer, a functionary, to be denominated the protector of Indian labourers, was to be appointed, with a salary of 800*l.* a-year. The Legislative body, on the receipt of this despatch, agreed upon a representation to the Governor-General of India, praying his assistance in conformity, and voted 25,000*l.* for the purpose of promoting the immigration of Indian labour.

CITY.

Money Market, Friday.—The abundence of money, and the improved state of the manufacturing districts have caused a further advance in prices. Consols closed at 92⅝ for money, and 92⅝ for the account. Bank Stock, 167-9. India stock, 251-2, Exchequer Bills (Old), 51-3. New, 49-51 prem.

Metropolis and its Vicinity.

Her Majesty's Visit to Scotland.—Great preparations are making on the river to do honour to Her Majesty's embarkation, which is appointed to take place at Woolwich on Monday next. The Lord Mayor, in order to pay respect to Her Majesty on the occasion, has applied to the Secretary of State for an intimation from what place Her Majesty would embark, that he may escort her through his jurisdiction, as Conservator of the Thames, in accordance with the precedent of 1824, when George the Fourth went to Scotland. His Lordship has received in reply a communication from Sir James Graham, conveying her Majesty's commands to inform his Lordship that the time of her departure was not yet definitively fixed; that her Majesty would embark from the Dockyard at Woolwich, and that it was her pleasure that all ceremonies connected with the conservancy of the Thames should be dispensed with on the occasion. The Lord-Mayor has given directions to Capt. Fisher, harbour-master of London, to attend at Woolwich, and to afford every facility during her Majesty's embarkation. Active preparations are making in all the departments of the Royal Household for the departure. On Thursday forty horses and several carriages, from the Royal stud, were shipped on board the Monarch at Blackwall, and further preparations were made yesterday. There is no doubt that the river will be greatly crowded on Monday, by persons anxious to witness the embarkation.

Consecration of Colonial Bishops.—On Wednesday the ceremony of consecrating the five new colonial bishops took place in Westminster Abbey. This being the first occasion on which the rite of ordination had been administered in a public cathedral, great interest was manifested on the part of the public. The doors were opened at nine o'clock, and before half-past ten, at which hour the entrances were finally closed, every seat in the choir and galleries was occupied. The names of the new bishops are—Archdeacon Parry, for the See of Barbadoes; Dr. Tomlinson, Malta and Gibraltar; Dr. Nixson, Van Diemen's Land; Dr. Davis, Antigua; Archdeacon Austen, British Guiana. The Archbishop of Canterbury being prevented from officiating at the ceremony by severe indisposition, a commission, empowering the Bishops of London, Winchester, and Rochester, to act for his Grace, had been granted; and those right reverend prelates, with the Bishop of Chichester, and the late Bishop of Barbadoes (Dr. Coleridge), assembled in the Jerusalem Chamber shortly after ten o'clock, where they were joined by the newly-appointed colonial bishops. The Queen's Advocate (Sir John Dodson) was also in attendance. At a few minutes before eleven the procession entered the choir. The service was chanted by the Rev. J. Lupton; the lessons were read by the Rev. J. Waters; the altar service was performed by the Bishop of London; the epistle was read by the Bishop of Rochester; the gospel by the Bishop of Winchester; and the sermon was preached by the bishop resigning the see of Barbadoes (Dr. Coleridge). The Rev. Prelate took his text from the fifth and sixth verses of the 43d chapter of Isaiah:—"Fear not, for I am with thee: I will bring thy seed from the east and gather thee from the west; I will say to the north, Give up; and to the south, Keep not back; bring my sons from far, and my daughters from the ends of the earth." He delivered an appropriate discourse, in which the universality of the Christian religion was eloquently alluded to. It concluded with an impressive address to the bishops elect, assuring them that, although removed by space, they were but integral parts of the same great family; that many a heart would go with them, and many a thought be theirs, when located in the scenes of their new and arduous labours. The sermon was listened to with great attention. At its conclusion the bishops elect retired into the chapel of Edward the Confessor, accompanied by the Bishops of Chichester and Barbadoes, for the purpose of being vested with their rochets. Meantime the Bishops of London, Winchester, and Rochester advanced to the front of the altar and seated themselves. In a few minutes the bishops elect returned to the choir, habited in the customary manner on such occasions, and accompanied as before. The Bishops of Chichester and Barbadoes then led Archdeacon Parry forward to the Commissioners, the former saying—"Most Reverend Father in God, we present unto you this Godly and well-learned man, to be ordained and consecrated bishop." The Bishop of London then demanded that the Queen's mandate should be read, which having been done by Mr. Dyke, the registrar of the Arches Court, the customary oaths of allegiance to the Queen, the oath of supremacy, and that of obedience to the archbishop were administered by Mr. Hodgson, the Archbishop's secretary, to each of the five new prelates, after which the Bishop of London read the address and Litany. At the conclusion of the Litany, the Bishop of London addressed the bishops elect, collectively, in the several modes required by the ritual; to all of which the responses were given in the usual manner. A final prayer having been offered, the bishops elect again retired in the same manner as before, to put on the remainder of their episcopal habits, and, returning into the choir, the precentors, the Bishops of Chichester and Barbadoes, advanced within the altar rail, and seated themselves with the three bishops forming the commission, the new prelates kneeling in front of the altar. The Bishop of London now rose and read the first verse of the anthem "Veni, Creator Spiritus," which was immediately taken up by the organ, the first three verses being chanted by Master Stevens, and the remainder given in full chorus by the whole strength of the choir. The anthem being concluded, all the bishops laid their hands on the head of Archdeacon Parry. The Bishop of London then read the ordination prayer, and delivering a Bible, pronounced the usual admonition. The same form having been respectively administered to each prelate, the ceremony ended, and all those who did not partake of the sacrament left the choir. There were, however, a very large number of communicants present, and the whole service did not conclude until after three o'clock, when the bishops retired in their order of precedence to the Jerusalem Chamber.

Death of Lieut.-Gen. Lord Vivian.—Intelligence reached town on Thursday that Lord Vivian, late Master-General of the Ordnance, had died in Germany. His Lordship was born July 28, 1775, and was well known as a distinguished and gallant officer. He served in Flanders and Holland under the Duke of York, and in all the battles during the expedition to the Helder. He commanded the 7th Hussars in the campaign of Sir John Moore, and served under the Duke of Wellington in the Peninsula from 1813 to the return of the army, including the battles of Orthes, Nive, and Toulouse. He commanded a Cavalry regiment at Waterloo. His Lordship's death causes a vacancy in the 1st Royal Dragoons, of which regiment he was Colonel. He is succeeded in his title by his son Major Vivian, M.P., whose accession to the peerage causes a vacancy for Bodmin.

Stock Exchange.—In reference to the report of the Exchequer-bills Commission and the proceedings of the Committee of the Stock-Exchange, who had suspended the two members of their body concerned in the circulation of the Bills, the Committee for General Purposes held a meeting on Friday last, and unanimously entered into the following resolutions:—"That by the report of the Exchequer-bill Forgery Commissioners, as well as by the Committee of the Stock-Exchange, Edward Lloyd Morgan appears not only to have acted solely as agent to his father, who is a defaulter, and thereby rendered himself ineligible as a member of the Stock-Exchange, but also to have been extensively concerned in the circulation of the forged bills. That this committee does not consider him entitled to re-election, and his application is rejected accordingly. That after mature consideration of the minutes of the evidence taken before the committee, of those taken by the Exchequer Forgery Commission, and the report of the latter, and after hearing whatever explanation Mr. De Berckem had to offer, this committee is of opinion that the conduct of Francis Townley De Berckem has been such as to render him altogether unfit to be a member of the Stock-Exchange, and that his application for re-election be rejected accordingly."

The Corporation.—The Coal, Corn, and Finance Committee have sent in their report relative to the income-tax to be paid by the Corporation of the City. They state that after duly examining the Chamberlain's accounts, they find that the City's income, subject to the duty of 7*d.* in the pound, amounts to the sum of 4,470*l.* 7*s.* 7½*d.*, and they are of opinion that the sum of 130*l.* 7*s.* 8*d.* should be returned to the Commissioners of Stamps and Taxes for carrying the Act into execution.

Southwark.—During the past week it has been confidently stated in the city that Mr. D.W. Harvey, commissioner of the city police, will be appointed High Bailiff of Southwark; and several candidates have, consequently, started for the office of Commissioner of Police. Captain Kincaide, the present governor of Bridewell, Colonel Campbell, Colonel Angelo, Colonel Grant, and Major-General Sir B. Connor, are already announced as candidates.

The Monument.—The City Lands Committee, at a meeting on Monday, determined to prevent any other persons from precipitating themselves from the top of this pillar, by having some strong iron bars fixed sufficiently close over the head of the visitor to leave no chance of squeezing through. The additional railings will be painted white, so as to be invisible at a distance. The surveyor of works was directed to proceed with the alteration immediately; and till it is finished the Monument will remain closed. The young woman who destroyed herself last week is the sixth person who has committed suicide in the same manner. On the 26th July, 1750, a young man, supposed to be a weaver, who was never owned, precipitated himself from the gallery, and was killed on the spot. On the 7th of July, 1788, John Craddock, a journeyman baker. On the 18th of June 1810, Mr. Lyon Levi, a diamond merchant residing in Haydon-square. In September 1839, Margaret Moyes, daughter of a baker in Hemming's-row; and, a few weeks after, a youth, one of the pupils of St. Ann's Society's Schools.

The Markets.—The supply of grouse on Tuesday morning in Leadenhall market far exceeded in quantity any previous arrival, the City of Aberdeen steamer alone bringing 470 boxes, each box containing upon an average three dozen birds. It is stated, that in consequence of the great heat, more than one half of this large quantity of game was totally unfit for consumption.

Chartist Meetings.—On Monday evening a meeting of Chartists was held on Kennington Common, pursuant to announcement by large placards. The meeting was advertised to take place at six o'clock, but long before that hour the mob began to assemble. About six, a Mr. Logan, a lecturer on phrenology at the Adelaide Gallery, commenced an address recommending that the meeting should be adjourned till Wednesday, as in consequence of the notices issued by Mr. Hall, the chief magistrate of Bow-street, and Mr. Mayne, of the metropolitan police, he wished to act within the pale of the law. At this moment the police made their appearance, consisting of about a dozen mounted on horseback, and about 800 on foot. There were now about 4,000 or 5,000 persons on the Common: the police made a general charge, and commenced driving the people away; and in less than half an hour the whole of the Common was completely cleared. Not an individual was suffered to remain in the roads, and at every avenue leading to the Common strong bodies of police were placed to prevent persons congregating. On the same evening, about eight o'clock, a body of Chartists, taking advantage of the absence of the police at Kennington-common, and other parts of the metropolis, assembled on Clerkenwell-green, for the purpose of holding an open-air meeting. The procession was headed by a van, which had already taken up its position on the Green, when the inspector informed them that no meeting would be permitted. The chair, however, was taken, and the chairmen commenced addressing the meeting, which gradually began to augment in numbers. A strong body of police soon arrived, and in the course of a few minutes the speaker and the van had disappeared. The mob was not so easily dispersed, and the people continued to assemble in small groups, occasionally attacking the police with stones and other missiles. On the same night there was an attempt to hold a meeting at Paddington, but it was equally unsuccessful. As early as 4 o'clock numbers of persons began to assemble on the bridge over the railway terminus, and continued rapidly increasing until about 7 o'clock. About half-past 5 a strong party of police marched to the railway terminus, where they remained until 6 o'clock, the hour appointed for the meeting to commence, when a portion of them were placed upon the bridge. About half-past 6 about 10,000 persons are said to have been collected; orders were then given to clear the bridge, which was immediately done. Near the west end several stones and brickbats were thrown at the police by the mob, who hissed and yelled at them repeatedly. From that time until late in the evening, the police repeatedly charged the mob, dispersing them in all directions, and placing constables in double files across the various roads, effectually prevented their uniting again. Between 8 and 9 the assemblage began gradually to disperse, and by 10 o'clock not 200 persons were remaining.—On Wednesday evening another abortive attempt was made by the Chartists to hold a meeting on Clerkenwell-green. During the whole of the day it was rumoured that the Chartists intended, in spite of the authorities, to hold a meeting, but the locality was only made known to a few of their own party. The people began to assemble about seven o'clock, and by eight about one thousand persons, men, women, and boys, the latter preponderating as ten to one, had assembled. About this time a few men and boys congregated around the lamp-post in the centre of the green, and one man began to address them, when two or three policemen came up and dissolved the meeting. The Chartists moved on to the pavement, and were followed by the police, who immediately cleared the Green and prevented any repetition of the meeting.—On Thursday night a public meeting, convened by the national charter or complete suffrage movers, took place at the National Association Hall, "for the purpose of considering the present alarming state of the country." There were about 1500 persons present. Several speeches were delivered, attributing the distress to class legislation, and denouncing the course pursued by Government in attempting to put down public discussion. Resolutions in accordance with these views, and affirming that the Charter was the only remedy for the people, were then carried, and the meeting quietly dispersed.

The Coal Trade.—On Wednesday, there was a general strike among the coal-whippers on the river, not accompanied, however, with any political movement. The object of the men is to relieve themselves from the thraldom of the middle men, who make a profit out of their labour. The wages formerly paid to the coal-whippers were seven farthings per ton each man, but of late years they have not been paid on the average more than a penny per ton, and out of that they have had to pay a large per-centage to persons who call themselves coal undertakers, and to the publicans who have the agency of the coal-ships, and who employ no men who do not consume a certain quantity of liquor. The coal-whippers held a meeting on Tuesday night, at Stepney, and another on Wednesday, at Shadwell. They then resolved to cease working until they can obtain a penny per ton clear of all deductions, and instead of being engaged by the middle men, who exact large sums from them for the working gear, they resolved to submit to no such exactions, but to be employed direct from the landing-places along shore, and be paid everything on board ship, as the Act of Parliament directs.

Finsbury.—On Monday evening, a meeting of the electors of this borough was held by requisition at White Conduit House. The meeting was convened by public advertisement, emanating from a committee of twenty-five electors, and for some days the northern suburbs had been placarded with bills, announcing that the meeting would take into consideration the alarming distress of the country, and that the borough members, Mr. T. Duncombe and Mr. Wakley, would attend. The room was so densely crowded that it soon became necessary to adjourn to the gardens; but it was evident that the great bulk of those present were not electors. After several speeches had been delivered, a resolution, expressing regret at the late disturbances, was proposed and carried. The following resolution was then moved and adopted unanimously:—"That this meeting have no hope of remedy in the measures hitherto pursued. We see no hope of peace in the poor destroying factories or the residences of the rich because the owners give no greater wages than the demands of class legislation leave them the power of doing; nor do we see any hope of peace in the rich coercing the poor because they endeavour to avoid starvation. These are the means of aggravating evils, which, in the opinion of this meeting, can only be remedied by the removal of class legislation; and, therefore, we are of opinion, that a petition founded on these resolutions be presented to the Queen, praying that her Majesty will be graciously pleased immediately to convene the Parliament, and take measures for securing to the people such a representation as will be in conformity with the prayers of the petitions presented to the House of Commons last session, and which petitions were signed by millions of her Majesty's loyal subjects; that the petition be signed by the chairman on behalf of this meeting, and that the members for the borough be requested to forward the same to her Majesty." The meeting was then addressed by Mr. T. Duncombe and Mr. Feargus O'Connor, after which it quietly dispersed.

Inquests.—An inquest has been held on the young woman who threw herself from the Monument last week. After the usual evidence, the Coroner summed up at length, and said that these occurrences were an outrage on public decency, and he hoped that something would now be done to prevent persons, whether they were sane or insane, from committing self-destruction in a similar manner. There was also great danger to passengers from such occurrences. The main question for the jury to consider was the state of mind in which the deceased was at the time, for it appeared beyond doubt that the act of destruction was her own. The jury having consulted for a few moments, returned the following verdict:—"That deceased destroyed herself while labouring under temporary insanity, produced by indiscretion in having remained absent from home all night." There were three dissentients on the ground of there being no sufficient proof of insanity, but 12 of the jury having agreed, the Coroner received the above verdict.—On Saturday, an inquest was held in Charterhouse-lane, on Mr. Tooth, a stockbroker, who was killed a few days previously on board a Richmond steamer, by the fall of a large gas-pipe from Blackfriars-bridge, in consequence of the funnel of the steamer having caught a wisp of hay suspended from the pipe as a caution to vessels not to pass through the arch. The evidence was given at some length, when the Coroner stated to the jury that it was his duty to inform them that, however great the amount of culpability on the part of any one with regard to this melancholy affair, it would be quite useless for him to pursue the inquiry any further. It was established in evidence that the cause of death was inflicted in the city, and that the death took place in the parish of St. Sepulchre, each locality being superintended by a different coroner. It had been recently decided in a court of law, that unless the Coroner for the district in which the fatal act of violence has occurred holds the inquest on the body, no legal steps can be taken against the party or parties whose proceedings lead to the death. The deceased, therefore, having been brought for proper attendance to his own home, in the parish of St. Sepulchre, which is out of the city, the body must be sent by the relatives back again to the jurisdiction of the City Coroner, for him to hold an inquest. Unless this was done, the culpability of the persons causing the death could not be followed by any measure of punishment. It would be useless, then, for the jury to pass a verdict which would involve a charge of manslaughter or otherwise criminate any person in relation to the death of the deceased, for the judges would only treat the inquisition as a piece of waste paper. This was proved by a recent decision of Lord Denman, to the astonishment of the coroners throughout the kingdom; that judge having decided that the proceedings were worthless in the case of certain deaths at an hospital in Reading, because the injuries were inflicted on a railroad in a district of the county belonging to another coroner. The coroner, after referring to the effect such a doctrine would have in cases of murder, further said, that, in the present case, he had been informed by the friends of the deceased's relations, that it would be too painful to the widow to send the corpse into the city again, so that whoever was culpable of the death must escape punishment. The jury, after a short consultation, returned a verdict in accordance with the evidence, but simply amounting to a delaration of accidental death.

Fires.—On Sunday morning a very destructive fire broke out in the premises of Mr. Morgan, an extensive soap-boiler and tallow-melter, in Tottenham-court-road, which for extent of damage will probably equal the recent conflagration in Bermondsey. The flames extended into the back premises of Hanway-yard, and the densely-inhabited district of Tudor-place, destroying a large mass of houses, and seriously injuring the St. Patrick Schools. Many small tenements were burnt, and their poor inhabitants have been wandering about during the week in great distress. No loss of life has taken place. The value of property destroyed is said to be 14,000*l*.—On Tuesday night, shortly before 12, great excitement prevailed in the vicinity of Kennington, in consequence of an immense body of fire suddenly shooting forth from the Surrey Zoological Gardens, which illuminated the horizon for miles round. It was found that the model of St. Peter's at Rome, had taken fire during the exhibition of the fireworks. The flames were checked by the workmen on the premises before the arrival of the engines, but they were not finally extinguished until a great part of the model had been destroyed.

Police.—During the week the magistrates have been occupied with hearing the different charges arising out of the late Chartist meetings in the neighbourhood of the metropolis. The first cases were connected with the attempt of the ringleaders to address the mob. Evidence having been adduced to prove the violent language used by the speakers, the magistrate said it was quite impossible that such language could be tolerated. Society could not exist if persons were allowed with impunity to address a riotous mob in the streets in such terms, and he felt that it was a case which could not be passed over. He therefore made the parties enter into their own recognizances to answer the charge at the sessions, and in the mean time to keep the peace. Another class of offenders were those who exhibited Chartist bills in their shop-windows, and in front of their houses. Some, who promised not to repeat the offence, were discharged, but others were held to bail for their good behaviour. The next and largest class were the rioters, who were charged with assaulting the police in the execution of their duty, by throwing stones, and by other acts of violence. The charges were fully proved, and the offenders were sentenced to different terms of imprisonment in the House of Correction.

Woolwich.—Preparations are in active progress for her Majesty's embarkation at this dock-yard on her visit to Scotland. The Royal George yacht, Capt. Lord Adolphus Fitzclarence, arrived on Monday, having been towed from the mouth of the river by the Monkey steamer. The Royal George has been moored off the dock-yard, immediately opposite the building from which the Trafalgar was launched last year. Some steam-vessels belonging to the General Steam Navigation Company, have been thoroughly repaired, in order to convey the royal carriages to Leith for the use of the Queen and suite during the sojourn of the royal party in Scotland. An order has been issued by the Admiralty, announcing that no person will be admitted into the dock-yard on the day that her Majesty embarks, excepting officers in full uniform.

Sheerness.—The Camperdown, with the Admiral's flag, has left her station off this dockyard, and anchored off the Nore Light, in order to be ready to receive her Majesty in passing down the river. The Pique frigate is also at anchor off the Nore, in readiness to attend the Royal George to Scotland.

Erith.—On Monday a new pier was opened at this place for the accommodation of passengers, who have hitherto been landed by small boats. It was quite a gala day to the inhabitants of Bexley, Crayford, and Dartford, who attended to witness the opening of this new line of communication with the metropolis. A dinner was given to commemorate the event, at which Sir Henry Wheatley presided. A regatta took place in the course of the day. This hitherto retired village will now soon lose its simplicity of character, and will become one of the ordinary resorts of the citizens on their weekly holidays.

Chatham.—Intelligence has been received in this Dockyard that the Crocodile troop-ship, Commander Elson, during her recent passage to North America, had a narrow escape from being destroyed by fire, the captain's steward having accidentally set fire to a store in the cockpit, adjoining the ship's magazine, on the 20th July. He had been absent from it about twenty minutes, without being aware of the dangerous position in which his light had been placed; and if the purser's steward had not providentially gone to the purser's store about that time to issue provisions to the troops for the ensuing day, the whole of the passengers and crew might have been blown up in the middle of the ocean. The fire was extinguished by the efforts of five individuals, and by the judicious manner in which the commander acted on the occasion, the knowledge was confined to them alone during the rest of the voyage.

Mortality of the Metropolis.—The following is the number of deaths, from all causes, registered in the week ending Saturday, August 13:—Total, 874. Males, 447; females, 427. Weekly average, 1838-9-40-1:—Males, 467; females, 445. The mortality from cholera and dysentery in London, for the three weeks ending August 6, amounted to 109 deaths; for the previous three weeks, ending July 16, 40: making an increase of 69 deaths in the course of the last three weeks. Children and aged persons have been the greatest sufferers.

Provincial News.

Manchester.—No attempt has been made since our last to disturb the peace of the town, and business has been gradually resumed during the week. The delegates held their last meeting on Saturday, in the Chartist room; only 12 persons were present. Having received intelligence of the apprehension of their chairman, Alexander Hutchinson, they despatched three delegates to inquire if the report were correct. At 11 o'clock they returned, and informed the meeting that the report was quite true. The delegates were so much alarmed by this information, that none of them dared to take the chair. Since their previous meeting they had dismissed their secretary, in consequence of some suspicions entertained of his want of attachment to their cause. It was reported that their former secretary was also apprehended at Eccles; and finding themselves thus deprived of leaders, they mutually agreed to separate, with an intimation from the chief spokesman of the party, that due notice would be given as to when and where they should reassemble. At the close of their proceedings they issued a concluding address to their constituents, from which the following is an extract: "Owing to the occurrence of the late civil commotions, of which we had not the slightest anticipation, and which we exceedingly regret, we found that the carrying out of our resolutions would, for the present, be impracticable; but we dissolve with the firm determination, that as soon as our organisation is sufficient for, and our resources adequate to the commencement of a national cessation from labour until the Charter becomes the law of the land, we shall do so legally and constitutionally, and we fear not but the result will crown our cause with victory." On Monday several hands went to work. In the afternoon information was received at the Town-hall that a large assemblage was taking place in the ground near St. George's-road, and that the mob had marched there in procession from different parts of the town. It was ascertained that the object of the meeting was to make an attempt to turn out the few hands who had entered into employment in the morning. It was considered by the authorities prudent to disperse the meeting, and 150 of the police force, and 250 special constables, with an adequate military force, marched to the spot. This large detachment was accompanied by the mayor and two of the borough magistrates, who gave orders to Capt. Sleigh to disperse the meeting, which he did with slight resistance. On Tuesday a few of the fine spinners went to work without molestation; but the disposition on the part of the workmen to resume labour was by no means general. Mr. Gregory, a barrister, commissioned by Government to institute inquiries into the causes and origin of the disturbances, has arrived, and is engaged in examining the documents, &c. seized in the houses of the Chartist leaders.

Stockport.—Towards the close of last week the turn-outs manifested a strong disposition to resume the riots, in consequence of many bleach-works, hat manufactories, iron foundries, &c., having commenced operations, and the hands being satisfied with the terms offered. On Friday there was a large and violent meeting, after which the mob turned out the hands of Messrs. Christy and Messrs. Carrington, and were proceeding to Edgeley, when they were intercepted by the troops. In the evening the magistrates issued an order, prohibiting political meetings in the open air. This had the desired effect, and the town continues peaceable, though the mills are still closed.

Ashton.—On Friday some endeavours were made at this place to compel labourers to strike work, but without success. The Riot Act was read, and a ringleader arrested on a charge of sedition. Two or three other active rioters were captured, and no further disturbances took place. The place was under the protection of a strong detachment of military, and 340 special constables. On Wednesday a mob assembled at Mr. Wanklyn's mill shortly after the military left for Oldham, and attempted to turn out the hands, but they were dispersed by a troop of dragoons.

Oldham.—The excitement which has so long prevailed in this neighbourhood has in a great measure subsided, so far as any apprehension in regard to property and life is concerned; but it is still considered necessary to keep up a force of special constables, in consequence of the outbreak which took place on Wednesday. It appears that during the latter part of last week the turn-outs continued to hold their meetings on Oldham Edge, and violent language was used. On Saturday upwards of 2,000 assembled, and, after some speeches resolved on marching in procession through the town, which they were permitted to do, and then quietly dispersed. On Sunday three meetings were held on the same spot, but all passed off quietly. On Wednesday evening another disturbance took place in the town; the mob attacked Mr. Hartley's mill, and a violent collision took place, which ended by the rioters overpowering the constables and stopping the works, as there were no military in the town. A body of infantry, however, arrived in the afternoon, and though all the shops were shut, order was again restored. The magistrates had read the Riot Act, and ordered all public-houses to be closed. The town has since continued in an excited state; but, from the precautionary measures taken, and the increased force of the military, no further outbreak is anticipated.

Lancaster.—On Monday all was again quiet in this city. The mills, with the exception of that of Messrs. Gregson and Mason, and that of Messrs. Satterthwaite and Barrow, were then still. On Monday morning a meeting of some hundreds of persons was held on the Green Area, and the speakers declared that their only wish was for peace and fair wages. About 400 then proceeded to the Bulk-road, and took up their quarters opposite the mill of Messrs. Gregson and Mason. They stayed there quietly for about three quarters of an hour, and finding the information as to a certainty of a "turn-out" following such a demonstration to be incorrect (for not one hand attempted to leave the mill), the mob departed quietly. A company of the 60th Rifles is in quarters at the Castle. We learn from a correspondent, that the active measures of the Mayor and County Magistrates have given great satisfaction; but that the differences between the masters and the men, on the subject of wages, are not adjusted. It is generally believed that the masters will not yield, and that the men will have to return at their old rate of wages.

Leeds.—Tranquillity is entirely restored in this town, and the accounts from Huddersfield, Halifax, and Bradford are very satisfactory. The neighbouring districts are also perfectly quiet. The energetic steps taken by the magistrates, both of the borough and riding, appear to have intimidated the Chartists, and to have arrested their career. The colliers are now in full work, and are receiving 24s. per week. It is said that this class of labourers have no sympathy with the Chartists in their present movement; on the contrary, it is their interest to see the mills kept at work, inasmuch as anything like a universal stoppage would inevitably throw them out of employment. The magistrates are aware of the importance of preserving peace in the mining districts, and are adopting vigilant measures to prevent the colliers being intimidated or seduced from their employment.

Sheffield.—On Monday, a Chartist meeting was held, which had given rise to some apprehensions. The troops were under arms, and the police were ready in case of emergency; but the affair passed off quietly. Some dispute arose about the propriety of a strike. One delegate told the meeting what had been done at the meeting of his trade, and thought the trades were not in a condition to strike. A packer from Manchester, called Dickinson, spoke at length, during which he advised peace, and denounced the Anti-Corn Law League as the authors of the strike system to gain their ends. Subsequently it was proposed by a delegate that there should be a strike, when two persons, well-known Chartists, named Harvey and Sparkes, spoke against it, and it was eventually carried that there should be no strike. Afterwards a proposition was carried, that a memorial be presented to the Queen to withdraw the military from the manufacturing districts, and to dismiss her present Ministers. It is said that only five delegates appeared from the trades.

Newcastle-on-Tyne.—This town, during the insurrectionary movements in Manchester and other parts, remained quiet up to Saturday evening, when a report became general in the town that some delegates had arrived from the south, in order to prevail upon the pitmen to strike. On Sunday a person delivered a lecture on the Quay side, on the distressed state of the labouring classes. He was attended by a great multitude of working men, and read several letters and papers to the mob, showing the sufferings of the operatives, and urging them to combine in measures to obtain their rights, which he said could only be done by physical force.—On Tuesday a Chartist Meeting was held in the Forth, which was attended by large numbers of workmen and colliers. Several resolutions on the subject of the late outbreak were passed, together with one requesting the Secretary of State to furnish the colliers in this neighbourhood with 10,000 stand of arms, for repelling any attack on the liberties of the people. The meeting at length separated without any disturbance, and the authorities did not think it necessary to interfere.

Birmingham.—The state of this town, and the country for twenty miles round, is reported as perfectly tranquil. Large bands of colliers, in the beginning of the week, perambulated the district; but they have in a great measure returned to work without committing any violence. One hundred and fifty pensioners have been sworn in as special constables; about 1,000 of the inhabitants have volunteered their services; and there is, moreover, a strong military force, with three guns. An attempt was made to hold a meeting at Summer-lane on Monday; but the police effectually dispersed it, and drove both Messrs. Joseph Sturge and Arthur O'Neill from the neighbourhood. Mr. Sturge has since issued a proclamation in the name of the Council of the National Complete Suffrage Union, referring to the recent occurrences, and postponing their final determination to the 7th September. Several attempts to hold Chartist meetings have since been made, but the police have prevented them; and it is now hoped that the men will be able to return to the pits without being molested by the turn-outs.

Stafford.—The intelligence from the Potteries is favourable. Several of the porcelain manufactories have resumed work, and there seems no reason to fear any further disturbances. An inquest has been held at Burslem on the body of the rioter who was killed by the firing of the military, when the jury returned a verdict of Justifiable Homicide.—At Hanley there had been a large meeting of the inhabitants, but not for purposes of violence. The object, which was effected with unanimity, was to vote an address of condolence to the Rev. Mr. Aitkin, on the melancholy destruction of his house and property by a lawless mob.—In Dudley, Bilston, Wednesbury, and Westbromwich, all is quiet. The magistrates in Dudley have determined to prevent any public meetings being held in the neighbourhood.

Derby.—The county magistrates having received information that a large gathering was to take place on Monday at Holbrook-moor, five miles distant, whence they intended to proceed and attack Messrs. Strutt's mills at Belper, and the various factories in Derby, made every preparation for preventing the proceeding. Soon after 5 o'clock the Dragoons were called out, and, accompanied by Mr. Mundy, M.P., marched to Holbrook-moor; the Derby troop of Yeomanry was sent to Belper; the Radborne troop, with the Infantry and Militia, marched round this town with fixed bayonets, and at 1 o'clock the Lord-Lieutenant, the Duke of Devonshire, arrived, and attended a numerous meeting of county magistrates. Many rumours were current during the day that the troops had charged the mob at Holbrook and Belper; but they have proved without foundation, the insurgents having dispersed whenever the soldiers approached them. The town is now quiet, and there is no anticipation of further disturbance.

Leicester.—Several attempts have been made during the week to produce an outbreak, but the magistrates have been completely prepared, and have succeeded in repressing the first appearance of a commotion. The mob, however, in some instances, seem to have taken to the Swing system, and some incendiary fires are reported. Several rioters have been brought before the magistrates and convicted in heavy penalties or imprisonment. The promptitude with which they have been brought to trial is said to have surprised them, and no large assemblage has since taken place.

Merthyr Tydvill.—An outbreak took place in this neighbourhood at the close of last week, connected with a strike for wages. On Friday the workmen held a meeting, and resolved not to work until they obtained the wages of 1840. They then went to the works of Messrs. Crawshay, at Cyfartha, when they had an interview with Mr. Crawshay, to whom they represented the purport of the resolution passed at the meeting. Mr. Crawshay gave them a direct negative with respect to their required advance of wages, and represented to them how impossible it was for the masters to increase their scale of payments with the present reduced price of iron. They then determined to go to Dowlais; and accordingly the miners and colliers on Saturday met to the number of 1,600 or 1,800, in the square; and a man named Miles having been called to preside over them, they marched two-and-two to Dowlais, to meet the workmen belonging to the Rhymny and Tredegar works, whom they expected to join them. Mr. Homfray, of Tredegar, and the proprietors of the Rhymny works, succeeded in preventing their workmen from joining the mob, which consisted of the workmen at the Cyfartha and Plymouth works, together with some from Alderman Thompson's works at Pen-y-Darren. After remaining about Dowlais for some hours, the mob returned to Merthyr, and appointed another meeting for the evening at Penrylgereg on the mountain. Mr. Crawshay, with a view to put an end to the disturbed state of the town, and to prevent the meeting on the mountain, sent the public crier round to summon a meeting of the workmen in his employ who were inclined to go to work, to meet him and his agent. At the appointed hour, about 1,300 of his workmen met him, and after his addressing them on the impropriety of their conduct in leaving their work, a large number promised to return to their work in the morning. It was thought that this course would have restored order, and would have been the means of preventing the meeting on the mountain. Much, however, to the surprise of the authorities, a very large meeting was held on the mountain at the very time that Mr. Crawshay was addressing the meeting in the town, the mountain meeting being swollen by numbers of workmen from Aberdare. At this meeting much indignation was expressed at, and threats were held out to any who might return to their work. They also agreed that their emissaries should induce the puddlers not to light the fires on Monday morning, which would, if they were successful, effectually put a stop to every kind of labour at the works. On Tuesday, however, a Chartist meeting was held, when it was decided to go to work on the following morning. Accordingly the hands returned on Wednesday, and the place has resumed its usual business appearance.

Chester.—A paragraph has appeared in several papers stating that the clergy of Chester, with the concurrence of the Bishop, have determined on the establishment of a school in this city, in which a hundred boys shall receive instruction to prepare them for admission to the Universities, to the legal or medical profession, or to the Army or Navy, and that Mr. John Brindley, the Anti-Socialist lecturer, has been appointed to the head mastership. In reference to this statement the "Standard" announces that it has authority to say that "the clergy of Chester" have not done any such thing, nor made any such appointment.

Deal.—The Lord Hungerford, East Indiaman, passed through the Downs on Monday, having on board Lord Auckland, the late Governor-General of India, and family: her dates of leaving are, from Calcutta March 12, Algoa Bay May 27.—A letter has been addressed to the morning papers by Mr. Bush, the engineer of the "Light for All Nations" on the Goodwin Sands, stating that the caisson is sunk below the sands 16 feet at low-water mark; that the whole portion is upwards of 42 feet high, being 9 feet above high water; and that in the course of next week he hopes to add 10 feet more, with every prospect of speedily finding a foundation suitable for the base of such an undertaking. He states that the caisson weighs 150 tons, and is 30 feet in diameter.

Marlborough.—It was stated a short time since that the Castle Inn, at Marlborough, Wilts, had been purchased by a committee, and was immediately to be converted into a public school for the sons of the clergy and others. Several noblemen and gentlemen in the neighbourhood have tendered their co-operation, and have undertaken the office of correspondents. The selection of Marlborough for the proposed school is considered satisfactory, as it is conveniently accessible by means of the Great Western railway, the principal station on that line being near Swindon, 12 miles distant, and the formation of a branch for the Swindon station to Cheltenham and Gloucester being now certain. It is expected that the school will be opened at Lady-day of next year.

Norwich.—The approaching musical festival begins to excite more than ordinary interest. A report has been addressed by Professor Taylor, of Gresham College, to the chairman of the Festival Committee, respecting the arrangements for the festival of this year, which commences on the 13th of next month, from which it appears that great efforts are making to keep up the high character which this city has acquired by its former celebrations. At the approaching festival the first morning performance is to consist of The Creation, but, as it is too short for a whole performance, it is to be preceded by Handel's Coronation Anthem, "My heart is inditing," Purcell's anthem "O give thanks," and a portion of Rossini's "Stabat Mater." The oratorio of the second morning is Spohr's "Fall of Babylon," and that of the third morning is Handel's "Samson," remodelled and arranged for the purpose by Mr. Taylor. There is one feature in the management of the Norwich festivals which is said to be peculiar to them. The labours of the committee are never suspended; the choral band is in regular training; and one triennial celebration is no sooner over, than preparations are commenced for the next. "The Crucifixion" of Graun; "The Deluge" of Schneider; the immortal "Requiem" of Mozart; "The Last Judgment," "The Christian's Prayer," and "The Calvary" of Spohr; have all been performed, for the first time in England, at Norwich; and all these great works have been eagerly sought and repeated elsewhere.

Plymouth.—It is stated that 100 of the oldest Captains in the Navy, not under 60 years of age, are to be allowed to retire with the rank of Rear-Admiral, on 20s. per diem.—The female rowers of Saltash, who have acquired such celebrity at regattas in this port and Portsmouth, left Southampton to proceed to the Havre regatta, last week, in order to contest for a prize for amateur rowers, open to all the world. They were politely received by the committee and the mayor of Havre; but the Frenchmen declined the proposed encounter on even terms. At length it was arranged that a match should take place between the Glanvillites and the English boatmen, and a subscription was entered into by the committee for a prize to be contended for by the female champions with the Englishmen, and in a few minutes four hundred francs were forthcoming for the purpose. English rowers having volunteered from the Grand Turk, the race, which was well contested on both sides, was soon begun and concluded, and amid the cheers of 20,000 spectators the Saltash women carried the day. The arrangements between the Admiralty and the Post-office, for the transmission of the West-India Mails twice a week by sailing packets, are now finally concluded. Twelve 10-gun brigs are now fitting-out here, to take the West-Indian and Mexican Mails, and those for the Brazils and Buenos Ayres.

Stockton-on-Tees.—The Duke of Cambridge, accompanied by Baron Brunnow, the Russian Ambassador, arrived at this place on Monday, by a special train from Darlington, on their way to Wynyard, on a visit to the Marquis and Marchioness of Londonderry. His Royal Highness was met at the terminus by the Mayor and authorities, and conducted to the Town-hall, where an address was presented in the name of the Corporation. A *déjeûner* was then given by the Mayor, after which his Royal Highness, accompanied by Lord and Lady Londonderry and party, set out for Wynyard. On Tuesday there was a dinner-party at Wynyard, and a ball in the evening, which was attended by a numerous party of gentlemen connected with the county. On Wednesday a dinner was given to the workmen at Pershar, provision having been made for upwards of two thousand.

Sunderland.—A correspondence has been published between Sir Hedworth Williamson, Mayor of Sunderland, and the Town-clerk and others of that town, respecting his refusal to preside at the public dinner to be given to his Royal Highness on his arrival in the neighbourhood. The following is an extract from the Mayor's letter to the Town-clerk, which explains the whole transaction:—"I understand that his Royal Highness is to be the guest of the Marquis of Londonderry, Lord-Lieutenant of our county, and, in all probability, will accompany him to the dinner. I feel how very desirable it is that the most perfect cordiality and unanimity should prevail. You, as well as the whole town of Sunderland, recollect the charge made by our Lord-Lieutenant in the House of Lords, early this session, against a considerable number of the Sunderland magistrates, including myself, which charge, though denied and explained by them, his Lordship has neither retracted nor endeavoured to prove, with a view to have them exposed and punished, as they would well deserve, if guilty of such conduct as he intimated. The health of our Lord-Lieutenant of the county will certainly be given, very probably accompanied with expressions of respect and approbation, in which, under present circumstances, I cannot, and do not wish it to be supposed that I do participate; I therefore think that I had better decline presiding at the dinner, which otherwise I should have been glad to have done."

Windsor.—Since the late entrance effected to the interior of Windsor Castle, by the man Quested, on Monday week, such precautions have been carried into effect as will effectually prevent the possibility of the Castle being invaded by the intrusion of unknown and suspicious characters. The police, who are stationed at the only entrance which it is possible for a stranger to pass through, now commence their duties several hours earlier in the evening, and remain until eight the next morning, from which hour the usual porters on the royal establishment are in constant attendance throughout the day, and until late in the evening.

York.—The Duke of Cambridge arrived here by rail way on Saturday, on his way to Wynyard Park, the seat of the Marquis of Londonderry. His Royal Highness proceeded to the Black Swan Hotel, where shortly afterwards the sheriff and town-clerk waited upon him, in reference to the presentation of an address of congratulation, agreed upon by the Lord Mayor, Aldermen, and Councillors of the city. Prince George arrived from Leeds, where he had been stationed with his regiment, the 17th Lancers, in the evening, on a visit to his illustrious father. The royal party on Sunday attended the morning and afternoon service at the Minster, and the Duke afterwards dined with Mr. Alderman Hudson; the Lord Mayor, in consequence of a recent domestic affliction, being obliged to forego the honour of receiving him at the Mansion-house. His Royal Highness left by a special train on Monday, for Darlington, on his way to Wynyard Park.—The local papers, in noticing the list of patents sealed last month, mention as singular the announcement of one granted to Lady Anne Vavasour, of Melbourne-hall, in this county, for the improvement of machinery for draining land.

Railways.—The following are the last weekly receipts of the principal railways:—London and Birmingham, 19,239*l.*; Great Western, 14,755*l.*; South Western, 7,980*l.*; Brighton, 4,679*l.*; Blackwall, 1,438*l.*; North Midland, 5,233*l.*; York and North Midland, 2,058; Greenwich, 820*l.*; Croydon, 428*l.*; Edinburgh and Glasgow, 2,464*l.*: Manchester and Leeds, 5,106*l.*; South Eastern, 969*l.*; Hull and Selby, 1,156*l.*; Glasgow and Ayr, 1,293*l.*; Glasgow, Paisley, and Greenock, 1,190*l.*—The half-yearly general meeting of the Great Western Railway has been held at Bristol. The report stated that the revenue for the half-year amounted to 310,871*l.*, of which 273,877*l.* was earned by the Great Western line proper. The directors state that although there has not been such an increase as they anticipated or expected, on account of the general stagnation of trade, the traffic bears a successful comparison with that of other railways, but the expenses have exceeded those of a previous period. A long debate took place on a proposition to abolish the reserved fund, and to declare a dividend of 7 per cent. instead of 6. The motion was supported by several proprietors, but, on being put to the meeting, it was lost. A dividend of 3 per cent. for the half-year was proposed and carried.—The Midland Counties Company have just held their half-yearly meeting. After some discussion on the charge of want of economy in the management, the balance in favour of the company on the revenue account was stated at 18,767*l.* 18*s.* 2*d.*, and from this a dividend of 30*s.* per share on each whole share, and 7*s.* 6*d.* per share on each quarter share, was declared payable.—The meeting of the Sheffield and Rotherham Company has also taken place. The report alluded to the considerable decrease in the traffic, but stated that the line was working well, and the receipts had been less reduced than those of almost any other inland railway dependent on the state of trade. The number of passengers by the local trains was 140,930, and by the North Midland trains 58,120, making a total of 199,050, or a decrease of 39,034. The receipts, after deducting the expenditure, left a surplus of 3,597*l.* 1*s.* 4½*d.*, which, with the balance of last year, made 6,866*l.* applicable for a dividend. Out of this, the directors proposed to make a payment at the rate of 7 per cent. per annum, when there would be left for another half-year 1,966*l.*, which was accepted by the shareholders after a short discussion.—The Lancaster and Preston Company have also held their summer meeting; the report attributes the decrease in the passenger traffic to the depression of trade, and to the want of a proper understanding with the North Union Company. It states also that the directors, not being able to come to any satisfactory terms with the North Union, which levied 6*d.* on each passenger for passing the archway at Fishergate, had disposed of the line by the unanimous consent of the proprietors, by leasing it to the Lancaster Canal Company for a period of 21 years, the agreement being that the Canal Company shall pay four per cent. per annum upon the paid-up capital, to be further increased should it eventually be determined to carry the railway forward to Carlisle.—On Monday, Major-General Pasley, the Inspector-General of railways, inspected the line of the London and Brighton Railway, previously to its further opening to the public, from Tonbridge to Headcorn, a distance of 15 miles. This opening brings the line into proximity with Staplehurst, which is within seven miles of Maidstone, to which a branch line is intended to be made. After a minute survey of the works along the line, General Pasley expressed himself highly gratified. Simultaneously with the opening to Headcorn, it is intended to increase the number of the trains, by running two on the line each way; the fares will also be reduced, so as to compete with the coaches, and third-class carriages will be placed upon the line.

IRELAND.

Dublin.—The local papers state that Mr. T. B. C. Smith, Queen's Counsel, is to succeed Mr. Jackson in the office of Solicitor-General, and that Archdeacon Pakenham, brother-in-law of the Duke of Wellington, is to have the vacant bishopric of Meath; but that neither vacancy will be filled until the return of Lord de Grey to Ireland.—The usual weekly meeting of the Repeal Association took place on Monday, when Mr. O'Connell addressed the meeting at some length; the week's rent was announced to be 82*l.* 5*s.* 1*d.* — Mrs. Byrne, whose trial on a charge of murder has lately engaged so much attention in this city, on leaving the Court-house on Tuesday evening, proceeded at once to the railway station, and sailed from Kingstown for England on the same night.

Cork.—The trustees of the corn-market, Cork, have agreed to grant the use of their premises for the establishment of an Agricultural Museum and Library, and the exhibition of farming implements. The authorities have at length succeeded in removing to safe custody the accomplices of the prisoners charged with vitriol-throwing. Their removal had been delayed by the serious riot which occurred in this city, in consequence of the jury having brought in a verdict of guilty against the principals. As soon as the result of the trial was known, the populace became so excited that it was deemed advisable by the authorities to procure a troop of the 7th Dragoons from Ballincollig, together with a body of mounted police, and a strong force of the constabulary. After sentence had been pronounced, the prisoners were placed in the van, and escorted by a large force to the jail, when the crowd collected outside assailed the police with missiles of every description, several were struck with stones and severely hurt, when the commanding officer ordered the cavalry to charge, and the people were at once repulsed; the prisoners were then safely lodged in jail. The prosecutor and the approver were, during this time, in the court-house, under the protection of the police, and the escort having returned from the jail, they were placed on a jingle for the purpose of being conveyed to their residences. On its being known that they were about to be removed, the stone-throwing again commenced, and it was again found necessary to charge the populace, so as to enable the escort to proceed. Several persons were seriously injured on both sides. In consequence of this affair, application has been made to the Court, on behalf of the Crown, praying that the trial of the accomplices may be postponed to the next assizes, as the witnesses are now afraid to give evidence. The Court intimated that it had no alternative but to comply with the application, and the parties are consequently to remain in custody until next assizes.

Limerick.—The Ordnance Survey of this city is completed, on the large scale of fifty inches to a mile, and with such minuteness and precision as to exhibit distinctly the site and position of every house and tenement in the respective parishes. The survey of the county has been finished for some time past on a scale of six inches to the mile. The entire trigonometrical survey of Ireland will be completed in about three months.—The local papers notice the great number of falling stars which were observed in the neighbourhood of Limerick last week, exceeding in frequency and brilliancy all those observed for some years in the same locality.

SCOTLAND.

Edinburgh.—The approaching visit of Her Majesty and Prince Albert forms a leading topic of conversation, not only in this city, but throughout Scotland, and a great variety of rumours and opinions have been circulated respecting the precise movements of the royal visitors. The first discussion has been with regard to their place of landing. No sooner was it announced that Granton pier was to be the favoured spot, than the magistrates and inhabitants of Leith felt that a slight had been put upon the ancient port, and, accordingly, they transmitted a memorial to London, praying Her Majesty to follow the example of five of her royal ancestors, who have successively made Leith their landing-place on visiting Scotland. A deputation has also waited upon the Duke of Buccleuch at Dalkeith to obtain his countenance in favour of Leith pier, instead of his own pier at Granton. The question does not appear to be decided, but the general opinion seems to be that the preference will be given to Granton. The proceedings to be adopted in order to give effect to Her Majesty's landing are, of course, the general subject of discussion. An illumination is talked of, and the committee of the Town Council have even recommended that the citizens should all wear blue coats in honour of the occasion. This recommendation has, however, met with opposition. At a meeting of the master and assistants of the Merchant Company, in reference to the procession, in which all the public bodies are expected to take part, it was unanimously resolved to disapprove of the recommendation issued by the committee of the Town Council; it being the opinion of the meeting that no rule should be laid down on the subject, but that parties should be allowed to join the procession in such dresses as they may severally think fit. The accounts from those districts which Her Majesty is expected to visit are full of details of preparations, and the utmost excitement has been caused by the news in all parts of the Highlands. Several of the nobility intend to bring their retainers in full Highland costume, and, among other indispensable ceremonies, it is said to be arranged that the glass of whiskey, always offered to a Sovereign on entering Scotland, will be presented on this occasion by the Duke of Buccleuch.

Glasgow.—The local papers contain long accounts of disturbances in the western districts of Scotland. They report that the unhappy state of feeling existing in the mining districts of England has shown itself in Ayrshire. Last week the colliers of Kilmarnock and Kilwinning, the principal mining district in the west, struck work, and held a delegate meeting at Irvine. The miners in this vicinity having sent no representative to attend it, were waited upon by a deputation, supposed to consist of four men from Glasgow, and two from Kilwinning, the result of which was a general turn-out of 800 men and boys in this vicinity without an hour's intimation, or any cause of grievance whatever being assigned. District meetings have been held over the county, and a great meeting has taken place on Irvine Moor, near the line of the Glasgow and Ayrshire Railway. On Friday a general meeting of the colliers of Mid and East Lothian took place in Musselburgh Links, which was attended by about 1,000 individuals, 800 of whom were colliers. After some discussion on the question of wages, the whole assemblage separated peaceably.—Accounts from Alloa state that the greater portion of the colliers in Clackmannanshire have struck work. Some of the masters of these works resolved on making an example of the supposed ringleaders of the strike; and, accordingly, several police and other officers were sent to Clackmannan to apprehend them; but whenever they appeared, and their purpose was seen, they were set upon by a mob, mostly women and boys, who gave the officers a severe handling. It was rumoured that the military had been sent for, and the constables lately sworn in at Alloa received notice to keep themselves in readiness. In Lanarkshire affairs have also been very threatening. At a meeting of commissioners held in the Court-hall, at Hamilton, Lord Belhaven in the chair, it was agreed on the motion of his lordship, to vote the sum of 300*l.*, for the purpose chiefly of protecting the miners who are disposed to accede to the terms of the masters, in opposition to the desire of their fellow-workmen. A meeting of the county gentlemen was held immediately afterwards, over which the Duke of Hamilton presided, at which a long discussion ensued on the alarming appearances of the country from the number of struck workmen. After several motions on the subject of the grievances complained of by the men, it was agreed to recommend the sheriff, magistrates, and justices of the county to do their duty, by seeing that the workmen were not defrauded of their weights by the masters.

Perth.—Accounts from the moors inform us that the 12th opened on the hills with one of those bright mornings which have so peculiarly characterised this autumn. The high temperature cooled the ardour of many; and, unlike most previous occasions, a few hours' morning shooting satisfied most sportsmen, unless upon some highly-preserved and well-stocked grounds. The general success has been better than appearances some weeks ago indicated; in proof of which it is mentioned that 95 boxes passed through Perth for the south on one morning, 35 of which were for the London steamer. The highest return for the first day was that of the Hon. Fox Maule, who bagged 84 brace at Kinloch, at the head of Strathbraan. Sir P. M. Thriepland, at Balnaguard, killed 61½ brace of grouse, and 5 mountain hares; Mr. Butter, of Faskally, 56 brace, and Sir John Mackenzie, 50, in the moors of Glentruim. The results from the Invernessshire side are not so good; individual parties at Dalwhinnie only bagged each from 15 to 30 brace, which has been about the daily average.

THEATRICALS.

Italian Opera. — The last performance of an unusually successful season took place on Saturday evening. It was the second of two extra nights, at reduced prices of admission. The attraction was the fine music of *Cosi fan Tutte*, and the theatre was crowded by a delighted audience. Rubini made his parting bow, and withdrew—never to return—from the stage of which he has so long been the ornament. He will appear, for the last time, at the Norwich Festival, and then leave England to enjoy the fruits of his industry in Italy.

Haymarket. — A new farce by Mr. Bayle Bernard, called "Locomotion," has been produced at this theatre with success. It is, like most modern farces, slight in construction, and extravagant in details; but the leading idea is novel, and it contains some pleasant hits at the follies of the day. The scene is an auction-room; *Mr. Floss* (Mr. Farren), auctioneer and house agent, a gentleman with a genius for everything, and more capital in his head than in his pockets, is the presiding personage, and the mainspring of the affair. By dint of diligent exercise of the puffing principle, and flaming advertisements, he disposes of two unlettable mansions to a *Mr. Leicester* (Mr. Vining) and his lady (Miss Charles), who, in a moment of passion, occasioned by the unfounded jealousy of the gentleman, resolves to faint. *Mr. Vernon* (Mr. Brindal), a cousin of the lady, having been the cause of the quarrel, resolves to reconcile the couple; he applies to *Mr. Floss*, and after engaging to indemnify him for the houses he has let, promises him a tempting bribe if he will assist in putting matters upon a proper footing. Some laughable scenes ensue. The lady and gentleman, in varying moods, are brought in turn upon the stage; and after divers shifts and changes, more amusing than intelligible, the heart of *Mrs. Leicester* is melted by a story of a pretended duel, in which she is told her husband has been wounded. Before, however, she can fly to his side, an auction of their furniture, which had been previously arranged, commences; the lady hides herself behind a screen, the portrait of her husband is put up. The enthusiastic bidding for the portrait from behind the screen attracts the attention of the original, who is present. He finds it is his wife who manifests such a strong desire for the possession of the picture, and the rest may be imagined. The piece is well got up. The stage looks like a veritable auction-room, and the auction itself is capital. Although the piece is too broad for Mr. Farren, his part is of course the vivifying principle of the whole, leaving little for the rest of the characters. The curtain fell amidst applause, and the piece was announced for repetition.

SPORTING.

EGHAM RACES.—At the commencement of the present season it was more than doubtful whether the annual sports of Runnymede would be renewed—they had closed in 1841 under a cloud; the gentry were lukewarm, funds were low, and the racing had been below par; everything portended a dissolution, or that, at the best, they would furnish "a heat and a walk over" for the Queen's guineas, as at Guildford, Lewes, and other places. The races, however, commenced on Tuesday; but they were rather indifferent in character. The following is an outline of the sport:—

Tuesday.—The *Gold Cup*, of 50*l.* value, by subscribers of 10 sovs. each. Two miles. Five subs.—Won by Mr. Gardnor's Monops (Nat); beating Sir G. Heathcote's Dark Susan, and Mr. Isaac Day's Tamburini. Betting: 5 to 4 agst Tamburini, and 6 to 4 agst Monops. Won easily by a length, after a slow race.

The *County Members' Plate* of 40*l*, added to a Sweepstakes of 5 sovs. each. Two-mile heats. Three subs.—Won by Lord Rosslyn's Cornuto (F. Butler); beating Mr. De Winton's Whitney, and Sir G. Heathcote's Mingrelia. Cornuto was the favourite, and won both heats in a canter.

The *Runnymede Stakes*, of 5 sovs. each, and 30 added. Heats, three-quarters of a mile. Seven subs.—Won by Mr. Bignold's Camille (Ling); beating Colonel Wyndham's Singleton, Mr. Rush's br. g by Exquisite, out of Maresfield's dam; Mr. Smith's f. by Ishmael, out of balance; Mr. Gardnor's Ben Brace, and Mr. I. Day's m. by Nimrod, out of Busk. Both heats were won very easily.

Wednesday.—The *Ankerwycke Stakes*, of 5 sovs. each, with 30 added. One-mile heats. 3 subs.—Won by Mr. Morley's Conjugation (Mann); beating Lord Chesterfield's f. by Muley Moloch, and Mr. J. Day's f. by Nimrod, out of Busk. Betting: 5 to 4 on Conjugation, 5 to 2 agst Busk, and 5 to 2 agst Muley Moloch filly. After the first heat, 10 to 1 on Conjugation, who won both heats very easily.

The *Surrey and Middlesex Stakes*, of 25 sovs. each. Two miles and a distance. 17 subs., 13 declared.—Won by Mr. Greville's Welfare (Nat); beating Mr. Scott's Mosque, and Sir G. Heathcote's Pannakeen. Betting: 5 to 4 on Welfare, 7 to 4 agst Mosque, and 5 to 1 agst Pannakeen. The three walked to the betting-stand, when Welfare made play to the first gap. Pannakeen then took it up at an improved pace to the distance, where Welfare regained her lead, and won cleverly by half a length; a good race for second.

Sweepstakes of 5 sovs. each, with 25 added. Heats three quarters of a mile. 6 subs. Won by Mr. Rush's br. g. by Exquisite, out of Maresfield's dam (Bartholomew); beating Mr. Bignold's Camille, Count Bathyany's Nicholas, Mr. Dockeray's Pickwick, and Mr. Gardnor's Mirabelle. The first three heats were beautifully contested; but the others were won easily. Nicholas broke down in the third, and immediately destroyed.

Thursday.—The heavy rain that fell in the course of the night had a most beneficial effect in various ways: it lowered the temperature, improved the running-ground, and made the visit pleasant to those who gave way to the temptation of a capital entry for the Queen's Plate.

The *Sunninghill Stakes* (handicap) of 5 sovs. each, with 25 added. Three-quarters of a mile. 6 subs.—Won by Mr. Balchin's Epaulette (Balchin); beating Lord Rosslyn's Camelino, Colonel Wyndham's Nora Creina, Lord Chesterfield's f. by Muley Moloch, and Mr. Potto's Short Bob. 5 to 2 on Camelino. Won by ten lengths.

Match, 50, h. ft. New mile.—Won by Mr. Goodman's f. by Ishmael, out of Balance (Nat); beating Mr. Briscoe's Phœbe. 6 to 4 on Balance. Won in a canter.

The *Queen's Plate* of 100 guineas. Two miles and a dis.—Won by Mr. Rogers's Bridegroom (Bartholomew); beating Mr. Forth's Vibration, Mr Goodman's Shadow, and Sir G. Heathcote's Dark Susan. Betting: 6 to 4 agst Vibration, 7 to 4 agst The Shadow, and 3 to 1 agst Dark Susan. Vibration made the running, followed by Dark Susan, Bridegroom third, and Shadow two or three lengths behind. They ran thus, at a strong pace, to the rails, where Dark Susan and Bridegroom changed places. The Shadow moved forward, and for a moment it looked like a race with the lot; half way up, however, The Shadow and Dark Susan were beaten, and left Bridegroom to contest it with the Favourite; Bartholomew waited to the last, made a desperate rush, and the judge's fiat declared it a dead heat. *Deciding* Heat: 6 to 4 on Vibration, who made play as before, was challenged at the betting-stand, and beaten cleverly by a length.

The *Egham Stakes*, of 5 sovs. each, with 30 added. Heats, one mile and a half. 3 subs. Won by Lord Rosslyn's Cornuto (F. Butler); beating Mr. Scott's Obelisk, and Mr. Potto's Short Bob. 6 to 4 on Cornuto. Won easily.

TATTERSALL'S, Thursday.—Owing to the Egham races being on, the attendance of members was small, and the betting scarcely worth quoting. The following were the only horses mentioned:—

ST. LEGER.

5 to 4 agst Colonel Anson's Attila
16 to 1 —— Mr. Dixon's Balinkeele (taken)
20 to 1 —— Mr. Bell's Eboracum (taken)
30 to 1 —— Lord Chesterfield's Sir Harry.

DERBY.

25 to 1 —— Mr. G. Clark's Philip (taken).

It is announced in the sporting circles that the Marquis of Westminster has made up his mind not only to reduce his splendid racing stud, but to retire from the turf altogether. The horses will be sent to Eaton-hall, where they will be brought to the hammer, after the Doncaster race meeting.

Law.

Central Criminal Court.—The present Sessions commenced on Monday, with a very heavy calendar. The Grand Jury early in the week brought in a true bill against the boy Bean, charged with a misdemeanour in presenting a loaded pistol at her Majesty.

Frederick Howe, aged 24, described as a clerk, was indicted for stealing 236 printed books, of the value of 40*l.*, the property of her Majesty. A second count charged the prisoner with stealing 586 lbs. of printed paper. The prisoner pleaded "Guilty." The Recorder said, it was necessary that the Court should be informed of the facts of the case.—Mr. Adolphus, who appeared for the Crown, said, the depositions were before the Court, and he was not aware that he could add anything to them. The prisoner was the son of a person employed in the office of the Board of Trade, whence the property was taken, and consequently had access to the premises. The papers consisted of various returns which had been printed by Messrs. Hansard for the use of the office, and were consequently valuable.—The Recorder told the prisoner that he had pleaded guilty to a very serious offence. Being the son of a person employed at the office of the Board of Trade, he had availed himself of the opportunity of visiting the premises and stealing property to a large amount. It appeared to be a system of robbery which had been carried on for some time, and consequently could not be passed over lightly. The sentence therefore was, that he be imprisoned and kept to hard labour for one year.

Trial of Nicholas Suisse.—On Wednesday Nicholas Suisse, the valet of the late Marquis of Hertford, was placed at the bar on an indictment charging him with stealing money and securities, principally French coupons, to a very large amount, upwards of 100,000*l.* The indictment contained twenty counts. Many of the facts have already been before the public in the police reports. Mr. Kelly stated the case. He said that the present indictment was one of several which the executors of the late Marquis of Hertford had thought necessary to prefer against the prisoner. He was charged with having feloniously possessed himself of a quantity of securities in the French funds, which were called inscriptions. The interest on these was represented by other securities called coupons. A large amount of those coupons, which had belonged to the late Marquis of Hertford, were traced to the prisoner's possession, without any satisfactory reason appearing to account for the fact. The prisoner had been for upwards of twenty years valet to the late Marquis, who had reposed great confidence in him. He had constantly attended the Marquis on his travels, and for the last few years of his life had been almost his sole personal attendant, and had paid all his bills and expenses. For these services he had received a salary of about 126*l.* a-year, together with many perquisites, which made his situation a valuable one. The learned counsel then proceeded to detail the circumstances out of which the present indictment arose, as they subsequently appeared in the evidence, and called several witnesses. The evidence adduced was in substance a very melancholy exposure of the habits of the Marquis and of his lavish expenditure on profligate dependents. Mr. Thesiger addressed the jury for the defence. Witnesses were called to prove that the Marquis had presented the coupons to the prisoner; and Dr. Fuller, the medical attendant of the Marquis, deposed that in his opinion the Marquis was in a state of mind quite competent to manage his affairs, and he never saw anything in his conduct that could for a moment induce him to entertain a contrary opinion. At this stage of the case Lord Abinger intimated his opinion that after this evidence the jury could not convict the prisoner. The case for the prosecutor was entirely founded upon circumstantial evidence, and only appeared to amount to strong suspicion, and an answer appeared to have been given to it by the witnesses who had just been examined. Mr. Kelly said that after such an intimation from the Court he would not, of course, think of proceeding any further. His clients had felt it to be their duty to put the case in a course to undergo the very fullest investigation. Lord Abinger said the executors had only done their duty, but under the circumstances, he was of opinion that the evidence did not support the charge. The jury having been some minutes in deliberation, Lord Abinger said if they were not satisfied the case should go on. The jury said they thought the fact of the prisoner asserting his poverty was a most suspicious circumstance. Lord Abinger said it was so undoubtedly, but that was the chief circumstance of the case against him, and that alone would not warrant them in convicting him. The jury then returned a verdict of "Not Guilty." Lord Abinger said the prisoner had chiefly to blame himself for the suspicion which attached to him, and it should be a lesson to him, and to all men, how dangerous it was to deviate for an instant from the truth. Mr. Kelly then said there were three other indictments against the prisoner, but one of them stood on a very different footing from that which had just been disposed of. He should, therefore, consult with his Learned Friends before he could announce what course they intended to pursue. The other indictments were then ordered to stand over.

Trial of Bean for Misdemeanour.—On Thursday morning the trial of John Wm. Bean, the youth charged with a misdemeanour in attempting to discharge a pistol at her Majesty, came on before Lord Abinger, Mr. Justice Williams, and Mr. Baron Rolfe. The case appeared to excite very little interest, and the Court was not more crowded than it is upon ordinary occasions. At ten o'clock the Learned Judges took their seats upon the bench, and the prisoner, a diminutive person, his head scarcely reaching above the bar, was immediately brought forward. He was decently dressed, and although he looked rather pale, he evinced no appearance of alarm at the position in which he was placed. The indictment against the prisoner contained four counts. The first charged that the defendant, being a disaffected person, and bearing ill will to her Majesty, did unlawfully assault her Majesty by attempting to discharge a pistol at her loaded with gunpowder and wadding. The second count charged, that the prisoner being, as aforesaid, a disaffected person to her Majesty, having a pistol loaded with powder and wadding in his right hand, unlawfully attempted to fire it off at her Majesty, with intent thereby to harass or alarm her Majesty, and also to alarm and terrify the liege subjects of her Majesty who were then present, and in breach of the peace. The third count charged the prisoner with a common assault. The fourth charged him with attempting to commit an assault. The Attorney-General addressed the jury, and said that the jury would have learned from the form of the charge against the prisoner that he was not accused of the offence of high treason, but merely with the misdemeanour of assaulting her Majesty by attempting to discharge a pistol at her as she was proceeding from Buckingham Palace to the Chapel Royal. He should not attempt to show that the prisoner had any intention of inflicting serious injury upon her Majesty, but still an offence of this description, which was so well calculated to create terror and alarm, and not only in the mind of her Majesty, but to all her loyal subjects, was of a very serious character, and which it was highly necessary, for the welfare and peace of society, should be put down for the future. The advisers of the Crown felt it to be their duty, therefore, to lay this case before a jury. The Learned Counsel went on to detail the facts of the case, which have already been before our readers. Several witnesses were then called for the prosecution; after which Mr. Horry, counsel for the prisoner, raised various objections to the indictment, which were overruled by the judges. He then addressed the jury for the defence, and called two witnesses; one attempted to show that the people were laughing at the time, considering the affair as perfectly foolish and unimportant, upon which Lord Abinger interfered, and said it was clear they could not have known what the real circumstances were, or they would not have laughed and treated the matter so lightly. The other witness, Thomas Vosper, a painter, in Duke-street, Grosvenor-square, deposed that he witnessed the whole occurrence; that when he saw him produce the pistol, and aim it at the Queen's carriage, he did not interfere, but waited "to see the result." Lord Abinger called upon him to explain; but his reply was so unsatisfactory, that the judge censured him severely, and said that a person of common judgment and common loyalty would have interfered, and have questioned a boy as to his object under such circumstances. The Attorney-General having replied, Lord Abinger summed up, briefly alluding to the law of high treason, and said that, if the jury believed the evidence established that the prisoner intended to do personal injury to the Sovereign, it would amount to that offence, and it would be their duty to acquit him upon the present indictment. They would, however, probably feel that they would not be justified in coming to such a conclusion, and that the chief point to which their attention should be directed was the second count, which charged the defendant with having attempted to discharge a pistol at her Majesty's carriage, intending thereby to harass and alarm her Majesty and her loyal subjects; and upon this he would express his opinion that the law considered such an act, with such an intent, amounted to a high misdemeanour. The jury would therefore look at the facts of the case, and see whether they would bear out such an interpretation. His Lordship then recapitulated the facts of the case, commenting upon them as he proceeded, and expressed his opinion that the constables who refused in the first instance to take the charge had been guilty of almost criminal negligence. After having gone through the evidence for the prosecution, his Lordship proceeded to remark upon the testimony of the witnesses for the prisoner, and remarked in very severe terms upon the proceedings of the witness Vosper, and said he had no hesitation in expressing his opinion, that the man who stood by the side of another, who had a loaded pistol in his hand, with which he anticipated an attempt would be made upon the life of the Sovereign, was very nearly guilty of misprision of treason. After some further remarks, his Lordship concluded by leaving the case in the hands of the jury. After deliberating for about five minutes, the following verdict was returned: "We find the prisoner guilty upon the second count of the indictment." The prisoner did not evince the least concern when the verdict was delivered, but continued leaning upon the front of the dock in the same position he had occupied during the whole of the trial. The Learned Judges having conferred together for a short time, the prisoner was asked in the usual form what he had to say why sentence should not be passed upon him. He made no answer. Lord Abinger then proceeded to pass sentence, and addressing the prisoner, he said that the jury, after a most patient inquiry, had found him guilty of an attempt to harass and disturb the peace of her Majesty, and also that of her loyal subjects, by the act he had committed, by attempting to discharge a pistol at her, loaded with gunpowder and wadding. It appeared that while her Majesty was proceeding to the performance of her religious duties at the Chapel Royal, this daring attempt had been made, and if the pistol had exploded, what must naturally have been the feelings of alarm entertained by her Majesty to find that upon such an occasion any of her subjects could be capable of the act of discharging a pistol at her? What, too, must have been the feelings of her loyal subjects who were about to join her in her devotions? And if the pistol had exploded, the necessary inference would have been that some traitorous attempt had been made upon the life of her Majesty, and this must necessarily have produced those feelings of terror and alarm which were charged in the indictment as being the probable consequences of the act he had committed. The Judges perfectly concurred with the verdict of the jury, and did not believe that any one present could entertain any other opinion than that he was guilty of the offence imputed to him; and they could not help looking upon it as an offence of the most serious description. It was an offence calculated to disturb the peace of the kingdom, and one which affected deeply every class of society. The Judges could not tell what motives could have induced such an act; but if, as had been suggested, the prisoner had been only actuated by a desire to obtain an ignominious notoriety, they did not know what could be said of a man, who, for such an object, would commit an act that was calculated to create terror and alarm throughout the whole country. He (Lord Abinger) wished that the present law of the country empowered him to inflict a punishment adequate to the offence; but it was as well it should be known, that if any person, after this, should commit an offence of the same description, he would attain a certain degree of notoriety by being publicly whipped, in addition to other severe punishment. At present the sentence was, that he be kept in confinement in the gaol of Newgate for the period of 18 months. The sentence was afterwards changed to 18 months' imprisonment in the Penitentiary.

MARK LANE, Friday, August 26.—The supply of Wheat by land carriage samples consisted of about 1500 qrs. new, the quality of which was very fine; of old there was scarcely any at market: the former declined 4*s.* to 5*s.* per qr. before any progress could be made in sales, when the stands were pretty well cleared; the old was much neglected, even at a similar reduction.—Foreign was generally offered at 3*s.* less without much business being transacted. No new Barley at market worth notice, and the supply of new Beans and Peas is stopped for the present; old remain at the same prices.—Best English Oats are unaltered in value, Irish 1*s.* to 2*s.* cheaper.—White Mustard Seed comes very slowly to market, but fine in quality, and has been sold at 9*s.* to 11*s.* per bushel; there are no buyers of brown.

Whale-oil soap, destructive to insects . . . . . 575 *c*
Whitmore Lodge, noticed . 575 *c*
Wire, to protect fruit from Wasps . . . . . . 577 *a*

HORTICULTURAL SOCIETY OF LONDON.

NOTICE IS HEREBY GIVEN, that the MEETINGS OF THE SOCIETY in Regent-Street are DISCONTINUED till Tuesday, October the 4th, in consequence of the Meeting-room being under repair.

HORTICULTURAL SOCIETY OF LONDON.

EXHIBITIONS AT THE GARDEN.

All persons interested in these Exhibitions are invited to suggest such improvements as may occur to them. The desire of the Society is to do everything that is calculated to attain the great object for which the Exhibitions were instituted, namely, the promotion of Horticulture; and any suggestions that may be made by letter, addressed to the Vice-Secretary, 21, Regent-street, will be laid before the Exhibition Committee for consideration. The following were the regulations observed during the past season:—

Subjects of Exhibition.—These will be divided into Classes, as explained further on. No articles not of horticultural produce will be allowed to be placed upon the tables. Exhibitors will do well to make themselves acquainted with the arrangements described in the following list, as they will in all cases be required to sign a declaration stating under what letter their plants are to be shown; and they are particularly requested to take notice, that if errors in the awards of the judges should occur, in consequence of mistakes on the part of exhibitors in filling up such declarations, the Society cannot undertake to rectify such errors afterwards. To enable the officers of the Society to attach names to the objects exhibited, it is requested that correct lists may be delivered to the clerk as soon as the exhibitor reaches the Garden.

Class I.—Flowers for which Nurserymen and Private Growers exhibit independently of each other.

A. Greenhouse Azaleas, to be shown in numbers not exceeding 12, GB, LS, SK.
B. Carnations, in pans of 24 blooms, LS, SK, SB.
C. Picotees, in pans of 24 blooms, LS, SK, SB.
D. Pinks, in pans of 24 blooms, SK, SB.
E. Cape Heaths, in collections of 20 species, GK, SG, LS, SK.
F. Cape Heaths, in collections of six species, GB, LS, SK.—*N.B.* No person who shows in E will be allowed to exhibit also in F.
G. Exotic Orchidaceæ, in collections of not fewer than six species, GB, LS, SK.
H. Exotic Orchidaceæ, in single specimens, LS, SK, SB.
I. Pelargoniums, in collections of 12 varieties, in pots, not exceeding 12 to a cast, GB, LS, SK, SB.
K. Pelargoniums, in collections of six varieties, in pots, not exceeding eight to a cast, SG, LS, SB.
L. Rhododendrons, in pots, not fewer than 12 plants, in 12 varieties, LS, SK, SB.
M. Moss Roses, SK, SB.
N. Common Garden Roses, exclusive of all Chinese or Chinese Hybrids, LS, SB, SK.
O. Chinese or Hybrid Roses, such as Bourbon, Noisette, Tea-scented, and similar varieties, LS, SB, SK.—*N.B.* No exhibitor of Roses can be allowed to occupy more than 15 ft. run of tables for all his Roses, which, being double, is equal to 30 ft. of boxes. If any Exhibitor gains the first medals both in M, N, and in O, he will be entitled to a Gold Banksian medal instead of the three Silver ones.
P. Stove or Greenhouse Plants, in collections of from 50 to 60 plants, GK, GB, SG, LS.
Q. Stove or Greenhouse Plants, in collections of from 15 to 20 plants, GB, LS, SK.
R. Stove or Greenhouse Plants, in collections of six distinct species, LS, SK.—*N.B.* Persons exhibiting in P and Q will not be allowed to compete in R also.
S. Herbaceous Calceolarias, in sixes, LS, SK, SB.
T. Shrubby Calceolarias, in sixes, LS, SK, SB.

Class II.—Flowers, for which all persons are admitted to equal competition:—

U. Collections of Stove or Greenhouse Climbers, GK, GB, LS, SK.—*N.B.* The Gold Knightian medal is not to be awarded for fewer than 12 distinct kinds.
V. Tall Cacti in flower, LS, SK.
W. Single specimens of Ornamental Plants, LS, SK, SB, C.
X. Miscellaneous Flowers, SK, SB, C.—*N.B.* Cockscombs, Hydrangeas, and cut flowers, are altogether excluded from prizes.
Y. Seedling Florists' Flowers, SK, SB, C.—*N.B.* Every seedling must be shown singly, and must be marked with the name it is to bear. The same seedling cannot gain a prize more than once in the season. Pelargoniums are to be shown in single trusses, with a single leaf, so far below the flowers as not to support them; and they are not to be dressed with cotton or wool, or any similar substance, but must be shown exactly as they grow on the bush.

Class III.—Fruit, for which market-gardeners, or persons in the habit of regularly supplying the market, and private growers, exhibit independently of each other.—*N.B.* All Fruit must be ripe and well-coloured; if the contrary, it will be disqualified.

Z. Miscellaneous collections of Fruit, consisting of at least three different kinds, Peaches and Nectarines being considered as only one kind, GK, GB, LS.—*N.B.* Cucumbers Tomatoes, Gourds, and similar kitchen-garden produce, are excluded from this letter.
AA. Grapes, SG, LS, SK, SB.
BB. Pine-apples, SG, LS, SK, SB.
CC. Peaches or Nectarines, in dishes of six specimens, SK, SB.
DD. Miscellaneous Fruit, SK, SB, C.

Judges.—The Judges have the power of increasing or diminishing the number and value of the Silver Medals offered by the Society for particular objects, and also of conferring Silver Medals or Certificates in cases not contemplated in these regulations, if they think it necessary to do so.

The judges are also required to bear in mind that the Society's medals are offered, less for new and curious objects, than for fine specimens of Horticultural skill, the design of the council in instituting these meetings being not so much to encourage the collector as to reward the skilful gardener; they are also not to make any award in cases where the objects exhibited do not appear worthy of a medal; otherwise a bad single exhibition might obtain a prize, merely because there is no better exhibition of the same class to oppose it.

WANDSWORTH HORTICULTURAL EXHIBITION will be held in the usual place, on Wednesday the 7th inst.; when a variety of Prizes will be given for Superior Productions.

ROYAL BERKSHIRE HORTICULTURAL SOCIETY.

THE FOURTH EXHIBITION of FLOWERS, FRUITS, and VEGETABLES, will take place, by permission, in the Castle Grounds, Wallingford, on Wednesday, Sept. 14, 1842, when the Royal Medal and other Prizes will be awarded for Dahlias, &c.

The ANNUAL DINNER will be provided at the Lamb Hotel, at 4 o'clock. Tickets 5*s*. each, including Waiters.

The Royal Medal for the best collection of 100 Dahlias will be open for competition to all classes of Members; and other persons entering before 11 o'clock on the morning of Exhibition, may compete for this and other Prizes, on the payment of One Guinea extra as entrance-money. Schedules of Prizes may be had on application.

J. J. Allnatt, Honorary Secretary.
Carey Tyso, Assistant Secretary.

Wallingford, Sept. 1, 1842.

A PRIZE of £10, open to all England, will be awarded at the THANET FLORICULTURAL and HORTICULTURAL SOCIETY'S EXHIBITION, to be held September 8th, at the Ranelagh Gardens, St. Peter's (two miles distant from Margate), for the best 24 Dissimilar Dahlias.

J. G. Hodgson, Hon. Sec.

Vicarage, St. Peter's, August 16, 1842.

N.B.—Exhibitors to provide their own Stands.

WARWICK AND WARWICKSHIRE HORTICULTURAL SOCIETY.

AT the FOURTH EXHIBITION for 1842, which will be held at the County Hall, Warwick, on Wednesday, September 14th, Two Prizes are offered, open to all England, of 5*l*. each, for 24 DAHLIAS—one to Amateurs, and one to Nurserymen. Entrance to Non-subscribers, 2*s*. 6*d*. each.

N.B.—All Specimens for Competition must be delivered into the Hall by Ten o'Clock, properly named, and authenticated as the growth and property of the Exhibitor.

Parties at a distance not wishing to attend may consign their flowers to the Secretaries; carriage paid.

T. AND C. LOCKHART, Florists and Seedsmen, 156, Cheapside, London, have just published a new and extensive LIST of FLOWER ROOTS and PLANTS, containing all the Novelties of the Season, and which will be forwarded, *Post free*, on application.

MYATT'S BRITISH QUEEN STRAWBERRY, after two years' competition, still maintains its pre-eminence; and, in returning thanks to their numerous patrons and friends, J. and W. Myatt beg to say they can with confidence recommend it as the most superb fruit yet known.

Also their new Seedling Strawberry Prince Albert, which for productiveness and size cannot be equalled. Price per 100, each, 50*s*.; and their Eliza, 20*s*. Runners are now ready, and may be had on application to them at Manor Farm, Deptford.

Myatt's famed Victoria Rhubarb, 50*s*. per 100 sets, or 1*s*. 6*d*. per root, will be ready in October.

DUTCH FLOWER ROOTS.—P. E. ERHARD, Florist at Haarlem, (Holland,) has just opened his Depot for the sale of Dutch Flower-roots, at No. 359, Strand, corner of Burleigh-street, as announced in the newspapers before. He flatters himself that he is able to give the greatest satisfaction to those who may favour him with their orders.

MESSRS. MARNOCK and MANLEY beg to inform their Friends and the Public that their DUTCH BULBS have arrived, in exceeding fine condition. Early orders are solicited, to prevent disappointment. Catalogues to be had at the Nursery.

Nursery, Hackney, Sept. 2nd, 1842.

TWITCHETT'S DON JOHN CARNATION (the finest Scarlet Bizarre in England); HEADLY'S SARAH, a splendid light edged Red Picotee—each One Guinea per pair. See Wakeling's "Florist's Guide" for Sept. 1841 and June 1842. Also TWITCHETT'S FAIR ROSAMOND, a rich rose-edged Picotee on a snow-white ground, 10*s*. 6*d*. per pair. The Trade allowance if six pairs be ordered. Address Mr. Twitchett, Cambridge, or Messrs. Dickson, Florists, Acre-lane, Brixton, London.

Mr. Twitchett will show 21 blooms of his Don John against the like number of Martin's Splendid, or any other Scarlet Bizarre, for Two Guineas each bloom, and Twenty Guineas the odds, July 1843, p. p.

MESSRS. B. ELY and SON, Florists, &c., Rothwell Haigh, near Leeds, Yorkshire, beg to inform the Nobility, Florists, and the Public in general, that they will send out this Autumn the following Carnations and Picotees, with which they have won Prizes at most of the principal Exhibitions in Yorkshire in 1841 and 1842:—

	s.	*d.*
Ely's Hugo Meynell, Pink Bizarre, . . .	10	0
Do. Wm. Beckett, Scarlet Flake, . . .	10	0
Do. Prince of Wales, do.	10	0
Do. Leviathan, Purple Flake, . . .	10	0
Do. George Lane Fox, Scarlet Picotee, Light Edge,	7	6
Do. Mrs. Wilson, do. . do. .	5	0
Do. Mrs. Bossville, do. . do. .	5	0
Do. Mrs. Meynell, Scarlet Picotee, Heavy Edge,	7	6
Do. Emperor, do. . do. .	5	0
Do. Empress, Purple Picotee, Light Edge, .	5	0
Do. Mrs. Ramsden, do. do. . . .	5	0
Do. Field Marshal, do. Heavy Edge, .	10	0
Do. Marchioness of Waterford, Rose Picotee, .	5	0
Do. Ada, do. .	5	0
Do. Mrs. Bland, do. . .	5	0

N.B.—B. Ely & Son have also an extensive collection of Carnations and Picotees, consisting of upwards of 2,500 pots, including most of the principal varieties grown, Catalogues of which may be had by post on application.

STAPLETON ROAD NURSERIES, near BRISTOL. W. MAULE and CO. beg to call the attention of Horticulturists to a new and desirable FUCHSIA, which they intend sending out by the name of "Racemiflora élegans." Its habit is gracefully elegant; the lateral branches are set at every joint with numerous long deep-red flowers, 1½in. to 2in. long, drooping around the main stem of the plant, forming a complete column of beauty. It is allowed by competent judges to be one of the best varieties in cultivation.—Fine strong plants, in bloom, will be sent, if ordered, at 5*s*. or 7*s*. 6*d*. each.

TO PELARGONIUM GROWERS.—Fuller's Splendid Pelargonium, MADAME RACHEL, will be sent out in Sept. next, at Two Guineas each. The colour is a delicate Pink, very striking, and distinct from any other Pelargonium yet offered.

The upper petals have an intense dark spot margined with pink. It is a good tresser, with the blooms standing well above the foliage, and flowers profusely. It will be found an acquisition to the most select collection.

Dr. Lindley's Opinion:—Your Seedling Pelargonium will make a showy variety for the Greenhouse; the delicate pink colour of the flower is very beautiful; the spot on the upper petals, which are of good form, is well defined.

Horticultural Grounds, Park Crescent, Worthing, Sussex. Orders also received by Mr. Harrison, 6, Downham, Norfolk.

CARNATIONS, PICOTEES, AND PINKS.—NATHANIEL NORMAN, Florist, begs to call the attention of the Nobility, Gentry, Amateurs, and his friends generally, to his select Collection, comprising the finest show varieties, with which he has gained twenty prizes this season at the following Societies: London Horticultural, Royal South London, South Essex, and Floricultural Society of London. Has 10,000 Plants now ready, in fine healthy condition.

Catalogues may be had on prepaid application.—Bull Fields, Woolwich.

THE MOST SUPERB DARK CHINA ROSE EVER OFFERED TO PUBLIC NOTICE—"MIELLEY'S PRINCE OF WALES."

WM. WOOD & SON have the honour to announce to their Friends and Amateurs in general, that they have purchased the entire stock of the above most magnificent Rose, and intend sending it out early in November, price for Dwarf Plants (on their roots) 10*s*. 6*d*. each.

The colour is of the deepest rich dark velvety purple violet, most perfect shape, beautifully cupped, large and very double, producing its elegant flowers on very strong foot stalks; the habit is luxuriant and pleasing, with fine glossy foliage; it is perfectly hardy, and may certainly be depended upon as a Show Rose of first-rate excellence.

A discount of 1*s*. 3*d*. will be allowed to the trade if six plants or more are taken at once. Early orders are respectfully solicited, which will be executed in rotation as received.

A remittance or reference will be required from unknown correspondents.

Woodlands Nursery, Maresfield, near Uckfield, Sussex.

TO GROWERS OF HYACINTHS, AND OTHER DUTCH BULBS.

MESSRS. YOUELL have much pleasure in announcing that they have just received their importation of the above direct from Haarlem, the Bulbs being remarkably large and sound. For particulars see their advertisement in the *Gardeners' Chronicle* of Saturday last.

Catalogues may be had on application.

Great Yarmouth Nursery, Sept. 1st, 1842.

ORANGE-TREES TO BE DISPOSED OF, from Two to Five Shillings each: only half their value. May be seen at Mr. Fryer's Nursery, Clarendon-terrace, Camberwell New Road. Orders from the Country attended to.

TO NURSERYMEN, PINE-GROWERS, AND OTHERS.

MESSRS. PROTHEROE & MORRIS are instructed by the Trustees of Messrs. Adamson and Son, Stoke Newington Common, to submit to public competition on the premises, on Monday, Sept. 19th, 1842, and following days, at 11 o'clock, the whole of their celebrated Stock of Pine Plants, Greenhouses, Hothouses, Graperies, Carts, Waggons, and general Farming and Agricultural Implements, and a considerable quantity of Building Materials. The whole comprises about 35,000 feet of Glass, with Brick and Ironwork and Water Apparatus complete; about 6,000 Pine plants of the first quality, and well-known established Stock; a considerable number of Cucumber, Melon, and other Frames and Lights; the stock of Greenhouse and other Plants, Garden Pots, &c.

May be viewed a week prior to Sale. Catalogues may be had of the principal Seedsmen, on the premises, and of the Auctioneers, American Nursery, Leytonstone.

The whole of their valuable Nursery and other Stock will be disposed of by public Auction about the third week in October next, of which timely notice and particulars will be given.

HOT-WATER APPARATUS FOR HEATING HORTICULTURAL BUILDINGS, DWELLING-HOUSES, CHURCHES, and MANUFACTORIES, upon improved principles, and at very moderate charges, erected by DANIEL and EDWARD BAILEY, 272, HOLBORN.

D. and E. Bailey having devoted much time to the consideration of this subject, and had much experience in the erection of apparatus for the above-mentioned purposes, have, by improvements suggested in their practice, rendered their mode of heating not only very efficient, but very simple, and have combined durability in the apparatus with economy in the charge. They have erected apparatus in England, Scotland, and Ireland, for many noblemen and gentlemen, and have had the honour to be employed by the Horticultural Society of London, in executing the works of their splendid Conservatory, lately erected at Chiswick.

D. and E. Bailey also construct in metal all descriptions of Horticultural Buildings and Sashes, and invite noblemen, gentlemen, and the public to an inspection of their various drawings and models, at 272, Holborn, where they have the opportunity of exhibiting, amongst other metal works, an extremely complete and convenient kitchen apparatus, or range, adapted for the continued supply of hot water, and an arrangement of the oven more complete than has hitherto been brought before the public.

D. and E. Bailey were the first to introduce metallic curvilinear houses to horticulturists, and can refer to the Conservatory attached to the Pantheon as one of their works, besides many others in this country and on the Continent.

D. and E. Bailey have prepared a quantity of the Galvanic Plant Protectors, which are now ready for immediate delivery: they beg to introduce to public notice a new Trough Pipe, for Orchidaceous or other Houses where vapour is constantly, or at intervals, required, and which may be seen at their Manufactory.

HOT-WATER APPARATUS, for Horticultural and other Buildings.—STEPHENSON and Co., Agents for the Old Park Iron-works, and Manufacturers, 61, Gracechurch-street, London, solicit an inspection of their improved Conical Boiler. (See Editor's description, *Gardeners' Chronicle*, March 12, p. 175.) To Amateurs these Boilers will be found invaluable. They are complete without furnaces or setting in brickwork, movable at pleasure, very ornamental in appearance, and require attention only once in 11 or 15 hours, price 5*l*. 5*s*. and upwards. Further particulars, with plans and estimates for heating any description of building, may be obtained as above; where also may be seen the improved Wrought-iron Boiler, as applied with Chanter's Smoke-consuming Furnaces at Chatsworth, and many other of the Nobility's Seats. Iron Fencing, Hurdles, Bedsteads, Ornamental Wire-work, Garden Implements, &c. &c. The trade supplied with Hot-water Socket-pipes.

N.B.—WATTE's New Patent Land-pressers and Drills.

THE CONICAL HOT-WATER BOILERS invented by J. ROGERS, Esq., may be obtained of any size from JOHN SHEWEN, Ironmonger, &c., Sevenoaks, Kent.

J. SHEWEN having had every opportunity afforded him by an extensive practice to bring this apparatus to perfection, begs to offer it as most efficient and economical: it may be seen at Messrs. Chandler & Sons' Nursery, Vauxhall; Messrs. Loddiges', Hackney; Messrs. Henderson's, Pineapple-place; Mr. Knight's, King's-road, Chelsea; Messrs. Veitch and Son's, Exeter; and at the Gardens of the Horticultural Society of London.

WIRE-WORK, HOT-WATER APPARATUS, GREEN-HOUSES, &c.

ST. THOMAS BAKER, MANOR-HOUSE, MANOR-PLACE, KING'S-ROAD, CHELSEA, Manufacturer of INVISIBLE WIRE FENCE, to resist Grazing Stock, and rendered Rabbit-proof. WIRE-WORK in Trainers, Arches for Walks, Bordering, Flower-stands, Pheasantries, &c. HORTICULTURAL BUILDINGS, Green and Hothouses, Conservatories, &c. The same heated by HOT-WATER APPARATUS, on improved and economical principles.

Parties waited on in Town or Country, and Drawings and Estimates free. Work for the Trade as usual.

EDWARD BECK, MANUFACTURER IN SLATE, Isleworth, Middlesex, respectfully informs Horticulturists, that his IMPROVED SLATE TUBS for Orange Trees and Conservatory Plants, mounted upon rollers, Slate Cisterns, Shelves, and Edgings for garden paths, may be seen in use at his house upon application to the gardener.

TO FLORISTS, HORTICULTURISTS, AMATEUR GARDENERS, &c.—CLARKE'S AIMATIC COMPOST, for the Flower and Kitchen Garden, Greenhouse Plants, Pineries, &c.: the application of this COMPOST will add greatly to the beauty of the Flower and produce of the Kitchen Garden. In making new Gardens it will be found invaluable; it has long been in use in the Royal Gardens at Kew. Price One Guinea per bag, containing two cwt., sufficient for a good-sized garden for one year.

Also, Prepared HAIR DUST. This Preparation will effectually preserve Flowers, Plants, Bulb-roots especially, from the ravages of worms, grubs, and all kinds of crawling insects. From its imperishable nature, its effect will be lasting. Price One Guinea per bag. Address, Stanbridge Clarke, St. Pancras Wharf, King's Cross; or Henry Clarke, seedsman, 86, High-street, Borough.

In Monthly Nos., 8vo, with Four beautifully-coloured Plates.
Price 2*s*. 6*d*.

PAXTON'S MAGAZINE OF BOTANY.

The Number for September, 1842, contains highly-finished drawings of *Combretum grandiflorum, Làlage Hoveæfòlia, Malva campanulata,* and *Péntstemon gentianoides,* var. *splendens*; likewise Papers on Gardening as a science: on Grouping Ornamental Plants; and Suggestions for Training Cacti. Floricultural Notices of new and beautiful Plants figured in the leading Botanical Periodicals for August; together with a complete Calendar of Monthly Operations for the Garden.

This work comprises, monthly, four admirably-coloured plates, and twenty-four pages of interesting and useful letter-press. The admirers of flowers are requested to observe—

1. That all the drawings are taken from nature, and are consequently made from plants which have flowered in Britain.
2. That, with few exceptions, they are all done by one artist, whose abilities are of the highest order, and who travels himself to the places where the plants are in flower.
3. That they are lithographed by the same individual, and, being coloured in a superior manner, have all the spirit and elegance, and much of the finish, of the original drawing.
4. That about one-half of the drawings are from plants which have never before been figured in this country, the rest representing the most popular novelties, as well as the more neglected, though sometimes far handsomer, old species; the majority being such as can be cultivated by every one possessing a flower-border and a greenhouse or frame.

It may, in conclusion, be safely asserted that, both for the beauty of its embellishments, and the utility of its contents, this work is well adapted to the wants of all who delight in gardening; and as the improved system of having the plates lithographed commenced with the present year, and as it is intended that each volume shall now be perfect in itself, the present is a desirable opportunity for those who wish to become subscribers.

London: W. S. ORR and Co., Paternoster-row.

TAYLOR AND WALTON, 28, Upper Gower-street, and Sold by all Booksellers.

I.

ANIMAL CHEMISTRY, or ORGANIC CHEMISTRY in its APPLICATIONS to PHYSIOLOGY and PATHOLOGY. By JUSTUS LIEBIG, M.D., Professor of Chemistry in the University of Giessen. Edited from the Author's MSS. by WILLIAM GREGORY, M.D., Professor of Chemistry, King's College, Aberdeen. 8vo, 9*s*. 6*d*. cloth.

"While we have given but a very imperfect sketch of this original and profound work, we have endeavoured to convey to the reader some notion of the rich store of interesting matter which it contains. The chemist, the physiologist, the medical man, and the agriculturist, will all find in this volume many new ideas, and many useful practical remarks. It is the first specimen of what modern Organic Chemistry is capable of doing for physiology; and we have no doubt that from its appearance physiology will date a new era in her advance.—*Quarterly Review, No.* 139.

II.

By the same Author (Translated by Dr. Playfair).

CHEMISTRY in its APPLICATIONS to AGRICULTURE and PHYSIOLOGY. Second Edition, much enlarged. Small 8vo, 9*s*. 6*d*. cloth.

"Every page contains a mass of information. I would earnestly advise all practical men, and all interested in cultivation, to have recourse to the book itself. The subject is vastly important, and we cannot estimate how much may be added to the produce of our fields by proceeding on correct principles."—*Loudon's Gard. Mag., March* 1841.

III.

ELEMENTS OF CHEMICAL ANALYSIS, INORGANIC and ORGANIC. By EDWARD ANDREW PARNELL, late Chemical Assistant in University College, London. 8vo, 10*s*. 6*d*. cloth.

Just published, price Threepence, 16 pages royal 8vo,
ILLUSTRATED WITH ENGRAVINGS.

THE GARDENER AND PRACTICAL FLORIST.—Contents of No. I.:—The Gardening Interests—Properties of Flowers and Plants—The Pansey—Royal Botanical Society—Victoria Park—Public Gardens and Parks—Canvass Houses for Plants—Glossary of Words—Gardening for September—Geranium and Geranium Growers.

London: R. Groombridge, Paternoster-row.

Ready for the Press, and shortly will be Published,

A COMPREHENSIVE PRACTICAL TREATISE, or a New Era in the CULTURE OF THE VINE UNDER GLASS, as to its earlier Precocity, &c. &c. Giving a plain, comprehensive, practical detail of the Author's Practice of propagating the Vine; Formation of Borders with proper composts; Planting the same on Scientific Principles, so as to bring it to a permanent bearing state some years earlier than usually practised; Summer and Winter Pruning; Temperature, in all its stages through the season; Thinning of the Fruit, reduced to fixed principles; on the colouring of the same; with a thorough Preventive of that bane of all success, Shanking and Shrivelling of the Footstalks and Fruit. Giving a complete Course of Culture, from the embryo bud to the permanent bearing of the plant, as practised by himself, carefully collected from great study. A Guide to the Amateur, the Tyro, and rising generation of Gardeners.—By JAMES ROBERTS, Gardener to Matt. Wilson, Esq., Eshton Hall, near Skipton, Yorkshire.

THE 'FRANKLIN MEMORIAL.'—The existence of the identical press at which Dr. FRANKLIN worked as a journeyman printer when in London (in 1726) having been mentioned in the "Athenæum," many persons were induced to visit the warehouse of Messrs. Harrild, in whose possession it then was, and among them Mr. J. B. Murray, of New York, who expressed a desire that the venerable relic should be preserved in the Museum of the Philadelphia Philosophical Society, as a memorial of his illustrious countryman. To this national good feeling Messrs. Harrild cheerfully responded, declining any price, but, wishing to make it instrumental in forwarding a work of charity in favour of decayed printers, proposed that a donation should be made for that purpose. The Society's constitution precluding any such arrangement, it was at once given unconditionally, and the press is now on its way to America. On its arrival at Liverpool, Mr. Murray, being anxious to carry out the benevolent intentions of the donors, caused it to be exhibited, and a public Lecture was given by the Rev. Hugh M'Neile, on the Life of Franklin. The result was a net sum of 150*l*. So unexpected and welcome an issue has led to the proposal of founding a Memorial of the philosopher, and to make this sum the nucleus of a subscription for the establishing of a pension or pensions bearing his name, in favour of indigent printers. It is proposed to found two pensions, if the funds will admit, one of 30*l*. for a decayed master-printer, whom misfortune has "reduced to the ranks," and one of 20*l*. for a decayed overseer who has served five years in an office with credit, or, failing any such applicant, a journeyman who has retained a situation for the same period—to be called the "Franklin Pensioners." Thus, as was observed by Mr. Murray, "each country will be put in possession of a new Memorial of Franklin: America of her citizen's Press, and England of an endowment bearing his name; directly resulting from the fact of his having worked at an English press; and in accordance with his benevolent and provident disposition." The above-named Lecture has been published, and the proceeds of the sale in England and America, and further subscriptions, will be added to the fund; and contributions, not only of the English public, but of the American nation and the Colonies, are confidently anticipated: in short, wherever an English press has been set up (for it has now become universal*) a collection should be made, and contributed to by all who feel that they are indebted to the printer's art for the intellectual enjoyments of social life. The name of FRANKLIN will ever be associated with that invaluable art, and his example serve to stimulate aspiring youth in the pursuit of its exercise. Many are they who have profited by his precepts; and his interesting Autobiography has served for a chart to the young adventurer by which to steer in the voyage of life. Let all those who have so profited—all who have attained success by following his course—look with compassion on those who have foundered or failed in the struggle with adversity. It is hoped at least that in every printing-office in the kingdom a collection will be made; and that every American residing in England will hasten to inscribe his name in so praiseworthy a record, in testimony of his approbation of the FRANKLIN MEMORIAL. The facilities of the post-office will enable every individual to contribute his mite, which will be thankfully received.

Subscriptions will be received by the following Bankers;—Messrs. Rogers & Co., 29, Clement's-lane; Stevenson, Salt, & Sons, 20, Lombard-street; and by Marchant, Smith, & Co., Printers, Ingram-court, Fenchurch-street; and Harrild & Sons, 11, Great Distaff-lane, Friday-street.

* So great has been the spread of the art of printing and the English press, that *one* manufacturer has, in the last 15 years, sent out upwards of 1500 presses to all parts of the world! If but a guinea were contributed by each of the respective parties, it would make a sum sufficient for the object proposed.

WANTED, in a wholesale Seed Warehouse, a YOUNG MAN, competent to undertake the Counter department. One who has been so engaged, and who has occasionally been employed in Travelling, would be preferred.—Apply, by letter only, to Mr. Henry Clarke, 39, King-street, Covent-garden, London.

WANTS A SITUATION as GARDENER a respectable young man, aged 28, who has a perfect knowledge of the Forcing, Flower, and Kitchen Gardens, and can be well recommended from the Situation he has just left, from which he can have two and a half years' undeniable character. He has likewise lived in the first of families. Direct to E. H., 2, Ingleton-street, North Brixton, Surrey.

WANTS a SITUATION as GARDENER, a Young Man, aged 30, who perfectly understands the Management of the Flower and Kitchen Garden, and the various modes of late and early Forcing; can produce most respectable references. Address to A. M., Gibb's Nursery, Wellington-road, St. John's Wood, Middlesex.

WANTS a SITUATION as GARDENER, William Stevenson, 33 years of age; has had thirteen years' practical experience in first-rate situations, including Oxenford Castle, Howkston, Stowe, &c., &c. For character, he refers Noblemen and Gentlemen to Mr. Ferguson, Stowe, Buckingham. Letters addressed to W. S., Aylesbury Nursery, Bucks, will be immediately attended to.

DARLEY'S SCIENTIFIC LIBRARY, for the Use of Schools, Private Students, Artists, and Mechanics. It is the purpose of this Work to furnish a Series of Elementary Treatises on Mathematical Science, adapted to the wants of the Public at large. To youth of either sex at public and private schools, to persons whose education has been neglected, or whose attention has not been directed in early life to such studies, and to Artists and Mechanics, these little Works will be found particularly suited. The principles of the various Sciences are rendered as familiar and brought as near to our commonest ideas as possible; the demonstrations of propositions are made plain for the mind, and brief for the memory; and the Elements of each Science are reduced, not only to their simplest, but to their shortest form.

1. A. SYSTEM OF POPULAR GEOMETRY. Containing in a few Lessons so much of the Elements of Euclid as is necessary and sufficient for a right understanding of every Art and Science in its leading Truths and general Principles. By GEORGE DARLEY, A.B. Fourth Edition, 4*s*. 6*d*. cloth.
2. COMPANION TO THE POPULAR GEOMETRY, in which the Elements of Abstract Science are familiarised, illustrated, and rendered practically useful to the various purposes of Life, with numerous Cuts. (A Second Edition is now ready.) 4*s*. 6*d*. cloth.
3. A SYSTEM OF POPULAR ALGEBRA, with a Section on Proportions and Progressions. Third Edition. 4*s*. 6*d*. cloth.
4. A SYSTEM OF POPULAR TRIGONOMETRY, both Plane and Spherical, with Popular Treatises on Logarithms, and the application of Algebra to Geometry. Second Edition, 3*s*. 6*d*. cl.

"For students who only seek this limited knowledge of these sciences, there are perhaps no treatises which can be read with more advantage than Darley's Popular Geometry and Algebra."—*Library of Useful Knowledge, Article "Mechanics."*

Taylor and Walton, Booksellers and Publishers to University College, 28, Upper Gower-street.

FUN FOR THE FIRESIDE!!
Bound in cloth, price 5*s*. 6*d*.,

JOE MILLER'S JEST-BOOK.

A Reprint from the first and genuine edition, such omissions and alterations only having been made as were required by the greater delicacy observed in modern conversation; but, that the volume might have some substance, and be a good table or travelling book, copious additions have been made from other old volumes of Facetiæ.

Extract from the Preface.

"Another strange circumstance connected with this work is, that everybody presumes that he himself and everybody else are perfectly familiar with its contents ...... and yet, if the reader will ask his acquaintance, it will appear that not one in five hundred ever set eyes on a copy. It is in consequence of like questions that this edition is published."

London: Whittaker and Co.

HODGSON and ABBOTT'S PALE ALE.—The above celebrated Beer, so strongly recommended by the Faculty, is to be procured only from E. ABBOTT, Brewery, Bow, Middlesex. The Trade not being supplied, the Pale Ale cannot be genuine if procured elsewhere.

City Office, 98, Gracechurch-street.

THE "ROYAL ESSENCE OF EGLANTINE" for the Handkerchief is prepared only by MR. WHITE, Chemist, 24, Cornhill, London, in bottles at 2*s*. 6*d*., 4*s*. 6*d*., and 8*s*. each. Where also may be obtained the "AROMATIC PUNGENT ESSENCE" so useful in Headaches, Fainting, &c., at 3*s*. each.

N.B. Public Offices and Merchants can be supplied with Postage Stamps and Envelopes in any quantity at Government Prices.

TO FLORISTS AND GARDENERS.

TO BE LET ON LEASE for 30 Years, or more if required, a small NURSERY, and Half-an-acre of Ground, with Dwelling-house, Greenhouse, and Hothouse. Stock, Frames, &c., to be taken at a fair valuation, which will not exceed 80*l*. Rent 28*l*. per annum. Inquire of Wm. Cox, Florist, Lark-hall-lane, South Lambeth.

MECHI'S ELEGANCIES IN PAPIER MACHÉ, No. 4, Leadenhall-street, London.—Card-cases, playing-card boxes, netting boxes, work and dressing boxes, work-tables, envelop card-racks, hand and pole screens, ladies' portfolios, ink-cases, writing-desks, note and cake baskets, tea-caddies, ink-stands, letter-boxes, chess and draught boards, and sets of tea-trays.

COPY of a Communication addressed to Messrs. Rowland and Son, No. 20, Hatton Garden, London:—

GENTLEMEN,—Being called upon to attend a Lady who had had a complaint in her head about a year before, and in consequence had lost nearly all her hair; I found very few hairs remaining, and those just like down, with no appearance of any fresh roots. She stated her desire to use your Macassar Oil, but I felt I could not conscientiously recommend anything for its recovery, as I considered it too far gone. She however determined to try one bottle, which was used in about a month, and then sent to my shop for another, stating her hair to be much improved; she has now used eight bottles in as many months, during which time I have frequently pointed it, and have now the pleasure to inform you that it is quite thick and long; and she is so much pleased with the change, that she says the expense is nothing, and she will never be without it. If you think this statement of facts worth publishing, you are at liberty to do so; and I remain, yours respectfully, JOHN LICKLEY, Hair-cutter.

Middle-street, Ripon, April 19, 1842.

*** On purchasing, ask for "ROWLAND'S MACASSAR OIL."

HORTICULTURAL SOCIETY OF LONDON.—The Very Rev. the Dean of Manchester having kindly forwarded to the Society a supply of Seeds of the CRINUM CAPENSE, mentioned in this day's *Chronicle*, NOTICE IS HEREBY GIVEN, that they are ready for distribution to such Fellows of the Society as may apply for them at 21, Regent-street.

The Gardeners' Chronicle.

SATURDAY, SEPTEMBER 3, 1842.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

Tuesday, Sept. 6	Floricultural	7½ P. M.
Saturday, Sept. 10	Royal Botanic	3½ P. M.

COUNTRY SHOWS.—Sept. 7, High Wycombe. 8, Teddington, Thanet, Dumfries, Hampshire. 9, Spilsby, Maidenhead. 13, Wingham. 14, Berkshire, Warwick. 15, Hoddesdon, Kingston, Shrewsbury. 16, Roxburghshire, Louth, Salt Hill.

THE Weeds that are really difficult to extirpate are those which live year after year, whether they seed or not; which form stout perennial roots, like the Dandelion; or which produce underground shoots, that readily propagate them, as is the case with the Couch-grass. Upon these plants hand-weeding has little effect; for some cannot be pulled up, and others will grow by means of every broken joint of their shoots.

When such weeds are the natural inhabitants of wet land, good draining will destroy them, as is the case with the Horsetails and Twitch-grasses; but in general more direct measures must be resorted to, and it is believed that nothing short of breaking up the land and tearing them out will effect their destruction. Certainly they may be thus destroyed, provided the extirpation is conducted carefully and for a sufficient length of time; but it is a very common thing to hear that, from particular circumstances, this means of destroying perennial weeds cannot be employed; and then comes the question as to what should be done.

The true mode of proceeding in all such cases is to attack the leaves, and to disregard the roots. If the leaves are unable to grow, the roots, or the underground stems, will be equally unable to do so; and although the plant may struggle for its life, and, indeed, with remarkable tenacity, it must in the end be destroyed.

The explanation of this fact is simple. When a stem produces a leaf, the latter organ is formed in part at the expense of matter contained in the stem. Every leaf, then, which a stem produces, assists in weakening it. But this weakening action is only temporary; for as soon as the leaf becomes fully formed, it returns to the stem and roots all that it had borrowed, and *much more.* So that although the first effect of the production of leaves is weakness, the final effect of their production is strength. This is a most important law, the consequences following from which are to be seen in a thousand different ways.

Now it must be plain that if a stem is allowed to produce leaves, and then is deprived of them before they are fully formed, that stem must be weakened outright, for no restorative action would take place. Let the succeeding leaves be destroyed in like manner, and the weakness of the stem will be increased; and by repeating the removal of the young leaves, the stem will at last lose all its power of organisation; its debility becomes excessive, and the next step must of necessity be death.

Here, then, lies the true secret of killing perennial weeds: have patience enough to destroy their leaves as fast as they sprout out. Be not discouraged by the trouble of it, but go on, and in the end you *must* triumph. The error that is committed by those who adopt this method, and fail, consists in allowing the leaves to become too old before they are destroyed, or in removing them only partially. Such a proceeding cannot be effectual, because, in the first place, the original weakening is compensated for by subsequent strengthening; and secondly, the action of those leaves which do grow is sufficient to invigorate the plant, and to supply it with materials out of which to continue its growth.

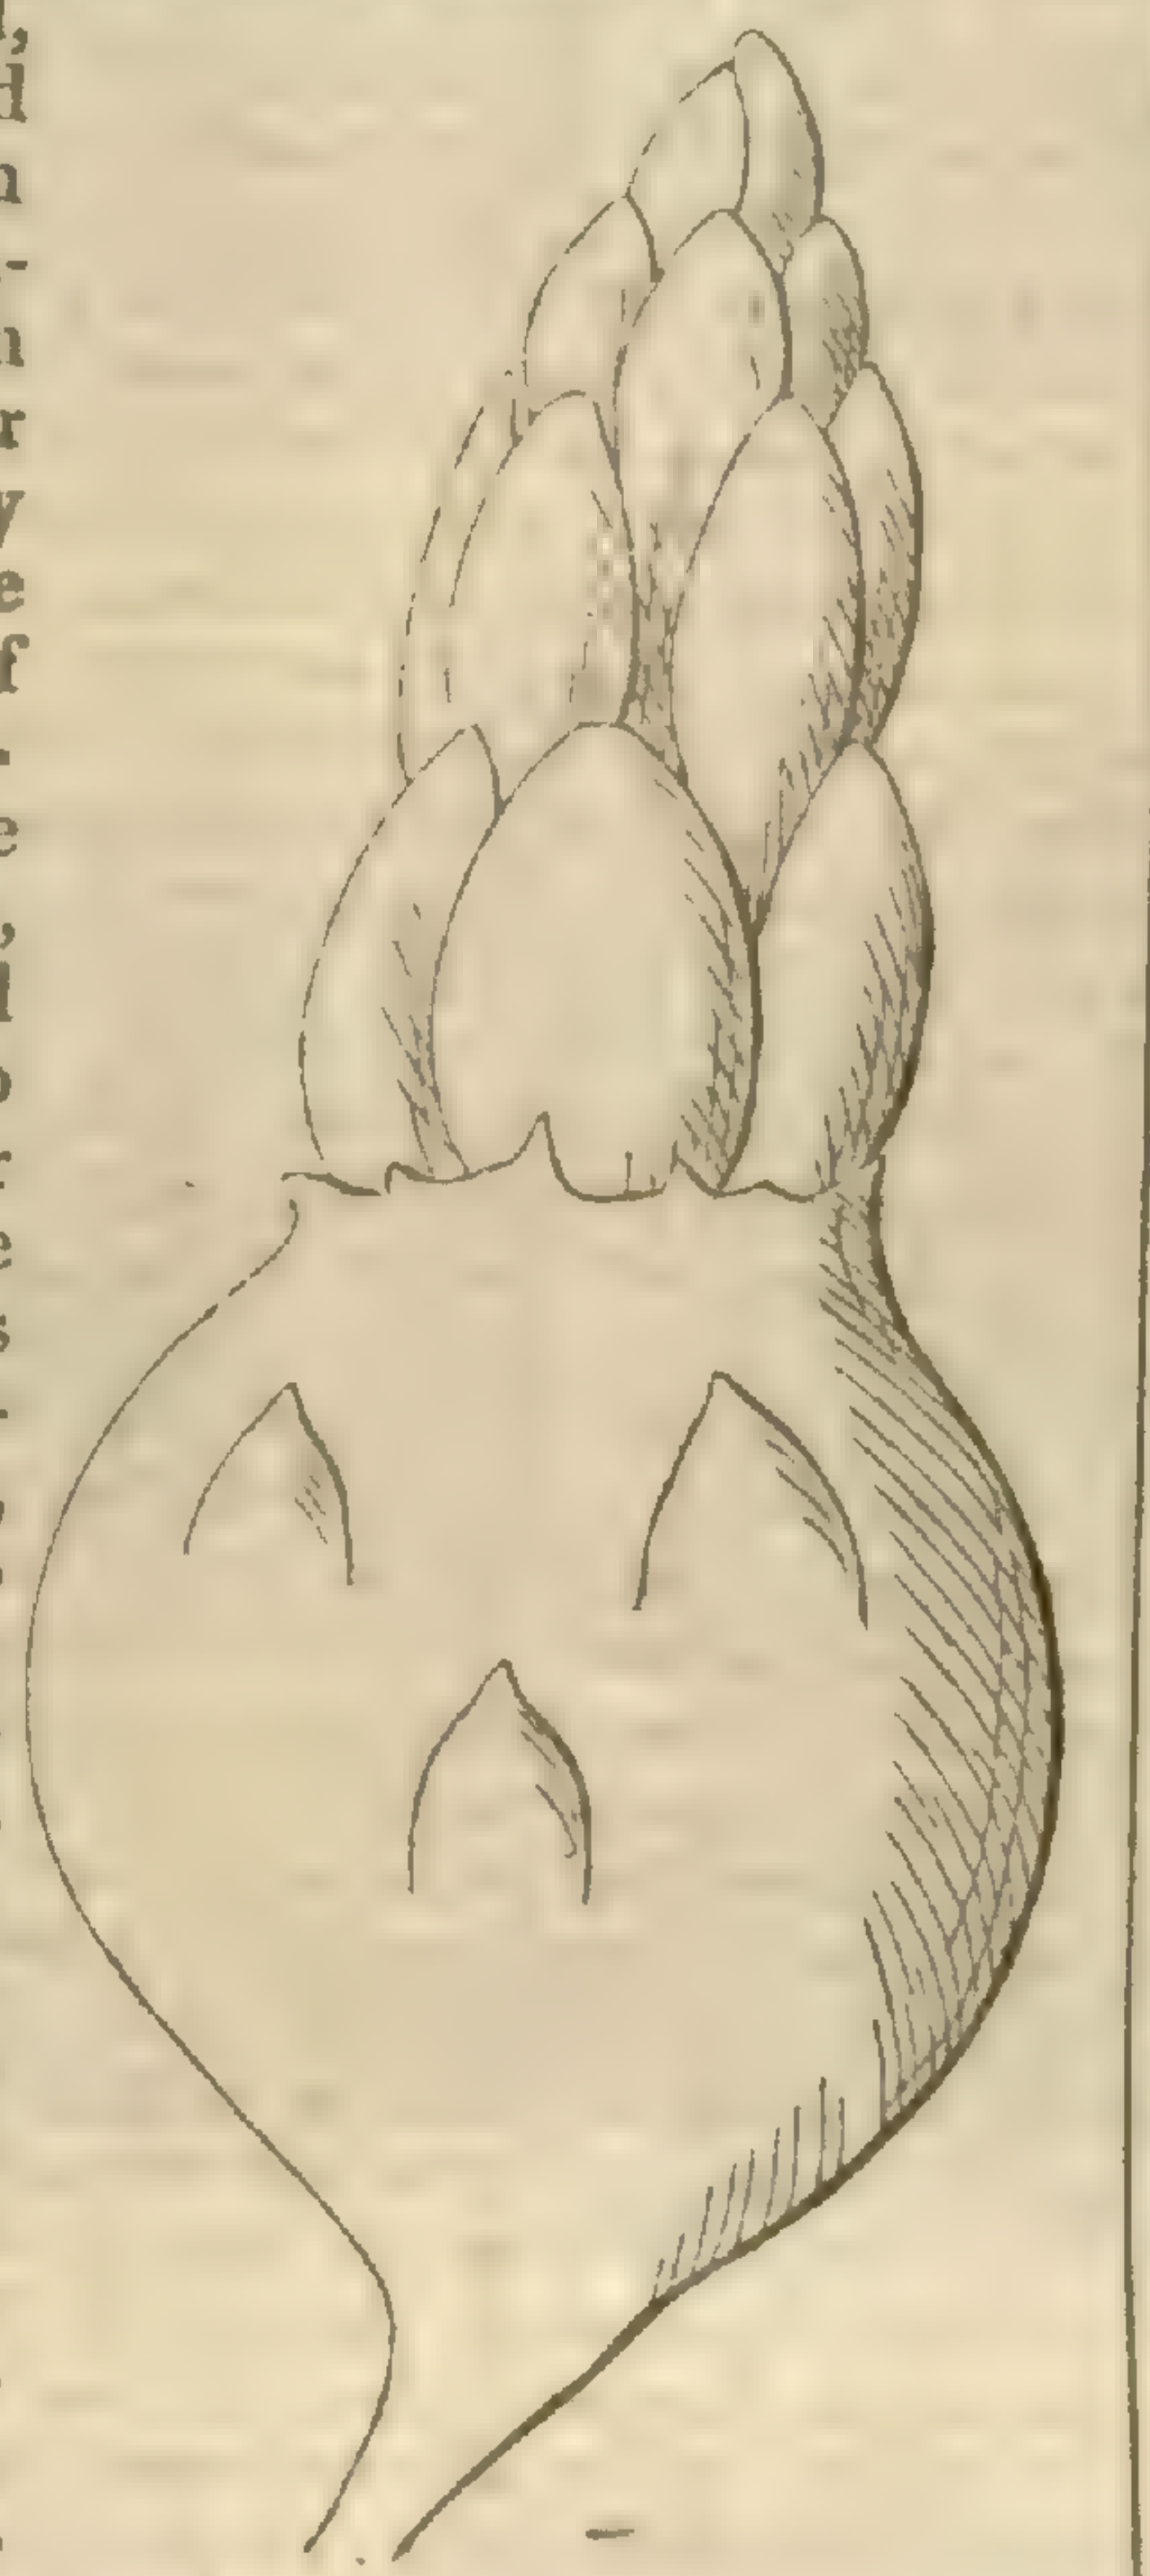
It is no matter what the weed is—Couch-grass, Cow-parsnep, Coltsfoot, Dock, Thistle, or Rib-grass—die it must if *perpetually* deprived of its leaves.

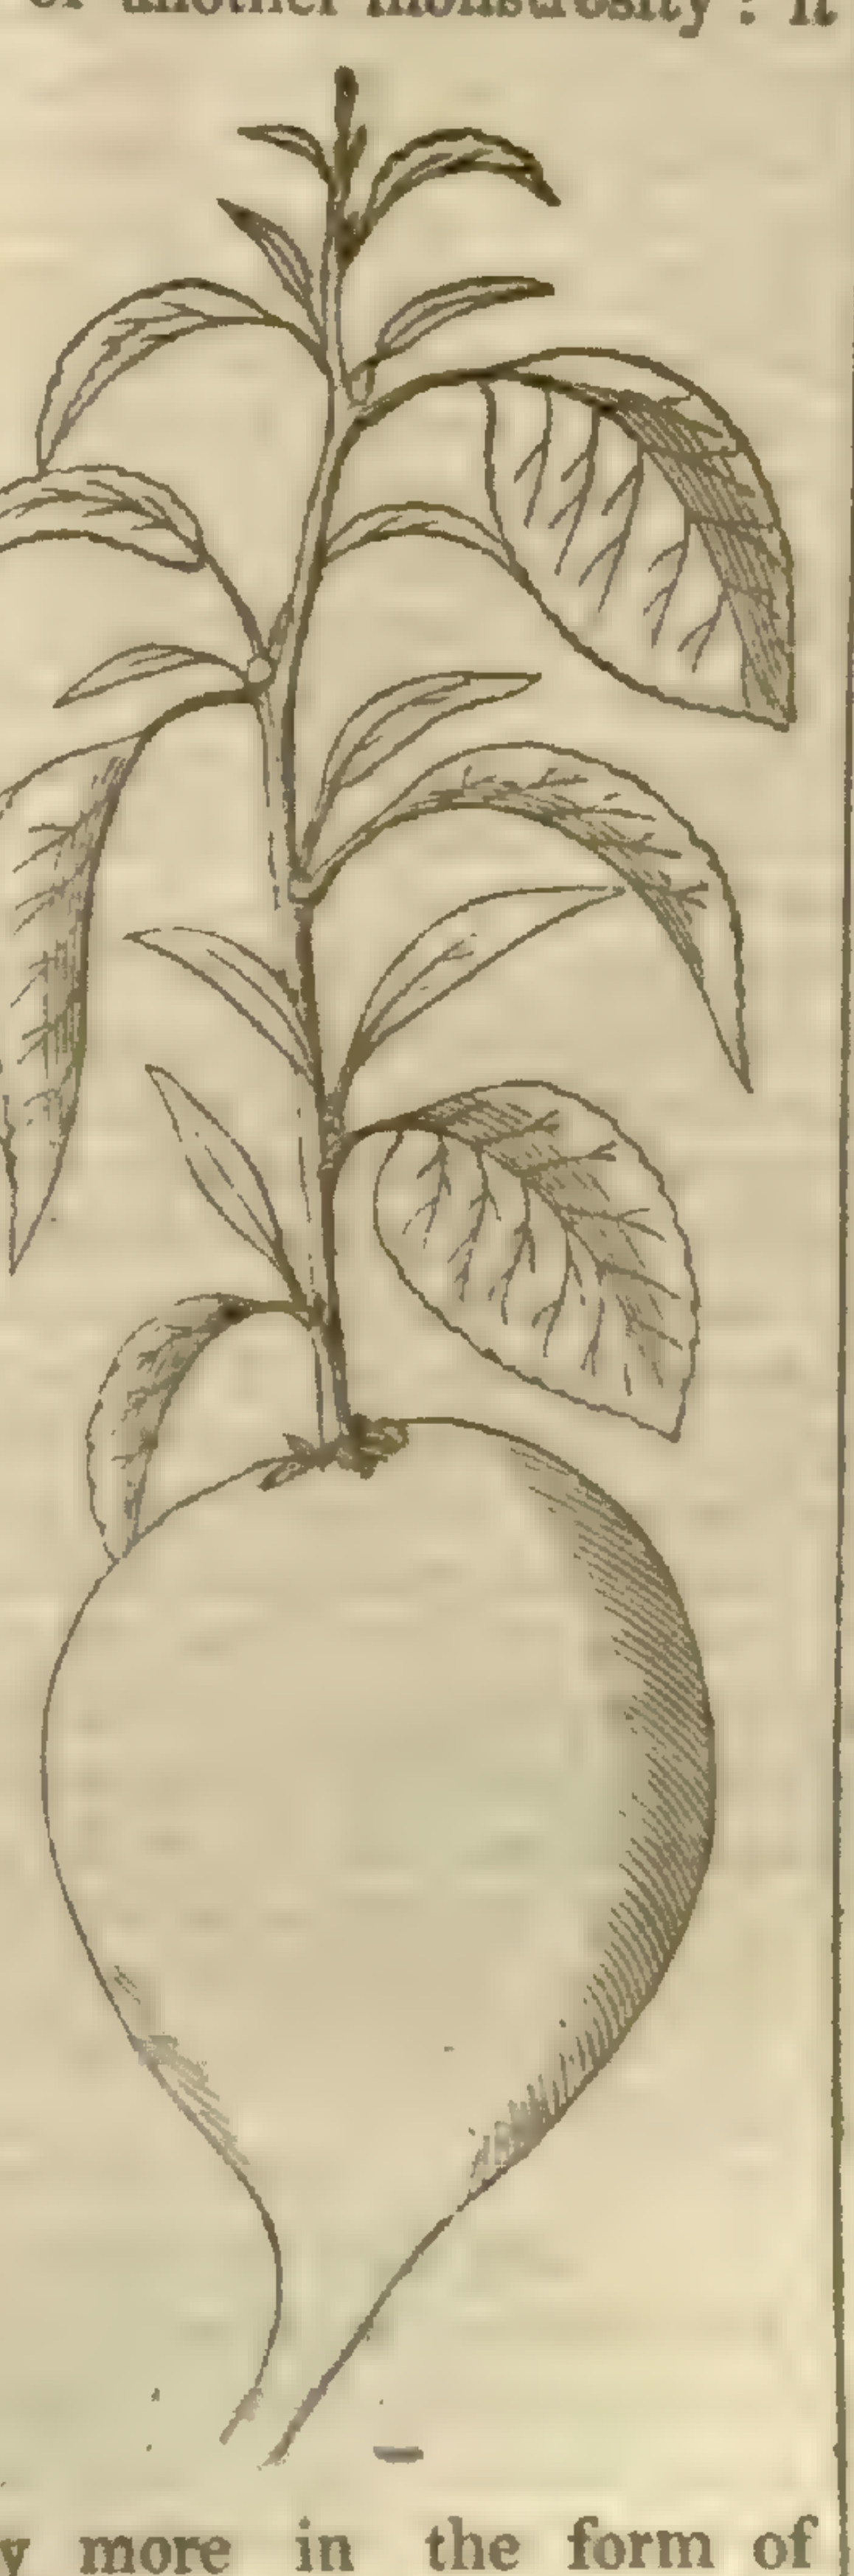
These observations, if rightly understood, will be found to explain the gradual death of many other plants, the cause of whose ill-health is not suspected. For example, a correspondent asks us this week how it is that he loses all his white Lilies. He imagines that the leaves which come up after the flower-stem dies down must *weaken* the bulbs! and so he cuts them all off. It is this cutting off that kills his plants: had he cherished the leaves, his bulbs would have been strong and vigorous, instead of puny and consumptive.

MANY attempts have been made to overset the modern theory of fruit being formed out of leaves; and ridicule, among other weapons, has been plentifully used in opposing the assertion. It does seem very absurd to maintain that a Peach is only a metamorphosed Peach-leaf, or that Walnuts, Filberts Corn, Acorns, Apples, Grapes, and Gooseberries are also leaves; and yet, somehow, the notion gains ground, and gathers converts, even in spite of the quizzing and incredulity of those who look no further than their dinner-tables.

We shall not pretend to go just now into the question formally, but we will ask our readers to look over their gardens for cases like those which we are now about to produce, and then to explain them if they can upon any other principle than that of regarding a fruit as a composition of leaves. A correspondent, signing himself "Cambricus," writes thus:—

"I enclose a rude sketch of a blossom of Fuchsia Standishii in a monstrous state, with one of the divisions of the calyx transformed into a large portion of a perfect leaf, both in colour, size, veins, and everything else; this, I think, is another conclusive fact, that all the parts of the flower consist of leaves. But if it should appear surprising for the flower to be in such a state of transition, how much more wonderful is it for the fruit itself to be found so! Yet such is the case: the enclosed sketch represents a Pear of the Bonchretien kind, which I gathered three years ago from the garden of a gentleman in North Wales; the lower part was not very different from the ordinary shape of Pears, with the exception of some slight protuberances, and it was of full size. From the top of this, or rather from out of it, there arose a fleshy mass of the same substance as the fruit, and from two to three inches long, imbricated after the manner of an Artichoke, as I have endeavoured to represent. This mass passed down through the lower part of the fruit. I cannot consider it in any other light than as an abortive endeavour of nature to form a branch out of the whorls of leaves of which the fructification of plants is composed. It was exhibited at the meeting of the Floricultural Society at Beaumaris, and excited great curiosity. I also enclose you a sketch of another monstrosity: it is a Pear gathered the same year from the same garden as the last. The Pear from which the branch protruded was, in this case, hard and woody. I consider it, if possible, more conclusive than the other of the doctrine of transformation."





Of these singular cases, the first is new to us; the second is common. They both afford, as "Cambricus" alleges, what looks like conclusive proof of the fructification being composed of leaves, having a tendency to grow fleshy in the Pear, to become hard in the Walnut, and to become a membrane in the Pea and Bladder Senna. Let us be more explicit.

A Pear is considered to consist of five leaves forming a calyx; of five others thinner, and colourless, forming a corolla; of twenty more in the form of stamens, and of five others constituting the seed-vessel in the middle. In all, thirty-five leaves are required to make this fruit; they are all fleshy at the lower part, grow together there, and by their adhesions form the Pear. When very young, they were all separate, and arranged in rings round a common centre, just as the young leaves are arranged round the centre of a bud when ready to burst in spring time. When thus separate, they resembled minute scales, and were all exactly alike, although they afterwards changed their appearance, and some became petals, others stamens, and others the seed-vessel. *This is not a matter of opinion, or speculation, of the most direct evidence;* we see the scales, and can separate them in their early state. The 35 leaves then, in the form of scales surrounding a common centre, do in fact at first constitute a common leaf-bud. But owing to some provision of nature incomprehensible to us, except in its results, such a bud is prevented from lengthening into a branch; and the leaves that compose it, in consequence of the onward force of extension being stayed, are converted into forms unknown among true leaves, the result of which is a flower. Now, if the flower is thus produced, so also *must* the fruit; because *the fruit is nothing but the flower, or a part of it, grown older.* In the Pear, one of the peculiar attributes assigned by nature to these altered leaves is to grow fleshy.

Let us now suppose that something occurs to stimulate the flower into more rapid growth than usual: then the central part will lengthen, and in lengthening will separate the leaves, and carry them up upon its surface, somewhat like leaves on a branch. In the first of the cases named by our correspondent, this lengthening of the centre did in fact take place, and the leaves were partially separated from each other; but in separating, they did not lose their fleshy quality; and the consequence was the Artichoke-like appearance that is so remarkable.

In the second instance, the first thirty leaves were completely consolidated, and had assumed their floral condition before the impulse was given which caused the centre to lengthen; when it was given, the five central leaves, constituting, or that would have constituted, the seed-vessel, were rapidly separated from each other by the sudden lengthening of the centre, and, not having at that time taken on the quality of seed-vessels, readily acquired that appearance which is the common condition of a Pear-leaf.

Such at least is the account given of these and similar appearances, by men of science; and such seems to be the only intelligible explanation that can be offered. If, however, any of our readers believe they can find a better solution of such problems, we shall be happy to receive it. Perhaps a right reverend Divine and great logician, who thinks it as absurd to call a fruit a modified leaf as it would be to call a fire-shovel a modified poker, will favour us with his views upon the subject.

ON ORGANIC MINERAL MANURES.—No. V.

By PROFESSOR CHARLES SPRENGEL (translated from the German).

(*Continued from p.* 572.)

I have observed, in another place, that compost, being a very concentrated manure, ought never to be buried in the ground, but should be used for top-dressing, or be harrowed in with the seed. It may be also used beneficially by putting it in small holes at a certain distance from each other, as is done with Potato or Maize crops, &c. To winter crops it may be given most advantageously in the early spring, when there is no fear of the manuring substances being dissolved during winter by rain.

The quantity of compost to be used on a given area depends entirely on its quality; it may require 2,000 lbs. per acre, or it may be 10-20,000 lbs.; 1,000 lbs. of compost will, however, rarely act so long as 1,000 lbs. of dry dung, because the former contains all its substances in a form particularly well suited for quick absorption by plants. But it is that very quality which speaks in its favour.

The simple compost of the English is composed of ten parts of humous earth, two parts of dung, and one part of lime, and is a very powerful manure. Less so is a compost composed of one part of lime, four parts of dung, and 20 parts of humous earth. It is not to be left in a heap more than three months, and it is to be worked up two or three times. If marl is used instead of earth, then one part of lime, five parts of dung, and ten parts of marl, are to be mixed; the heap is to be covered with earth, after three months to be worked up with the shovel, and then carried on the field.

In order to prevent lime, ashes, and humous earth from getting into layers in the heap (in which case they will not act properly upon each other), it is best to throw them in the first instance into a heap by themselves and in layers, then in three or four days afterwards to turn them well over, and to add this mixture to the compost-heap.

There have been cases, even in Germany, when the discoverer of an efficient compost has obtained a patent. One of these patented manures is said to be prepared in the following manner:—At the bottom is placed a layer of very strawy dung, 15 to 20 inches thick; or, in the absence of this, mere straw, forest sweepings, fern, heath, thistles, potatoe-haulm, turf, mould, and marl. This foundation is wetted with dung-water, or, if this is not at hand, with common water, and covered over with night-soil, dung of poultry, sweepings of the streets and yards, pulverised bones, offal, kitchen slops—in short, with every soluble substance of that kind which can be procured. Over this 1-4th of an inch of pulverised sulphury coal-ashes or wood-ashes are strewed, or 1-8th of an inch of fresh wood-ashes will do as well; over this is placed a layer of good earth, mould, or marl, 3 inches thick, all which is covered by a layer of fresh dung of horses, sheep, or cattle, 18 inches high, over which ashes are again strewed. The heap is next wetted with water, and is then covered with a layer of pond-mud, ditch-scrapings, mould, or marl, and 1-4th of an inch of ashes is again strewed over it; and, finally, dung, straw, and other substances are placed on the top, in the same succession as before, until the heap is 8 or 9 feet high. The heap is left quiet for 2 or 3 weeks in summer, or 4 to 6 weeks in winter, when fermentation will come on, as the smell will indicate. If, however, in any part of the heap a considerable degree of heat should be observed, the spot is immediately to be covered with a layer of earth, 3 or 4 inches thick, and wetted with water: if, on the contrary, spots should be discovered where the mass does not ferment, holes are to be made there, so that air (oxygen) may reach these inactive parts. After the compost has lost its pungent ammoniacal smell, and every substance has been properly dissolved, it is to be well wetted with water, worked up, and again put in heaps, 8 or 9 feet high, and covered with a layer of rich earth, 10 to 12 inches thick; and when it has thus remained for some short time, it may be carried on the fields, and harrowed in with the seed. It cannot be doubted, that compost thus prepared will be very serviceable, as the soil will receive more from these combined substances than any one of them could effect singly; but to say that its preparation is in accordance with chemical principles, is only half true; because, in the first instance, a great deal of a most powerful manuring substance, namely, ammonia, is lost, and if this does not escape, either *more* humous earth, or *less* dung, offal, dung-water, or other nitrogenous substances, must be added. Even assuming that the covers of earth, or the wetting with water, will somewhat diminish the evaporation of the ammonia; still a great part of it will be lost, as the very smell will fully indicate. These are circumstances that cannot be too carefully considered; for we may rely upon it, the manner in which manure is prepared is quite as important as the way in which it is used.

One general remark applies to compost. Its preparation will only be of real use, when materials, which do not afford singly an efficient or convenient manure, are made to do so by their mixture. Every farmer has it in his power so to compound the best from his store of manuring materials, that the defects of his soil may not only be remedied, but that the crops may receive those substances in sufficient quantity which are required for their vigorous growth. To do this, however, it is requisite to know not only the component parts of the soil, but also those of the crops. If these are not taken into account, no clear idea of the composition of manure will ever be obtained; and many substances of real value will be tried without result, although one single accurate chemical analysis of the soil would point out at once what it is that the land required.

THE APPROPRIATION OF GARDEN-FRAMES TO THE GROWTH OF GREENHOUSE PLANTS.

In the autumn of 1839, when I was gardener at Viewpark, being deficient in accommodation for our collection of Heaths and Pelargoniums, I procured two melon-frames, the dimensions of which were 20 feet long by 8 wide. To render them capable of containing the plants, it was necessary to build a few courses of bricks, inclosing an area of the exact size of the frames upon which they were placed. The floor was elevated six inches above the ground level, and paved with bricks, laid in finely-sifted coal-ashes, having the crevices between them filled with sand, which makes a better jointing than lime, the close joints of which leave no escape for the surplus water, which in winter would cause an overcharge of moisture, and which at that season of the year should be avoided as much as possible.

In placing the building in a longitudinal direction from east to west, two advantages are obtained by this manner of construction: firstly, should it be desirable to retain plants under glass in summer, a partial shade may be secured by reversing the slope to the north; secondly, the facility with which the woodwork can be removed, and a few additional courses of bricks added as the height of the plants increase.

As a fire flue would have occupied more space than could be spared, Mr. Rogers' conical boiler was adopted, and has given satisfaction.

The boiler and pipes are made of copper, and found to be as suitable for the purpose as cast iron; the boiler is placed on the outside, and is inclosed in a case of double sheet iron, with a moveable cover and funnel of the same material, for the conveyance of smoke into a brick chimney; the space between the case and boiler being filled with sand, as an excellent non-conductor for both heat and cold. At right angles to the end of the pit is a brick wall about three feet high, inclosing the boiler on two sides, leaving an open space in front for the admission of air and the clearing away of ashes. A moveable wooden cover of a triangular form is placed above, to protect the whole from the effects of the weather.

The size of the boiler is 18 inches high by 12 in diameter at the base, and it is placed upon a cast-iron grating, having a furnace door beneath for the regulation of air; the pipes, 2½ inches wide, are conducted along the front, and secured to the wall with iron hooks, it being unnecessary to convey them round the back, as the apparatus is found sufficient to heat a space of double the size.

For fuel, we have uniformly found coke to maintain a constant and regular heat; indeed, this sort of boiler is not suited for the consumption of coal, although, by a little alteration of the present form, it might be made to consume it as freely as coke. When the external temperature was as low as 20°, the internal heat of the pit did not vary above 3° in fourteen hours, during which time it required no attention, and the cost of fuel did not exceed twopence in twenty-four hours. When slight storms occurred, a covering of Russia mats was substituted in lieu of fire heat, which is always, to a certain degree, injurious to greenhouse plants, but more particularly so to Heaths; a class of plants which, when cultivated in proper constructed pits, have a decidedly more healthy appearance than those grown in greenhouses. We can assert with confidence the improvement in our own plants after their removal. It was far otherwise in former years, when, after the severities of winter had passed away, many of them were badly coloured and drawn up; but they here assumed that dwarfness of habit and green glossy hue, which are so pleasing to the eye and are so characteristic of a healthy vegetation.—*Alex. Cramb, Redbraes, near Edinburgh.*

AMATEUR'S GARDEN.—No. XXXVI.

The beauty of the flower-garden during the summer and autumnal months depends chiefly upon a race of half-hardy plants which ought to be propagated extensively now, providing they can be kept from frost in winter. None of these are more beautiful or more lasting than the Verbena. Annuals can be grown with less trouble, they are pretty and gay while they last; but as they come soon to maturity, so they likewise soon fade and die, and blanks are left in the beds and borders, perhaps just at the time when we are most anxious for them to be full. The varieties of Verbena are not liable to this objection, for they continue one mass of flowers from the beginning of the season until they are destroyed by the frosts in winter. Their flowers are of various colours, scarlet, purple, rose, white, and all the intermediate shades, forming striking contrasts with each other and with the rest of the plants by which they are surrounded. A few years ago the number of varieties was very limited, but great numbers have been lately raised from seed in this country, out of which I have selected the following kinds, which can be confidently recommended as distinct and well worthy of a place in the flower-garden: *White*—V. pulchella alba: this is a very dwarf sort, and is not only pretty in a bed or clump, but is also valuable for contrasting with and relieving other colours. V. teucrioides: a strong-growing kind producing dense spikes of sweet-scented flowers. From the latter a great number of hybrids have been raised, which possess the good properties of the original with regard to their being of easy growth and flowering freely, and at the same time, the colour of the flowers being generally pink or lilac, a pleasing contrast is produced. The best of these are, teucrioides rósea, t. Barnesii, t. Iveryana, and t. cárnea; the two last are particularly fine, and ought to be in every garden. *Lilac*—V. Neíllii: this, although not new, is of a pretty colour and very sweet scent. *Scarlet*—V. ígnea: this is one of the finest of its class, darker than the old melindres, having all its brilliancy of colour, and moreover being a free-grower. V. Chandlérii is equally good; but both of them need not be grown in one garden, for the colours are too nearly the same. V. Tweediana grandiflora and V. melindres latifólia are two of the best of the common scarlet kind, but their colours are not so deep as the former. *Purple*—V. purpúrea and V. Hendersónii are two of the best of this class.

Besides these there is another changeable rose-coloured sort, called V. variegata, which is well worthy of a place in a small collection. Many others might be named, for the varieties are very numerous, but these will be more than sufficient to make a splendid display in a small garden; if the list contains too many varieties, a selection of the colours that are most wanted can easily be made from it. For cuttings, select the young growing shoots which have no flowers at their points; many of these are now forming little roots, to send down into the soil, and require only to be taken off, and planted about an inch deep in pots which are filled either with sand or light earth. The pots ought then to be put in a close frame, and kept shaded during bright sunshine until the cuttings are rooted. When they are rooted, which will be in a fortnight or three weeks, pot them off into 60-sized pots and keep them in the greenhouse, or in a pit protected from frost during winter; or they may be kept in the cutting pots, where they will take up less room. Early in spring, when they begin to grow, if heat can be commanded, they can be propagated extensively, and both the plants struck now and then will flower in great profusion all the summer.

Grapes on the walls will now be ripening fast if the vines have been properly attended to. Go over them frequently, removing the useless laterals and exposing the bunches to sun and air, at the same time using some means to prevent the wasps and flies from destroying them. Nail in the main branches to prevent them from being injured by the boisterous winds, which may be expected in a short time.—*R. F.*

HOME CORRESPONDENCE.

Forest-tree Pruning.—It is a fine lively animal, that same hobby-horse of "Quercus'." Such reciprocity between the mane and tail; so docile, that halter or bridle have never yet been applied! Curb not at all, is his motto. See with what grace and ease he leaps upon his back, and exclaims, "It is marvellous that men who are so conversant among hobby-horses cannot see that the effect of restraint must necessarily retard their progress." It is not my intention to enter upon a disquisition concerning hobby-horses; some are harmless and praiseworthy, and some the reverse. I would not approach the great horse of the Champion of England at the ceremony of a coronation in Westminster Abbey, and throw a glove down before him, upon any consideration; and there are other hobbies that are not to be meddled with. Much has been written lately on the subject of pruning forest-trees, and many excellent remarks have been made, with a view of increasing the quantity and improving the quality of timber; but, after all, I am no convert to the no-pruning system. Every tree, as well as every animal, has a distinctive or constitutional peculiarity, and would not the great object in view be promoted by a careful attention to that circumstance? When we look abroad in the park or the forest, we see individual trees of the same species assuming different outlines of form and of stature; some more erect in the stem, producing valuable timber; some dwarf, throwing around numerous spreading branches, and wasting their energy in the production of spray, faggot, and firewood. But then it is said, and truly, that every leaf is elaborating sap to be converted into wood; but it does not, therefore, follow that the tree containing the greater number of leaves will likewise contain the greater quantity of valuable timber. Hence the necessity of early and judicious pruning; and hence, what I consider most important, and what I fear is too generally neglected, the selection of seeds only from such trees as exhibit this valuable peculiarity.—*J. Falconer, Cheam.*

Maturation of late Pears.—From various considerations on the want of maturity in late Pears, I was last autumn induced to try an experiment, which had for its object the completion of the maturing process, after the fruit was gathered from the tree. The reason, in my opinion, why the more tender and late varieties of our Continental Pears do not arrive at a proper state of maturity in this country, is, that our summers are too short and cold for the saccharine assimilation to be completed, before the frosts of autumn render it necessary to remove the fruit to the store-room; and, consequently, the maturing process being incomplete, the aqueous and other particles are left in an undigested state, instead of being converted into sugar, as they would be under the more favourable circumstances of a Continental sky, or artificial assistance in this country. Reasoning upon these facts, I left some exceedingly fine specimens of Beurré Rance on a south wall, as late as I could do, without subjecting them to frost. To secure them from being bruised or from falling, and also to expose all sides of the fruit alike to the full solar influence, by occasional turning, I secured them on the trees by strings. They were allowed to remain on the wall until the third week in November; at which time they had obtained a most beautiful pale brown colour, and had every appearance of being perfectly ripened. Not content, however, with this, I placed them in a late vinery, in which Grapes were kept, until they were quite ripe, which was about the end of February. On cutting them, they were found quite melting, rich, sugary, and very juicy; indeed, everything that could be desired in a late Pear, except, perhaps, some of them were a little too flat for some palates. This, however, I do not attribute to the method of keeping, but to several of them having been slightly frosted prior to their removal to the house. As the above experiment was only made on a very limited scale, I do not recommend it for general adoption until further experience has established its utility. I merely throw out the hint, with the hope that some of the readers of the *Chronicle* will be induced to test its claims to public notice; and if the experiment were extended to other late kinds, such as the Old Colmar, Ne plus Meuris, Beurré Diel, and Easter Beurré, it would be better. Whether it is the increased light or heat that improves the fruit, I will not pretend to say; but certain it is, they were as good as I ever tasted of the kind. As light is said to be injurious to fruit after it is ripe, it would be well to remove some of each kind to the fruit-room, after they have been exposed on the wall, and in the vinery, for a few weeks.—*W. P. Ayres, Chicksands, Bedfordshire.*

To preserve Apples.—Perhaps it might be useful to some of your readers to state how I have kept Apples of last year's growth in a sound state until the present time. My Apple-room is a lean-to behind a long building, and fronts the North, so that it gets no sun for eight months in the year; and although we have had such a long drought, there are now large fungi growing on the walls. The fruit-room is about eight feet high in front, and slopes upwards in the manner of a greenhouse; it is thirty feet long, with two sash windows to admit air (if wanted), with shutters to keep out the frost: which is all the protection they get. The shelves are placed at the back at equal distances until they reach the top, and are capable of housing 150 bushels. Apples do not require to be kept so dry and warm as many people imagine. I had a fruit-room adjoining the laundry, which was always very dry; and I could never keep Apples till January without shrivelling. Last year I had two casks made air-tight—one I filled with Apples put in dry sand, the other I filled with Apples wrapped separately in paper, and had the heads of the casks put in and made secure with plaister of Paris. When I opened them in March, every Apple was quite rotten. Apples always perspire more or less, and I think a little air now and then is useful and helps to preserve them; but they should on no account be handled in frosty weather. It is thought by most Gardeners that Apples will not keep if gathered when wet; but about eight years ago, during a wet season, I had a large quantity gathered when it rained hard—I laid them on a floor which was covered with straw; the next day being fine, I had more gathered in a dry state, which I laid near the others, and I found that both kept equally well, for the wet ones soon became dry, and the others perspired. Since then I do not mind their being rather wet, nor do I wait till the dew gets off before I gather them. Of course I prefer gathering when the trees are dry.—*Caleb Diplock, Heath Lane Lodge, Twickenham.*

Caprification of Figs.—In the *Chronicle* of May 14, the "Caprification of Figs" is taken notice of. Various opinions are given respecting the effect produced by an insect piercing the Fig when in a young state. According to Tournefort, "the prickers contribute perhaps to the maturity of the fruit of the garden Fig-tree, by causing the nutritious juice to extravasate in those vessels which they tear asunder in depositing their eggs. Perhaps, too, besides their eggs, they leave behind them some sort of liquor, proper to ferment greatly with the milk of the Fig, and make the flesh of them tender." Others are of opinion, that a kind of gnat enters the interior of the Fig, and acts beneficially, not only by carrying in pollen, and dispersing it, but by puncturing the pulp, and occasioning a diffusion of nutritious juices. Perhaps your correspondent "Ruricola" can tell whether the young Figs are only pricked by the flies, or whether they enter the interior, and there deposit their eggs, and what kind of flies they are. Some say that they are gnats, others that they are cynips. From the account given by travellers who have visited the Grecian Archipelago, it appears that the caprification of Figs is of great benefit to those who cultivate them. It is stated that one tree frequently bears between two and three hundred pounds of fruit, whereas those of France seldom yield above 25 or 30. We are informed that the wild Fig, from which the flies are procured, produces three kinds of insects, called Fornites, Cratitires, and Orni, which are of absolute necessity towards ripening the garden Fig. Pliny, in his Natural History, probably refers to these when he says, "Caprifici triferæ sunt." Has any attempt been made to introduce these wild Figs and the insect into this country?—*P. Mackenzie.*

To produce Early Gooseberries.—As a journeyman gardener has given a plan for protecting mature Gooseberries, I will give another for forwarding them a month or five weeks sooner than the usual time. Procure some boxes, of the sizes necessary to cover the bushes, with four sides, so that the four fronts may face the cardinal points. All the sides must be furnished with hinges, to open when required, and there must be a slanting roof, to carry off the wet. After the pruning season is over, the boxes should be put on; they should be kept shut on frosty nights, and opened only when the frost is off the ground, at which time all the four doors should be thrown open, except there be a cold cutting wind from the north or north-east; in such cases all the sides should be closed except the south. Sprinkle the bushes with soft water through a fine rose on mild mornings, and attend to the closing and opening of the sides every night and morning, until the fruit is ready for tarts, which will be by the end of March, or the first week in April. The Rifleman and Willmot's Early are the best sorts which I know of for the purpose. I have seen Gooseberries grown in this way at Sir John Boyd's, which answered very well.—*Anglicanus.*

Syringing Vines.—I do not think your correspondent "Tyro," in No. 26, has adduced a sufficient reason for doing away with syringing; from the circumstance of his not seeing the water upon the surface of the leaf immediately assimilated by the Vine. As well might he expect a fish, with its mouth open, to swallow all the water in contact with it, as to think a plant could appropriate the water as it came from the syringe. The fish abstracts the oxygen from the water, and liberates the residue by its gills. The plant has not a very dissimilar process, by which it developes itself. Now, if water must be thus decomposed before it is assimilated by the leaf of the Vine, in what situation is it more likely to become so than upon the leaves? particularly when the house is just shut up for the day. I think few gardeners apply fire-heat at this season, and consequently there could be no great evaporation from the trough on the pipes. To restore, therefore, in part to the Vine what it has lost by a comparative exposure to the external atmosphere, by damping the floor, is a much slower method than syringing, because it is effected by conduction.—*C.*

Crinum Capense.—I recommend gentlemen to plant this largely, as a cover for wild ducks on islands, or by the water-side. It thrives either on dry land or under water; but entire islands should be planted with it, above the level of the stream. Its blossoming is endless, and it forms a very thick cover about two feet high, the flower-stems rising above. The seedlings should be housed or sheltered till the bulbs are strong enough to plant out. They will grow all the winter if kept very wet, or in a cistern in the stove.—*W. Herbert.*

Ornamental Border Plants.—Would it not be a desirable thing at this season, for those persons who have the care of superior flower-gardens, to give an account, through the medium of the *Chronicle*, of those plants which now form their most conspicuous ornaments? Many amateurs might derive advantage from the details of the best methods of growing, flowering, and grouping the beautiful Brugmansias, Fuchsias, Lobélias, and other half-hardy plants now so profusely in bloom. What I wish particularly to ask, however, is, whether there are not many other inhabitants of our greenhouses, or even stoves, which might, by their foliage and flowers, render our borders more attractive than they are at present. Some hints for making Rhododendron beds gay during the absence of their own flowers were given in the *Chronicle*. Might not such hints be enlarged on, by more full directions for mingling American shrubs with those plants that would assort well with them, and impart bright colours to them during the late summer months? It is almost needless to say, that the judicious grouping of such flowers is as necessary as planting them—directions to this effect are earnestly requested.—*Z.*—[We commend this letter to the kindness of our correspondents.]

Ipomœa Learii.—A few weeks since I removed a plant of this beautiful climber from the stove to the base of a south wall in the Botanic Garden; it is now flowering freely, and producing healthy and vigorous shoots. Can any of your numerous readers inform me if it has ever perfected seeds?—*N. S. Hodson, Bury St. Edmunds.*

Lobelia gracilis, a Hardy Annual.—I was delighted, about three weeks ago, to discover that this beautiful annual had sprung up plentifully upon a piece of ground which was self-sown last autumn, some of the plants having since spread over a surface of eighteen inches in diameter. The soil is bog, with a cold retentive clayey subsoil, and the situation very bleak, apparently anything but congenial for such an occurrence; and our Leeds climate is far from being the warmest in Yorkshire, consequently this fact may have been long ascertained in the more southern counties, as the plant has been an interesting object in our gardens for the last forty years, and seeds freely and abundantly. Like the Eschschóltzia califórnica, and crócea, it looks best when spread promiscuously over an extent of surface, so as to mingle freely amongst trees, shrubs, and tall herbaceous plants; and if the plants be not there to seed themselves, it can be sown in the autumn, or as the seeds ripen.—*John Mearns, F.H.S., Leeds Botanical Garden.*

Geodorum nutans.—During my absence from home my gardener had, by mistake, set Geodorum nutans (planted in light loam), which had stood for years in the flue in a very hot place, into a cistern of water amongst the Hymenocallides; where I found it growing with greater vigour than usual. Perhaps the habit of it and Govenias may be like that of Epipactis palustris. It stood on an inverted pot with half an inch of its pot under water.—*W. Herbert.*

On Plants for the Edgings of Walks, &c.—In former Numbers of the *Chronicle* considerable attention has been devoted to the subject of edgings for walks, flower-beds, &c.; various plants have been recommended for these purposes, but all are, I think, more or less objectionable. Wherever flowering plants, whether annual or perennial, are employed to define the margins of beds and walks, whatever advantage is gained by their showiness whilst in bloom, is almost counterbalanced by their untractable nature; for if they thrive, they invariably spread over too large a space of ground; and if, on the other hand, they do not grow so freely, they are unworthy of the position in which they are placed. Even the Thrift, the least questionable, perhaps, of this class of plants, is liable, in a certain degree, to the same objection, unless very frequently transplanted; and this soon becomes a tedious and expensive matter, besides which the edging in such cases is necessarily weakly and scanty for a greater or less period of time. These objections all vanish when we turn to a well-kept Box edging, which is at once neat, elegant, lively, and, if well managed, as permanent as such things can be. It is true we have not our edges defined then by gaudy colours, but we have something certainly better in the subdued green tint of our little favourite. It may be said that the plants which have been recommended as above noticed, were plants adapted for the edgings of walks in shrubberies and shady places, where Box will not thrive; but even in these places their adoption seems questionable, and open still to some of the objections I have briefly mentioned above. In such situations it appears to me that nothing is so suitable as Ivy, intermixed with Periwinkle. These plants might be permitted to spread over the whole surface, and would thus save much trouble and expense in hoeing and cleaning—of itself no small advantage; whilst they would render the surface at all times cheerful, especially if flowering plants, such as thrive in woods, were thinly scattered here and there between the trees. The edges might be kept very accurate by the use of the shears. There is, however, one situation in which the class of plants of which we have been speaking are peculiarly appropriate; and this is as an edging to flower-beds, whenever these latter are for any reason elevated above the level of the ground adjoining them, and their sides supported by rockwork. In these positions, growing over, and amongst the masses of stone, such plants are peculiarly at home; and in early spring nothing can be more pleasing than the proliferous manner in which such plants as Drabas, Alyssums, Aubriétias, Saxifragas, Soldanellas, &c., &c., produce their tiny flowers. My object is, however, more especially to notice a plant which, by a particular course of treatment, becomes equally suitable for the decoration of such edgings throughout the summer. I refer to a small species of Lobelia, known as L. grácilis, and which, in such situations as those just mentioned, is now flowering most beautifully in the garden of the Royal Botanic Society. The treatment requisite to ensure this is most simple. The plant is one which produces seeds freely: these are sown in early spring, and treated as half-hardy annuals usually are at that season; when the seeds have vegetated they are transplanted thinly into convenient-sized pots; and again, when of increased size, thinned sufficiently to bear separation. When finally planted out, they ought to be kept in a greenhouse, where plenty of air is admitted, till about the end of April, and then removed to a frame for a short time previously to being planted out; though generally small at first their growth is very rapid, and they soon commence flowering freely, and continue to do so for a very long period.—*T. Moore, Regent's Park.*

Twitchett's "Don John" v. Martin's "Splendid."—It affords me no small gratification to find that your sense of justice has induced you to insert Mr. Headly's contradiction of Mr. Martin's misstatement with regard to his Carnation "Splendid." In your paper of the following week (Aug. 13), I challenged to show 21 blooms of my "Don John" against the like number of Mr. Martin's "Splendid," for two guineas each bloom, and 20 guineas the odds. By this number, the relative merits of the two flowers would be so decisively tested as to satisfy every florist; and as this is my earnest desire, I would much rather increase the number to 31, or even 41 blooms, on the same terms, than reduce it to a less number. Mr. Martin, after indulging in a fortnight's deliberation, without taking the least notice of my challenge, proposes to show 11 blooms for 25 guineas. If he really wishes the question of the comparative merits of his "Splendid" and my "Don John" to be brought to a satisfactory issue, why not accept my terms? As his flower was out before mine, he surely will not plead a want of stock. I also am an old, and consider myself an experienced grower; and believing in common with most other florists that my "Don John" is the best scarlet bizarre in England, I shall be happy to join issue with Mr. Martin, on the terms I proposed long before he thought of challenging a comparison.—*J. Twitchett, Cambridge.*

The Vegetable Marrow.—My gardener this year made the experiment of raising some plants of the Vegetable Marrow by putting some grass (lawn) mowings in a heap, about 1½ bushel, covered with three or four inches of garden soil, in which the seed was planted. The plants are now as luxuriant as they need to be. This vegetable would be valuable to the cottager if he could grow it as easily as his Cucumbers, which he may do by following this simple treatment.—*H. B., Essex.*

Onion Grub.—Having seen numerous complaints respecting the grub in Onions, I am induced to forward you the plan which I adopt to ensure a tolerable crop of that useful esculent. In the first place, having determined on the piece of ground which I intend to devote to the purpose, about the end of February, or the first week in March, according to circumstances, I get my ground trenched, at least eighteen inches deep, at the same time mixing with it a thick layer of rich and well-rotten manure, with which the contents of cess-pools may be advantageously trenched in. In addition to this, I collect on the piece of ground all the rubbish of the previous year, such as old pea-sticks, the pruning of Gooseberry, Currant, and Apple trees, &c., &c., which are set fire to in different places, and after the whole are reduced to ashes, and in as hot a state as possible, they are spread equally over the surface of the ground, and forked in directly. After this is done, I proceed in the general way to sow the seed. I prefer sowing in drills, rather than broadcast—the appearance is neat, and the ground is kept clean with greater ease. I have also found the dust of charcoal, in some seasons, to prevent the grub, by being sown in the drills with the seed; but the former plan I have pursued this year, and my crop has well repaid me for the trouble I have taken. I measured one bulb which was 15 inches in circumference.—*W. Dunsford, Capesthorne.*

To obtain a Second Crop of Beans.—Instead of pulling up my Bean-stalks after they have done bearing, I have them cut within 4 inches of the ground, which causes them to send up a number of young shoots. These should be thinned out, and only one or two allowed to remain. I have had a very good second crop of Beans by this method, which I have practised for two years.—*John Abberley, Shrewsbury.*

To destroy Wasps.—As both wasps and flies are very numerous this season, it may benefit many fruit-growers to know how to destroy them in a simple and effective manner. My practice is to mark the nests conspicuously in the course of the day, and late in the evening to pour tar into the entrance of the nest; which, on a level surface, soon covers the wasps and nest. On a bank or slope a spade must, however, be used, to cut the mould in front of the aperture into the shape of a basin to contain the tar. If the nest is downwards, it is soon smothered; but if on the rise, by firing a gun into the aperture, it will force the tar upon them. I have destroyed a great number in this way, for escape is impossible, as they cannot get disengaged from the tar. Those that hover about during the day are entrapped by two hand-glasses, one placed over the other, and made close at the shoulders by a little moss or wool, the lower one having a few holes made at the top (by breaking the glass) of the size of Walnuts; this done, elevate the glasses on three flower-pots or bricks, a few inches above the ground, and cover the surface under and about the glass with decayed useless fruit, to attract the wasps and flies under the glass. In rising, they enter the aperture at the top into the space between both glasses; here they buzz and fight until they become exhausted and die. This trap wants no other attention than feeding with a little decayed fruit every other day. If a few such traps were placed in a fruit-garden, and as many of the nests destroyed as possible, it would be the means of saving a great quantity of valuable fruit from destruction at little trouble or expense.—*H. Bowers, Laleham.*—[We are well acquainted with this contrivance, and know it to be an effectual check upon the ravages of these destructive insects. We have also received an account of the same from Mr. Smee, gardener at Gosfield Hall, Essex.]

FOREIGN CORRESPONDENCE.

Paris.—Among the plants culivated in this neig bour-
hood, none, during their period of flowering attract
greater attention than the Pæony and Iris. hat lover
of nature can view without admiration the agnificence
of the one or the delicacy of the other, even amongst
those long since introduced? How muc greater, then,
will be his delight when he beholds the eautiful varieties
of later introduction! It is principa ly to the Parisian
florists that Europe is indebted for th e amelioration whic
has taken place. The names of M odeste, Fion, Mathieu
Lemon, Buré, and Milne (of Ful am), are familiar to all

lovers of these splendid flowers; and well have they earned the reward which has attended their labour and zeal. The present season has been exceedingly favourable to show the luxuriant colouring of Pæonies, and the sun has been sufficiently powerful to draw out the rich glossy hues of carmine and crimson, without in the least injuring those of a more delicate tint. It is to be much regretted that this plant should remain almost a stranger to many amateurs' gardens. I do not speak of P. officinalis rubra and rosea, but of P. arborea and sinensis; the cultivation of which is alike easy, and the varieties far more numerous and beautiful. I am aware that the price is to many an obstacle, 5*l*. and 10*l*. being a large sum to give for a new flower; but then it must be remembered that the Pæony is not multiplied very rapidly,—and, after all, it is not more than is frequently demanded for a Camellia or Rhododendron. As most of the older varieties are well known, I will only enumerate a few of the newest, which struck me as being particularly fine. Some of these are now ready to be sent out; others will not be fit until next year, at which time the whole may be obtained at from 15*s*. to 50*s*. each, of most of the London nurserymen, who have connexions with all the leading florists here:—

Anemoneflora striata—rosy lilac, and white centre;
Cárnea plena—pale rosy white;
Chrysanthemiflora—pale rose, and creamy centre;
Comte de Paris—dark rose, and rosy yellow centre;
Elegans—rosy white, and sulphur centre;
Hericartiana—bright rose, and rosy white centre;
Lútea variegata—rosy white, and yellowish centre;
Luteola alba—delicate rose, and creamy centre;
Papaverácea plenissima—rose lilac;
Pulchérrima—clear rose, and rosy fawn centre;
Reine des Françaises—bright rose, and yellowish white centre;
Reine Hortense—rose, and creamy centre;
Speciosa striata—bright rose, and rosy white centre;
Sulphúrea—sulphur, changing white;
Victoire modeste—rose carmine, and rosy white centre.

The improvement of the Iris (Germánica, &c.,) has not been less distinguished than the former. It is but very few years since the colours of these species were almost entirely confined to the different shades of blue, purple, and yellow; now they are nearly as diversified as the Dahlia or Tulip, and scarcely inferior in elegance or pencilling. From the artificial impregnation of Germánica, plicata, Buriensis, Swertii, and pallida, totally new colours have been produced; and the beautiful mixtures in augustíssima, Conqueror, Incomparable, Honorabilis, &c., &c., give abundant proof of what may be done by judicious hybridization; and it is not unreasonable to hope for something yet more striking. Already white grounds have been obtained bordered and feathered with violet and purple; and may we not also expect white and rose, or carmine, so conspicuous in Koningkroon, Pluto, Sir John Broughton, Beauté excellente, and some others of the finer varieties of Iris xiphioides? Of yellow, and orange intermixed with brown and purple, there are also several far superior to any of the same shades in I. xiphium; while the darker colours are diversified with various tints, from the most delicate lavender to the deepest violet. The following new varieties are, I believe, but little if at all known in England:—

Adonis—lemon, pencilled with brownish purple;
Amélie—white, pencilled with violet;
Antinöus—orange and brown;
Apollon—lemon and brownish violet;
Augustíssima—orange and dark bronze purple;
Augustus—light blue and lilac, pencilled with purple;
Bocage—pale lemon and purple;
Boismilon—white, bordered with purple;
Cerbère—yellow and bluish purple;
Conqueror—orange and dark brown;
Cornélie—orange, veined with brown;
Diomède—white, veined with violet purple;
Don Carlos—pale lilac and purple;
Donna Maria—pale sulphur and white, pencilled with brown;
Durasque—white, bordered with purple;
Dusoulget—white, bordered with rosy lilac;
Honorabilis—orange, veined and feathered with brown;
Incomparable—white, tipped and veined with violet;
Jacquesiana—bronze, salmon, and violet;
Julia Grisi—white and violet;
Lelieur—white and violet;
Lorenzo—fawn, shaded with violet and brown;
Mademoiselle Dubarry—pale lilac, veined with violet;
Multicolor—golden yellow, shaded and veined with brown;
Munico—orange and brown;
National—blue, shaded with violet purple;
Orpheus—orange, shaded with brown;
Paganini—white, veined with violet;
Phidias—yellow, shaded with brown;
Pulchérrima—lilac and violet purple;
Raphael—white, feathered with purple and violet;
Rebecca—yellow and brown;
Reticulata alba—white, veined with blue;
Rolandiana—lavender, veined with purple;
Spectábilis—lemon, veined with brown and purple;
Tarquin—bluish violet;
Télémaque—lilac and blue;
Theresita—pale lilac, veined with violet;
Unique—white, veined with blue;
Victorine—white, pencilled with purple.

COUNTRY SHOWS.

Alnwick Horticultural Society, Aug. 23.—The display of flowers, fruit, and vegetables at the autumn exhibition far exceeded that of any previous one. The award of prizes was as follows:—FLOWERS—BEST 6 CARNATIONS: Flora's Garland, Albion, Grenadier, Maud's Routon, Cottage Girl, and Queen of Roses, Mr. T. Allan. *Best Carnation:* 1, Simpson's Superb, Mr. E. Hudson; 2, Mr. G. Robson, gr. to P. Nairn, Esq. 6 PICOTEES: 1, North Durham, Triumphant, Sir Hamilton Seymour, Lady Williamson, Lady Ravensworth, Maid of Aln, and No Mistake, Mr. A. Oliver, gr. to the Hon. Mr. Liddell, M.P.; 2, Maid of Orleans, William the 4th, Jenny Jones, Admiral Southern, Derby Willow, and Mark Antony, Mr. T. Allan. *Best Picotee:* 1 and 2, Admiral Southern and Jenny Jones, Mr. T. Allan. *Seedling:* Mr. Thompson. 12 DAHLIAS: 1, Yellow Defiance, Bridesmaid, Argo, Phenomenon, Beauty of the Plain, President of the West, Miss Johnson, Marquis of Lothian, Unique, Springfield Rival, Conservative, and Rival Sussex, Mr. A. Oliver; 2, Marquis of Lothian, Springfield Rival, Bridesmaid, Unique, Rouge et Noir, Miss Johnson, Phenomenon, Egyptian, King, President of the West, Beauty of the Plain, and Lewisham Rival, Mr. Oliver. 9 DAHLIAS (*Amateurs*): Eclipse, Unique, Maid of Bath, Tournament, Fanny Keynes, Rouge et Noir, Phenomenon, Queen, and Miss Johnson, Mr. E. Hudson. 6 DAHLIAS: 1, Beauty of the Plain, Eclipse, Rouge et Noir, Marquis of Lothian, Yellow Defiance, and Scarlet Defiance, Mr. Hudson; 2, Marquis of Lothian, Pickwick, Beauty of the Plain, Phenomenon, Lee's Bloomsbury, and Nicholas Nickleby, Rev. — Orrell. 3 DAHLIAS: 1, Pickwick, Beauty of the Plain, and Yellow Defiance, Mr. Hudson; 2, Regina, Tournament, and a seedling, Mr. T. Allan. BEST SELF DAHLIA, *open to all classes:* 1, Andrew Hofer, Mr. J. Crossling, gr. to G. Burdon, Esq.; 2, Maria, Mr. A. Oliver. *Variegated Dahlia:* 1, Duchess of Richmond, Mr. J. Crossling; 2, Mr. A. Oliver. *Seedling* of 1841: *2d class prize*, Mr. J. Thompson. COLLECTION OF PLANTS, *not exceeding* 20: 1, Mr. J. Huntley, gr. to E. Thew, Esq.; 2, Mr. R. Straffen, gr. to Gen. Grey. COLLECTION OF 10: 1, Mr. A. Oliver; 2, Mr. T. Allan. STOVE PLANT: Achimenes coccínea, Mr. T. Allan. GREENHOUSE, do.: Fúchsia corymbiflora, Mr. A. Oliver. COCKSCOMBS: *Dwarf*, Mr. J. Huntley; *Giant*, Mr. J. Crossling. BOUQUET: 1, Mr. Crossling; 2, Mr. Oliver. FRUIT—PINE APPLE: Mr. Crossling. MELON: 1, Mr. Mortimer, gr. to P. Selby, Esq.; 2, Mr. Robson. GRAPES: 1 and 2, Mr. Crossling. PEACHES: 1, Mr. N. Billau, gr. to Rev. — Cook; 2, Mr. Winship, gr. to Capt. Coulson. NECTARINES: Mr. Wm. Murray, gr. to Miss Grey; 2, Mr. Crossling. APRICOTS: 1, Mr. G. Dobson; 2, Mr. Brown, gr. to Earl Tankerville. PLUMS: 1 and 2, Mr. Crossland. PEARS: Mr. A. Oliver. APPLES: *Dessert*, 1, Mr. A. Oliver; 2, Mr. Shield. *Kitchen*, 1, Mr. W. Murray; 2, Mr. P. Reay, gr. to Rev. — Rooke. GOOSEBERRIES: 1, Mr. M. Brewis; 2, Mr. A. Oliver. CURRANTS: 1, Mr. Barrow, gr. to W. Burrell, Esq.; 2, Mr. Brown. EXTRA PRIZES: *Cherries*, Mr. Brown; *Strawberries*, Mr. Reay; *Raspberries*, Mr. Macfarlane; *Vegetable Marrow*, Mr. Reay; *Cucumbers*, 1, Mr. Mortimer; 2, Mr. Barrow; *Pears*, Mr. G. Robson and Mr. Crossling; *Capsicums*, Mr. Hugh Noble, gr. to W. Pawson, Esq. VEGETABLES—CARROTS: 1, Mr. Barrow; 2, Mr. A. Oliver. TURNIPS: 1, Mr. Reay; 2, Mr. Barrow. BEET: Mr. Crossland. CELERY: 1, Mr. A. Oliver; 2, Mr. Macfarlane. PEAS: 1, Mr. Macfarlane; 2, Mr. Barrow. KIDNEY BEANS: 1 and 2, Mr. Barrow. POTATOES: 1, Mr. Reay; 2, Mr. Barrow. ONIONS: Mr. M. Brewis. SHALLOTS: Mr. M. Brewis. EXTRA: *Cabbage*, Mr. B. Gibbeson, gr. to Gen. Grey. LETTUCE: Mr. M. Brewis. PARSLEY: Mr. Rickeby. CAULIFLOWERS: Mr. Gibbeson. PARSNEPS: G. Selby, Esq. EXTRA PRIZES were also awarded to Miss Leithead, for *Nerium Oleander*; to Mr. Barrow, for *Striped Marigolds*; to Mr. G. Mason, gr. to J. Carr, Esq., for a *Device of Dahlias* (*a Windmill*); to Mr. T. Allan, for a *Seedling Calceolaria*; to Mr. J. Burnett, for 12 blooms of a fine *Seedling Heartsease*; and to W. Forster, Esq., for a *Dish of Potatoes of last year's growth*, in an excellent state of preservation.

Battle and Hastings Horticultural Society, June 29.—This exhibition took place in the Assembly Rooms, at the George Inn, and the plants exhibited far surpassed those of previous summers. The following is a list of the successful competitors:—Prizes of the FIRST CLASS: to Lady Webster, for the *best Balsams, perennials, hardy plants, and Carrots*; and *second best Pelargoniums, Stocks, greenhouse plant, and Cauliflowers*; to Sir W. Ashburnham, Bart., for the *best Pinks and Pelargoniums*; *second best bouquet, hardy plant, and Cherries*; to the Ven. Archdeacon Hare, for the *second best Heartsease*; to T. Frewen, Esq., for the *best Beans, Strawberries, and Cherries*; to Mr. M'Vean, gr. to Sir C. M. Lamb, Bart., for the *best design, Heartsease, and second Pinks*; to Mr. Ogle, gr. to A. E. Fuller, Esq., M.P., for the *best greenhouse plant, Peaches, Nectarines, Grapes, Cucumbers, and Cauliflowers*; to Mr. Williams, gr. to Alex. Dalrymple, Esq., for *best bouquet, collection of vegetables*, and *second design*; to Mr. Morris, gr. to W. Brisco, Esq., for the *best Cabbage and second Cucumbers*; to Mr. Niller, for the *best Stocks and Peas, second best annuals, perennials, Potatoes, and Turnips*; to T. Smith, Esq., for the *best Melon and French Beans*; to Mr. Denyer, for the *best Strawberries and a collection of fruit*; to the Rev. B. Cole, for the *best annuals*; to Mr. Turle, for *fourth Strawberries*; to Mr. J. Knight, for the *best Beans, Turnips, and Potatoes*, which were from seedlings raised by himself, and had been planted only eight weeks. SECOND CLASS PRIZES: to Mrs. C. Laurence, for the *best bouquet*; to Mr. W. Daws, for the *best design, greenhouse plant, hardy plant, and Cucumbers, and third Strawberries*; to Miss Daws, for the *second Roses, Pelargoniums, annuals, and perennials*; to Miss Humphrey, for the *best Roses and Pelargoniums*, and *second Pinks and Heartsease*; to Mrs. Miller, for the *best Pinks, Stocks, annuals, second best Apples of last year, and greenhouse plant*; to Mr. H. Ransom, for *best Heartsease and Potatoes, second Beans and Carrots*; to Mr. C. Gausden, jun., for the *best greenhouse plant*; to Mr. J. Laurence, for the *best perennials and second Gooseberries*; to Mr. C. Alderton, for the *best Gooseberries*; to Mr. Kell, for the *best Cherries and second Strawberries*: to Mr. G. Slatter, for the *best Strawberries*; to Mr. W. White, for the *best collection of vegetables, Turnips, and Apples, of last year*; to Mr. R. White, for the *best Peas, Beans, Carrots, Cabbages, second Potatoes and Turnips*. SWEEPSTAKES FOR ROSES: 1, Mr. M'Vean; 2, Mr. W. Daws; 3, Lady Webster. There is to be a sweepstakes for Dahlias at the September Show, towards which Mr. Mitchell gives a sovereign, and Mr. Wood ten shillings. It is to be confined to the present members of the society, not growing Dahlias for sale.—*Sussex Advertiser.*

Birmingham Horticultural Society, Aug. 25.—The following prizes were awarded:—ORCHIDACEÆ: 1, Stanhópea quadricornis, G. Barker, Esq.; 2, Cattleya crispa, J. Willmore, Esq.; 3, G. Barker, Esq.; 4, Cattleya Loddigésii, G. Barker, Esq. *Six plants:* 1, Miltónia vittata, Mormodes citrina, Peristéria pendula, Brássia multiflora, E'ria velutina, Brássia verrucosa, G. Barker, Esq.; 2, Stanhópea insignis var., Stanhópea ebúrnea, Galeandra Baueri, Zygopétalum maxillare, Zygopétalum stenochilum, Acropera fulva, G. Barker, Esq. STOVE PLANTS: 1, Ceropégia stapeliæformis, J. Willmore, Esq.; 2, Achimenes longiflora, G. Barker, Esq.; 3, Achimenes rósea, G. Barker, Esq.; 4, Justícia cárnea, J. Willmore, Esq. GREENHOUSE PLANTS: 1, Lílium lancifólium punctatum, J. Willmore, Esq.; 2, Swainsónia coronillæfólia alba, J. Gough, Esq.; 3, Lílium lancifólium album, T. Kenrick, Esq.; 4, Róchea falcata, Mr. J. Moore. ERICAS: 1, trícolor major, J. Willmore, Esq.; 2, ventricosa, Messrs. J. Pope and Sons; 3, exímia, J. Gough, Esq.; 4, ampullácea, J. Willmore, Esq. PELARGONIUMS: 1, Mabel, Messrs. J. Pope and Sons; 2, Spéculum mundi, J. Gough, Esq. CALCEOLARIAS: 1, *seedling*, J. Willmore, Esq.; 2, *ditto*, J. Willmore, Esq. MELOCACTI, *six plants:* 1, G. Barker, Esq.; 2, G. Barker, Esq. BALSAMS: 1, A. Kenrick, Esq.; 2, R. G. Reeves, Esq. GROUPS OF FLOWERS: 1, R. G. Reeves, Esq.; 2, Mr. J. Cole. ALPINE PLANTS: 1, Messrs. J. Pope and Sons; 2, Mr. J. Moore. HERBACEOUS do.: 1, Mr. J. Moore; 2, Messrs. J. Pope and Sons. HOLLYHOCKS: 1, J. Gough, Esq.; 2, J. Willmore, Esq. PAN OF CARNATIONS: 1, Jos. Mason, Esq.; 2, J. Mason, Esq. PICOTEES: J. Mason, Esq. DAHLIAS: 1, Westbury Rival, Mr. W. Earl; 2, Girling's Prince of Wales, Mr. W. Earl; 3 and 4, Bloomsbury, and Lewisham Rival, Mr. W. Earl. *Twenty-four sorts* (*nurserymen*): 1 and 2, Mr. W. Earl. *Twelve sorts* (*gardeners and amateurs*): 1, Jos. Mason, Esq. CHINA ASTERS: 1 and 2, Mr. W. Earl. GERMAN STOCKS: ditto. FUCHSIAS: 1 and 2, A. Kenrick, Esq.; trícolor, Messrs. J. Pope and Sons. FERNS: 1, Mr. J. Moore; 2, Messrs. J. Pope and Sons. ORANGE OR LEMON TREE in fruit: J. F. Ledsam, Esq. ROSES: 1, Adelaide d'Orléans—Mr. J. Moore; 2, G. Barker, Esq.; 3, Messrs. J. Pope and Sons. FRUITS: *collections*, W. Robins, Esq. PINE: *Enville*, ditto; 2, *Queen*, J. Y. Bedford, Esq.; 3, *Trinidad*, W. Robins, Esq. GRAPES: *Black Hamburgh*, 1, J. F. Ledsam, Esq.; 2, *Muscat of Alexandria*, W. Robins, Esq.; 3, *Tokay*, Earl of Stamford. PEACHES: 1, *Red Magdalen*, ditto; 2, Henry Dawes, Esq.; 3, J. Gough, Esq. NECTARINES: *Scarlet*, Earl of Stamford. MELONS: *Canteloupe*, 1, J. Y. Bedford, Esq.; 2, *Green-fleshed*, A. Kenrick, Esq.; 3, Earl of Stamford. APRICOTS: *Orange*, H. Dawes, Esq. PEARS: 1, *Jargonelle*, R. G. Reeves, Esq.; 2, *Windsor*, Jos. Mason, Esq. APPLES: 1, J. F. Ledsam, Esq.; 2, *Lemon*, Mr. F. Brewer. PLUMS: *New Orleans*, 1, J. F. Ledsam, Esq.; 2, *Orleans*, ditto. CHERRIES: *Morello*, 1, W. Robins, Esq.; 2, *Morello*, J. Gough, Esq. GOOSEBERRIES: *Warrington*, J. F. Ledsam, Esq. BRACE OF CUCUMBERS: *Manchester*, 1, J. Willmore, Esq.; 2, J. F. Ledsam, Esq.; 3, R. G. Reeves, Esq. CAULIFLOWER: 1, Mr. W. Earl; 2, ditto. PEAS: *Scimitar*, 1, J. Gough, Esq.; 2, H. Dawes, Esq. KIDNEY BEANS: 1, Mr. W. Earl; 2, G. Barker, Esq. POTATOES: *Ash-leaved*, 1, W. Anderton, Esq.; 2, *Golden Drop*, H. Dawes, Esq. TURNIPS: *Stone*, 1, J. Y. Bedford, Esq.; 2, W. H. Rogers, Esq. CELERY: *Manchester*, 1, Jos. Mason, Esq.; 2, W. H. Rogers, Esq. ONIONS: *Tripoli*, 1, J. Gough, Esq.; 2, *White Spanish*, ditto. NEW OR RARE VEGETABLES: *French Turnip*, 1, Jos. Mason, Esq.; 2, *Ulm Kohlrabi*, W. Phipson, Esq. EXTRA PRIZES: *Æschynanthus grandiflorus*, W. Robins, Esq. *Grapes:* H. Dawes, Esq. *Ditto*, J. F. Ledsam, Esq. *Catasetum Russellianum*, W. Robins, Esq. *Erythrolæna conspícua*, Messrs. J. Pope & Sons. Some Cottagers' prizes were also distributed.

Birmingham Gooseberry and Carnation Show, August 8.—This exhibition was held at the Sun Tavern, Bristol Road, where the following prizes were awarded:—CARNATIONS: *Premier*, Game Boy, Mr. Britten. *Scarlet Bizarre*, 1, Game Boy, Mr. Britten; 2, Hepworth's Leader, Mr. Flindell; 3, Hufton's Patriarch, Mr. Fletcher. *Crimson Bizarre*, 1, Cartwright's Rainbow, Mr. Fletcher; 2, Gregory's King Alfred, do.; 3, Ely's Lord Milton, Mr. Britten. *Scarlet Flake*, 1, Booth's Conquest, Mr. Fletcher; 2, Taylor's Festival, do.; 3, Rob Roy, Mr. Britten. *Rose Flake*, 1, Queen of Roses, Mr. Fletcher; 2, Fletcher's Duchess of Devonshire, Mr. Flindell; 3, Plant's Lady Hood, Mr. Britten. *Purple Flake*, 1, Brabbin's Squire Meynell, Mr. Flindell; 2, British Queen, Mr. Fletcher; 3, Lady Hewley, do. PICOTEES: *Premier*, Nulli secundus, Mr. Flindell. *Purple Edge*, 1, Pullen's Lady Peel, Mr. Flindell; 2, Lee's Mary, do.; 3, Pullen's Incomparable, Mr. Britten. *Red Edge*, 1, Britten's Sultana, Mr. Britten; 2, Seedling, Mr. Fletcher; 3, Lee's Elizabeth, Mr. Flindell. DAHLIAS: 1, Marquis of Lothian, Mr. Rodway; 2, Essex Rival, do. GOOSEBERRIES: *Premier*, Thumper, 20dwts., Mr. J. Fairfield; *Red*, 1, Companion, 19dwts. 18grs., Mr. Mills; 2, Lion, 18dwts. 20grs., Mr. Barton; 3, Caledonian, 18dwts. 17grs., Mr. Betts; 4, Atlas, 18dwts. 15grs., do.; 5, London, 18dwts. 9grs., Mr. Fairfield; 6, Wonderful, 18dwts. 3grs., Mr. Barton; 7, Royal George, 18dwts., Mr. Fairfield; 8, Briton, 16dwts. 20grs., Mr. Tolley. *Yellow*, 1, China Orange, 19dwts., Mr. Fairfield; 2, Seedling, 17dwts. 16grs., do.; 3, Duckwing, 17dwts. 4grs., Mr. Mills; 4, Shuttle, 16dwts. 18grs., Mr. Barton; 5, Bunker's Hill, 16dwts. 4grs., Mr. Betts; 6, Husbandman, 15dwts. 22grs., Mr. Tolley; 7, Two to One, 15dwts. 19grs., Mr. Barton; 8, Seedling, 15dwts. 18grs., Mr. Britten. *Green*, 1, Thumper, 19dwts. 18grs., Mr. Fairfield; 2, Peacock, 19dwts. 6grs., Mr. Tolley; 3, Green Overall, 18dwts. 18grs., Mr. Fairfield; 4, Bumper, 17dwts. 12grs., Mr. Barton; 5, Bates's Favourite, 16dwts. 18grs., Mr. Tolley; 6, General, 16dwts. 17grs., Mr. Betts; 7, Surprise, 15dwts. 22grs., Mr. Barton; 8, Providence, 15dwts. 19grs., Mr. Betts. *White*, 1, Seedling, 19dwts. 18grs., Mr. Fairfield; 2, White Eagle, 18dwts. 12grs., Mr. Barton; 3, Tally Ho! 18dwts. 6grs., do.; 4, White Swan, 17dwts. 6grs., Mr. Fairfield; 5, Lady Delamere, 17dwts. 1gr., Mr. Mills; 6, Lily of the Valley, 16dwts. 22grs., Mr. Tolley; 7, Chorister, 16dwts. 18grs., Mr. Betts; 8, Audley Lass, 16dwts. 14grs., do.

Crieff Horticultural Society, July 14.—The first meeting for the season took place in the Mason's Lodge, where the Prizes were awarded as follows:—PELARGONIUMS.—1, Mr. Campbell; 2, Mr. M'Donald; 3, Mr. Anderson. *Seedling*, 1 Mr. Anderson; 2, Mr. Campbell. PINKS.—1, Mr. M'Donald; 2, Mr. M'Naughton; 3, Mr. Campbell. *Best three*, 1, Mr. M'Donald; 2, Mr. M'Lean; 3, Mr. M'Gregor. *Seedlings, best three*, Mr. M'Donald. STOCKS, *Ten Weeks*, 1, Mr. M'Donald; 2, Mr. Gorrie; 3, Mr. M'Naughton. *Any other sort*, 1, Mr. M'Naughton; 2, Mr. M'Donald. BOUQUET OF FLOWERS.—Mr. M'Donald. ROSES.—*Best six*, 1, Mr. Campbell; 2, Mr. M'Donald; 3, Mr. Anderson. *Double Ayrshire*, 1, Mr. M'Naughton; 2, Mr. Campbell; 3, Mr. M'Donald. *China*, 1, Mr. M'Donald; 2, Mr. Anderson; 3, Mr. Oswald. DAHLIAS.—1, Mr. Anderson; 2, Mr. Oswald; 3, Mr. M'Gregor. HARDY BIENNIAL AND PERENNIAL HERBACEOUS PLANTS.—1, Mr. Macnaughton; 2, Mr. Campbell; 3, Mr. Anderson. IRIS.—Mr. Anderson. CALCEOLARIAS.—1, Mr. M'Donald; 2, Mr. M'Gregor; 3, Mr. Oswald. GREENHOUSE PLANTS.—1, Mr. Oswald; 2, Mr. M'Donald; 2, Mr. M'Naughton. *Cut Specimens*, 1, Mr. M'Donald; 2, Mr. Anderson. VIOLETS.—*Best six different*, 1, Mr. M'Donald; 2, Mr. M'Gregor; 3, Mr. Gorrie. *Seedling*, Mr. M'Donald. FRUIT AND VEGETABLES: GRAPES.—1, Mr. Arnott; 2, M'Naughton. *White Muscat*, Mr. Arnott. CHERRIES.—1, Mr. Arnott; 2, Mr. M'Donald; 3, Mr. M'Lean. STRAWBERRIES.—*Keen's Seedling*, 1, Mr. M'Lean; 2, Mr. Campbell; 3, Mr. Arnott. *Any other sort*, 1, Mr. M'Gregor; 2, Mr. M'Naughton; 3, Mr. Arnott. APPLES.—*Six best preserved*, 1, Mr. Anderson; 2, Mr. M'Donald. CAULIFLOWER.—1, Mr. Campbell; 2, Mr. M'Lean; 3, Mr. Gorrie. CUCUMBERS.—1, Mr. M'Donald; 2, Mr. Campbell. LETTUCE.—1, Mr. Arnott; 2, Mr. M'Naughton; 3, Mr. Campbell. *Cabbage*, Mr. Arnott; 2, Mr. M'Naughton; 3, Mr. Gorrie. POTATOES.—1, M'Donald: 2, Mr. Arnott; 3, Mr. Campbell. CABBAGES.—1, Mr. Cumming; 2, Mr. Gorrie; 3, Mr. Campbell. RHUBARB.—1, Mr. M'Donald; 2, Mr. Arnott; 3, Mr. Anderson. PEAS.—1, Mr. M'Gregor; 2, Mr. Anderson; 3, Mr. M'Donald. TURNIPS.—1, Mr. M'Donald; 2, Mr. Campbell; 3, Mr. Gorrie. Many Cottagers' Prizes were also given.—*Perthshire Constitutional.*

Felton Florists' Society, Aug. 29.—The florists of Felton and its vicinity held their annual Show of Carnations and Picotees at Mr. Appleby's, the North Briton Inn. Owing to the long continuance of fine weather, the show was rather late; but there was, nevertheless, a full table of flowers, many of them in fine condition; and it may be pronounced the best show of the kind that has been seen in Felton. The prizes were awarded as follows:—CARNATIONS: 1, Mr. Forsyth, gr. to A. J. B. Cresswell, Esq., M.P., for Ely's Regulator; 2, The Rev. Jos. Orrell, for Harvey's Tally-ho! 3, Mr. Forsyth, for Hogg's Foxhunter; 4 and 5, Mr. Burn, gr. to C. W. Bigge, Esq., for Simpson's Superb and Duchess of Richmond; 6, Mr. Orrell, for Ely's Lady Hewley. PICOTEES: 1, Mr. W. Harrison, for Ely's Dr. Horner; 2, Mr. Gowens, for Tyso's Aspasia; 3 and 4, Mr. Orrell, for Fair Helen and Fanny Kemble; 5, Mr. Forsyth, for Lamb's Miss Baker; 6, Mr. Burn, for Le Papillon. The prize for the *best seedling* of 1842 was also awarded to Mr. Burn, for a beautiful dark-edged yellow Picotee which he named Burn's Lady Prudhoe.

Morningside Practical Gardeners' Society, Aug. 2.—This meeting was held in the school-room, when prizes were awarded as follows:—ROSES: 1, Mr. J. Douglas, gr. to Sir T. Dick Lauder, Bart., for Crimson Moss, Black Tuscan, White Provence, Maiden's Blush, Anna Maria, and White Hip; 2, Mr. J. Fargie, gr. to Mrs. Dr. Gregory. PINKS: 1, J. Douglas, for Jack of Trumps, Duke of St. Albans, Queen Victoria, Tweedside Beauty, Brilliant, and Queen Charlotte; 2, Mr. J. Liddell, gr. to A. Thomson, Esq. VERBENAS: 1, Mr. J. Downie, gr. to Gen. Robertson, for Tweediana grandiflora, picta, and ignea; 2, Mr. W. Ewing, gr. at Broughton

Point. Calceolarias: 1, J. Downie, for Enchantress, Reliance, and Solomon. Salvias: 1, J. Downie, for fulgens, patens, and splendens. Grapes: 1, J. Fargie; 2, J. Liddell. Melon: 1, Mr. H. Gibb, gr. to Mrs. Stark; 2, Mr. J. Muir, gr. to W. M. Innes, Esq. Gooseberries: 1, J. Liddell; 2, Mr. R. Anderson, gr. at Burromuirhead. Strawberries: 1, H. Gibb; 2, J. Douglas. White Currants: 1, Mr. J. Johnston, gr. at Bradesburn; 2, J. Muir. *Red*: 1, J. Johnston; 2, J. Liddell. *Black*: 1, J. Johnston; 2, Mr. J. Cockburn. Raspberries: 1, J. Douglas; 2, J. Johnston. Cauliflower: 1, J. Douglas; 2, J. Johnston. Cabbage: 1, Mr. W. Denholm, gr. to Sir J. Forrest, Bart.; 2, H. Gibb. Lettuce: 1, J. Douglas; 2, J. Johnston. Cauliflower (*Amateurs*): J. Cockburn.

Practical Floral and Horticultural Society of Ireland.—The following is a list of the prizes awarded:—Private Gardens.—Stove Plants: J. C. Humphreys, gr. to the Hon. Col. Wingfield. Pelargoniums: *Dark*, P. Hynes, gr. to M. M'Kay, Esq. *Light*, P. Hynes. *Mixed*, 1, J. H. Evans, Esq.; 2, P. Hynes. Ericas: 1, J. C. Humphreys; 2, J. Dorle, gr. to H. Flood, Esq. Fuchsias: 1 and 2, Mr. Cahill, gr. to Col. Jones. Ornamental Plants: J. C. Humphreys. Herbaceous Plants: 1, P. Hynes; 2, T. Pidgeon, Esq. Hardy Bouquet: 1, Mr. Montgomery, gr. to Rev. C. Wolseley; 2, Mr. Raper, gr. to J. Clarke, Esq. Exotic Bouquet: 1, J. H. Evans, Esq.; 2, Mr. Montgomery. Carnations: *Pink Bizarres*, 1, B. Kane, gr. to E. Clibborn, Esq.; 2, G. M. Walthew, Esq. *Scarlet Bizarre*, 1, B. Kane; 2, G. M. Walthew, Esq. *Pink Flake*, B. Kane. *Scarlet*, 1, — Williams, Esq.; 2, B. Keane. *Purple*, 1, B. Kane; 2, G. M. Walthew, Esq. *Premier pan of Seven*, G. M. Walthew, Esq. Picotees: *Scarlet*, 1, B. Kane; 2, — Williams, Esq. *Purple*, 1, — Williams, Esq.; 2, G. M. Walthew, Esq. *Yellow*, B. Kane. *Rose*, B. Kane. Pansies: *Twelve Varieties*, G. M. Walthew, Esq. Dahlias: *Twenty-four*, 1, Mr. Ogilvie, gr. to Earl of Leitrim; 2, G. M. Walthew, Esq. *Twelve*, 1, Mr. Ogilvie; 2, G. M. Walthew, Esq. *Six*, Mr. Campbell, gr. to Dr. Stock. Hollyhocks: G. M. Walthew, Esq. Public Gardens.—Stove Plants: D. Livingston. Pelargoniums: *Dark*, J. M'Laine. *Light*, 1, J. M'Laine; 2, D. Livingston. *Mixed*, J. M'Laine. Calceolarias: *Shrubby*, A. Campbell. *Herbaceous*, A. Campbell. Fuchsia: J. M'Laine. Ornamental Basket: 1, J. M'Laine; 2, D. Livingston. Herbaceous Plants: 1, L. Doyle; 2, J. M'Laine. Hardy Bouquet: J. Gough. Carnations: *Pink*, 1, B. Fox. *Flake*, 1, B. Fox; 2, J. Gough. *Scarlet Flake*, 1, D. Livingston; 2, J. Gough. *Purple Flake*, 1, B. Fox; 2, J. Gough. *Variety*, 1, B. Fox. Picotees: *Scarlet*, B. Fox. *Purple*, T. Robinson. *Yellow*, B. Fox. *Rose*, 1, B. Fox; 2, T. Robinson. Pansies: T. Robinson. Dahlias: *Twenty-four*, A. Campbell. *Twelve*, 1, A. Campbell; 2, J. Goodbody. *Six*, A. Campbell. Open Competition.—Light Pelargoniums: J. M'Laine. Carnations: *Seedling*, B. Fox; *Rose Flake*, C. Williams, Esq.; *Scarlet Flake*, C. Williams. Picotees: *Seedling*, 1, Captain Johnston; 2, Mr. Collier. *Premier*, 1, T. Pidgeon, Esq. 24 Seedling Pansies: Mr. Collier. Six Annuals: J. H. Evans. Fruit and Vegetables.—Melons: *Green-flesh*, 1, J. Ogilvie; 2, J. Campbell. *Any variety*, 1, J. Ogilvie; 2, Mr. Raper. Grapes: *White*, J. Alexander, gr. to his Grace the Duke of Leinster. *Black*, 1, Mr. Ogilvie; 2, W. Kelly, gr. to Col. Connolly, M.P. *Muscat*, 1, Mr. Kelly; 2, J. C. Humphreys. Peaches: *Noblesse*, 1, W. Kelly. *Any variety*, 1, A. Ellis; 2, J. C. Humphreys. Nectarines: *White*, J. Ogilvie. *Red*, J. Ogilvie. Apricots: 1, J. Ogilvie; 2, H. Montgomery. Plums: *Greengage*, 1, W. Cahill; 2, J. C. Humphreys; 3, Capt. Johnston. Apples: *Prince Albert's Glory of England*, 1, Capt. Johnston. Plums: *any variety*, 1, J. Ogilvie; 2, J. Alexander; 3, H. Montgomery. Figs: 1, J. Ogilvie; 2, Capt. Johnston. Gooseberries: *Red*, 1, A. Campbell; *Green*, J. Alexander; *White*, J. Ogilvie; *Yellow*, J. Ogilvie. Currants: *Red*, A. Ellis; *White*, J. Ogilvie. Jargonelle Pears: 1, W. Cahill; 2, Captain Johnston. *Any variety*, 1, A. Campbell; 2, Capt. Johnston. Vegetables: *Six Heads of Celery*, H. Johnston, gr. to H. Hanbidge, Esq. Cauliflowers: 1, W. Lumnden, gr. to the Hon. Mrs. Vesey. Onions: the Right Hon. Chief Baron.—*From the Dublin Freeman's Journal of Aug.* 22.

Royal Devon and Cornwall Horticultural Society, July 21.—The summer exhibition took place at Devonport; the spacious Hall being splendidly decorated with a rich display of flowers, plants, and fruit. The following is the list of prizes:—Fruit: *Grapes of various sorts*, Mr. H. Saunders. *Best dish of black*, W. H. Evens, Esq.; 2, Mr. T. Ellis. *Best dish of white*, Mr. R. Luke; 2, T. Holberton, Esq. *Best dish of Plums*, C. Jeffery; 2, Mr. T. Ellis. *Melons*, Mr. Taylor; 2, R. Blackmore, Esq.; 2, Mr. T. Roberts. *Best dish of Pears*, Mr. T. Ellis; 2, Mr. C. Jeffery. *Best dish of Apples*, Mr. J. Ellis; 2, Mr. R. Luke. *Best dish of Black Currants*, T. Briggs, Esq. *Best dish of White*, Mr. T. Ellis; 2, Mr. J. Taylor. *Best dish of Red*, Mr. T. Ellis; 2, W. H. Evens, Esq. *Best dish of White Cherries*, Mr. J. Ellis. *Best Black*, Mr. R. Luke. *Best Mayduke*, Mr. J. Taylor. *Twelve highest-flavoured Gooseberries*, Mr. J. Paul; 2, Mr. C. Jeffery. *Best dish of Red Gooseberries*, Mr. J. Paul; 2, G. W. Soltau, Esq. *Best dish of White ditto*, Mr. J. Paul; 2, G. W. Soltau, Esq. *Best dish of Green ditto*, Mr. J. Paul; 2, Mr. H. Whiddon. *Best dish of Yellow ditto*, Mr. J. Paul; 2, Mr. H. Whiddon. *Best dish of White Raspberries*, R. Robertson, Esq.; 2, Mr. J. Ellis. *Best dish of Red ditto*, G. W. Soltau, Esq.; 2, Mr. J. Taylor. *Best dish of Strawberries*, Mr. J. Ellis; 2, Mr. J. Taylor. *Best dish of Figs*, Mr. R. Luke. Extra Prizes: Mr. R. Luke for *Mayduke Cherries, Lemons, and Grapes*. Flowers and Plants: *Best six Stove Plants*, Mr. J. Griffin. *Best twelve Greenhouse Plants*, P. E. Lyne, Esq. *Best collection of Pelargoniums*, ditto. *Seedling Pelargonium*, Mr. F. Wood. *Twelve best Carnations*, Mr. J. Griffin; 2, Mr. C. Doidge. *Twelve best Picotees, Yellow*, Mr. J. Griffin. *Twelve best ditto, not Yellow*, Mr. J. Griffin. *Six best Fuchsias*, P. E. Lyne, Esq.; 2, W. C. Hodge, Esq. *Best collection of Dahlias*, Mr. Bate. *Six best China Roses, grown in pots*, W. C. Hodge, Esq. *Twelve best Dutch Roses*, Mr. Griffin. *Best six Hollyhocks*, T. Dennis. *Best collection of Calceolarias*, P. E. Lyne, Esq. *Six best Tender Annuals*, P. E. Lyne, Esq.; 2, W. C. Hodge, Esq. *Best Hardy Annuals*, W. C. Hodge, Esq. *Best ten-week Stocks*, Mr. J. Paul. *Best Hardy Perennials*, W. C. Hodge, Esq. *Best twelve Verbenas*, W. C. Hodge, Esq. *Best collection of Indigenous Plants*, Mr. Griffin. *Best design of Cut Flowers*, Mr. J. Taylor. *Best specimen Plant*, Mr. Griffin. Extra Prizes: Mr. Luke, for *Orange plant with fruit*; Mr. Doidge, for *Picotees*; W. C. Hodge, Esq., for *Cockscombs*; H. F. Spence, Esq., for *Heartsease*; Mr. R. Barrett, for *Carnations*; H. F. Spence, Esq., for *Phlox alba grandiflora*; Mr. R. Barrett, for *Picotees*; Mr. J. Ellis, for *Indigenous plants*; R. Blackmore, Esq., for *hardy Annuals*; Dr. Budd, for *Zinnias*. Vegetables: *Celery*, Mr. R. Baskerville, gr. to Sir E. Thornton; 2, W. C. Hodge, Esq. *Cauliflower*, Mr. T. Roberts. *Cape Broccoli*, Mr. J. Ellis. *Cucumbers*, R. Robertson, Esq. *Cos Lettuce*, W. H. Evens, Esq. *Cabbage Lettuce*, J. Dingle, Saltash. *Peas*, Mr. T. Roberts. *Kidney Beans, dwarfs*, R. Robertson, Esq. *Kidney Beans, runners*, T. Briggs, Esq. *Artichokes*, Mr. C. Jeffery. *Basket of Vegetables*, Mr. C. Jeffery; 2, G. W. Soltau, Esq. Extra Prizes: Mr. T. Roberts, for *Cucumbers*; Mr. C. Jeffery, for *Lettuce*; Mr. W. Bray, gr. to G. Strode, Esq., for *Peas*. Numerous Cottagers' Prizes were also distributed.—*Abridged from the Plymouth Herald.*

Sunderland Floral and Horticultural Society, July 12.—The second exhibition of plants, fruits, flowers, &c., was held in the large Polytechnic Hall of the Athenæum. The prizes were awarded as follows:—Ranunculuses: 12. 1 and 2, Mr. T. Hull. *Best six do.* 1 and 2, Mr. T. Hull. *Best three ditto*, 1 and 2 Mr. T. Hull. Pinks: *best six*, Bexley Beauty, Barratt's Conqueror, Bates' Freeholder, Tagg's Wellington, Eltringham's Paul Pry, Miss Fanny Kemble, Mr. I. Mallin; 2, Bower's Paragon, Davie's Juliet, Shakspeare, Davie's Wellington, Barr's Princess Charlotte, Duke of Northumberland, Mr. T. Hull. *Best three*, Bexley's Beauty, Dowson's Gauntlet, Barrat's Conqueror, M. I. Mallin; 2, Bower's Paragon, Barr's Princess Charlotte, Wellington, Mr. T. Hull. *Best Pink*, Ainsworth's Omega, Mr. I. Mallin. Pelargoniums; *best three*, Splendidum, Garth's Perfection, Joan of Arc, Mr. T. Cook; 2, Victory, Conservative, Garth's Perfection, Mr. J. Hastie. Calceolarias; *best three*, Negro Boy, Incomparable, Shepherd's Queen Victoria, Mr. J. Hastie; 2, Incomparable, Majorana, Harrisonia, Mr. Crone. Roses: *best twenty-four*, Mr. T. Pattison, gr. to Mrs. Richardson; 2, Mr. T. Cook, gr. to Sir H. Williamson. *Best twelve*, Mr. T. Pattison. *Best six*, Mr. T. Pattison. *Best Rose*, Blush Moss, Mr. T. Cook. *Best Bouquet of Roses*, Mr. T. Pattison: 2, Mr. T. Cook. Greenhouse Plants: Asclépias salicifólia, Petúnia grandiflora, Melaleuca decussata, Mr. T. Cook: 2, Fúchsia globosa, Sollya heterophylla, Sálvia patens, Mr. G. Robson, gr. to the Rev. Dr. Wellesley. Stove Plants: Erythrina Crista-galli, Seedling Cactus, Sinníngia violácea, Mr. T. Cook. Climbing Plants: Clématis Sieboldi, Thunbérgia alata, Thunbérgia alata alba, Mr. T. Cook. Bouquet of Flowers: Mr. R. Cloughton; 2, Mr. J. Ross, gr. to R. Pemberton, Esq. Black Grapes: Mr. J. Ross; 2, T. R. Wilkinson, Esq. White Grapes: T. R. Wilkinson, Esq.; 2, Mr. G. Robson, gr. to the Rev. Dr. Wellesley. Melon: Duncan's Greenfleshed Egyptian, Mr. J. Clarke, gr. to J. Simpson, Esq.; 2, Netted Scarlet Fleshed, Mr. G. Robson. Strawberries: Keen's Seedling, Mr. G. Allen. Cherries: Elton, Black Eagle, Mayduke, W. Featherstonhaugh, Esq. Cauliflowers: Mr. T. Cook. Prizes were also awarded for four well-grown *Fuchsias*, to N. Horn, Esq. For *a dish of Mushrooms*, to Mr. Pellowe. For a *collection of greenhouse plants*, to Mr. J. Hills. For a *Melon*, Mr. J. Clarke. For a *collection of Irises*, to Dr. Young. For a *collection of greenhouse plants*, to Mr. G. Dale, gr. to R. A. Davison, Esq. For a dish of *Black Brunswick Figs*, to Mr. G. Allen, gr. to W. R. Robinson, Esq. For a *large collection of greenhouse plants*, to H. Gibson and Son. For a *bouquet of cut greenhouse flowers*, to Mr. T. Cook. For a *collection of cut flowers*, to Mr. I. Mallin.

NOTICES OF NEW PLANTS WHICH ARE EITHER USEFUL OR ORNAMENTAL.

Pri'mula denticulata. Toothletted Primrose. (*Hardy Herbaceous Plant.*) Primuláceæ. Pentándria Monogýnia.—This plant flowered last spring in a frame in the garden of the Horticultural Society, and is certainly quite hardy. It requires a rich loamy soil, and a dry situation; is easily increased, either by dividing the old plants when in a dormant state, or by seeds, which should be sown in pans, filled with light rich soil, about a quarter of an inch deep. In May they will be fit for potting off singly into small pots; and eventually they may be planted in the open border, care being taken to select for them a rather dry situation. They suffer more from wet than cold during the winter. The plant flowers during the months of March and April; the seedling will not flower the first season.—*Bot. Reg.*

Vanda cristata. Crested Vanda. (*Stove Epiphyte.*) Orchidáceæ § Vándeæ. Gynándria Monándria.—An epiphyte, with the habit of Vanda Roxbúrghii, found in 1818 on trees in Nepal, by Dr. Wallich, flowering in the month of April. He describes it as a flower of exquisite beauty. It, however, hardly deserves so much praise, because, notwithstanding its rich marking and velvety surface, its flowers are too small and dull-coloured. It succeeds well when grown at the warmest and dampest end of the Orchidaceous stove, and may be fastened on a block of wood, or placed in a basket and suspended from the rafters; in either case it ought to be well supplied with water. A quantity of sphagnum put round the block or in the basket will be found very useful in keeping the plant in a vigorous and healthy state. Its general treatment should be the same as is given to such things as Aérides and Saccolábiums.—*Bot. Reg.*

Campa'nula Læfli'ngii. Mr. Læfling's Campanula. (*Greenhouse Annual.*) Campanuláceæ. Pentándria Monogýnia.—A beautiful little Portuguese annual, raised in the garden of the Horticultural Society, forming an entangled mass of the most delicate blue bells, with a tender foliage, reminding one of the texture of the fragile ivy-leaved Bell-flower. It is to be feared that it will scarcely be hardy, coming as it does from the west of Europe. It is said indeed to inhabit the vicinity of Madrid and Mogador, in which case it may exist with us in the open air during summer; but its delicate substance will hardly resist the cold nights which we so often experience, unless in very favourable seasons. It is well worth a place in a greenhouse.—*Bot. Reg.*

Sobra'lia macrantha. Large-flowered Sobralia. (*Stove Orchidaceous Plant.*) Orchidaceæ. Gynándria Monándria.—A flower of the most delicate texture, of the richest crimson, and between 7 and 8 inches in diameter, growing on the summit of a reedy stem, will give the reader some notion of the magnificence of this rare plant, which lately flowered in the garden of the Horticultural Society, from specimens sent from Guatemala by Mr. Hartweg. Or it may be compared, for the flowers, to a huge Cattleya. It is one of the terrestrial species, and apparently easy enough to cultivate in a cool stove; but it is at present in few collections, no one liking to divide the roots until something more shall have been heard of its habits. It is stated by Mr. Skinner that each flower-head will go on blossoming for many weeks successively, provided the faded blooms are pulled off before they decay.—*Bot. Reg.*

Mormodes luxatum. Distorted Mormodes. (*Stove Epiphyte.*) Orchidáceæ. Gynándria Monándria.—This extraordinary plant, collected near Mexico, has lately flowered with G. Barker, Esq. It is of large size, of a stately habit, with a very delicious fragrance, although powerful, but with no brilliant colours to render it what *we* call handsome. Its flowers are 3 inches in diameter, pale lemon-colour, fleshy, rather globular, but so distorted by the complete dislocation of all the parts, that it would be difficult to ascertain their real nature, if it were not for the token given by the labellum. The latter has a deep brown streak drawn down its middle, and covers over the column like a hood. The leaves of this plant are about 3ft. long, narrow, deep green, with a very fine glaucous bloom upon their under side. It is worthy to be associated with even Sobrália macrantha in the choicest of all collections of these plants.—*Bot. Reg.*

Dendróbium Scopa. Broom-like Dendrobium. (*Stove Epiphyte.*) Orchidáceæ. Gynándria Monándria.—A very singular but not handsome species from Manilla, which flowered a short time since in Messrs. Loddiges' collèction. The stems are erect, about a foot high, stiff, and strong. The leaves are from five to six inches long, and two and a half broad. The flowers are small, whitish, in axillary fasciculi. Their lip is very curious, being broken up at the point into a kind of broom, consisting of long entangled curling threads.—*Bot. Reg.*

MISCELLANEOUS.

Charcoal.—Some experiments upon the growth of plants in charcoal have been lately made. Mr. Feast had quite a collection of Orchidàceæ; and as none of them had thriven very well, it occurred to him that he might make use of the charcoal with good effect. The whole of the plants were consequently repotted in a mixture of peat and charcoal: this was done in June or July, and when we saw them in August, many of the plants were throwing out new roots with much vigour. The charcoal seems to act as a conductor and retainer of heat, and, by keeping the soil light and open, facilitates the rooting of the plants. Mr. Feast has also tried charcoal in rooting plants from cuttings, and has succeeded in growing in this way Herbemot's Musk Cluster Rose, which he has been unable to multiply by cuttings, in the ordinary way. Combrètum purpùreum, a plant not easily increased, was speedily rooted in charcoal. We would recommend further experiments to be made, as we are convinced the system is attended with excellent results.—*Hovey's Magazine.*

Treatment of the Poplar in Ladakh.—The Poplars which, along with Willows, are planted about every village in Ladakh, are sometimes the Lombardy, but more frequently the Black Poplar. They are in very insufficient numbers for the wants of ordinary consumption, as the plantations are not allowed to encroach upon the cultivation of corn. The supposed deficiency of surface for timber has suggested an expedient for the multiplication of the produce of wood, which is ingenious and successful. When a Poplar, at about five feet from the ground, has attained a diameter of five or six inches, it is headed down; the summit of the stool, just below the cut surface, is girded by a Willow withe four or five times so tightly, as to become slightly imbedded in the bark, and the top is covered with a thick lump of clay. Shortly after this, a crop of shoots rises from the whole circumference of the bark of the tree, which is thinned to the number which it is supposed will thrive. These, also, as they reach a sufficient growth are removed, and repeated crops of Poplar staves are in this manner obtained.—*Moorcroft's Travels*, vol. i., p. 308.

Ipomœa Quamoclit.—In the garden of Dr. J. S. Gunnell, of Washington, the following method of growing the Cypress Vine, or Ipomœa Quamoclit, is adopted. The plants are sown in a circle about three feet in diameter; in the centre of the circle, a large tall stake is placed, twelve feet or more high; at the root of each plant is a forked peg, made of stout twigs of trees; to each of these a strong piece of twine is attached, which is carried to the top of the stake, and there made fast to the edge of a smaller circle, about six inches in diameter. When the Vines reach the top of the stake, they wreathe their branches from one string to another, and form a complete pyramid of delicate foliage, interlaced with brilliant crimson starry blossoms. Every one who possesses a garden may have it in equal perfection, by sowing the seeds in April in a hot-bed, or in May in the open garden, and by transplanting into circles, when it is desirable to form a pyramid, as here described. Thunbergia alata, a. alba, and a. aurantiaca, may also be treated in the same manner, though not with equal effect; the foliage of the latter in no way comparing with the Cypress Vine; but the mixture of large buff, deep orange, and pure white flowers, would form a galaxy of beauty which would be admired by all lovers of flowers.—*Hovey's Magazine.*

Blue Tropæolum.—We understand that roots of this fine plant have at length reached England, alive, and are in the hands of a nurseryman. The flowers appear, from the dried specimens we have seen, to be as blue as those of a Siberian Larkspur: the species is *Tropæ'olum azúreum.*

GARDEN MEMORANDA.

Bagshot Park.—The gardens and pleasure-grounds of her Royal Highness the Duchess of Gloucester have been tastefully laid out, and are now in excellent order. There is nothing to be seen of that littleness of conception—that working out without a plan—which too often mars the beauty of such a place as this. The site of the flower-gardens appears to have been originally part of the extensive plantations which environ the park, and now consists of a series of gardens, interspersed and surrounded with specimens of noble trees. One general plan seems to pervade the whole, by which each individual part harmonises with the rest. There is one thing in particular which deserves to be noticed in the general plan, which is, that there is no attempt made to have flowers in all parts of the grounds. If that peculiar taste had been approved of here which must have clumps of shrubs faced with autumn-flowering plants, such as Verbenas and Pelargoniums—which can see no beauty in a garden unless it is one mixture of glaring colours, the grand effect of the whole would have been spoiled. Such, however, is not the case. The eye is made to rest with pleasure in one place on green grass and fine-spreading trees, and in another on a wide space of gorgeous flowers. Besides the more common kinds of trees, some of which have grown to a large size, there are fine-spreading specimens of the Hemlock Spruce (Abies canadensis), and Deciduous Cypress, at least 50 ft. high. The Indian Cedar (Deodar), and certainly one of the finest specimens of the Cunninghámia lanceolata in this country, also ornament the grounds; the latter stands the winter without protection of any kind, and seems to be quite as hardy as Araucária Dombeyi. The series of gardens or open spaces in the pleasure-grounds have each a different character; one is filled with the most ornamental kinds of Herbaceous plants, and in the centre of it stands a good specimen of the Glycine sinensis, trained on trellis-work, and flowering abundantly every year. Another is a Rose garden, having an elegant temple, covered with the climbing varieties, in the centre; and a third is filled with Verbenas and plants of that description. The American garden is larger and even more beautiful than any of these: here thousands of Azáleas, Kálmias, Rhododendrons, and other things of that kind, flourish, and must be far more beautiful than they can be even in their native soil. A terrace-walk has been raised along one side of the American garden, from which a good view is obtained over the whole. In the earlier part of the summer, when the plants are in full bloom, the scene must be of the most enchanting description. Another open space, which may well be called the Garden of Baskets, presents at the present time a striking and novel appearance. This is in front of a summer-house, amongst some fine old trees. A group is formed of baskets of different shapes and sizes, filled with summer-flowering things, such as scarlet Pelargóniums, and make, in the situation in which they are placed, a fine foreground to a beautiful picture. If it had been fashionable for flowers to go in gipsy parties like the higher orders of the creation, most assuredly this would be taken for a camp of such wanderers. Mr. Toward has a method of clumping scarlet Pelargóniums which is particularly worthy of being generally known and adopted. In autumn, instead of cutting down all his plants, some are left of different heights, so that when planted in a small round clump in the following season they form an irregular cone. The tallest are about 3 or 4 ft. high, and are planted in the centre, and surrounded with others which fall gradually to the outside, the outer row being as dwarf as possible. At this season the whole have the appearance of one plant in full bloom, and look extremely well. The variety which Mr. Toward uses for this purpose is called Compactum. All who have visited Bagshot Park have admired the summer seats which are erected in different parts of the garden; they are specimens of neatness and taste which have never been excelled, but which it is next to impossible to describe. The whole are substantial, and, what is perhaps better, they are comfortable resting-places; an example which ought to be followed by those who are often at great pains to make rustic seats, in character as they imagine, but which are not made to sit upon. The greenhouses in the flower-garden, and the conservatory at the house, are very gay with flowers, including some of the original species of Fuchsias, such as F. coccinea, which one so seldom sees in collections now. There is a new hybrid variety called F. delicata which is very handsome. Achimenes longiflora is also finely in flower, and promises to go on flowering for some time to come. Many of the Pines in the kitchen-garden are throwing up fine fruit, and all are clean and healthy; the same may be said of the Vines and Peach-trees. As the Red Spider has been very injurious to the latter in many gardens this summer, Mr. Toward thinks his has been saved by the efficacy of a sulphur-wash, which he applies every spring. In many parts of the garden, and also in the woods, self-sown Rhododendrons are coming up as thickly as they do under the greatest care in seed-pans.—*R. F.*

Mr. Groom's Nursery, Clapham Rise.—We have just been gratified with a sight of Mr. Groom's extensive and well-cultivated collection of Lílium lancifólium and its varieties—punctatum, rubrum, and speciosum. Scarcely anything can be imagined more beautiful than some of the specimens of the two latter varieties; in both of them the flowers are of a rich mulberry colour, which becomes gradually lighter towards the edges and tips of the petals; the whole being studded with glands and spots of a much deeper colour. In fact, the only difference between the two appears to lie in the leaves of L. speciosum being curled, whereas those of L. rubrum are perfectly flat. We observed a single stem of the latter, with 21 flowers upon it; many of the flower-stems branching out and producing two and even three blossoms upon each; a circumstance which does not occur so often either in L. lancifólium or punctatum. To give some idea of Mr. Groom's successful management of this splendid tribe, we need only mention that one specimen is loaded with no less than 38 blooms. We doubt not but they will soon become more generally cultivated, as they flower at a season when there is little else to enliven the greenhouse or conservatory; while by keeping the plants out in the open air, and shading them when in bloom, they may be preserved in perfection until the middle or latter part of September, when most of the higher classes have retired to their country seats, and when the gardener is more particularly desirous that all under his charge should assume as gay an appearance as possible. Mr. Groom has also a flourishing stock of the handsome Rigidella flámmula.—*R. A., Aug.* 29.

Rebiews.

Remarks on the Management, or rather the Mis-*Management, of Woods, Plantations, and Hedge-row Timber.* By J. West. 8vo. Perfect, Newark; Longman, London.

This is exactly what its title sets forth; that is to say, an exposure of the mis-management of timber, and not an explanation of the right mode of treating it. The author is unsparing in his censure of the proceedings of landlords, land-agents, woodmen, foresters, and all owners, occupiers, or overseers of woodland property, whether ancient, planted, or in hedge-rows: he sees nothing but blunders in all that they do, an ignorance of the principles on which it should be managed, or a neglect of their interest, or an indifference to it, which is quite lamentable: he points out at every page the mischief of bad draining, bad pruning, bad planting, bad thinning, and bad felling, which, he says, involves English property in hedge-row timber almost to the extent of a hundred millions sterling.

So far as the exposure of mis-management is concerned we have no fault to find; on the contrary, we agree with Mr. West in most, though not all, that he alleges. But when we look for the remedies proposed by him, we seek almost in vain. What information he gives upon that subject is scanty, and sometimes leaves his reader as much in the dark as ever. Not that he does not occasionally give his advice; and when he does so, it is so judicious that we should be glad to know more of his plans; but this forms but a small part of his book. It would seem, indeed, as if the author were of opinion that general rules can rarely be laid down advantageously, and that in each case what should be done is to be determined by its own peculiar circumstances. At least, such is the conclusion at which we have arrived after a careful perusal of the work. For example, in speaking of ancient woods, we have the following statement:

> "It will at once be perceived, by a practical eye and a sound judgment, whether a wood is in such a state, as to the prospect of a crop, that it is the proprietor's interest to make a sacrifice in the underwood and cut it, although it may sell for nothing but faggots, rather than finish, or run out, the term, at the end of which it would be cut in the usual course. I have seen hundreds of such cases: there are many in almost every neighbourhood where woods exist at all; and I confidently ask, what would be the use, or how would it be possible to show the propriety, of completing the term of the cycle, if, first, the wood contained nothing valuable as underwood; and if, secondly, it contained a considerable portion of timber that required immediate attention, on some account or other? I should, for instance, instantly determine to cut where I found a wood crowded with a class of unhealthy oaks, or other timber: but it is not necessary to particularise, as I would not pretend to give such directions here as would enable a gentleman to decide, for that could only be done after inspection. So many points have to be considered, that a careful survey of a wood must be made. This done, fortunately there is no difficulty in coming o a correct conclusion upon such a question as this. A practical man, who understands what he is about, will be in no danger of committing an error in the decision to which he will be led, for these are not subjects on which a difference of opinion might naturally arise upon an examination taken. The various considerations for cutting, or forbearing to cut, would so certainly present themselves to the mind of a person really competent to judge, that I should say there would be no doubt whatever of his deciding correctly, if he were not interfered with by the personal wish, or taste, of his employer. It is with this as with most other subjects:—wherever men understand what they are about, and are guided and governed by fixed principles, matters go on well; but the misfortune with regard to woods is, that ages of 'mis-management,' and other causes, interpose obstacles and difficulties which it will be no slight task to overcome. To give a brief summary of my views upon this important point, I would remark, that no wood ought to be allowed to run out its term which is not stocked as it ought to be, or which, if stocked tolerably well, is suffering injury from imperfect drainage. As I have just said, these points must be determined by an examination of the wood by some person whose judgment may be relied upon; but any gentleman may see at once, if he will, that if a wood is really in the state which I have supposed, viz., without either timber or underwood worth standing, &c., it would be perfectly absurd to let it stand; for at the end of the cycle it would be very little better than at the beginning, and so much more time would be irrecoverably lost."

Now in this it is difficult for the reader to apprehend exactly what he should do; and he feels that after the most careful consideration of the advice that is given him, it is requisite to consult Mr. West himself about it.

However, there is a great deal in the book that is worth the attention of country gentlemen, to whose perusal we recommend it. We shall probably return to it again.

CALENDAR OF OPERATIONS *for the ensuing week.*

With the exception of a few favoured localities which have been visited by occasional showers, the present season has been extremely unpropitious to vegetation, more especially in the kitchen-garden department. Not only has the produce of late crops of Peas, Beans, Cauliflowers, and almost all other vegetables which generally are plentiful in the end of summer, been unusually scanty, but the extreme dryness of the soil has been unfavourable to the germination, and the weather to the after-growth, of those seeds which are commonly sown in autumn for the production of spring crops. The late rains appear to have been more general, and the ground being in better condition in consequence, we advise an additional sowing to be made of such articles as are likely to be most in demand in the spring months. Onions especially should not be lost sight of; for as in many gardens these have partially failed, the Tripoli variety, sown now, will come in useful early in summer, after the dried stock is exhausted.

I.—KITCHEN-GARDEN AND ORCHARD.

In-door Department.

Pinery.—The plants that were first potted will now be growing rapidly, and less shade and more air will be advantageous to them. Keep in mind the directions formerly given respecting bottom-heat and water. As these are most essential points in Pine-apple culture, we deem it advisable frequently to direct attention to them. A sufficient quantity of dung should be prepared by turning, and watering if necessary, to make linings to all pits that are heated by such means. Fresh dung will not be necessary, while the bark-bed retains a brisk heat; but when that is found to decline, immediately renew the lining either at the back or the front of the pit, but not both at one time. These plants will require but little water at the root, if daily dewings with a syringe are given.

Vinery.—The early forced Vines may now be pruned. Long-spur, short-spur, and long-rod training have each their advocates among cultivators; but whatever system may be adopted, to prune Vines *well* the knife must be used freely. From the strength of the Vine it can be estimated how many bunches it is competent to bear next season, and the young wood should be regulated accordingly. In spur training, when a shoot has been produced near the base of the spur, the latter ought to be cut off and the young growth retained to supply its place. If this is not done, the spurs will in time acquire an unseemly length.

Peach-House.—The second house should be treated as recommended at p. 528. In this fine season, the young wood in the late house will scarcely require artificial assistance to mature it, except in cold northern districts, where either glass or fluid walls are necessary to ripen the general crop; nevertheless, the trees ought not to be openly exposed to cold nights and rough weather, so as to damage the foliage while it is in active operation.

Fig-House.—Where there is a second crop yet to ripen, the same attention in watering, giving air, &c., should be paid to the house as heretofore.

Cucumbers and Melons.—Great attention must be paid to Cucumber plants in pots, which are intended to fruit in the winter and spring months in Pine-stoves or elsewhere, as success depends in a considerable degree upon the manner in which they are reared. Place them near the glass, and let them have air at every fitting time, to induce a short-jointed, stocky growth. Some of the forwardest are, perhaps, large enough for removal to their fruiting-pots, in which they should be planted deeply, to allow room for top-dressing. When Melon plants are watered or sprinkled, it should be done in the morning, that the leaves may dry before night, it being now cool and damp at that time.

Out-door Department.

Cabbages.—Continue to put out as the plants become large enough. If those sown in the end of July are planted one foot apart in the rows, every other plant might be cut for Coleworts, and the rest will form heads early in spring.

Cardoons.—If not yet done, those from the first sowing should be tied up with hay-bands, and afterwards earthed at once to the required height.

Celery.—If any plants still remain in the nursery-bed, they may be turned to good account by planting them any time during this month, on dry ground, so deeply that the leafstalks are covered with mould. This planting will furnish the latest crop next spring.

Leeks.—The forwardest may have a little earth drawn round the stems.

Lettuce.—Cos should be tied up once every week or ten days, regulating the number by the consumption.

Onions.—Take the earliest opportunity to house them when dry enough, for a good soaking of rain materially affects their keeping, which is a matter of great consequence. One, and perhaps the best, method of storing Onions for winter preservation, is that familiarly known by the term "tracing," which is done by tying them one above another to a straight stick, or a handful of straw. If previously sorted into sizes of large, middle, and small, any particular kind can be obtained when wanted, without loss of time. Inferior ones should be laid aside for present use.

Orchard.—The Red Spider is very prevalent this season upon Peach and Nectarine trees; the use of the engine should therefore be resumed as soon as the fruit is gathered. Late sorts, in cold situations, may not yet be so near maturity as to make washing prejudicial to the fruit. If wasps continue troublesome, suspend bottles about the trees in the way directed last week for Grapes. New plantations of Strawberries may now be made, if necessary. The present year's bearing wood, and any useless canes, should be cut away from Raspberry-trees, which will be considerably strengthened thereby. Pears which only keep a short time ought to be gathered before they get too ripe; but the late varieties require to be well matured upon the trees.

II.—FLOWER-GARDEN AND SHRUBBERY.

In-door Department.

Stove.—Finish all alterations and get the plants back to their winter-quarters as soon as possible, for the air is now getting cold. The shades for the orchidaceous house must be used less frequently, and only during very bright days, otherwise they will do more harm than good. A wooden house, with common stove plants, will not require any more shade this autumn unless the weather becomes very hot again. The air of the house need not be made so damp, and many of the plants will now require less water.

Greenhouse and Conservatory.—All plants that are likely to suffer from exposure to a slight degree of cold, or to wet, should no longer be risked out of doors; for in our uncertain climate, a low night temperature, or even actual frost, may now be expected. The pots should be washed, the soil top-dressed, and the plants neatly trimmed and tied before they are taken into the house. Pay attention to the newly-potted Pelargóniums; these must be sparingly watered, and kept rather warm till they begin to grow. The tuberous Tropæ'olums are probably beginning to shoot again; if so, they should be potted in small pots, and the delicate stems carefully tied to sticks; be cautious also in watering them.

Pits and Frames.—The time being at hand for housing tender plants, all other necessary work should be hastened. If not yet done, therefore, cuttings must be immediately put in of the plants intended for bedding out. Propagate Calceolárias by their rooted offsets, which, with any that may have been previously taken off, must be very sparingly watered. Soft-wooded plants for blooming late should be transferred to their blooming-pots, if it has not already been done. Fúchsia cuttings put in now will make fine blooming plants next season. Cuttings of single Caméllias should likewise be potted.

Out-door Department.

Presuming that the directions heretofore given have been followed, there will be little now to be done in this department except the requisite attention to mowing, sweeping, and other operations conducive to neatness. In the reserve ground, transplant into nursery rows the young Pinks which have been struck this season. Sweet-Williams, Hollyhocks, and other biennials or perennials, will be greatly strengthened if similarly treated. Sow thinly, in a dry place, some showy sorts of hardy annuals, to be removed to the flower-garden.

NURSERY AND FOREST DEPARTMENT.

Nursery.—Whenever the ground is sufficiently moist, proceed with the propagation of Laurels, and other evergreens, by cuttings and layers. Late-budded stocks will now require untying.

Forest and Coppice Woods.—Autumn is the best season for planting on all soils which are not naturally wet and incapable of being drained. Where there is much to be done, Evergreens may be proceeded with directly, provided the late rains have penetrated far enough into the ground to moisten it.—*J. B. Whiting, The Deepdene.*

State of the Weather near London for the Week ending Sept. 1, 1842, as observed at the Horticultural Garden, Chiswick.

August	Barometer.		Thermometer.			Wind.	Rain.
	Max.	Min.	Max.	Min.	Mean.		
Friday 26	29.916	29.818	69	56	63.0	E.

The highest temperature during the above period occurred on the 7th, in 1835—thermometer 80°; and the lowest on the 10th, in 1838—thermometer 34°.

REPORT ON COVENT GARDEN MARKET,

For the week ending Sept. 2, 1842.

The market has been well supplied with fruit and vegetables during the past week; but trade is far from being brisk. *Fruit:* Pines are tolerably abundant, and consist principally of Queens, from 3*s.* to 5*s.* per lb. Grapes and Melons have not varied in price since our last report. Peaches and Nectarines are cheaper even than they were last week; their flavour is good, although many of them are small in consequence of the long drought. Apricots are no longer to be met with. The dessert Plums are chiefly confined to Green Gages, which are far from being so plentiful as they were; but Damsons and other plums for preserving and culinary purposes are unusually abundant: Damsons fetch from 1*s.* 6*d.* to 2*s.* per half-sieve. English Figs appear to be good and are selling from 1*s.* to 3*s.* per doz. There has been little alteration in the price of Apples for several weeks; the culinary kinds are very cheap, many samples of Hawthornden not fetching more than from 1*s.* 6*d.* to 2*s.* per bushel. A few Autumnal Bergamot Pears have made their appearance, from 3*s.* to 4*s.* per bushel: Jargonelles fetch from 3*s.* to 6*s.*, and William's Bon Chrétien from 2*s.* to 4*s.* per bushel. Filberts sell from 40*s.* to 75*s.* per 100 lbs. Natural Cucumbers are abundant, and sell from 6*d.* to 9*d.* per dozen: but the frame fruit fetch from 3*s.* to 4*s.* per dozen. *Vegetables:* Cauliflowers are becoming rather scarce, and are selling from 4*s.* to 6*s.* per doz. Broccoli have been in the market for several weeks, but the samples offered have not been good. Cabbages are plentiful, from 9*d.* to 1*s.* 3*d.* per dozen; and Coleworts, from 2*s.* to 2*s.* 6*d.* per dozen bunches. A few Peas are still to be obtained, but at the high price of 5*s.* and 6*s.* per sieve. Turnips are abundant, but their quality is not good from want of rain. Carrots appear to be better, and fetch from 3*s.* to 5*s.* per dozen bunches. We observed some tolerably fair samples of Red Celery, from 1*s.* 3*d.* to 1*s.* 6*d.* per bundle; the white is far from being so fine, and is selling from 9*d.* to 1*s.* per bundle. The Beet of this year's growth is good, and is selling from 1*s.* to 1*s.* 6*d.* per dozen. Tomatoes are abundant, of a large size, from 1s. 6d. to 2s. 6d. per half sieve. Field Mushrooms are rather plentiful, and fetch from 4s. 6d. to 5s. per bushel: those of in-door growth, from 1s. 6d. to 1s. 9d. per pottle. *Flowers:* Amongst the Cut Flowers are, Trevirana coccínea, Siphocámpylus bícolor, Passifloras, Bignónias, Alstrœmérias, and Amaryllises.

PRICES, SATURDAY, SEPT. 3, 1842.—FRUITS:—

Pine Apple, per lb. 3s to 6s
Grapes, per pound, 1s to 3s
— Muscats, per pound, 2s to 4s
— Spanish 1s to 1s 6d
— Portugal 1s
Melons, English, each, 1s to 3s
— Dutch, 6d to 1s 6d
Peaches, per doz. 6d to 3s
Nectarines, per doz., 6d to 3s
Figs, per doz., 1s to 3s
Plums, dessert, per hf. sieve, 2s 6d to 5s
Damsons, per hf. sieve, 2s 6d to 3s
Greengages, per punnet, 1s 6d to 2s
— Baking, per hf.-sv., 3s 6d to 8s
Pears, dessert, per hf. sieve, 2s to 5s
Apples, dessert, per bush., 2s 6d to 7s

Crabs, Siberian, per hf.-siv., 2s to 2s 6d
Cherries, Morello, per lb. 6d to 1s 6d
Mulberries, per gallon, 8d to 10d
Cucumbers, per doz., 6d to 4s
Oranges, per doz., 1s to 2s 6d
— per 100, 6s to 16s
Lemons, per doz. 1s to 3s
— per 100, 10s to 18s
Almonds, per peck, 7s
Sweet Almonds, per pound, 2s
Filberts, English, per 100 lbs. 50s to 65s
Walnuts, per bushel, 16s to 24s
Nuts, per bushel—
— Brazil, 20s
— Barcelona, 24s

VEGETABLES.

Cabbage, per doz. 9d to 1s 3d
— plants, per doz. 2s to 2s 6d
Broccoli, per bunch, 9d to 1s 3d
Cauliflowers, per doz., 4s to 6s
Peas, per sieve, 5s to 6s
Beans, Kidney, per hf. sv., 2s to 3s
— Scarlet, per hf.-sv. 1s 3d to 1s 6d
Potatoes, per ton, 50s to 80s
— per cwt. 2s 6d to 4s
— per bushel, 1s 6d to 1s 9d
— Kidney, per bu., 2s to 2s 6d
Artichokes, per doz., 2s to 3s
Turnips, per doz bun., 2s to 2s 6d
Carrots, per doz. bunch, 3s to 5s
Red Beet, per dozen, 1s to 1s 6d
Horse Radish, per bundle, 1s 6d to 5s
Radish, per doz. hands (24 to 30 each) 9d to 1s 6d
— Turnip, p. doz. bch., 9d to 1s 6d
Onions, per doz. bch., 3s 6d to 4s
— Green, p. doz. bun. 3s to 3s 6d
— Spanish, per doz. 1s to 3s

Spinach, per sieve, 2s to 2s 6d
Chives, per bunch, 3d to 4d
Leeks, per doz. bun., 3s to 4s
Garlic, per lb. 4d to 6d
Shallots, per lb., 9d to 1s
Lettuce, Cabbage, p. sc., 1s to 1s 3d
— Cos, 1s 3d to 1s 6d
Endive, per score, 1s 6d to 2s
Celery, per bd., (12 to 15), 1s to 1s 6d
Small Salads, per punnet, 2d to 3d
Watercress, per doz. sm. bun. 4d to 6d
Parsley, per doz. bunch., 2s to 2s 6d
Tarragon, per doz. bun., 2s to 3s
Mint, per doz. bunches, 2s to 2s 6d
Basil, per doz. bunches, 2s to 3s
Vegetable Marrow, per doz., 6d to 8d
Tomatoes, per hf. sv. 1s 6d to 2s 6d
Capsicums, green, per 100, 1s to 2s 6d
— Ripe, per doz., 6d to 1s 3d
Mushrooms, per pottle, 1s 6d to 1s 9d
— Field, per bus., 5s

Notices to Correspondents.

MR. PAXTON'S COTTAGER'S CALENDAR is now reprinted in the form of a small volume, for general distribution, price 3d. each copy; it may be ordered of all Booksellers. Gentlemen wishing to distribute copies among their cottage tenantry may have them *delivered in any part of London* by remitting a Post-office order to this Office, at the rate of 5s. for every 25 copies required.

Tenby.—ASPARAGUS BEDS should be formed about 3½ ft. in width, with alleys 2 ft. wide between them, and require no particular preparation beyond a previous good trenching. Instead of procuring young plants, let Asparagus seed be sown in March, in drills 18 in. apart, and 2 in. deep. When the plants are 6 in. high, they should be thinned to about 1 ft. apart; and in the following spring a layer of rich or stimulating manure, a few inches thick, should be spread over the bed, and dug in lightly when the plants have done growing in the autumn. During the growing season the beds should be copiously watered with salt and water, or salt should be strewed over the beds, the particles of which will be carried down to the roots by heavy rains and frequent waterings. In the third spring from the time of sowing, the Asparagus will be fit to cut; but previously to cutting, the bed should be covered very lightly with dead leaves to the depth of 8 in. In the autumn, these leaves should be removed, and another dressing of rich manure should be applied; and these operations should be repeated every season. We have no doubt that sea-sand would be of great value in mixing with the soil; and where irrigation is practicable, it should on no account be neglected.—‡

If *G. H.*, who sent specimens of the Green Pine Apple Strawberry to the *Gardeners' Chronicle* office a fortnight since, has any runners to spare, and will communicate his address, he would oblige a subscriber.

A Malholm Cove.—Your plant is Adésmia microphylla.—†

Ilex.—Your plants are, 1 and 2, Pharbitis híspida; 3, Silene quinquevúlnera.—†

J. H. O.—We cannot undertake to name plants, unless the flowers of each are sent as well as the leaves. One of those sent is Eleusine índica; and another seems to be Erýsimum Perofskianum.—†

Ignoramus is referred to one of the leading articles in this day's paper.—‡

Cadwallader.—Your plants are, 1, the long-flowered Marvel of Peru; 2, the soft Acanthus.—†

G. H. C.—If you have a Greenhouse in which, after they have acquired sufficient strength to be potted off singly, you can protect your seedling CINERARIAS during winter, we would recommend you to sow the seed immediately; by doing which, you will save at least six months. If, however, you have only a *cold frame* wherein to preserve them, you had better defer sowing the seed until the spring.—‡

C. O.—The best time to FELL all kinds of timber trees is the beginning of winter, because at that time the wood is driest. The worst time is when the sap is rising in the spring, for at that time the wood is wettest. If, however, you want the bark, you must strip that when it will run.—†

L.—Those papers on Timber are really too absurd. We cannot conduct an argument with people when there is no common ground to stand upon. How silly to talk about "vegetable membrane" in connexion with the growth of timber! When the bones, and the fat, and the flesh of an ox are growing, do people say it happens by the increment of animal membrane? Nonsense.—†

An Exonian.—When FIGS do not bear, and are in good health, cut a trench round them, near enough to divide some of the main roots, and fill it up again with old mortar, broken bricks, or any similar rubbish. It is not desirable to take off their leaves when ripening.—†

A Willing Subscriber can obtain all the STRAWBERRY plants he inquires about of any respectable Nurseryman. The Swainstone is rather acid, but is a good useful sort. The PEAR with crimson flesh is the "Sanguine;" it is not decayed; it is only "bletted"—that is to say, it is in the state of a Medlar, and is now fit for eating by those who like it.—†

T. Cowan.—Your plant is Oncídium ramosum, sometimes called O. Batemannianum.—†

A Constant Reader shall have the explanation he asks for, in a leading article, ere long. We cannot give him a *good* answer without going into considerable detail.—†

Mr. Harrison's BEAN-STALK appears to be an instance of a flower, and consequently its bean, having been formed under ground. This propensity is habitual in some plants allied to the Bean, such as the Arachis and Voandzeia, but we never heard of it before in the Bean itself. It also occurs in some Violets, Trefoils, and certain other plants. The specimen which Mr. H. has so obligingly sent is very curious.—†

A. E.—Your PLANT seems a mere variety of the common Convolvulus major. When the roots of fruit-trees throw up SUCKERS, it is generally a sign of the soil being ill drained, or the roots planted too deep. Suckers do no harm if you keep them well hoed down.—†

Servant.—The back numbers cannot be had, unless by accident.—†

Weaver.—One of the Aconites you sent is A. variegatum. We really must decline the labour of NAMING your species of Phlox, Veronica, Aster, Aconitum, &c. It can only be done by persons of *much* leisure—we are persons of *no* leisure.—†

Tyro's plants are: 1, Hermánnia hyssopifólia; 2, Státice oleæfólia; 3, Cynanchum Vincetóxicum; 4, Arenária grandiflora; 5, Agératum conyzoides; 6, an Inula. According to *common* sense upwards of 50 signifies more than 50; perhaps your friend is a person of *uncommon* sense.—†

J. S. H.—Your Carnation and Picotee are not uncommon; they are both good border varieties, and are much esteemed by our Continental neighbours. They were probably raised from imported seeds.—*

R. Aldridge.—Your DAHLIA is a beautiful flower: its properties are good, and its colour is agreeable; but we fear its size will prevent it from becoming a show flower.—*

Watson, Suffolk.—Your DAHLIA was unfortunately crushed. The colour and shape of the petal are good; but we cannot form an opinion of the centre, or general appearance of the flower. We should feel obliged by your sending another bloom.—*

Smith and Co., Hackney.—Your crimson purple DAHLIA (Sir R. Sale) is a flower of first-rate properties, fine general form, centre well up, with great depth of petals. In the Duke of Wellington, rich scarlet crimson, the centre is full, although a little depressed, and the petals well arranged: it is a desirable flower, and rich in colour.—*

S. H.—For productiveness and good quality, perhaps no better variety of POTATO could be named, to succeed the Ash-leaved Kidney, than the Early Manly; but it is round. If, as a matter of fancy, Kidney-shaped, or long, tubers are preferred, the Lady's Finger may be selected. Should this not be palatable to some, on account of its being too floury, recourse may be had to Knight's Yellow Kidney. Knight's No. 6 is a very dwarf early Kidney, but small, and only to be recommended for frames. His No. 2 possesses a good deal of the character of the Early Manly.—‖

Gerard will be able to obtain the information which he requires concerning the LABOURER'S FRIEND SOCIETY, at 19, Exeter Hall.—‡

A Correspondent is desirous of ascertaining the weight of the heaviest head of CELERY which has been exhibited at any horticultural meeting; also the name of the grower, with the date of the exhibition. Can any of our correspondents furnish us with the desired information?

A Lover of the Dahlia.—The best remedy with which we are acquainted for driving away THRIPS from Dahlias, is to dust the upper part of the plants lightly over with sulphur, or Scotch snuff.—‡

P. M.—Your Rose is Rosa laxa.—†

A. N.—You will find an account of the treatment necessary to raise CONIFEROUS PLANTS FROM SEEDS, at p. 83 of this year's *Chronicle.*—‡

An Amateur.—Both KENYON'S AND MILLS'S CUCUMBERS are recommended for winter forcing: but there are few better for that purpose than the Sion House Cucumber. Long-fruited kinds should never be cultivated for winter use.—‡

J. Sutton.—The name of your Apple is not known; but it is probably the Early Harvest.—‖

C. B. t.—The following are large FLOWERING SHRUBS OR TREES, which will succeed very well in a chalky soil near London:—Scarlet flowering Hawthorn, Laburnum, the Bird Cherry, Double-flowering Cherry, Snowy Mespilus, Almond, Æsculus cárnea, and the Guelder Rose. For an answer concerning VERBENAS, we refer you to our Amateur's Garden of to-day. Campánula frágilis hirsuta is a frame plant, very dwarf, and blooms freely; the colour is a light blue.—§

An Essex Subscriber.—The Plum you sent is Lucombe's Nonesuch; it is a good bearer, and is allied to the Green Gage, being superior to it in point of size, but not equal to it in flavour.—‖

Leicester.—No doubt your SÓLLYA HETEROPHYLLA requires to be repotted; previously to doing which, we would recommend you to cut it down, so as to leave only a few of the strongest shoots, which generally spring from the base. It should be potted in sandy peat or heath mould, with a slight addition of loam, and plenty of drainage. It is rather a difficult plant to propagate by cuttings, and may be increased more readily by seeds. We do not imagine that the reason why your CACTI have not flowered is owing to bottom heat never having been applied to them; it is more probable that, as you grow them at a window, they are not sufficiently exposed to the sun's rays during the summer months, which is very essential to their well-doing.—‡

P. R. W.—Your plants are Tórilis anthriscus, A'triplex angustifólia, Lemna polyrrhiza, and Ranúnculus aquátilis.—‡

A Young Botanist.—The plant is Ceanothus azúreus, and belongs to the natural order Rhamnáceæ.—‡

A Constant Reader.—The plants sent are:—1, Fúnkia subcordata; 2, Erica verticillata; 3, Róchea falcata; 4, Hypéricum elatum; 5, Rudbéckia hirta; 6, Agératum cœlestinum; 7, Sedum Teléphium.—‡

Gamma.—Bignónia venusta *is* a stove plant. Flowers of it may be seen at Mrs. Johnstone's, Covent-garden Market.—‡

C. G. A.—Your Orchidaceous plants are Epidendrum ciliare and Maxillária vitellina —†

T. S. P.—You should compel your heaps of WEEDS to ferment, and then the seeds will be destroyed. This may be done by adding gas-water to them, or by mixing them with stable litter. Or you may dry and burn them; their ashes are almost as useful as their decayed stems. If you will water your terrace with a strong solution of BLUE VITRIOL, you will destroy the greenness you complain of; salt produces the same effect, but moss is apt to grow again after a time; gas-water will also destroy the moss, if it is that which causes the greenness. The large Pea is Láthyrus grandiflorus, the smaller appears to be Pisum maritimum; No. 3 is Andrómeda polifólia; No. 4 is Andrómeda calyculata.—†

F. M.—We cannot recommend one Nurseryman in preference to another. POTENTILLAS should be divided either in the autumn, after the flower-stems have died down, or early in the spring before they begin to shoot afresh. The reason why your Vines do not bear fruit out of doors is, because the wood does not get sufficiently ripened before winter; whether the white kinds are worth preserving for out-door cultivation, is more than we can tell, unless we are made acquainted with their names. Fúchsia corymbiflora generally retains a few leaves upon the ends of the shoots during winter.—‡

Rumtitum.—Common ink is used for writing upon SPODE'S PORCELAIN TALLIES; and when the ink has become dry, a coating of Copal Varnish is applied over the whole surface, which protects the writing from the wet.—‡

Senex.—Your plants are, 1, Helianthus atrorubens; 2, an Erígeron, apparently philadélphicum. Your Pear is a very handsome specimen of the Caillot Rosat.—† ‖

T. S. P.—In general the autumn, that is to say November, is the best time for TRANSPLANTING trees of all sorts. The only exceptions are where the soil is very wet and undrained, or when the place is very windy, in which case February is to be preferred. But no soil, ill drained, ought to be planted at all with trees, and even in windy places November is the best, if *small* plants, that is plants 9 to 12 inches high, are employed, which we should recommend. When LAWN is uneven, it is customary to pare it off and relay it; but we know no reason against filling up the hollows *firmly* with good soil, and sowing a little crested Dog's-tail Grass and White Clover. JUNIPERS should have their berries gathered when ripe, kept mixed with sand in heaps all the winter, and sown in March in light soil, the berries being buried about an inch deep.—†

* *—To be sure we do not. No one is more opposed than ourselves to books which, whatever their attractions, and however disguised, are in any way immoral or irreligious. It is because of his freedom from everything of that kind that we like *Punch*, in spite of his bad jokes.—†

A Lady.—The plates in the "ICONES PLANTARUM" are not coloured. They are made from dried specimens. We can hardly judge how far they may be interesting to others, but for us they have great value. The book is very cheap.—†

P.—You cannot have a better book for determining the GENERA of plants found wild in this country, than "Baxter's British Flowering Plants."—†

H.—Some of your seeds are very interesting, but we fear they will require more heat than you can give them, and they are not very handsome. They must be raised with bottom-heat, exactly as you would raise Cucumber seeds, and treated like tender annuals, such as Balsams. Nos. 1 and 2 are the Sennas of the shops, which *we* never saw alive. No. 8 is probably the Pasha's Indigo; 5, may be the Colocynth plant; 17, is the Rose of Jericho, concerning which you will find many remarks at p. 363 of this year's *Chronicle;* 21, is the Balsam Apple, a well-known tropical plant of the Cucurbitaceous order, with handsome warted bright orange fruit, but with no beauty in the flowers. It is scarcely advisable to sow the seeds before the spring, if they are in good condition; because they are generally soft and difficult to keep over the winter. Nos. 7, 10, 14, 16, 18, 20, and perhaps 2 or 3 more, are little better than weeds.—†

J. D., Cheltenham.—The Dahlia named Hudson's Princess Royal is a light bright buff, tipped with rosy purple; Whales' Attila, rosy lilac.—*

A. N.—The thermometers, from the indications of which the TEMPERATURE AT CHISWICK is given, are on the lawn, apart from any radiation of heat from buildings, and are attached to a post upon which they are elevated at the height of 3 feet from the ground; a parasol of painted canvas guards them from the direct rays of the sun.—

A Practitioner's paper upon budding will appear next week.—†

T. R.—BIGNÓNIA TWEEDIANA should be planted out in the border of a warm greenhouse, amongst some rich free soil; its branches require to be trained over a considerable surface near the glass. With this situation and management it will flower freely. Cereus setáceus has frequently flowered in England.—§

J. S. M.—The shoots and leaves of your Pear-tree correspond with those of Hacon's Incomparable. BONE-DUST mixed in small quantities with the soil in which Pelargóniums are potted would not, we imagine, be prejudicial to them; but we are not aware that it has ever been used for that peculiar purpose.—‖ ‡

A Constant Subscriber.—MYATT'S ELIZA STRAWBERRY is a tolerably large ovate fruit, and rather early; but it is far inferior in quality to Myatt's British Queen. It is far from being so well adapted for forcing as Keen's Seedling is.—‖

A. N. L. H.—You will find your question answered amongst the Home Correspondence in this day's paper.—‡

M. N. B.—We cannot give you better advice respecting the treatment of PINE PLANTS in winter than is contained in our weekly "Calendar of Operations." No doubt the cause of your plants turning yellow at that season is owing to the want of sufficient heat. The temperature of the pits, or houses in which they are grown, should never be allowed to fall below 50°, and the bed should be kept a few degrees above that of the house. If your stock of Pine plants does not exceed 200, you cannot afford to fruit more than 45 or 50 during the year.—‡

Æsculapius.—Three good varieties of PEARS for summer use, are the Citron des Carmes, Jargonelle, Dunmore; three to follow these may be the Fondante d'Automne, Marie Louise, and Beurré Diel; and for winter and spring, those recommended in last week's *Chronicle.* All these will succeed as open dwarfs or standards, with the exception of the Jargonelle, and it will bear well on a northern aspect. The Crassane, d'Auch, or Old Colmar, and the winter Bon Chrétien, will neither of them answer as standards; the two first are excellent upon walls with a good aspect. The Duchesse d'Angoulême, though large, is not high-flavoured when grown on a wall, but is very good from standards. The Chaumontel is only excellent in some seasons; and the same may be said of the Beurré d'Aremberg. The other varieties to which you allude are included in the above list, with the exception of the Winter Nelis, which is variable in its time of ripening, but will always prove acceptable when it does become fit for use; you will therefore doubtless find room for it, as well as for the Althorp and Winter Crassane, both raised by the late Mr. Knight. Four varieties of GRAPES for the open wall may consist of the Royal Muscadine, Grove-end Sweetwater, Black Cluster, and Black Prince. Most varieties of fruit-trees may be obtained correct from respectable nurserymen.—‖

As usual, many letters have arrived too late for answers this week.

NEWS OF THE WEEK.

THE Overland Mail from India arrived this morning, and has brought, we regret to say, very disastrous news from Affghanistan. The telegraphic despatch had already announced that the army at Jellalabad, under General Pollock, had been decimated by disease, excessive heat, scarcity of provisions, and the *Simoom;* that discontent at the state of indecision and inaction in which they were kept had spread throughout all ranks; and that the Governor-General, in this melancholy state of things, had left General Pollock to act entirely upon his own judgment. The detailed accounts received this morning do not altogether bear this unfavourable character, but they are still highly unsatisfactory. Nothing certain was known of the intentions of Lord Ellenborough, but a withdrawal was confidently spoken of. The Seikhs had shown symptoms of mutiny; and the Bala Hissar, and all its treasures, had fallen into the hands of Akbar Khan. In China no progress has been made of any decisive kind; preparations had been completed for a march upon Chapoo—but the troops, like those of Affghanistan, were weary of inaction, and had become dispirited. The Emperor was said to have taken refuge in Tartary.—In France the Regency Bill has passed the Chamber of Peers by an immense majority; the discussion on the Bill only lasted two hours, and fourteen votes only were recorded against it. The Bill received the royal assent on Tuesday, and the Chambers have been prorogued to the 9th of January.—Our Spanish news is not important: troops continue to be concentrated on the Portuguese frontier and in the Asturias, where some insurrectionary movement is anticipated.—In Lisbon the address of the Portuguese deputies, in reply to the speech from the throne, has been carried in favour of the Ministry by a large majority; but the resignation of the President in consequence of the proceedings of the opposition had complicated the affairs of the Chamber, and considerably embarrassed the movements of Government.—From Berlin we learn that the convention between Russia and Prussia for the mutual exchange of deserters has been renewed for several years, and that the military reviews on the Rhine will commence on the 12th, in the presence of a large number of distinguished visitors.—Advices from the Levant state that the Syrian question has again been brought under discussion by the English and French Ambassadors, who have been instructed to urge its immediate settlement. There seems to be no doubt that the dispute with Persia will be settled without any further demonstration of hostilities.—From the United States we have the confirmation of the advices received last week, respecting the treaties with England; the Senate has been deliberating on them with closed doors, and no doubt was felt that they would be passed without modification. The municipal authorities of New York were preparing to give Lord Ashburton a cordial reception, and they had by a unanimous vote placed at his disposal the apartments in the City Hall, usually reserved for the use of the Governor of the State.

At home, the leading point of interest is the Queen's visit to Scotland. Her Majesty and Prince Albert embarked at Woolwich on Monday in the Royal yacht. The accounts of their progress along the coast are filled with details of rejoicings in honour of her Majesty's appearance off the eastern ports. The yacht reached Aberlady Bay on Wednesday night, and the landing and progress of her Majesty to her Scottish capital were appointed to take place early on Thursday morning. The manufacturing district is not yet restored to its usual state. The mills in some towns have recommenced working, but a great body of hands remain unemployed, and there is little prospect at present of any permanent agreement on the subject of wages. In many places great distress prevails among the families of the workmen, and though the instances of open violence are few, the continuance of the strike cannot fail to lead to serious consequences.

Home News.

Court.—Her Majesty and Prince Albert embarked at Woolwich early on Monday morning, in the Royal yacht, on a visit to Scotland, attended by a numerous suite. Our Metropolitan news contains an account of the embarkation, and of her Majesty's progress along the coast. The squadron arrived at Aberlady Bay on Wednesday night, and her Majesty intended to land on Thursday morning at the Duke of Buccleuch's pier at Granton. The Prince of Wales and the Princess Royal are well, and remain at Windsor. The Duke of Saxe Coburg Gotha left the Castle on Saturday, and embarked on the same day at Woolwich on his return to Germany.

The Archbishop of Canterbury.—We are happy to state that the health of the Archbishop has somewhat improved, although the continued weakness which has come on affords ground for serious apprehension. His Grace is in his 77th year. The spasmodic cholera with which the Primate was originally attacked has not returned; but its severity was such as to leave his bodily powers in that utter state of prostration, that the best medical skill for some days was ineffectual in restoring the tone of his corporeal faculties. The following is the bulletin of yesterday:—"His Grace the Archbishop has had some hours of tranquil sleep, has taken some food, and his state, as compared with that of yesterday, is more satisfactory.—Addington Park, 2d Sept., 1842."

Gazette Announcement.—We learn by Tuesday's "Gazette" that on Saturday the 27th ult., the Queen was pleased to confer the honour of Knighthood upon Charles George Young, Esq., Garter Principal King at Arms; to invest him with the gold chain and badge, and to deliver to him the sceptre of the office of Garter.

The Army.—A notice from the War Office appeared in the "Gazette" on Tuesday, announcing that in consideration of the distinguished gallantry displayed by the 13th Light Infantry, during the campaigns in the Burmese empire and in Affghanistan, her Majesty has been pleased to approve of that regiment assuming the title of the 13th, or Prince Albert's, Regiment of Light Infantry, and of its facings being changed from yellow to blue. Her Majesty has also been pleased to authorise the Regiment being permitted to bear on its colours and appointments, a mural crown, superscribed "Jellalabad," as a memorial of the fortitude, perseverance, and enterprise evinced by that regiment, and the several corps which served during the blockade of Jellalabad. Her Majesty has been likewise pleased to permit the 13th Regiment to receive and wear a silver medal, which has been directed by the Governor-General of India to be distributed to every officer, non-commissioned officer, and private, European and native, who belonged to the garrison of Jellalabad on 7th of April, 1842, such medal to bear on one side a mural crown, superscribed "Jellalabad," and on the other side, "7th of April, 1842."

Foreign.

France.—*The Regency.*—The Regency Bill has been adopted by the Peers by an immense majority, and has now become law. On Monday, before the discussion on the Bill began, a communication was read from his Majesty, thanking the House in his name, and that of the Royal family, for the resolution to erect a statue to the late Duke of Orleans, passed in Saturday's sitting. The debate on the Regency Bill was then opened by the Marquis de Dreux Brézé, the partisan of the Duke of Bordeaux, who made an able and moderate speech in opposition to the principles laid down in the project of law. M. Villemain, the Minister of Public Instruction, replied. Count Murat, the Marquis de Gabriac, and the Prince of Moskwa, Marshal Ney's son, also spoke in favour of the Bill, the general discussion not lasting two hours when it closed. The ballot was then taken, after the articles had been unanimously voted, and the numbers were 163 in its favour, and 14 against it. The President and Chancellor then announced that the King would receive the Peers on Tuesday, to thank them for the passing of the Regency Bill. The report on the Bill, which was drawn and brought up by the Duke de Broglie, is mentioned by papers of all parties, as by far the most eloquent, dignified, and comprehensive discourse which has been delivered in either Chamber upon this important subject. The Duke victoriously refuted the arguments adduced by the Radical party in favour of a constituent power distinct from the legislative power, and energetically declared himself the partisan of a regency conferred by law, and against an elective regency. The Duke likewise approved the appointment of collateral princes to the exclusion of females. In regard to their exclusion, he expressed his opinion in the following passage:—"This principle was said to be new in matters of regency. But was not everything new in France? And was not the spirit of the Salic law against women? Women might reign in countries where royalty was the object of chivalrous devotion. But in France people loved a Sovereign with a calm, serious, and calculating affection, given in proportion to benefits reaped. A French Sovereign must expose his person, struggle with the perverse, brave calumny, affront outrage, swallow disgust, be satisfied with the silent esteem of honest people, and with that dose of popular gratitude which rarely bursts into expression. A woman could not go through this ordeal. It is not for her interest that she should. It must be sufficient glory for a Queen-mother to educate the future King. And the task which rendered Fenelon illustrious, cannot be inglorious for her."—The Chambers were prorogued on Tuesday till the 9th of next January. The ordonnances for the prorogation were read in the Chamber of Peers by Marshal Soult, and in the Chamber of Deputies by the Minister of the Interior. Immediately after this, the King, who had returned from his château of Eu, received the deputation of the Chamber of Peers who presented the Regency Bill. His Majesty left town in the evening after giving his assent to the Bill.

The Press.—The Paris papers continue principally occupied with the late defection of M. Thiers, and the reception of the Duke de Nemours in the eastern departments of France, which the Government journals represent as more triumphant than that of his lamented brother.—The French journalists, who generally take the lead in the outcry against England, discuss at great length the designs which they attribute to this country of making the conquest of the Isthmus of Panama. When England was a party to the treaty to pacify the East by preserving the integrity of the Ottoman empire, these same writers contended for a couple of years that our sole object was to take possession of the Isthmus of Suez, in order to insure a short cut to the East Indies. The "Presse" commenced the subject by a violent article, on learning that the English Admiral and fleet was before St. John of Nicaragua, because, it said, the English Admiral cannot intend less than to swallow up the country, or, at least, cut the Isthmus through. To these fears the "Débats" replied, that the English Admiral and fleet had returned to Halifax. The "Presse," however, now exclaims that this is still worse. To have cut the Isthmus of Panama in two with a few blows was bad; but to have declared the port of St. John's blockaded, and then depart from it, is beyond all precedent. It is a paper blockade—"a doctrine which amounts to a maritime excommunication of all the points, where England has an interest to land alone—a doctrine which enables her to intercept all communication with certain countries without incurring the expense of surveillance, entailed on all other nations by measures of this kind." The "National" has also distinguished itself by violent articles on the subject, but they exhibited so little knowledge of geography, that some of the other Paris papers thought it necessary to reply to them. In addition to these speculations, the papers have discovered the existence of a plot for declaring India independent, and erecting it into a military republic, governed by Generals of the English Army. The details of the scheme are of the most absurd character, and are said to be of German origin.

The Capital.—Two individuals, in whose possession ammunition, arms, projectiles, and incendiary machines were found, have been sentenced by the Court of Correctional Police to 18 months' imprisonment, two years' surveillance, and 3,000f. fine. Three others were acquitted after undergoing four months' confinement.—The papers state that the Duke de Bordeaux has sent his bust, executed at Rome by Tenerani, as a present to M. de Chateaubriand.—It is understood that terms of compromise are in negotiation, and likely to be concluded, between the heirs and next of kin of the late Baroness de Feuchères on the one part, and the Conseil d'Administration of the Hospitals on the other, upon the completion of which the hospitals will relinquish all further claim upon the estates and property of the late Baroness, in right of the grant from the Baron, in consideration of a donation to be made to the hospitals by her family.—On Tuesday the Cour Royale confirmed the judgment of the Tribunal of Commerce, by which Mlle. Fanny Ellsler, who had broken her engagement with the Opera, by refusing to fulfil it at the time stipulated, as she was then abroad reaping a golden harvest, was condemned to pay 60,000f., the amount of the penalty fixed by the agreement.—The police having discovered that frauds of a most criminal nature were committed in one of the most important departments of finance, and that, by the aid of forgeries and supposition of persons, considerable sums of money were abstracted from the public treasury, has issued warrants to arrest the guilty persons. More than a dozen individuals, all accused of forgery, and of whom the greater part have fully confessed their crime, were arrested on Friday last.

The Provinces.—The Brest papers announce that the Tribunal of that Port had sentenced to hard labour for life the captain and officers of a Portuguese vessel captured off Mozambique by a French cruiser for piracy and slave-trading.—The "Moniteur" contains a royal ordonnance of the 22d of June last, dividing the territory of France into five railroad districts, and appointing in each an inspector charged with the control and direction of the works.—It now appears that M. Thiers has changed the course of his summer tour. We learn from Boulogne that he arrived in that town last week, and occupied himself in visiting the harbour, the roadstead, the column, the camp-grounds, and other points on which were posted the Grand Army, which will fill so large a space in his history of the Empire. He was attended by the sub-prefect, the mayor, the captain of the port, the chief engineers, and all the other civil and military officers, who furnished him with every information he required. He has since gone to Lille by St. Omer.

The Royal Family.—For some days past a rumour has been current in the political circles of Paris, that the King has yielded to the earnest prayers of the Queen, and has promised to abdicate in favour of his grandson, the moment that age or infirmity may affect his health. It is said, in private letters, to be the King's desire to be a witness during his life of the Duke de Nemours' regency, in order to direct his son with his counsels when no longer able to bear all the burthens of the state. Although the King's general health is at present good, the shock which his Majesty received by the awful affliction of the death of his eldest son is known to have shaken the King, and at times he is said to appear so overwhelmed, as not to be conscious of the presence of persons, or sensible of current events. It is this symptom of wandering which gives the greatest apprehensions to those who are so naturally anxious for the prolongation of his life and faculties.

Spain.—Our accounts from Madrid of the 21st ult. are totally destitute of interest. The Regent had approved the dismissal of 2 commanders and 22 officers of the Regiment of Guadalaxara, pronounced by General Van Halen. Troops continued to be concentrated at Zamora, on the Portuguese frontier, and in the Asturias, where it was apprehended that an insurrectionary movement would be attempted. Some fears were likewise entertained for the tranquillity of Galicia, Brigadier Oribe, who escaped into Portugal after the events of October, having subsequently opened a correspondence with the disaffected of that province. Barcelona was tranquil at the date of these advices. The papers contain a despatch of the Consul of Spain at Perpignan, announcing that the Carlist Chief Planademunt, Colonel Pedro Morato, and five other Carlist officers, arrested by the French troops on the frontiers of Catalonia, had left, under an escort of gendarmes, for Calais, where they were to embark for England. Prince Licknowski, formerly a general in the service of Don Carlos, and a nephew of Prince Metternich, has been arrested at Barcelona, as a Carlist travelling with an irregular passport.

Portugal.—We have received Lisbon news to the 22d ult. Prince Frederick of Austria had arrived in the Bellona frigate, and had gone to their Majesties at Cintra. The address had been carried by the ministry in the Chamber of Deputies by 62 votes against 19. The new President had tendered his resignation in consequence of the insults he had received from some of the Opposition deputies; but the Ministerial party had moved a vote of censure on the delinquents, and a deputation to invite the President to return to the chair, which was under discussion, and expected to be carried in the affirmative. The Spanish slaver mentioned in our last remained in the Tagus; the Government had informed the Chamber of Deputies, in reply to an inquiry of one of the members, that it would not be allowed to sail. Viscount Sa had presented a petition from 100 manufacturers, to the Chamber of Peers, praying to be heard before any alteration was made in the tariff, which remains quite stationary. He had also introduced a measure for securing the gradual abolition of slavery in Portuguese India, and another regulating and restricting emigration to Brazil.

Germany.—The Hanover Government Gazette of the 22d ult. publishes a royal proclamation respecting the intended marriage of the Crown Prince with the Princess Mary of Saxe-Altenburg. It adverts to the amiable and elevated qualities of the august bride, and states that the reciprocal cordial attachment of the affianced couple allows the King confidently to hope that the happiness of his son is fully secured by this union. It is said that Hanover has given up the intention of joining the German Customs Union. From Berlin we learn that the convention formerly concluded between Prussia and Russia, for the extradition of deserters, has been renewed for several years. The Cologne journals state that the Kings of Würtemberg and Hanover had been invited by the King of Prussia to the *fêtes* about to take place in that city. It is said that in consequence of the continuance of the very hot weather, his Majesty has been pleased to make some alteration in the plan of the reviews on the Rhine. As the grand parade of the two corps of the army is not to take place till the 12th, a change in the temperature will probably take place before that time.—The Vienna papers contain the official notice that the Provincial Estates of Styria, out of gratitude for the resolution of the Emperor that an iron railway shall be made at the expense of the State, through Styria to Trieste, have offered to take on themselves the purchase of the ground required for this undertaking, and that their offer has been accepted by the Government. The "Augsburg Gazette", of the 24th ult. states that the Duke of Bordeaux and the Duchess of Angoulême were to have left Tœplitz on the 19th. The Prince was said to have experienced considerable benefit from the use of the mineral waters of that place, but it was still feared that he would be lame for life. During his stay there he carefully avoided going abroad on foot.

Belgium.—The Frankfort journals assert, that Belgium has entered into a commercial treaty with the German League, similar to that just concluded with France, allowing the silks and wines of Germany to enter at the same duties. The silks and wines of Germany have, however, no dangerous competition with France.—The Flanders papers state that dealers in pictures and curiosities are again traversing the province to purchase and carry to England paintings and other objects of art possessed by the churches; and they express a hope that this time the brokers will not cover the expenses of their journey. The Bishop of Ghent, in order to put a stop to these proceedings, has published a decree forbidding any monument in the churches to be despoiled, any altar to be displaced, or any sculpture or painting meriting attention by its antiquity to be sold.

Switzerland.—The Basle journals of the 25th ult., publish a circular of the Executive Council of Neufchâtel, informing the people that it was the intention of the King of Prussia to visit the Canton towards the latter end of the month, if the health of the Queen enabled her Majesty to undertake the journey.—The "Sentinelle de Jura" announces that, in the night of the 7th ult., one of the glaciers of the Simplon gave way with a tremendous noise, carrying away with it in its fall a number of châlets and some cattle. The shock was so violent that tables and other furniture were upset in the interior of the houses.

Italy.—Advices from Rome, of the 16th ult., announce that the rumoured retirement of Cardinal Lambruschini from the Cabinet had not been confirmed. The Neapolitan Government had authorised the construction of a railroad from Naples to the frontier of the Papal dominions, the expense of which will be defrayed by Baron de Rothschild, Torlonia, and other bankers.—The rumour of a probable breach between the Roman Court and that of Vienna gains ground, and is considered likely to become as serious as that with Russia. It appears that the Pope sent lately a nuncio to Vienna, who differed from those ordinarily chosen for its representatives, in being comparatively young, keen, observing, and energetic. He saw, as he stated, and as the Court of Rome believes, that "the Austrian Government was sapping the foundation of religion, by appointing to bishoprics, and other exalted stations in the church, men unfitted by their talent, their rank, or their education, for those important offices, in order to insure undue and inordinate influence over them, and through them over the whole population."

Russia.—Letters from St. Petersburgh state, that a gamekeeper, named Rheimann, had shot with a pistol Prince Gagarin, Master of Ceremonies of the Imperial Court, and Vice-President of the Cabinet. The assassin waited for the Prince in the antechamber of the Palace, where he perpetrated the crime. It was supposed to be an act of private revenge, for the Prince enjoyed universal esteem. A court-martial was immediately assembled to try the offender, who was sentenced to receive 6,000 lashes, inflicted by 500 men. He had already partly undergone his punishment, and was removed to the hospital, and when cured will suffer the remainder. Should he survive, he is to be transported to Siberia, and employed to work in the mines during life.—The Emperor has released from Siberia all Prussian subjects condemned for crimes of contraband.—The accounts from the Black Sea fully confirm the defeat of the Russian army in Circassia, and state that the great expedition of Gen. Graabe against the Lesghees had completely failed. These disasters are attributed to the obstinacy of the General, who, in his anxiety to strike a decisive blow, neglected the warning of the friendly chiefs who accompanied him, and penetrated so far into the country, that he was surrounded on all sides, and compelled to fight his way back, without being able to give any rest to his troops during 4 days and 4 nights. The Russians are said to have lost 6,000 men and 80 officers in the retreat, who were immediately put to the sword. The Circassians captured the whole of the ammunition, and some pieces of artillery.

Turkey and Syria.—From Constantinople we learn that the Syrian question was again under discussion, the British and French Envoys having received fresh instructions from their respective Governments to push the settlement with the Porte.—The accounts from Jerusalem are unfavourable: the British Proconsul was on bad terms with the authorities. The overseer of the works, a skilful Maltese workman, had quitted the service, and had been immediately employed at Mount Carmel by the Terra Santa monks. Bishop Alexander is said to be very ill, and confined to bed from fever, having already been several times slightly indisposed.—At Tarsus, the British Vice-Consul, Mr. Clapperton, had been beaten by several Spahis, but satisfaction had been afforded by the Governor, who deprived them of the land they held on the tenure of military service, and appropriated it to his own use.

Egypt.—The extreme lowness of the Nile causes great apprehensions to all those connected with this country. Last year it had already risen at this period 20 or 25 feet, while as yet it has not risen this year at Cairo more than 5 feet. No goods can be brought down to Alexandria, from the scarcity of the water in the river and the canal, and all business is at a stand. The crops will, in consequence, be very scanty, and the country people look forward to a distressing season. On the 29th ult. a meeting was held of the British residents of this place, to take into consideration the affairs of the Protestant church of Alexandria, and a Committee was appointed to make the preliminary arrangements.

India.—The Overland Mail reached Marseilles on Tuesday, bringing, we regret to say, very disastrous news from India. The following telegraphic despatch was immediately forwarded to Paris:—"Malta, August 26.—The Great Liverpool, which arrived at 5 o'clock this evening, with despatches from India, brings the following news from Jellalabad, and from the camp of General Pollock. They are dated the 22d of June, and are of the most melancholy description. Sickness, extreme heat, want of food, and the simoom, are decimating the army. The discontent at the inaction in which the army has been left is at its height. Akbar Khan has seized the Bala Hissar and the treasures which it contained. The Governor-General has given full permission to General Pollock to act as he may think proper. The intelligence from Candahar is up to the 11th of June, and is destitute of interest. Nothing important has taken place in China. It is said that the Emperor has taken refuge in Tartary. The preparations for marching upon Chapoo were completed, but the army remained inactive, and seemed to have given themselves up to a state of despondency."—We have this morning received the details of this intelligence. Affairs in Affghanistan remain very nearly in the same state as at the departure of the last mail. General Pollock's force is still at Jellalabad, unable to advance or recede; and General Nott's position at Candahar is not much more satisfactory, though he has distinguished himself by several brilliant affairs with the enemy. Akbar Khan, son of Dost Mahomed, has obtained possession of one of the bastions of the Bala Hissar at Cabool; while Futteh Jung, son of Shah Soojah, still holds the citadel; but was not expected to be able to do so long. It is therefore probable that Akbar Khan is in possession of absolute supremacy over the whole Affghan nation. Nothing certain is known respecting the intentions of Lord Ellenborough on the question of Affghan politics—there being still room to doubt whether they incline to the absolute abandonment of the country, or to an ultimate and more vigorous prosecution of the war—whether an advance or a retirement is to be the order of the day. The balance of probability, however, appears to be on the side that the troops will be withdrawn. There is no statement of the terms of this withdrawal. Lady Sale and the other captives are at Cabul, and it is said that she has written to urge "the necessity of moving forward as the only means of saving the lives of the prisoners." Some accounts state that the troops are positively to withdraw in October, while others say that they are waiting for the army of reserve, of which the Governor-General has directed the formation on the north-western frontier. It is to consist of 18,000 men, and to be placed under the orders of the Commander-in-Chief in person. The accounts from the different Presidencies state that the rumoured withdrawal of the troops is received with a universal feeling of disappointment and surprise.

China.—The dates come down to 27th May, but there is no news of importance. The auxiliary troops had not arrived, and matters were in the same state as at the date of the last report. As soon as the troops arrived, the plenipotentiary intended to advance to the northward. It was currently reported that the Emperor, alarmed at the preparations which the English were making to attack him, had given his subjects a paternal exhortation to resist the barbarians to the utmost, and retired into Tartary. His departure from Pekin, before the troops could reach it, though highly probable, was considered unfortunate, and it has become a question, if he should have removed himself and his family beyond the great wall, with whom are we to conclude a treaty? The new settlement at Hong Kong was progressing rapidly. The intelligence of the Emperor's flight is derived from the French missionaries at Pekin, who are supposed to have access to some good sources of information.

United States.—The Columbia steamer has arrived from New York, bringing papers four days later than those brought by the Great Western. The treaties between the United States and Great Britain were sent to the Senate on the afternoon of the 11th ult. The Senate, when in what is termed an "Executive sitting," deliberate in secret. Two or three such sittings had been held on the treaties, but, of course, no information respecting them had found its way into the newspapers. Not the slightest doubt was felt that the Senate would approve of them. A sum of 12,000*l.* in the treasury of New Brunswick, denominated "the disputed territory fund," and arising from duties levied upon the timber cut on that territory during the last six or seven years, is, according to the terms of the treaty, to be paid over to the United States, for the benefit of Maine and Massachusetts. The municipal authorities of New York were preparing a cordial reception for Lord Ashburton. A joint committee of the two city boards had been appointed to receive his Excellency, and do him the honours of the city. They had, by a unanimous vote, placed at his disposal the large apartments in the City Hall, usually appropriated to the use of the Governor of the State, in which his Lordship would see company.

West Indies.—By the royal mail steamer Trent, letters have been received from Jamaica to the 23d ult. The crop of sugar had been gathered, and the quantity produced had not disappointed the anticipations previously formed. In most of the islands, Jamaica especially, the labourers were behaving well, and those who had arrived from Africa had proved extremely useful. Although much embarrassment still continued among traders, yet some improvement had to be noted, and it was hoped that the greatest depression had passed. No change for the better had occurred in the condition of Demerara, where commercial as well as planting affairs were exceedingly bad. Hayti was still the scene of misery, desolation, and plunder, with a continued vibration of the earth. Antigua had been visited by an alarming shock of an earthquake, without personal damage. Grenada and St. Kitt's had also smart shocks on the 28th June. Letters from the Havannah state that the capture of a slaver on the shores of the island is an occurrence almost unheard of, although the trade has resumed all its activity. Several descents had lately been made on the shore, and within a few days nearly 1,000 Africans had been added to the slave population. There seems to be a complaint that the cruisers designed to suppress the traffic are employed for the conveyance of bullion from the mines of Mexico and South America, for the advantage of the officers. The unfortunate West India steamers have sustained another calamity. One of their vessels, the Clyde, struck on a reef of rocks in proceeding from St. Thomas's to Barbadoes, in which she lay 36 hours in a very critical state. After being lightened, by having her coal thrown overboard, she was got off, and succeeded in returning to Saint Thomas's, whence, after undergoing some repairs, she was expected to proceed to England.

CITY.

Money Market, Friday.—The disastrous news brought by the overland mail has produced a decline in the funds. Consols closed at 92⅞ sellers for the account, and 92⅝ to ¾ for money; Bank Stock, 167½ to 8½; Three per Cents. Reduced, 93¼; Three-and-a-Half per Cents. Reduced, 101⅞ to 2; New Three-and-a-Half per Cents. 101 to ⅛; India Stock, 250 to 1; Exchequer Bills, 51*s.* to 53*s.* prem.

Metropolis and its Vicinity.

The Queen's Voyage to Scotland.—On Monday morning the Queen and Prince Albert left town on a visit to Scotland. They left Windsor Castle at 5 o'clock, accompanied by a numerous suite, and proceeded by a special train to Paddington. Shortly before seven the Royal party arrived at Woolwich. The preparations for her Majesty's reception were on an extensive scale, and, notwithstanding the early hour, the Duke of Cambridge, and several members of the Government were in attendance. The Queen, on leaving her carriage, was received by the Duke of Cambridge, the Earls of Delawarr, Liverpool, Jersey, and Haddington, Sir G. Cockburn, Sir F. Collier, Sir Robert Stopford, Lord Bloomfield, and a large number of naval and military officers. The yachts and vessels in the river were decorated with colours, and the Harbour-master of London, with a large body of Thames police, were employed in keeping the passage clear. In consequence, however, of the early hour of the embarkation, and the heavy rain which fell during the morning, the boats and steamers were not numerous. Her Majesty and the Prince embarked under the usual salutes, followed by the Duchess of Norfolk, Lady in Waiting; the Hon. Miss Matilda Paget, Maid of Honour; Colonels Bouverie and Wylde, Equerries in Waiting; Captain Meynell; and the Hon. G. E. Anson, Treasurer to Prince Albert, and the Earl of Morton, Lord in Waiting; Earl of Delawarr, Lord Chamberlain; the Earl of Liverpool, Lord Steward; the Earl of Jersey, Master of the Horse; and Sir James Clark her Majesty's physician. On the Queen and Prince Albert entering the Admiralty barge, his Royal Highness presented the crew with a purse containing gold. Sir Francis Collier had the honour of steering the barge, and on its arrival alongside the royal yacht, her Majesty was received by Lord Adolphus Fitzclarence. As soon as her Majesty was afloat, the yards of the different vessels that comprised the squadron, and others in commission in the river, were manned, and formed a very imposing spectacle, and as her Majesty stepped on board the royal yacht, the sailors loudly cheered. The cheering was caught up by the men of the other vessels, and was continued on the shore. The royal standard was immediately hoisted to the mainmast of the Royal George, and another discharge of cannon announced that the Queen had embarked. The weather at this time was most unfavourable and the rain fell heavily. The Monkey steamer then took the yacht in tow, and the whole squadron proceeded down the river, preceded by the Lightning, which cleared the passage. The Black Eagle, the Rhadamanthus, the Shearwater, and the Fearless were grouped ahead and astern of the Royal George, and the Trinity steam yacht and the Trident brought up the rear. The squadron had not proceeded far down the river, when the Monkey, being found of insufficient power, the yacht was taken in tow by the Black Eagle and Shearwater. The weather now began to clear, and her Majesty and Prince Albert made their appearance on deck. By this time several steamers endeavouring to make up for lost time, had come down the river, and were one by one overtaking the fleet; the instant, therefore, her Majesty was recognised, she was hailed by loud bursts of cheering, which she repeatedly acknowledged. As the fleet moved on, the weather every moment improved, and the scene became more animated. At Gravesend the spectacle was particularly imposing, as the river was crowded with vessels of all rigs, and of many nations. The royal squadron passed through the motley fleet, with the bells of Gravesend ringing, the people on the shore cheering, and Tilbury fort opposite blazing away as it might have done in the stirring days of Drake and the Armada. From Gravesend to the Nore the distance was soon passed; as the squadron approached the Nore, the Camperdown, bearing the flag of Sir Edward Brace, the Pique frigate, and the Daphne sloop of war, manned their yards and saluted. The fleet of vessels which had accompanied the squadron from the river then bore up, and the Royal George, still in tow of the steamers, stood out to sea. The scene at this time is described as most animating. At half-past 12 the squadron passed Herne bay. On its arrival off Walton-on-the-Naze, about 4 o'clock, a salute was fired from the pier-head, amidst immense cheering from hundreds of persons who had gone out to meet it in crafts of all descriptions.

The weather at the time was particularly fine, with a slight breeze from east. At a quarter past five, the squadron arrived in the sound off the entrance of Harwich Harbour. Here it was met by the Orion and Queen steamers, decorated with flags; the former having on board the mayor and town authorities of Ipswich, and the other an excursion party. The military bands on board immediately struck up the National Anthem, and as the yacht passed it was greeted with loud huzzas. Her Majesty and Prince Albert were upon deck, and acknowledged the cheers by repeatedly bowing. The yacht, soon after leaving Harwich, hoisted her foremost staysail and jibsail, the wind having veered a point or two round to the south-east; the Lightning and Shearwater steamers still, however, continued towing, followed in the rear by the Fearless, Monkey, and the rest of the squadron. At half-past seven it passed Aldborough and Orfordness. The next accounts received of its progress are from Yarmouth, quarter past ten, P.M. The squadron was then proceeding through the roads. All the steamers had lights hoisted at their bows and mast-heads, and when off the town, Bengal lights were burned on board the Lightning and Shearwater, which illuminated the yacht and the whole squadron, presenting from the shore a most imposing sight. The weather was still fine, and very little sea prevailed. The squadron passed Southwold at 9 o'clock. Early on Tuesday morning it was off the north coast of Norfolk, the yacht still towed by steamers; thick weather prevailed during the night, and it is supposed that the squadron brought up below Yarmouth. They were soon off the Humber. About eight miles before the Dudgeon Floating Light, in the "Deeps," between nine and ten o'clock, the squadron came up with the Innisford steamer, having on board the 87th Regiment, which left Hull that morning, for Edinburgh, to form the Queen's body guard. As soon as the yacht, which was still towed by steamers, approached near the Innisford, the band of the regiment struck up "God save the Queen," and the whole of the troops presented arms, and continued to do so until the squadron had passed. Prince Albert was at the time parading the quarter-deck with Lord Adolphus Fitzclarence, and appeared taken by surprise at the reception; which, however, he received with evident gratification. The Innisford steamer afterwards bore away to the east, and subsequently headed the Royal squadron, the speed of which did not exceed eight miles an hour, owing to the wind, which was completely against them, accompanied with drizzling rain. At about thirty minutes after four o'clock the Royal squadron came in sight of the white cliffs at Flamborough-head, with the lighthouse at the head point; but soon afterwards the atmosphere became hazy, the rain descended heavily, and it became difficult to distinguish the shore. The wind having veered round in the course of the afternoon from N.E. to N.W., the course that the squadron was then bearing was towards the coast, but it did not touch Flamborough nearer than 10 or 12 miles. The Royal George in passing hoisted signals to Watson's Telegraph Station, but from the distance and the thick weather the flags could not be distinguished. As the evening approached the weather became extremely boisterous, and preparations were made on board the yacht, as well as in the steamers, for a stormy night, for the wind had freshened to a stiff breeze, and the sea was rolling heavily. Owing to the great number of colliers that were bearing down from the northward, and the night becoming excessively dark, the Monkey steamer was ordered to proceed in advance of the squadron, to keep a sharp look-out, and warn them off the track which it was then steering. Additional lights were likewise hoisted on board the yacht and the steamers, including the General Steam Navigation Company's steam-ship Trident, which joined the fleet immediately after her Majesty's embarkation at Woolwich, and kept up with it the whole distance. Notwithstanding the unfavourable state of the weather, the appearance of the squadron during the night was of a novel and imposing character, and at times it was greatly heightened by the firing of Bengal lights as signals of precaution. By six o'clock the squadron passed Scarborough Castle, bearing in a north-easterly direction, within seven or eight miles from the coast. At seven it arrived off the lofty cliffs southward of Robinhood's bay, and at about half-past eight o'clock passed Whitby. Soon afterwards the night darkened to such a degree that it was impossible to distinguish any object beyond two lengths of a vessel, in consequence of which the rate of the steamers towing the yacht was reduced to three-quarters speed. The time occupied in reaching the next port, Sunderland, a distance of about seventy miles from Whitby, was upwards of eight hours, the squadron not arriving there till near five o'clock on Wednesday morning. As it was expected to pass by on the previous day, which certainly would have been the case had the weather been favourable, the authorities determined to give her Majesty and her illustrious consort a hearty welcome, and flocked on board several steamers, attended with military bands, to meet her; but not being able to obtain any tidings of the Royal squadron, they retired greatly disappointed. Colours were hoisted on the steeples of all the churches in the town, and a battery of 18 guns was erected on the beach to fire a salute. As it was, the squadron passed the port unobserved several miles out at sea. Shortly before 11 o'clock the yacht and squadron hove in sight of the ruins of Tynemouth Castle, with the lighthouse and Tynemouth garrison adjacent on the lofty rocks at the north entrance to Shields harbour. The weather had become somewhat clear, though the wind was still blowing fresh from the N.W. Her Majesty here met with a gratifying reception. At the entrance of the harbour were numbers of steamers tastefully decorated from stem to stern with colours of all descriptions and nations, crowded with people. There were, besides, an immense number of sailing vessels of all descriptions and sizes; and the scene was one of the greatest animation. As the Royal squadron advanced, it was met by this immense fleet; the Lightning and Shearwater steamers still having the yacht in tow. On coming alongside, the huzzas were reiterated in every direction; aud upon its arrival off the harbour, a salute was fired from the Castle. It was then half-past 11, and in an hour afterwards the squadron was out of sight. It passed Ratcliff Craggs about three, and about ten P.M. was off Dunbar, and brought up in Aberlady Bay at half-past one on Thursday morning. Her Majesty would land on that day at ten o'clock. The Royal yacht had been fitted up for the reception of her Majesty in the most complete manner; and in order to ensure a constant supply of pure air, Dr. Reid had been engaged in making arrangements on his new principles of ventilation. A mechanical contrivance had accordingly been fitted for the purpose, and Dr. Reid accompanied the yacht to superintend its working.

City Improvements.—At the Lord Mayor's Court, last week, an issue was tried under the Act of Parliament for the city improvements, to ascertain the value of premises occupied by Mr. Burton in Wood-street, Cheapside, which are about to be pulled down by the city, and what compensation should be paid to the defendant for the loss occasioned to him by being deprived of these premises, and for the injury which he would suffer by his removal from them. After the usual proceedings the trial terminated in a verdict for the defendant—for lease and goodwill, 150*l.*; removal, 100*l.*; loss of trade, 200*l.*; and fixtures, 78*l.* 12*s.*; making a total of 528*l.* 12*s.*

Custom-House.—An inquiry is now in progress respecting some irregularities which have been discovered in some of the inferior departments of this establishment. It appears that numerous articles have been for some time admitted in larger quantities than have been reported for the payment of duty, and that the profits arising from this system have been shared between the parties concerned and the officers whose duty it was to report upon the imported articles.—It is mentioned in the daily papers as a singular fact, that the Customs' Report for several days past does not give one entry of duty paid upon a single piece, pipe, or otherwise of port wine. Such a circumstance has not occurred, it is said, within the memory of the oldest wine-merchant. The fact is attributed to the undecided state of the commercial treaty pending with Portugal, by which it is well understood the duties on wine will be altered and lowered.

Chartist Meetings.—In the course of Sunday evening the neighbourhood of the London-road was placarded, stating that a meeting of the working classes would take place on Monday, and the chair would be taken by a working man. In accordance with this announcement, at one o'clock about one hundred persons, consisting of men, women, and children, congregated, but for some time no further appearance of a meeting took place. At length a person of the name of Franklin was proposed to preside, who at once mounted a chair, when the business of the day began. Several persons proceeded to address the meeting, and adverted in the usual manner to the prevailing topics. The meeting then quietly dispersed.—On Monday night a meeting was held at the hall of the National Association, Holborn, to promote the cause of universal suffrage, Mr. Joseph Sturge, the late candidate for Nottingham, in the chair. Payment of one penny was required for admission, which was received by Mr. Neesom, a member of the late convention. Mr. Sturge opened the proceedings in a long speech, in which he said that the working classes should fight their own battle, backed by the incidental assistance of the middle classes. The middle classes had refused joining the Chartists, but they were coming round. He then referred to the Southampton election, and the probable success of the Chartists at Reading, if Lord Chelsea had been allowed to accept the Chiltern Hundreds. He alluded to his own defeat at Nottingham, which he attributed to bribery, corruption, and intimidation, to his advocacy of teetotalism, and to the alliance of the Liberal and Conservative parties that took place. He expressed a strong hope that, ere long, an opportunity would be given to the people of trying their right to hold open-air meetings. Messrs. Vincent, Lovett, and others, followed; and the business concluded with a string of resolutions, attributing the distress and disturbances of the country to her Majesty's Ministers, and calling upon the people to stand by the Charter.

Woolwich.—On Monday morning this town was a scene of continued bustle, in consequence of the embarkation of her Majesty. Immediately after the yacht had proceeded down the river, deputations from the workmen in the various departments waited upon Sir George Cockburn, and represented that it was usual on all occasions when a crowned head visited or embarked at the Woolwich Dock-yard, to obtain a holiday. The gallant Admiral received the deputation in the kindest manner, and immediately granted the request.—On Saturday, being the anniversary of Prince Albert's birth-day, the keel was laid of the Royal Albert, 120 gun ship, ordered to be built on the plans of Mr. Oliver Lang, on the slip from which the Trafalgar was launched last year. The usual ceremonies on the occasion were performed by Miss Collier, daughter of the superintendent, in the presence of a large number of naval and military officers. The new ship will be 15 feet longer on the gun-deck than the Trafalgar, and will exceed her in burthen by 673 tons.

Hanwell.—Last week the pauper lunatics at this asylum were treated to another entertainment similar to those which we have before had occasion to notice. At 4 o'clock nearly 400 of the male patients assembled in the front grounds of the asylum, where for some time they were engaged in games of bowls, quoits, &c., and in music and dancing. Their tea was then served to them on the green. Between 6 and 7 heavy rain came on, and the patients were compelled to retire to their wards, which had been previously decorated with evergreens and flowers in ornamental devices. Tables were then arranged in the centre, and supper served. At its conclusion music was again resumed, and the amusements of the evening were continued until 9 o'clock, when the delighted patients retired to their sleeping rooms. The number at present inmates of the asylum considerably exceeds 900.

Death of Mr. Longman.—We regret to state that Mr. Thos. Norton Longman, the eminent bookseller and publisher, of Paternoster-row, died on Monday morning at his residence at Hampstead, in consequence of his horse having fallen with him on Wednesday last, by which accident the unfortunate gentleman was precipitated to the ground with such severity as to occasion an extensive fracture of the skull, from which he never recovered. Mr. Longman was much esteemed for his amiable and unassuming qualities in private life, and was universally known and respected for the extent and integrity of his commercial dealings. He was in his 72d year. An inquest has since been held, and a verdict of "Accidental Death" returned.

Thames Tunnel.—In consequence of the completion of the tunnel, a new station on the Greenwich Railway will be opened in a few days, so as to afford facilities to the public making their way from the north side of the river and the numerous docks to Greenwich and Woolwich. It is situated at the Spa-road, Bermondsey, about midway between London and Greenwich.

Mortality of the Metropolis.—The following is the number of deaths registered for the week ending Saturday, Aug. 20, in the Metropolitan districts:—Males, 490; females, 469; total, 959. Weekly average 1838-9-40-1, males, 467; females, 445.

Provincial News.

Manchester.—There has been no renewal of the disturbances during the past week, and very little change in the state of things in this town has taken place. The return to work is far from being so general as was expected at the end of last week, as very few in addition to those who had then returned to work have been added to the number of hands in employment. All the power-loom weavers and a great portion of the fine spinners are still out, and some persons accuse the manufacturers of being implicated in the prolonged cessation of work, in order to get rid of their large stocks, which they have been enabled to do at a considerable advance in prices. On Monday two meetings of the power-loom weavers were held in the News Room in Little Ireland, at which it was unanimously resolved not to return to work until they had obtained their demands. Meetings have been held in various places in the neighbourhood, at which language of a violent nature has been uttered, and reports are in circulation that arms are in possession of some of the more desperate Chartists. On Sunday evening a turbulent meeting was held in the Hall of Science, at which a person named Doyle used strong language, but he was put down by the majority of those present; and in various districts in this neighbourhood meetings continue to be held on Sundays, at which violent speeches are delivered. In the districts of Glossop, Godley, Mottram, &c., there were meetings of large bodies of people on Monday, who marched in procession along the roads, and stopped every respectable person they met, to ask him for subscriptions to support them in their present struggle. Mr. Maude, the stipendiary magistrate, has been sitting in the Old Court, for the purpose of binding over witnesses in a great number of cases which have been heard during the week, and in which it was determined to commit to the assizes. Mr. Gregory, the solicitor, (who has been sent down as a Commissioner by the Government for the purpose of inquiring into the various cases connected with the disturbances,) has been actively occupied with his duties. In those cases which were bailable, he has pressed for its being fixed at a sufficient amount to ensure attendance to take their trials. The bail was fixed by the bench in some cases at £25, in others at £30, and as high as £50. No less than eighty-five prisoners were committed for trial on the various charges of riot, assaulting the police, destroying property, or obtaining food or other articles by means of threats, but about half the number were told that bail would be taken for their appearance. The Mayor has transmitted to the Home Secretary a letter explaining the conduct of the authorities in the recent outbreak. He denies the statement that the magistrates were aware of the intention of the Ashton operatives to enter Manchester and compel the mills to stop work, and declares that the statement, so far as concerns the magistrates, is utterly and entirely without foundation. He states that the first intimation received by any one of the borough justices of the intention of the Ashton operatives to visit Manchester was given verbally by Sir Charles Shaw, when on his way to the Town Hall, to one of the magistrates, whom he accidentally met in the street, on the Tuesday morning, at too late an hour for him to adopt any measures for preventing the entrance of the procession into the borough; that Sir C. Shaw requested Mr. Maude, by letter, to put himself in communication with Col. Wemyss, with which he instantly complied, and that he accompanied the military when they met the procession from Ashton. He concludes by saying, that "whatever information may have been possessed by other parties in the borough relative to what had taken place at Ashton or in the neighbourhood on the Sunday or Monday, none was communicated, officially or otherwise, either to myself, as Mayor, or to any other magistrate; and therefore it is evident that no responsibility for not having taken steps to prevent the entrance of the operatives from Ashton into the town on the Tuesday, can possibly rest with the magistrates. I may further add, that not only had the magistrates not received any information as to the particular occurrences above referred to, but that they were entirely without information of any kind which might have led them to anticipate the possibility, much less the probability, of any outbreak."—A meeting of operatives has been held at Carpenters' Hall, but it turned out a very small affair; the principal speaker was a man called Duffey, who declaimed against the Anti-Corn-Law League, which had, he said, produced the outbreak by reducing the wages of their workmen on purpose to create an outcry against the Corn Laws. A scene of great uproar ensued, one party contending that the League had compelled the men to turn out for party purposes, and another affirming that the character of the speaker was not to be depended on.—A staff of from two to three hundred special constables has been selected from the two thousand lately dismissed, and will be employed on duty until October, when the appointment and selection of the police force of the borough devolve upon the town council. Some important changes will then be made in the command and constitution of the force, with a view to increase its efficiency. The late disturbances not only suspended the performances at the theatre, and public lectures of all kinds, but put a stop to all auctions, &c. The walls of the town are now placarded with numbers of notices of sales of furniture, proving the decay in trade and resources, from which the middle classes and shopkeepers are suffering.—On Wednesday a meeting of the Town Council took place, which was very fully attended. The Mayor entered into a long and minute statement of the conduct of the magistrates, and of the steps taken to quell the disturbances. Though *ex-parte*, it is an interesting document in the present state of affairs; but we can only state that its prominent feature is the entirely new version which the Mayor gives of the manner in which the hands were turned out. According to him, the mob of Manchester themselves were turning out the hands at the factories at the very time the processions from Ashton were entering Manchester. He says that he was not obliged to know what was going on at Ashton, and that if it is the duty of a magistrate to be a police officer, he begs leave to decline it.

Birmingham.—On Friday morning George White, the Birmingham Chartist, against whom a warrant had been in the hands of the police for some days past, was apprehended after some show of resistance. He was at once taken before the magistrates, when he addressed the Court in a long and vehement speech, after which the magistrates determined to commit the prisoner for inditing and publishing seditious placards, and also for uttering language calculated to endanger the public peace. They had some doubt whether the language proved against him did not amount to treason. They therefore committed him to take his trial at the borough sessions. They should require sureties, himself in 200*l.*, and two bondsmen in 100*l.* each, with 48 hours' notice of the bail offered. White made no reply, and was immediately removed below into the prison. There was a slight disposition to tumult expressed in the Court, but it was very speedily suppressed. The bail amounts to 1,200*l.*; himself in three indictments (200*l.* each) to 600*l.*, and his sureties to the same amount. The news of his commitment was speedily communicated throughout the town, and some thousands of persons soon assembled round the public office. A detachment of the 3d Dragoons speedily arrived, and took up a position opposite the office. A carriage followed, and in a few minutes White was brought out of the prison, placed between two turnkeys in the vehicle, and, amidst the hootings of the mob, started under the escort of the military for Warwick gaol. In the course of the evening several attempts were made to get up a meeting, but they were prevented by the police, and the town has since remained free from any appearance of violence. At West Bromwich, many of Lord Dartmouth's pits have commenced working under military protection; and at Oldbury the pits are also working at intervals. An attack was made on Sir H. St. Paul's colliery, at Tipton, on Friday, in consequence of the men resuming work. Some damage was done to the machinery, but four of the ringleaders were apprehended. At Bilston the rioters have also interfered, and beaten the men who had returned; and on Friday night it was necessary to send for the military.

Oldham.—The Chartist leader of this town, Samuel Yardley, who was apprehended last week, has been brought before the magistrates, for the purpose of further examination. No distinct charge was preferred against him, but the depositions of several witnesses were taken at length. They stated that they had attended meetings at which the prisoner was generally present, and took an active part, until Tuesday last; and on that morning the chief constable deposed that a meeting was held in a field, at which the prisoner was present, and advised them not to work until they had obtained the Charter. The witness also deposed to other inflammatory language being used by the prisoner, and to his reading a placard addressed "to the men of Birmingham" of a seditious tendency. He also said he could not think of advising them to go to work, as the country was all up and stirring; but they might please themselves. After he had spoken, a resolution was put to the meeting that they should not return to work until the Charter was the law of the land. The Bench then determined to remand the prisoner for further evidence, and refused to take bail.

Dudley.—On Friday evening O'Neill, the Birmingham Chartist, was apprehended in this neighbourhood. It appears that the pits in the neighbourhood of Oldbury, about four miles from this place, had resumed working, but a body of men had ill-used the colliers who returned to their employment. No sooner was O'Neill aware of the disposition of the men to resume their labour, than he started off to Dudley, to induce the men to continue in their strike, and to adopt other measures, which were kept private. On Friday morning a meeting was announced to take place, at which O'Neill would be the principal speaker. He was seen to leave Birmingham in the morning, and the next thing heard of him was his apprehension at Craidley, about the middle of the day. The apprehension created considerable noise and excitement, and it was at first feared that disturbances would occur. Beyond, however, the congregation in the streets, there was no cause for alarm. On Saturday and on Monday he was examined before the magistrates, when the mob around the hall was so violent that it became necessary to read the Riot Act. Another chartist, called Blanchfield, was brought up at the same time. The prisoner O'Neill refused to take his hat off, which was removed by a constable. There were some women in the court, connected with his congregation at Birmingham, who wept very loudly. After a long examination, the magistrates retired to consult; they then committed the prisoners to Stafford gaol, but expressed their willingness to accept heavy bail. As this was not forthcoming, they were ordered to be removed to Stafford. As soon as their commitment was made known, the people who surrounded the Town-hall became tumultuous, and great fears were entertained of a disturbance. Precautions had, however, been adopted by the authorities, and instructions were immediately given to clear the streets. This was soon done, and about half-past 3 a car drew up to the gates of the hall, into which O'Neill and his companion were immediately conveyed, and, escorted by a detachment of the 3d Dragoons, were sent off to the Wolverhampton station, on their way to Stafford gaol. The troops were assailed with groans and other demonstrations of disapprobation, but beyond this nothing occurred to disturb the peace.

Leicester.—On Friday Thomas Cooper, known as the Leicester Chartist, was apprehended in this town, on a warrant from the Newcastle magistrates, charging him with seditious language and exciting the mob to acts of violence, Numerous letters and papers, some addressed to White, the Birmingham Chartist, were seized at the same time. A private investigation took place before the magistrates, which ended in his being committed to the custody of two officers, who came after him, and he was removed trom the police station to the railway guarded by a body of police. The intelligence of the prisoner's apprehension spread rapidly through the town, and hundreds of his supporters followed him to the station. At the corner of the market-place the crowd was so dense that the omnibus was obliged to be stopped, and large numbers took the opportunity to thrust their hands through the windows of the carriage to bid good-by to him. After the train had left the station, an attempt was made to get up a meeting in the market-place, but without success.

Lancaster.—A meeting was held here on Friday at which it was resolved to call on the inhabitants for contributions to support the men in their turn-out. The applications for relief from the starving families are increasing very fast, and the House of Correction is full to overflowing. On Monday the mill-bells were rung to give notice that the masters were ready to commence work; but a sufficient number of hands to enable the master to carry on his work applied only to one factory, that owned by Mr. J. Greg, and then only about one-third of the hands returned. On Wednesday, however, others had followed the example, and the mill was in full work. Some benevolent persons in the town have proposed to raise a public subscription to afford relief to the workmen and their families until matters are accommodated with the parties; but such a plan can but ill supply the want of wages, which are understood to have amounted to at least 500*l.* weekly. There, however, exists no apprehension for the safety of property or the public peace.

Leeds.—The turn-out in Yorkshire may now be regarded as quite at an end. Last week, at the Assizes at York, the Hon. S. Wortley stated to the Court that he was instructed, on behalf of the Attorney-General, to make a motion with reference to the prisoners, who had been committed for trial since the commencement of the present assizes, for offences connected with the late disturbances. The motion he had to make was that the prisoners should remain upon the commitments until a special Government commission could be issued, He made the motion on the affidavit of Mr. Maule, the solicitor to the Treasury, from which it appeared that there were about 111 prisoners, who had been sent for trial for various offences, which had arisen since the commencement of the assizes, and there were also 56 others in custody in York Castle, waiting for examination; and the affidavit of Mr. Maule further stated that it was likely other persons would be taken, and sufficient time had not been allowed for the various committing magistrates to communicate with the Home Secretary and her Majesty's Government. The Judge said that as his commission was to clear the gaol, he must proceed until he received orders from the higher authorities to bring the assizes to a close.

Macclesfield.—The whole of the silk-mills, with one exception, were at work in this town on Monday at the old prices. The cotton-factories are all closed, nor is there any probability of an early resumption of employment; the men resolutely adhering to their determination not to work except at advanced prices, and the masters being equally resolved as to their inability to comply with the terms required. Public meetings continue to be held; but the workpeople are peaceably disposed. The Stockport Hussar troop of the Cheshire Yeomanry, under the command of Capt. Tatton, took their departure on Sunday night, leaving the Arley troop, under Capt. Brooke, to act in case of any unexpected disturbance. During the stay of the Hussar troop, it had fully acquired the confidence of the inhabitants. The best feeling prevailed towards them among all classes, and this favourable result was greatly promoted by the high personal character and popularity of their Captain. The colliers at Pott Shrigley have returned to their pits, and the Poynton colliers were expected to resume work yesterday.

Stockport.—On Monday morning one silk-mill commenced work, and continued without interruption during the day. Several cotton-mills were also opened, in expectation that the operatives would have been willing to re-commence work, having been idle since the 11th ult. This expectation, however, was not realised, for the operatives are determined not to resume work till they obtain the prices paid in 1840, and the masters appear equally resolved not to give it. No communication has yet taken place between the operatives and the employers, the leaders of the former saying the masters know what they are contending for, and as soon as they concede what is demanded they are willing to commence work, but not before. A subscription was commenced by the operatives' committee, on Saturday, among the shopkeepers; and from the proceeds nearly one hundred loads of potatoes have been purchased, which have been distributed among the turn-outs. The Macclesfield and Morley troops of Yeomanry remain in the town, but the Altringham and Tabley troops have been ordered home.

Glossop.—On Monday some of the ringleaders in an attack which took place last week on the mills of Mr. Cooper and Mr. Shipley were committed by the magistrátes to Derby gaol, to take their trial at the Assizes. The mob became so exasperated at this result, that they attacked Mr. Cooper on his return home, and beat him so severely that he was carried home in a very dangerous state, having been left in a field apparently lifeless. Early on Tuesday morning, small detachments of people collected in various places about Ashton, Staleybridge, and other villages, and having met to the number of between 400 and 500 on Wednesough-green, they marched in procession, many of them being armed with large sticks or bludgeons, in a direction towards the works of Mr. Shipley, of Brookfield, where they arrived about noon. Mr. Shipley, being aware of their movements, had caused a considerable number of his hands to be sworn in as special constables. This body were armed with staves, and placed under the command of Mr. Shipley himself, who had also provided a number of fire-arms in his factory, being determined to use them should any attack be made on his property. When the mob arrived at his factory, a parley ensued, during which Mr. Shipley stated his intention to fire if necessary for the defence of the mill. The rioters, however, began to demolish the windows. Mr. Shipley then fired upon them, and several were wounded. The mob became furious, and were preparing to execute their threat to pull down the house, when they were dispersed by a company of military which had been despatched from this town. The neighbourhood is in a state of great excitement. One of the ringleaders, a man named Pilling, well known as a Chartist speaker, has been apprehended and examined by the magistrates, but there was no proof of his identity.

Merthyr.—This manufacturing town has assumed its usual appearance, as far as every branch of the iron trade is carried on, and all the men who are allowed to work are busily engaged. It is said, that 100 men at Dowlais, 35 at Plymouth, and upwards of 100 at Cyfartha, are not permitted now to do what they actually refused in the beginning of last week. Several Chartist meetings have been held, at which it was resolved to stand by the principles of the Charter, but not to compel any man to abstain from his work. With these exceptions, the town and neighbourhood are perfectly quiet.

Norwich.—Some feeble endeavours have been used to disturb the peace of this city during the last week, in imitation of the Northern rioters, and a mob was assembled in the Market-place, but it was so insignificant in character that the authorities did not consider it worthy of attention. A notice was issued, cautioning persons against attending illegal meetings, but further than that no exertion of authority has been made or was necessary. About a hundred Jacquard weavers, for the sake of 1*d.* per dozen, left work on Monday, and paraded the streets begging; but the city is perfectly quiet, and no apprehensions of any disturbance are entertained.

Carlisle.—This town is now perfectly quiet. On Saturday night the delegates of the working classes met, and agreed to issue a handbill, advising the operatives to resume their work. On Monday morning all the hands had gone in, and a considerable quantity of work has been given out to the hand-loom weavers. The Yeomanry left the town on Tuesday, and it is hoped that no further disturbance will occur.

Bath.—On Saturday, the 20th ult., a party from Wootton-under-Edge took a pic-nic excursion to Sharpness Point, where, after spending the greater portion of the day, two young men of the party, Mr. James Cooper and Mr. Charles Hill, incautiously strayed on the centre sands of the Severn as the tide was coming in. It is supposed they had got the distance of half-a-mile, when some of their friends noticing that the tide was running up and surrounding the sands, immediately gave the alarm, when the unfortunate youths ran towards the shore, and in endeavouring to wade through the water, went into the current, then running high, and were swept away and lost in sight of the whole party, who had no means of rendering them any assistance. Mr. Cooper was about 20 years of age, and the only child of Mrs. Cooper, of Wootton-under-Edge; his body was shortly afterwards found, and every means used to restore him, but without avail. Mr. Hill was the son of Mr. Hill, the surgeon of the same place, and about 18 years of age; his body was not discovered till Tuesday morning, though every effort was used to find it. His parents and sisters were witnesses of the catastrophe.

Bristol.—The valuable collection of paintings belonging to Mr. D. W. Acraman, of Bristol, which had acquired more than a local reputation, was brought to the hammer last week, for the benefit of the creditors. The attendance and competition were very great. The "Dentist," by Teniers, brought 320 guineas; the "Ferry-boat," by J. and A. Both, 410 guineas; Rippingille's "Recruiting Sergeant," 111 guineas; "A Party at a Château preparing for the Chase," by Wouvermans, 310 guineas. The renowned Berghem, of "Muleteers arriving," supposed to be the *chef-d'œuvre* of this master, after a very spirited competition, was knocked down to M. Niewenhuys for 1,570 guineas, and is supposed to have been purchased for the King of Bavaria. It is stated that in a few hours after the sale of this picture, an express arived from the Prussian Ambassador, to purchase it, under a limit of 2,500*l.*, for the King of Prussia. The produce of the sale during the three first days was nearly 8,600*l.*—The Bishop of Gloucester and Bristol has appointed Dr. Phillimore to be Chancellor in this city and diocese, on the resignation of the Venerable Archdeacon Thorp.

Durham.—The local papers are filled with details of the visit of the Duke of Cambridge to Wynyard Park, the seat of the Marquis of Londonderry. In passing through this city, his Royal Highness, accompanied by Baron Brunow, the Russian Ambassador, attended divine service in the cathedral. His progress was everywhere attended with civic processions and addresses, and nothing could exceed the respect with which his Royal Highness was received in all the towns he visited. At Wynyard a large party had assembled in honour of the visit. His Royal Highness during his stay visited Seaham Harbour and the Marquis's extensive coal-pits. The dinner given to his Royal Highness at Sunderland was attended by about 200 persons, including most of the nobility of this county.

Liverpool.—The discouraging condition and prospects of the Atlantic Steam Navigation has become a source of great apprehension in commercial circles, and has now assumed a character which makes it a national question. We noticed last week that the Admiralty had directed several 10-gun brigs to be fitted out at Plymouth, in order to supersede the steamers of the West India Company. It is now stated that the Great Western Company, trading between Bristol and New York, are in such pecuniary difficulty as to be compelled to bring the whole concern to an early close; and the North American Mail Company, or "Cunard's line," the only party now left to prosecute the steam communication with America, are appealing to Government and to the trading interest to afford them more efficient support, without which they also must throw up their contract. It is scarcely necessary to add, that this contract has hitherto been executed with a rapidity, precision, and safety altogether without a parallel. It seems that the Company, with a capital of 300,000*l.*, admirably managed even in its minutest details, discovered in nine months after their vessels began to run that it was a losing undertaking. They were, therefore, compelled to apply to Government to increase their allowance for carrying the mails. A searching inquiry was instituted on the part of Government, and it was clearly proved that, even when the vessels were full of passengers and light cargo, the receipts could not cover the expenditure; the allowance for the mails was consequently increased from 60,000*l.* to 80,000*l.* per annum. Notwithstanding this addition, it is now announced that the concern returns no profits to the proprietors, and commercial men are apprehensive that it will ultimately be broken up. It is generally admitted that if this company cannot succeed no other ever will, and that if it fails a regular steam communication with America must be considered altogether at an end. In regard to the interference of Government to prevent such a result, the "Times" says, "We should be glad, not only to see the North American Company secured in permanence to the public service, but an attempt made to re-organise on better principles, and under more prudent management, that West India Company of which the ruin is pronounced to be all but certain. To return to the old vicious system of the West India packets and 10 gun brigs is a misfortune; to recede from the great project for a communication by steam with America, so long successfully worked, and to the future success of which the want of money is the only impediment, is a national disgrace. Future improvements in this navigation may render that profitable hereafter which is not so at present; but if the chain is once broken, any attempts of that kind will be without a motive."

Plymouth.—Tuesday next is the day fixed for the launch of the Albion, of 90 guns, at this port. On the same day the Superb, of 80 guns, will be launched at Pembroke. Five new war steamers are building at the different yards, which the Admiralty have ordered to be called the Rattler, Rocket, Ruby, Scourge, and Gladiator. The Board, in consideration of the hard work performed by the ropemakers, have ordered the superannuation pensions of that class of workmen to be increased from 20*l.* to 24*l.* per ann.

Southampton.—The long-expected opening of the first of these docks took place on Monday. The directors, however, deferred the celebration of the event by any public ceremonial, because the dock, though capable of receiving ships, will, as a whole, for some months necessarily wear an unfinished appearance. The large dock thus opened is stated to be one of the noblest basins in the world, and in some points wholly unrivalled. It comprises an extent of sixteen acres water area, with 3,500 lineal feet of solid masonry quay wall; has an open entrance accessible from the Channel at all hours of day and night, and a depth of never less than 18 feet water at the lowest spring tides, so that vessels of every size adapted for mercantile purposes are enabled to enter and lie afloat at all times of tide. The Southampton Railway extends into the docks, and it runs from within 20 feet of the quay-wall direct to London; consequently cargoes of merchandise arriving in the morning may be craned in the docks from the ship's hold into the railway waggon and be in London the same day. The Liverpool, which arrived in the harbour from Lisbon while the ceremony of opening the docks was in progress, was the first vessel which entered the basin: the Tagus followed her, and the event was observed with the usual rejoicings.—On Wednesday, the meeting of the proprietors took place at the London offices. The report stated that the claims of the contractors for constructing the dock were about to be submitted to Mr. Macneill, civil engineer, for his arbitration and decision. The recent resale of the forfeited shares had increased the pecuniary resources of the company, but from 15,000*l.* to 20,000*l.* more would be required to complete the approaches to the dock, from the business opening of which on the 1st October considerable revenue would be derived. Great complaints were made against the management of the company, that the expense of the construction of the docks as far as they have already gone has doubled the estimate which was given in for the completion of the whole undertaking.

York.—The local papers inform us that it has been determined to establish in Yorkshire and the counties adjacent a society, the object of which will be to promote the improvement of church architecture, and to adopt effectual measures to counteract the paltry manner in which most of our new churches have been built. The scheme has received the full approbation of the Archbishop of York and the Bishop of Ripon; and it is expected to be followed by similar societies in other counties.

Railways.—The following are the returns of the principal railways for the past week:—Eastern Counties, 1042*l.*; Northern and Eastern, 1363*l.*; Blackwall, 1371*l.*; Greenwich, 782*l.*; Croydon, 416*l.*; Brighton, 4463*l.*; South Eastern, 969*l.*; South-Western, 7734*l.*; London and Birmingham, 17,370*l.*; Birmingham and Derby, 1412*l.*; Birmingham and Gloucester, 2033*l.*; Manchester and Leeds, 4222*l.*; Midland Counties, 2940*l.*; North Midland, 5208*l.*; York and North Midland, 2211*l.*; Great North of England, 1507*l.*; Edinburgh and Glasgow, 2357*l.*; Great Western, 14,409*l.*; Hull and Selby, 1104*l.* The half-yearly meetings of many of the different companies have just taken place; their proceedings in some cases are given at great length, but the following abstract will no doubt interest many of our readers. The report of the directors of the Birmingham and Gloucester railway, read at their half-yearly general meeting on the 19th ult. at Birmingham, states that, notwithstanding the stagnation of trade, there had been an increase of goods' traffic on their line during the last half-year of 50 per cent. on the quantity, and about 60 per cent. on the money receipts compared with the half-year ended the 30th of June, 1841. The receipts during the half-year were 41,967*l.* The expenses, excluding interest on scrip and on loans, but including depreciation of carrying stock, were 28,298*l.* The interest amounted to 12,053, and the balance was 1615*l.* No dividend was declared.—The Bristol and Exeter Company held their half-yearly meeting last week, and the prosperous state of affairs induced the directors to recommend a dividend of 1*l.* 6*s.* 8*d.* per share on all shares on which 70*l.* shall have been paid on or before the 6th day of October next, for which date the dividend is made payable. The report states, that 45 miles of the line are in active traffic, yielding under the lease a clear income of above 50,000*l.* a year, with the prospect of a considerable increase at every future opening. The principal materials for the entire railway to Exeter are secured at the present reduced prices, while the contracts for the tunnel and several miles beyond it are satisfactorily let. The disposable balance for a dividend was 170,000*l.* At this meeting the directors were empowered to borrow 450,000*l.* upon the loan notes of the company, at the rate of 5 per cent., which will obviate the necessity of calling upon the shareholders, for the present, for the 30*l.* per share yet to be paid as capital.—At the meeting of the North Midland Company, a dividend of 20*s.* per share upon each whole share, a dividend of 10*s.* per share upon each half-share, and a dividend of 6*s.* 8*d.* upon each third-share, clear of income-tax, was declared, leaving a balance of 2,784*l.* 3*s.* 2*d.*, out of the 31,854*l.* 3*s.* 1*d.* stated to be the amount of net profits. The directors attributed the decrease to the state of trade; but the shareholders have instituted a committee of inquiry, who are empowered to investigate and devise means for the better conduct of the Company.—The Taff-vale Railway has declared a dividend of 28*s.* per share on the original shares, payable out of the disposable balance of the half-year's workings of 4,376*l.* 14*s.* 2*d.*, while a further sum of 22*s.* per share is to be carried to the credit of the old shareholders, as capitalised interest, making the nominal amount of each share 116*l.* 4*s.* 6*d.* The receipts from passenger traffic are stated to have exceeded that of the corresponding half-year, while the tonnage from the coal-works, although not equal to what the directors anticipated, has been proportionately good.—At the half-yearly general meeting of the South-Western Company, on Saturday, the report stated that the total receipts during the half-year amounted to 141,080*l.*, being an increase of 18,313*l.* over the corresponding period of 1841, 14,416*l.* of which had principally arisen from the excess in the passenger traffic, which had amounted in the whole to 38,100*l.*; 10,542*l.* had been received for goods, and 1,242*l.* for carrying the mails. The net available balance was 69,371*l.*, out of which the directors recommended that a dividend of 30*s.* per share be declared, the income tax from the 5th of April last to be paid out of the traffic of the current half-year. The proprietors in the Gosport branch railway, which was opened in February last, would participate in the dividend. The report concluded by stating that the French Legislature had sanctioned the continuation of the Paris and Rouen line to Havre, by a gift of 320,000*l.* and a loan of 400,000*l.*; and in order to render the projected chain of communication complete, the directors would encourage, by every means in their power, the establishment of an effective system of steam transit from Southampton to the French coast.—At the Blackwall Railway Meeting on Monday, the report stated that the directors had borrowed, on the security of debentures, a portion of the sum of 60,000*l.*, allowed by the new Act. The gross receipts for the half-year amounted to 21,932*l.*, leaving a balance, after payment of the current charges, of 1,472*l.*, which the directors regretted was not sufficient to warrant them in declaring a dividend. The expenditure for the half-year amounted to 23,068*l.* The passenger receipts had considerably increased, without causing any augmentation in the working expenses. The great productive source of traffic to the railway was that in connexion with the steam-boats at the Brunswick Pier, the resources to the railway arising from which were by no means fully developed. The total number of passengers between Blackwall and Gravesend during the summer months of 1841 and 1842 amounted to 335,273, producing 14,075*l.* Out of the 70,000 persons who landed and embarked at Gravesend during the first week of the present month, nearly 30,000 of them came from Blackwall. The directors recommended, now that the passenger traffic was established, that the fares should be raised respectively from 4*d.* and 6*d.* to 6*d.* and 8*d.*, from the 1st of October next. A long and stormy discussion took place as to the heavy expenses of the line, and the large amount of the solicitor's bills. Several proprietors wished it to be understood that they repudiated all participation with the directors in the steam-boat speculations in which the latter had engaged. Much angry discussion ensued on a proposal for the election of Capt. Mangles as a director, in the place of Mr. Rennie, who had resigned, but was again proposed for re-election. The result was the election of Capt. Mangles by a majority of six. The meeting was very numerously attended.—At the meeting of the Aylesbury Railway, the report stated the receipts at 3,500*l.*, leaving, after paying expenses, a balance of 1764*l.*; but the directors proposed that no dividend should be declared. This suggestion was carried, together with a motion empowering the directors to negotiate with the London and Birmingham Company, for the sale of the line or the renewal of the lease, which will expire in June 1844.—The meeting of the North of England Company was held at Darlington on Tuesday. The report recommended a dividend of 1*l.* 5*s.* per share for the half year ending June 30, 1842, being after the rate of $2\frac{1}{2}$ per cent. per annum, which was agreed to. From the half-yearly statement of accounts it appears that the Company's receipts have been 33,543*l.* 10*s.* 6*d.*, making, with the reserve fund of 4,268*l.* 13*s.* 5*d.*, the sum of 37,812*l.* 3*s.* 11*d.*; and that that the disbursements of the company have been 21,040*l.* 1*s.* 9*d.*; leaving a balance available for dividends of 13,772*l.* 2*s.* 2*d.*; out of which the company will pay 1*l.* 5*s.* per share, as stated above, exclusive of the income-tax.

IRELAND.

Dublin.—It is understood that Earl De Grey is expected to arrive in London from Wiesbaden in about a fortnight, when his leave of absence from his Viceroyalty will expire. The noble Earl has derived much benefit from the waters. It is also said that his Excellency, after staying a few days in St. James's-square, will proceed to this city direct, to resume the Government now administered by Lords Justices.—It is stated in the local papers, that there is likely to be a contest for the University, and judging from the pretensions of the two candidates, it will no doubt be a severe one.—A requisition from several of the heads of the college has been addressed to Mr. T. B. Smith, who has this week received the appointment of Solicitor-General, requesting that gentleman to stand for the vacancy created by the elevation of Mr. Jackson to the bench; and it is reported, that should Mr. Smith accede to the requisition, he will have Government support in his favour. Mr. Hamilton, notwithstanding these circumstances, is determined not to withdraw his claims on the electors, a great number of whom have already decided on supporting him in preference to any other candidate.—A meeting of the Corporation was held on Saturday, for the purpose of examining Sir J. K. James, the late treasurer, to whom the corporation has not yet awarded the compensation to which he is legally entitled. The affair is likely to end in a suit at law.—It is reported that Mrs. Augustus Byrne, whose recent trial caused so much excitement in the country, and who has already been twice a widow, will shortly be united in wedlock to the officer in whose charge she was, pending the inquest on her late husband!—The difficulties that stood in the way of commencing the atmospheric railway to Dalkey are completely at an end, and the proprietors of the Dublin and Kingstown Railway are about to authorise the directors to accept a loan of 25,000*l.* from the Board of Works, for the completion of the extension to Dalkey. The works will commence immediately, and it is confidently stated that the first regular line of railway on the atmospheric principle that has ever been attempted will be in operation within a few miles of the Irish metropolis early in the ensuing spring.—The usual weekly meeting of the Repeal Association took place on Monday. Mr. O'Connell attended and spoke at some length. The rent for the week was announced to be 60*l.* 13*s.* 3½*d.*

SCOTLAND.

Edinburgh.—The preparations for her Majesty's visit have surpassed everything of the same kind within the memory of the oldest inhabitant. For some days past the town, and indeed the whole of this part of Scotland, has been in a state of great excitement at the prospect of her Majesty's arrival. On Thursday morning the news arrived that the Royal squadron was in the Forth. The Monarch steamer had gone down to meet it, and first descried the yacht when off St. Abb's Head. She then proceeded on her course, and met the royal fleet off Eyemouth. At that time the wind was N.W., and the Royal George yacht was towed by two steamers—the Black Eagle and the Shearwater. The Royal George, in order to steady her, had her jib, flying jib, fore-staysail, and driver set, the wind blowing on the larboard bow. The Monarch then put round, and saluted. At this time it was observed that her Majesty was reclining on a couch between the main and mizen masts, while Prince Albert was pacing the deck close by. The cheering was distinctly heard on board the yacht, as her Majesty rose and repeatedly acknowledged the loyal demonstration. About this time the Trident steamer, belonging to the General Steam Navigation Company, came up from Granton; the Monarch and Trident then dropped astern, and fell into the wake of the royal squadron. Night was now drawing on, and lights were hoisted at the mast head. The Monarch, about ten miles to the eastward of Inchkeith, left the squadron, which was now keeping close to the southern shore, with the apparent intention of taking the inner passage. At half-past one, the Monarch arrived off Granton, and it was then ascertained that the royal squadron had anchored in Aberlady bay. It was accordingly announced that the landing would take place on Thursday morning, on which day the Town Council were summoned to meet at half-past ten. The Duke of Buccleuch, and numerous members of the nobility, were on Granton Pier, anxiously looking out for tidings of the royal squadron during the early part of the night. The preparations for the landing were on the most extensive scale, but we defer noticing them until next week. The disappointment of the people on Wednesday was very great, but as soon as possible, the local authorities received intimation, through Sir Robert Peel and the Earl of Aberdeen, that it was her Majesty's desire to contribute, as much as could be consistently expected, to the gratification of her loyal subjects, and therefore, should her Majesty and retinue arrive off Granton late on Wednesday night, her Majesty and Prince Albert would pass the night on board the yacht, and land on Thursday.

Miscellaneous.

Niger Expedition.—The daily papers announce that the Tagus steamer, which arrived at Falmouth, from the Mediterranean this week, spoke her Majesty's steamer Kite, steering for Lisbon, from the coast of Africa, last from Sierra Leone and Madeira, with the remnants of the crew and apparatus of the late Niger expedition. The Tagus received her despatches, but no details could be obtained. A letter since received from Lisbon, dated Aug. 22, mentions the arrival of the Kite at that port, with the officers of the expedition on board, which is reported to be broken up.

Liberia.—The American papers contain a letter addressed to the editor of the "North American," containing an account of this colony, from which the following are extracts. It appears that the Secretary of the American Colonization Society, lately visited Liberia, accompanied by Mr. Zion Harris, an uneducated man of colour, who emigrated to the colony 12 years ago from the State of Tennessee. At recent meetings at Boston, Mr. Harris gave an account of his residence, observations, trials, and conflicts in Africa; described the country, its features, productions; the manners, character, and superstitions of the African tribes in the vicinity of the Society's settlements; stated the causes of the wars in which the settlers have occasionally been engaged; their successful endeavours against the slave trade, and the protection they have extended over several thousands of the unoffending nations who have fled to them from their cruel foes, and the benefit of the Gospel which has been communicated to these unfortunate people, in such a manner as to awaken the deepest interest in Boston in behalf of himself and his fellow-labourers in the colony. Mr. Harris accompanied his father-in-law, the Rev. G. M. Erskine, to Africa, in 1829. Mr. Erskine was a coloured preacher of the Presbyterian Church, highly respected in Tennessee and other parts of the Union. A part only of his family went with him to Africa, and at his death, which occurred in six months after his arrival, he requested Mr. Harris, if he should ever be able to return to the United States, to bring the rest of his family to Liberia, as "it would make him smile in his grave." His request has been complied with in part: Mr. Harris has been to Tennessee, and carried with him to Norfolk 13 of the descendants and relatives of his father-in-law, and 70 others are in a few days to embark with him for his chosen country. Some still remain in servitude, but it is believed they will follow. Mr. Harris was the leader in the defence of the missionary station at Haddington, against the cannibal chief Gouturah and from four to six hundred of his warriors. This savage was the terror of all that region of Africa, and within a small district of country may be seen the ruins of 30 to 50 villages, burnt by him in the dead of night, in order to murder, rob, and enslave the inhabitants. In the missionary school at Haddington, when the attack was made, were 70 or 80 African children, and several teachers (mostly females) from the colony. The sole object of Gouturah was to take these children to sell them into slavery, to get possession of the property, and feast upon the Godmen, as he called them. Mr. Harris, aided by two colonists and three converted native boys, contended with this band of savage warriors, for one hour and twenty minutes, and finally killed Gouturah, and compelled his followers to retreat with great loss. The writer states that no work of fiction has equal interest with the statements of Mr. Harris, who has given a more vivid picture of life in Africa, and shown more conclusively the good which is to be effected by colonisation in that country, than anything to be found in books, or heard from living men. Mr. Harris thinks 400 coloured missionaries might now be employed, and find a welcome among the native tribes. About 10,000 of these people enjoy peace and security on the lands of the colony. Not far from 400, he thinks, give some evidence of conversion to Christianity. The letter concludes by stating that New England is about to take a decided stand in favour of African colonisation.

The Alpine Goat.—A short time ago an aged inhabitant of the commune of Saint Agnes, in the beautiful valley of Griesivaudan, shut in by the snow-topped Alps, went out at an early hour of the morning to gather some wild fruits, and at the same time led his goat and her kid to pasture. Seeing a large stone detach itself from a rock above his head, and come rolling down upon him, he, to avoid being crushed by it, stepped back, but, happening to put his foot on a sandy hollow spot, he lost his balance, and fell over a precipice to a depth of 200ft. Although severely cut and bruised, unable to raise himself up, or even to move, he remained the whole day under the torments of pain and hunger, aggravated by the swarms of insects which came to attack his wounds. As the night came on, the sufferer was surprised by seeing his goat come down the steep, and, on her reaching him, voluntarily offer her dugs to his parched lips. In this manner the affectionate animal supported her master for four successive days, repeatedly bleating with all her force. By this exertion of her instinct, one might almost say of her sagacity, the animal at length attracted the notice of a goat-herd, who, with great intrepidity, got down the dangerous descent, and reached the old man thus miraculously preserved. It was, however, only for a short time, for, being brought home by the collected exertions of many of his fellow-villagers, he expired on the following day in the arms of the curé of the parish, who eagerly purchased the faithful goat which had preserved her master so long.—*Galignani's Messenger.*

Law.

ASSIZE INTELLIGENCE.

NORTHERN CIRCUIT.—YORK.—*Moor v. Cook.*—This was an action of trespass. It appeared that in the year 1834, a Mr. Cockburn was the clergyman of Pocklington, and being anxious to have an evening service throughout the year, took steps to have the church fitted up with what might be necessary to light it during the winter months. For this purpose a number of branches to hold candles were put up, but these not being found sufficient, it was subsequently determined to light it with gas. The branches were therefore taken down, with the exception of those at the pulpit and reading-desk, and were taken in part payment of the gas-fittings which were substituted. Stoves also were put up, and pipes attached, for the purpose of warming the church. The parish, however, refused, in its parochial capacity, to take upon itself the expense of these improvements, and a subscription was set on foot to defray it. This, however, was not very successful, there being no more realised than from 20*l.* to 22*l.* The cost, too, was much greater than had been originally contemplated, amounting to somewhere about 140*l.*, and this amount, after some considerable delay, was, with a charge for interest, which made the whole amount to 150*l.*, paid by Mr. Cockburn out of his own pocket. Further than this voluntary subscription the parish paid no part of this original charge; but it would appear they afterwards went to some considerable expense in improvement of the pipes connected with the stoves, and additions for the purpose of increasing their efficiency. During the summer months, a considerable part of the gas apparatus, such as the pillars to hold the jets, was removed under the direction of Mr. Cockburn, and placed in a box belonging to the parish until they might be required the following winter. Matters continued in this way until the latter part of the year 1840, when Mr. Cockburn left Pocklington, the income of which living was, it would appear, considerably under 200*l.* a year, and went to reside in another part of the country. He, in consequence, wrote to the churchwardens, requesting them to call a meeting of the parish to consider whether they would purchase the fittings in question, saying that he could not afford to lose the money which had been sunk in lighting and warming the church; but if the parish would offer anything in reason, he would much prefer accepting their proposal, and leaving the apparatus for the use of the parish instead of taking it down. The churchwardens on this did call a meeting, which was not, however, very numerously attended, and some conversation took place as to the propriety of setting a subscription on foot for the purpose of reimbursing Mr. Cockburn. Several parties recommended this course, but nothing was done, and Mr. Cook the defendant, as solicitor for Mr. Cockburn, finally resolved to remove the matters in question. Application was made to Mr. Tyndale, one of the plaintiffs, as churchwarden, for the key of the church, which was given, and Mr. Cook then proceeded to remove the greater part of the fittings, leaving, however, a good portion which could not be taken away without doing considerable injury to the church, and among the rest all that portion of the stove-pipes which had been paid for by the parish. The value of goods so removed, if sold immediately, would be, in their present state, about 20*l.*, though, should the sale be deferred until a favourable opportunity, they might realise about 30*l.* The removal of these goods was the trespass complained of. It appeared, during the case for the plaintiffs, that one of them, Mr. Tyndale had given permission to the defendant to remove the gas-fittings, but the stoves had not been mentioned, and it seemed questionable whether this permission extended to more than the pillars, &c., which had been usually removed every year, at the close of the winter. For the defendant it was contended that these fittings had never been the property of the parish, and that Mr. Cockburn had done no more than permit the use of them to the parish during his incumbency. At all events, with regard to such portions as were affixed to the body of the church, to them the present plaintiffs had no title, as the property, if it passed out of Mr. Cockburn, would rest in the vicar for the time being. As to those not so affixed the permission of the churchwarden to remove them was a sufficient authority. His Lordship having summed up, the jury returned a verdict for the plaintiffs, damages 40*l.*, being of opinion that the fittings had been originally given to the parish by Mr. Cockburn, trusting to a subscription to remunerate him, and that the permission of the churchwarden did not extend to the greater part of the articles removed.

Rawstone v. *Cheadle, Clerk.*—This was an action for work and labour, and for money had and received by the defendant to the plaintiff's use. It appeared from the evidence, that the defendant is vicar of Bingley, in the West Riding, where for many years the vicarage had been held together with an endowed school. The vicarage-house was a very poor one, and the incumbent had, therefore, resided in that attached to the school. On the death of the last incumbent the trustees of the school resolved to separate it from the living, and in consequence, when the defendant became the vicar, there was no sufficient residence for himself and his family; and accordingly, in the year 1838, he resolved to attempt the erection of a new vicarage house, for which purpose a subscription was set on foot, which amounted to 300*l.* The plaintiff is an architect at Bradford, and was employed by the defendant to draw plans for a residence, which he did on the scale of a building which he estimated to cost 600*l.* As the subscription did not succeed to the extent which was expected, an application was made to the trustees of Queen Anne's Bounty, who, as the living was worth 250*l.* per annum, could not make any grant from their regular funds, but were enabled to grant a sum of money from some other source, which did not appear. It is a constant rule of theirs to make no grant towards any building of the kind, unless the plans are drawn in detail, and a copy of them submitted for their approval; and they also require some person besides the clergyman to engage for the completion of the contract. The plaintiff was employed to draw these plans, which were approved as being quite sufficient for the purpose, and he was appointed to superintend the progress of the works, and a sum of 60*l.* was to be allowed him for his remuneration. The defendant also applied to him to allow the contract to be made in his name, which he assented to. The sum the building was to cost was 1,090*l.*, and the 60*l.* allowed for the architect made a total of 1,151*l.*, which was to be drawn for in bills on the certificate of the plaintiff that work to that amount had been duly executed. The money so obtained was handed to the plaintiff as the nominal contractor with the workmen, and paid by him into a bank, whence it was drawn out to pay the various description of builders. Before the works were actually commenced, the defendant wished the site to be changed. This was done; but when the ground was opened, it was found necessary to pile some portion of it in order to secure a sufficient foundation. The defendant also wished to have the house a foot wider, and some rooms larger, in consequence of which the expense was considerably increased, and the whole 1,151*l.* was consumed, without leaving anything for the remuneration of the plaintiff. For the defendant it was contended that there was no proof of any contract for the first set of plans, which the witness valued at 20*l.*, nor did it appear that the plaintiff expected remuneration for them, as they could not be carried into execution, but were superseded by others, in which they might be considered to have merged, and as to the 60*l.*, the plaintiff had had the money in his own hands, and if he chose to pay it all away, he must abide by his own act and bear the loss. Some evidence was put in, and counsel addressed the jury in reply, and argued that though the money had passed through the plaintiff's hands, it could only be obtained by the signature of the defendant, and as he had signed draughts only for the workmen, it could not be said that the plaintiff had ever had it in his power to retain the money; while it was clear, on the other hand, that as 60*l.* had been specially appropriated to the plaintiff out of the money, and the whole had been received by the defendant, that 60*l.* had been received to the plaintiff's use, and he was also liable, on his own account, to pay for the first plans, which had been drawn by his directions. His Lordship summed up the case, and the jury returned a verdict for the plaintiff both for the 20*l.* and the 60*l.*

Church Rates.—Dale v. *Pollard and others.*—This was an action of replevin, brought by John Dale, an inhabitant of Bradford, against George Pollard and Benjamin Briggs Popplewell, the churchwardens of Bradford, and John Andrew and George Waddington, constables. Mr. Wortley, for defendants, opened the case, as the affirmative lay upon them. This action arose out of a distress under the justices' warrant for the recovery of a church-rate, and he thought that in the course of the case it would appear that the disputes between the plaintiff and the defendants were rather matters of law than any matters of fact upon which the jury would be called upon to exercise their judgments. By the ancient law of this country it was the duty of the parishioners to maintain the fabric of the parish church. That law rested entirely upon prescription and was as old as the oldest times. In the parish of Bradford there were many townships. There had been always two churchwardens appointed for the parish church of Bradford, and for the other townships in Bradford there had been also other officers, called chapelwardens, elected and appointed by the various townships. But the churchwardens elected by the township of Bradford had immemorially called the vestry meetings for the purpose of making a church-rate, and to them was confided the duty of taking care of the fabric of the parish church. About 1835, as the jury were aware, considerable excitement upon this subject prevailed, and there was a disposition to dispute the necessity of laying such a rate for the purpose of repairing the parish church as had anciently, and by the law of this country, immemorially been made: this disposition to oppose church-rates arose partly from religious scruples and partly from excitement. The dispute ran high, and in the year 1835 a rate was for the first time refused in the parish of Bradford. From time to time attempts were made to lay the rate, but unsuccessfully. An attempt was afterwards made by private subscription to repair the fabric of the parish church, but this attempt was not successful. In 1841 it became evident that it was requisite that something should be done for the maintenance of the parish church. Accordingly, in February, 1841, a vestry meeting was called in the ordinary way by the churchwardens of the parish of Bradford. The vicar presided, and it was very strongly stated that there was an absolute necessity for laying out in repairs upon the church a sum of between 300*l.* and 400*l.* Nevertheless, such were the dissensions at that time amongst the parishioners, that the proposition for laying such a rate was very strongly opposed, and in the result successfully. In the meantime a church-rate case was decided in the Court of Exchequer, and after that decision, the churchwardens, the first two defendants on the record, Mr. Pollard and Mr. Poppleton, who felt themselves deeply responsible for the state of the church, called another meeting of the parishioners in the month of May, to give the parishioners an opportunity of making a rate, or, if the majority refused to lay a rate, with the consent of the minority. Consequently, according to the ancient custom, the usual notices were given, the parishioners assembled in the parish church, the vicar presided, and everything was carried on in the ordinary way. But, besides this, another step was also taken, making it, if possible, still more imperative on the parishioners to assent to the rate required—namely, an application was made to the Ecclesiastical Court at York, and what was called a monition was issued, without any opposition on the part of the inhabitants of Bradford, and which ordered the parishioners to make a rate for the purpose of maintaining the church. It was under that monition, and under the circumstances which he had stated, that the meeting was held on the 14th of May. At that meeting the monition was read, and the parishioners were informed of the necessity of a rate and of the circumstances under which the meeting had been called. A rate was proposed by the senior churchwarden and seconded by the junior churchwarden. The rate proposed was no higher than was shown to be sufficient at that time for the restoration and the maintenance of the fabric of the church. Upon that proposition being made a counter-proposition was made by a gentleman of the name of Winterbottom, that there be no rate laid for the maintenance of the fabric of the church. On the question being put from the chair, the proposition of Winterbottom was carried by a considerable majority. Subsequently to this, the meeting was asked whether there was any other proposition to be made. And then the same gentleman, Mr. Winterbottom, made a proposition to this effect:—"*I propose to all pious, benevolent, and honourable Churchmen, and to all good and peaceable Dissenters, to all Quakers, Independents, Methodists, and Baptists, that they commence this day a voluntary subscription to help the Church people in the maintenance of the church.*" That proposition was put to the meeting, and carried by a majority. The churchwardens felt that this was a mere voluntary offer, on which they could not rely; and they accordingly said that they would accept no such offer, but would proceed to make a rate. Accordingly, with the concurrence of the minority, the churchwardens proceeded to make a rate in the usual form—that appeared upon the minutes of the parish meeting, and the rate was signed by the members of the minority present on that occasion. No step was taken subsequently to that rate by any of the parties present at the meeting, or by any parishioner, as they might have done, in the Ecclesiastical Court. No steps were taken to set the rate aside, nor was any obstacle made to prevent its collection. Accordingly, the churchwardens proceeded to have the rate collected; and, with very few exceptions, that was done without difficulty. But in some cases, and especially in the case of John Dale, the plaintiff, refusals were made to the payment of the rate. Dale was assessed for 1*s.* 5*d.* on a house which he occupied in Bradford. But when he was applied to to pay that sum, he gave a distinct and flat refusal to pay it. It became the duty, therefore, of the churchwardens in some way to enforce the payment of the assessment due from Dale. By an Act of Parliament passed in the 53d year of George III., a summary mode of recovering small sums due for church-rates was appointed—thus preventing the great expenses which were formerly incurred by proceedings in the Ecclesiastical Court. A section of that Act of Parliament empowered the justices to hear the complaint, to order payment of the rate, and, if payment were refused, to issue a warrant of distress, to recover the amount claimed. The churchwardens accordingly attended before the justices, and made their complaint. A summons was issued against Dale. Dale appeared before the justices, along with a legal gentleman. But although Mr. Dale appeared, he did not give notice to the magistrates that he intended to dispute the validity of the rate. Dale, however, refused to pay the rate of 1*s.* 5*d.*, and the justices issued a warrant of distress, under which three or four account-books (Mr. Dale being a bookseller) were seized in satisfaction of the rate.—Mr. Baines, for the plaintiff, submitted to his Lordship that the defendants had not proved their cognizance. He contended that proof of a notice of objection to the rate before the magistrates had been adduced even by the evidence of the defendants, and that the plaintiff was entitled to a verdict. The order which the justices had made could not be a good and valid order, because they had no jurisdiction with respect to a rate which had been laid by a minority of the parishioners. The order pronounced by the magistrates was a perfect nullity. There never was a valid rate, there never was a valid order made by the justices. He also submitted that there was no legal proof whatever that the order had been duly served upon the plaintiff, nor was there any proof of the allegation that the plaintiff refused to pay to the churchwardens the sum of 1*s.* 5*d.* There was no evidence of any neglect or refusal on the part of the plaintiff to pay this money. Consistently with all the evidence in the case, the assessment might have been paid. After some discussion as to the best mode of raising the points of law for future decision, it was agreed that a verdict should be taken for the plaintiff for the sum of 3*l.* 3*s.*, the facts to be put into a special case for the opinion of the Court above.

Whetenall v. *the Manchester and Leeds Railway Company.*—This was an action, tried before a special jury, to recover damages for injury received by reason of the negligence of the defendants, through their servants. Mr. Knowles in stating the case said, this was an action which the plaintiff, Edward S. Whetenall, had been compelled to bring against the defendants, to recover damages for a very severe injury which, through their negligence and fault, he had sustained—an injury so severe, that it considerably impaired the plaintiff's powers of usefulness, and which must, therefore, affect his prospects through the whole of his future life. The plaintiff is a young man, not yet 22 years of age. He is the son of a person who was well known in one part of this county—the chief engineer of the Low Moor Ironworks; and the plaintiff himself had been educated and brought up to that profession, and at the time of the injury in question was about opening in business in that line for his own support. The defendants are a very powerful and important body, called the Manchester and Leeds Railway Company. They carry passengers, not only on their own line, which extended from Manchester to Normanton, but, by an arrangement with the North Midland Railway Company, from Normanton to Leeds; their own carriages are permitted to go on, as well as their own servants, to Leeds. The plaintiff became a passenger in a third-class carriage from Wakefield to Leeds, on the 1st March, and in the afternoon two persons, of the names of Gray and Brook, called upon the plaintiff, for the purpose of accompanying him to Leeds. They proceeded to the railway station, for the purpose of going to Leeds by the 4 o'clock train. A short time thereafter the train arrived on its way to Leeds. The plaintiff became a passenger, as well as his friends, and took their places in a third-class carriage. They proceeded without the occurrence of any particular circumstance until they came to Woodlesford. About this time, while plaintiff was conversing with one of his friends, and reclining against the door, suddenly, and without any notice, without anything in the world occurring to draw the attention of the plaintiff or his friends, the door of the waggon flew open, and the plaintiff was thrown out, and fell with one leg upon the line. Immediately the whole train of carriages behind passed over his leg, and it was superfluous to state, that the leg was irrecoverably lost. The attention of the guard was called to the circumstance, the position of the plaintiff was pointed out to him, he was implored immediately to get the train stopped, and see what could be done to the sufferer. The guard in answer said, that the man must be dead, that there was no use stopping the train, and that a fall like that must kill any man The train went on, and the man was left where he had fallen. He was thrown with his head and breast on the other line of railway, so that if a train had come up from Leeds he must have been killed, as there was a bend on the line at that part and they could not have seen him, or, at all events, they could not have stopped the train. If the train had been stopped the plaintiff might have been carried to Leeds in ten minutes, and there received the best surgical assistance; but as it was, 40 minutes elapsed before a train reached him from Leeds. The plaintiff was taken care of by some labourers on the line, and afterwards conveyed back to Wakefield, where, on the same evening, his leg was amputated a little below the knee. The learned counsel charged the company with negligence in reference to the formation of the carriage, the door of which latter was not properly fastened. A number of witnesses were examined for the plaintiff, who fully proved the case stated by the learned counsel, with the exception of the motives which induced the conductors to go forward rather than stop. Mr. Baines, for defendants, contended that the accident was not caused by any fault of the Manchester and Leeds Railway Company or of their servants, but that it was attributable to the misconduct and imprudence of the plaintiff himself. The plaintiff and his friends were conducting themselves in an improper and riotous manner before they got into the carriage at all, and while they were in the carriage they behaved in a frolicsome manner. Gray gave the plaintiff a push which forced him up to the end of the carriage, the door gave way, and he fell out. The guard made a signal to the engineman to stop the train, but as the engineman did not see the accident, but only saw a hat fall out of one of the carriages, he thought that the object for stopping the train was to pick up the hat, and, knowing that that was against the regulations of the company, he did not stop the train. There was no pretence for casting an imputation of harshness upon the company, for everything had been done for the plaintiff, after the accident, that could be done. Witnesses were then called in support of the defendant's case, but nothing was elicited tending to shake the testimony of the witnesses for the plaintiff. Mr. Knowles replied. Lord Denman summed up the case, and the Jury, after a short retirement, returned a verdict for the plaintiff—Damages 1,000*l.*

WESTERN CIRCUIT.—BRISTOL.—*Gordon* v. *Pitt.*—This was an action on a bill of exchange for 160*l.* The plaintiff, Mr. Alexander Gordon, was stated to be a gentleman of fortune, and the defendant a Lieutenant of the 11th Hussars. The drawing and acceptance of the bill was not denied, but the defendant had set up two kinds of defence: first, he said he was not liable because he was an infant at the time the acceptance was made; and, secondly, he pleaded that the bill was accepted by him for the accommodation of Lieut. Cunningham without consideration, and indorsed by him to the plaintiff without consideration.—Mr. W. Hastings Reed, of Duke-street, St. James's, was examined for the plaintiff. He deposed that he had been engaged as agent of the plaintiff in negotiating money matters on his account. Mr. Pitt, the defendant, was a Lieutenant in the 11th, or Prince Albert's Hussars. Negotiated the bill in question for 160*l.*, and paid the money to Lieutenant Cunningham, the drawer, who paid it over at once to the defendant. Saw defendant afterwards at Epsom races, and had a conversation with him on the subject of the bill, and of some others for which Mr. Cunningham had become liable for him. He expressed his regret that Mr. Cunningham should have been applied to and troubled on the subject; and he said he would pay the amount of those bills, in all 640*l.* On his cross-examination the witness stated that he was a commission agent, and when persons wanted money they applied to him, and he obtained it for them. Discounted bills for Mr. Pitt's, and also for Mr. Cunningham's accommodation. The terms of the discount were twenty per cent. per annum. There was also a procuration fee of five pounds in every 100*l.* on bills of six months, and two-and-a-half per cent. on bills at three and four months. Mr. Gordon was a gentleman of considerable property, well known as a discounter. He paid over to Mr. Cunningham for Mr. Pitt's use, at the time the present bill was discounted, 144*l.* Mr. Gordon was now at Aberystwith with a Mr. Alexander, who was his brother-in-law. They were not housekeepers; they lived in lodgings. Were sometimes in London, in Stafford-place, Pimlico. They did not now keep on a lodging in London. Was not aware that they had any ostensible property. Their property was in cash and acceptances. The attorney in this cause was Mr. Cook. Witness sometimes managed parts of his business for him. In the present case drew a part of the brief. Gordon and Alexander keep no banker.—Mr. Erle addressed the jury for the defendant. He said his client was a young man of family, born to a good fortune, who, on becoming of age, found, as young gentlemen of fortune often did, a number of claims set up against him; and addressing, as he was, gentlemen of mercantile experience, he was sure that he need do no more than simply remark how convenient it was to have a gentleman in the character of a commission agent to go between such gentlemen, and certain persons who, without being possessed of ostensible property, became the discounters of bills of exchange. On the present occasion the plea which the jury would have to try was that of infancy, for he apprehended that they would hear from his Lordship that the conversation deposed to was not one which would entitle the plaintiff to a verdict. Should the opinion of his Lordship be against him on that point, then he would ask them to consider the nature of the evidence, the account which the witness gave of himself and of the plaintiff, and ask themselves whether it had been proved to their satisfaction that such a conversation as that related had taken place. He should call before them evidence which would satisfy them of the defendant's infancy. His father, Mr. William Moreton Pitt, was for several years one of the Members in Parliament for the county of Dorset, in which he resided. He married a lady of the name of Seymour, and the present defendant was his only son. There were some remarkable circumstances connected with the birth, which would enable the witnesses to fix the date very precisely. The lady of Mr. Pitt was, in May 1821, brought to bed of twins, of which the first, a daughter, was born on the night of the 16th, and the other, the present defendant, on the morning of the 17th. He should prove these facts clearly, and, he apprehended, should entitle himself to their verdict for the defendant. Several witnesses were then called, who clearly proved the birth as having taken place on the 17th of May.—Mr. Justice Wightman, in summing up, said, although he was of opinion that even taking the conversation to have been proved to their satisfaction, the defendant was entitled to their verdict, yet in order to give the Learned Counsel an opportunity of setting him right, if he should be wrong in that opinion, he would take the verdict of the jury as to whether or not they were satisfied that the conversation had taken place. The jury having consulted for a few minutes, the foreman said, "We find for the defendant: we think the conversation did not take place."

CENTRAL CRIMINAL COURT.—*The Chartist Meetings.*—William Taylor, a plasterer, was indicted for feloniously cutting and wounding Robert Collins, a constable, with intent to do him some grievous bodily harm; by the second count he was also charged with committing the offence in order to prevent his legal apprehension. The occurrence arose out of one of the Chartist meetings which took place on Kennington Common on Monday last. It appeared that in consequence of the great mob assembled, the police were ordered to clear the common, and in doing so they were attacked in every direction with stones and other missiles. The prisoner, who was standing in the road, was observed to be amongst the most active in throwing stones. The prosecutor went towards him to take him into custody, when the prisoner knocked him down, took his truncheon from him, and struck him a violent blow on the head, which completely stunned him. The prisoner also struck him on different parts of his body, and on recovering his senses, he found himself bleeding profusely from the wound in his head. Other constables arrived at the moment, and the prisoner was taken into custody. Mr. Payne addressed the jury on behalf of the prisoner, and called several witnesses who gave him a good character, and described him to be an industrious hard-working man, and also informed the Court that he had a wife and five children. Mr. Baron Rolfe having summed up, the jury, after a long deliberation, returned a verdict of "Guilty" against the prisoner upon the second count of the indictment, but coupled with the verdict a strong recommendation to mercy on account of his previous good character. Mr. Baron Rolfe told the prisoner that his case had been considered most carefully by the jury, and they had felt themselves compelled to find him guilty. It was a very serious offence for a great number of persons to assemble together in a riotous and tumultuous manner, and it was a proceeding calculated to alarm all the peaceable and well disposed of the community. The mere pressure of persons coming to swell the numbers of the mob, and, of course, increase the alarm of the public, was in itself, therefore, somewhat of a serious kind, and it would be impossible, therefore, to pass over the offence of the prisoner without the infliction of some punishment. The prisoner was then ordered to be imprisoned and kept to hard labour for three calendar months.

The Receiving Case.—Benjamin Handley, Edward Gifford, and Sarah Ann Hunt, were charged on several indictments—Handley for stealing various articles of valuable property, Gifford and Hunt for receiving the same, knowing them to be stolen. Handley pleaded guilty. The particulars of the finding an enormous quantity of stolen property in the house of the prisoners, in Warwick-street, Charing-cross, have appeared at great length within these few weeks in the daily papers. The evidence confirmed the indictment in all particulars. Gifford and Hunt were sentenced each to 14 years' transportation, and judgment on Handley was postponed, in the expectation that he will make important disclosures. There are still 14 indictments against the prisoners not yet disposed of.

The Rev. Stephen Aldhouse, late curate of Allhallows, Lombard-street, was placed at the bar, charged with feloniously marrying Hephzibah Roberts, his wife being alive. Mr. Clarkson stated the case. He said the prisoner was a clergyman of the church of England, and then proceeded to detail the facts as they appeared in evidence. John Yarrow, parish-clerk of St. Leonard's, Shoreditch, produced the register of the marriage of the prisoner with Frances Morse, on the 21st of January, 1824. William Webb, parish-clerk of St. James's, Clerkenwell, produced the register of the marriage of the prisoner, who was styled the Rev. Stephen Aldhouse, clerk, widower, to Hephzibah Roberts, widow, on the 4th of January, 1831. Several witnesses were then examined, and the jury returned a verdict of "Guilty." The Recorder said, that it was most painful to the court to have to pass sentence upon a gentleman of education, and especially of one holding the position in life which he did, and belonging to such a profession. The injury which he had done to the lady with whom he had gone through the ceremony of matrimony, was a very great one. He (the Recorder) felt bound to say, that in all similar cases the court had considered it their duty to send the offender out of the country, where the education and position of the party aggravated the offence. The court felt bound to pass the full sentence of the law upon him, there being no extenuating circumstances in his case. But if he succeeded in obtaining a mitigation of the sentence from another quarter, the court would not interfere to hinder its effect. The Recorder then pronounced the sentence of transportation for seven years.

TATTERSALL'S, THURSDAY.—A considerable number of bets were laid on the St. Leger in the course of the afternoon, without in any material instance affecting the previous prices; the only novelty was an official announcement that The Golden Rule will not start either for the Leamington Stakes or the St. Leger. Closing prices:—

LEAMINGTON STAKES.

7 to 4 agst	Retriever (taken)	5 to 1 (offered) against Retriever winning this and the Great Yorkshire Handicap (take 6 to 1)	
1 to 1	Rhodanthe (taken)		

ST. LEGER.

5 to 4 agst	Attila (taken several times)	22 to 1	Ballinkeele
		25 to 1	Rosalind (taken)
12 to 1	Policy (taken)	50 to 1	Cattonite (taken)
12 to 1	Fireaway (taken)	35 to 1	Master Thomas (takn.)
15 to 1	Cabrera (taken)	50 to 1	Sir Harry (taken and afterwards offered)
15 to 1	Eboracum (taken)		
18 to 1	Seahorse (taken and afterwards offered)	50 to 1	Belcœur (taken and afterwards offered)
20 to 1	Agreeable colt (taken and afterwards offd.)	10 to 1	Scott's lot, bar Attila, (taken)

It is stated in sporting circles that the Hon. Col. Anson and Lord Chesterfield have determined to follow the example of the Marquis of Westminster, and sell off the greater part of their valuable racing studs: Col. Anson's stud has already been despatched to Bretby Park, the seat of Lord Chesterfield, for sale.

MARK LANE, FRIDAY, SEPT. 2.—Since this day se'nnight there has been an extensive sale of Foreign Wheat, and on Wednesday, at rather improving prices; the demand still continues, although it has been checked by the advance asked to-day, yet there has been a fair sale at an improvement of 2*s.* to 3*s.* from Monday.—There was scarcely any English Wheat at market, but it would sell at more money.—Other articles are unaltered in value.—Oats continue very dull.

Frames, appropriated to the growth of greenhouse-plants in winter . . . . 588 *a*
Gardeners' Foreign Library . 591 *c*
Geodorum nutans . . . 589 *b*
Gooseberries, to force . . 589 *a*
Groom's Nursery, noticed . 592 *a*
Ipomœa Learii, in the open air 589 *a*
— Quamoclit, its treatment in America . . . 591 *c*
Iris, good kinds of . . . 590 *a*
Leaves, their transformation into fruit . . . . 587 *a*
Lobelia gracilis, hardy . . 589 *b*
Mormodes luxatum . . . 591 *b*
Onion-grub, to destroy . . 589 *c*
Organic Mineral Manures, No. 5 587 *c*
Pæony, good kinds of . . 589 *c*
Pears, good kinds . . . 593 *c*
— to ripen late kinds . 588 *c*
Pine-plants, cause of their turning yellow . . . . 593 *c*
Plants, ornamental kinds for the border . . . . 589 *a*
Plants suitable for edgings . 589 *b*
Poplar, its treatment in Ladakh 591 *c*
Potatoes, good early kinds . 593 *b*
Potentillas, to propagate . . 593 *b*
Primula denticulata . . . 591 *b*
Shrubs, flowering . . . 593 *b*
Sobralia macrantha . . . 591 *b*
Soliya heterophylla, its treatment . . . . . 593 *b*
Strawberry, Myatt's Eliza . 593 *c*
Timber, best season for felling 593 *a*
Transplanting, season for . 593 *b*
Tropæolum azureum . . 591 *c*
Vanda cristata . . . . 591 *b*
Vegetable Marrow, to raise seeds 589 *c*
Vines, benefit of syringing . 589 *a*
Wasps, to destroy . . . 589 *c*
Weeds, perennial, to extirpate 587 *a*
— to destroy their seeds . 593 *b*
West's remarks on the Mismanagement of Timber, rev. 592 *a*

FLORICULTURAL SOCIETY OF LONDON.— The DAHLIA SHOW is appointed for TUESDAY, the 20th SEPT., at the CROWN and ANCHOR TAVERN, STRAND, when the following Prizes will be awarded:—

Amateurs growing above 200 plants, 1st prize, 3*l.*; 2d, 2*l.*; 3d, 1*l.* Amateurs growing under 200 plants, 1st prize, 2*l.*; 2d, 1*l.* 10*s.*; 3d, 15*s.* This class is confined to Members.

Professional Florists, 1st prize, 3*l.*; 2d, 2*l.*; 3d, 1*l.* 10*s.*; 4th, 1*l.* Entrance: Members, 2*s.* 6*d.*; non-members, 7*s.*

Open to all Classes—For the best Purple, Crimson, or Dark Self, 10*s.*; Rose, 10*s.*; Scarlet, 10*s.*; Yellow, 10*s.*; *White, 10*s.*; Edged, 10*s.* Entrance: Members, 1*s.*; non-members, 3*s.*

Seedlings—the number of Prizes is not limited, but left to the discretion of the judges.

	£	s.	d.
1841, 6 Blooms, 1st class prize .	1	0	0
Do. do. 2d do. . .	0	10	0
1842, 1 Bloom, 1st do. . .	0	10	0
Ditto, ditto, 2nd ditto		0	5

Entrance—Members, 1*s.*; Non-Members, 3*s.*

The last exhibition of White Seedling Dahlias of 1841, for a 5*l.* 5*s.*, offered by Mr. Wildman, will take place on the 20th.

Notice to be given to the Secretary on or before Monday, the 19th inst., addressed Grove-place, Southampton-street, Camberwell. Exhibitors to provide their own stands; and parties wishing to show Seedlings, may forward the same to the Secretary, at the Crown and Anchor Tavern, Strand, with the entrance money; but none will be received unless accompanied by the names intended to be given to them. Seedlings may be exhibited in the classes, but not on stands.

T. C. WILDMAN, Hon. Sec.

N.B.—The Society had intended to meet every week during September, but in consequence of the South London Society's Show taking place on Tuesday, the 14th, the Floricultural Society will only meet on Tuesday, the 20th and 27th of this month.

* And the entrance money paid for Mr. Wildman's prize.

ROYAL SURREY ZOOLOGICAL GARDENS.

LAST FLOWER SHOW OF THE SEASON!—NEXT TUESDAY.

THE ROYAL SOUTH LONDON FLORICULTURAL SOCIETY'S GRAND AUTUMNAL DAHLIA SHOW and Miscellaneous Exhibition of Flowers, Fruit, and Vegetables, takes place on TUESDAY, Sept. 13th.—73 Gold and Silver Medals will be awarded, 23 Prizes for Dahlias, and 50 for Asters, Miscellaneous Plants, Heartsease, Cut Flowers, Roses, British-grown Fruit and Vegetables, Specimen Plants, Orchidaceæ, &c. J. Bent, Esq.

PRIZES.

1st Class,	Amateurs, or Gentlemen's Gardeners,		24 Blooms	4 Prizes	
2nd „	„	„	6 „	4 „	
3rd „	Nurserymen		36 „	4 „	
4th „	„		12 „	4 „	
5th „	Seedlings	1841	4 „	8 „	
6th „	„	1842	1 „	4 „	

Entrance, to the 1st, 2nd, 3rd, and 4th Classes, 10*s.* 6*d.*
„ „ 5th and 6th, 5*s.* each.

Entrances to be made on or before the 13th of September. Stands will be provided for the Exhibitors. Seedlings not to be exhibited in the Stands with named Flowers. Each Exhibitor to take a Dinner Ticket. No Flowers to be removed before Six o'clock.

As the first Train from the West of England, and the Quarter-past Ten from London, arrive at Slough before Eleven o'Clock, advantage may be taken of these Trains for the conveyance of the Blooms, as the time for staging is extended to Half-past Eleven o'Clock. Trains arrive at the Slough Station every hour throughout the day.

A Military Band will be in attendance. Doors to be opened at One o'Clock. Tickets 2*s.* each, and after Four o'Clock 1*s.* each.

All communications to be addressed to

MR. THOMAS BROWN, Slough,
Honorary Secretary.

CROYDON FLORAL AND HORTICULTURAL SOCIETY. The last Exhibition for the year 1842, of FLOWERS, FRUIT, &c., for Prizes, will take place in the Garden of T. L. Robinson, Esq., on Thursday, September 15th, 1842; on which occasion a Band will be in attendance.

Admittance from 2 o'clock till 5.—Subscribers, Gratis.—Non-Subscribers, One Shilling.—Children, Sixpence.—Gardeners of Subscribers and Cottagers exhibiting admitted Gratis after four o'clock.

The Members of the Society, and Friends introduced by them, will dine together at the Greyhound on the day of the Exhibition, at five o'clock precisely. Tickets (10*s.* 6*d.* each) to be obtained of Mr. Gardner, the landlord, on or before Monday, the 12th of September.

Tickets and lists of the Prizes may be obtained at Mrs. Ebbutt's and Mr. Robt. Henbrey's, High Street, Croydon; where Subscriptions and Donations may be received.

MANCHESTER BOTANICAL and HORTICULTURAL SOCIETY.

PATRONS.

The Right Honourable the Earl of Stamford and Warrington.
The Right Honourable the Earl of Wilton.
Sir Thomas de Trafford, Bart.

PRESIDENT.—Lord Francis Egerton, M.P.

VICE-PRESIDENTS.

Wilbraham Egerton, Esq.
R. W. Barton, Esq.

Thomas Fleming, Esq.
William Entwisle, Esq.

The Third Exhibition for 1842 will be held at the Gardens, Old Trafford, on Friday, September 16th, at One o'clock at Noon, when Prizes will be awarded to Gentlemen, Amateurs, Gardeners, Nurserymen, and Cottagers, for the best specimens of Dahlias, Stove and Greenhouse Plants, Fruits, and Vegetables.

Regulations for Exhibiting.

Productions may be exhibited, from any part of the kingdom, either for sale or competition, free of any charge.

Specimens intended for exhibition or competition, forwarded from the country, addressed to the Secretary, with instructions, will be duly attended to; and he will see that they are properly staged, without charge, and returned to the contributor.

Specimens intended for exhibition must be at the Gardens, and a list given to the Secretary, containing the names of the Plants, Flowers, Fruits and Vegetables, not later than half-past nine o'clock; and all productions must be placed in the several classes, and all labelled with their proper names, not later than eleven o'clock; after which time none will be allowed to be staged. The specimens must remain staged until six o'clock, when they will be delivered to the Exhibitors.

Regulations for Admission.

Hereditary Members and Annual Subscribers of Two Guineas have free admission to the Exhibitions and Gardens for themselves and all the resident members of their families.

Annual Subscribers of One Guinea have the right of personal admission only to the Exhibitions and Gardens, during the current year of their subscription.

Non-Subscribers 2*s.* 6*d.* each, from One to Six o'clock.

S. E. COTTAM, Sec.

STAPLETON ROAD NURSERIES, near BRISTOL. W. MAULE and CO. beg to call the attention of Horticulturists to a new and desirable FUCHSIA, which they intend sending out by the name of "Raccmiflora élegans." Its habit is gracefully elegant; the lateral branches are set at every joint with numerous long deep-red flowers, 1½in. to 2in. long, drooping around the main stem of the plant, forming a complete column of beauty. It is allowed by competent judges to be one of the best varieties in cultivation.—Fine strong plants, in bloom, will be sent, if ordered, at 5*s.* or 7*s.* 6*d.* each.

CARNATIONS, PICOTEES, AND PINKS.— NATHANIEL NORMAN, Florist, begs to call the attention of the Nobility, Gentry, Amateurs, and his friends generally, to his select Collection, comprising the finest show varieties, with which he has gained twenty prizes this season at the following Societies: London Horticultural, Royal South London, South Essex, and Floricultural Society of London. Has 10,000 Plants now ready, in fine healthy condition.

Catalogues may be had on prepaid application.—Bull Fields, Woolwich.

MYATT'S BRITISH QUEEN STRAWBERRY, after two years' competition, still maintains its pre-eminence; and, in returning thanks to their numerous patrons and friends, J. and W. Myatt beg to say they can with confidence recommend it as the most superb fruit yet known.

Also their new Seedling Strawberry Prince Albert, which for productiveness and size cannot be equalled. Price per 100, each, 50*s.*; and their Eliza, 20*s.* Runners are now ready, and may be had on application to them at Manor Farm, Deptford.

Myatt's famed Victoria Rhubarb, 50*s.* per 100 sets, or 1*s.* 6*d.* per root, will be ready in October.

MICHAEL BREWER, Nursery, London Road, Cambridge, begs respectfully to call the attention of the Nobility, Gentry, and the Public to that invaluable new Strawberry, the EMPEROR. It is a strong grower, a great bearer, and has a fine flavour, with large scarlet fruit superior to Keen's Seedling, with the great advantage of being ripe a fortnight earlier.

Fine strong plants are now ready at 30*s.* per 100.

MESSRS. TYSO and SON, Wallingford, Berks, respectfully invite the attention of the Nobility, Gentry, and the Public, to their Extensive Collection of FLORIST'S FLOWERS, a descriptive priced Catalogue of which may be had *gratis*, on prepaid application, enclosing a twopenny postage label.

TULIPS.

Messrs. T. and Son have 460 varieties, embracing most of the new and approved sorts, which they offer at the following low prices, in beds, containing an equal number of Roses, Byblœmens, and Bizards, under name, arranged for planting:—

	£	s.	d.
1st ASSORTMENT.—A bed of 30 rows, or 210 bulbs, including many extra fine new sorts	20	0	0
A bed of 40 rows, or 280 bulbs, ditto . .	25	0	0
2d ASSORTMENT.—A bed of 30 rows, including many very fine sorts	12	0	0
A bed of 40 rows ditto . .	15	0	0

RANUNCULUSES,

In assortments, with names from 50*s.* to 100*s.* per hundred; and fine Mixtures, from 5*s.* to 20*s.* per hundred. Splendid new Seedlings, 100 varieties, 10*l.* Mixed Seedlings, from 5*s.* to 40*s.* per hundred. SEED saved from named Sorts, 5*s.* and 10*s.* per paper. Named Ranunculuses and Seed can be forwarded with safety *by post*, and will be sent free, to gentlemen forwarding the cash with the order.

FERNS.

WM. PAMPLIN, NURSERYMAN, LAVENDER HILL, WANDSWORTH, begs to invite attention to his Collections of that beautiful tribe of Plants—the Ferns. W. P. offers strong healthy Plants in pots at prices varying from 9*d.* and 1*s.*, to 10*s.* each, according to rarity of species, &c.

W. P. will also supply ASSORTED COLLECTIONS as follows:

	£	s.	d.
A Collection of Forty species for .	2	2	0
„ of Twenty „ . .	1	5	0

Wardian cases of Ferns, or Ward's portable Greenhouses, of various sizes and prices, with the Plants, from Seven Shillings and Sixpence to Two and Five Guineas.

*** Wardian Cases fitted up and furnished with Plants at very moderate prices.—Lavender Hill Nursery, Sept. 10, 1842.

TO GROWERS OF HYACINTHS, AND OTHER DUTCH BULBS.

MESSRS. YOUELL have much pleasure in announcing that they have just received their importation of the above direct from Haarlem, the Bulbs being remarkably large and sound. For particulars see their advertisement in the *Gardeners' Chronicle* of 27th August.

Catalogues may be had on application.

Great Yarmouth Nursery, Sept. 1st, 1842.

S. GIRLING begs to inform the Public that he will have strong and well-rooted Plants of the following ready for delivery on and after the 1st of October:

PANSIES.

DESIDERATA.—For colour and description of this beautiful Pansy, see *Gardeners' Chronicle* for May 28th of the present year. F. Barnes's, No. 5. Price per plant, 7*s.* 6*d.*

CLARA.—Upper petals, bright puce; lower petals, pure white, with a splendid eye; quite round, flat, and superb show flower. Price 5*s.*

PHLOX OMNIFLORA MAGNA.

This splendid Phlox is of a pure white, very large, round, and of excellent habits; very superior to any Phlox in cultivation. Price 5*s.*

VERBENAS.

IGNESCENS.—A bright fiery scarlet, producing large corymbs of fragrant flowers, equal in size to V. Delicata. Price 3*s.* 6*d.*

EXIMIA.—A bright, rosy pink, close and compact growing, large, and very fragrant, and quite distinct from any out. Price 3*s.* 6*d.*

N.B.—No allowance to the trade unless three or more of either variety are taken.

S. G. likewise begs to state he has strong plants of his much-admired Seedling Verbenas of last and the preceding year's growth, viz., Teucrioides carnea, T. rosea, Barnesii, violacea, delicata, punicea, &c., &c., at moderate prices.

Remittance or reference from unknown correspondents is respectfully solicited, and early orders are particularly recommended, as the stock of some is limited.

P.S.—Orders taken by Warner and Warner, Cornhill.

Danecroft Nursery, Sept. 8, 1842.

GENUINE DUTCH AND CAPE BULBS.

J. CARTER, Seedsman and Florist, 238, High Holborn, London, begs to inform his customers, that his annual supply of DUTCH AND OTHER FLOWER BULBS is now arrived. On account of the very favourable season the quality is much finer than usual.

GUERNSEY AND BELLADONNA LILIES, 8*s.* per dozen, box included. These ought to be planted as soon as possible.

CARNATIONS AND PICOTEES.

FLORISTS TO HER MAJESTY THE QUEEN DOWAGER.

YOUELL & CO.'s Superb Collection of the above will be found to contain every attainable variety worthy of cultivation; and having spared no expense in rendering their Collection the most extensive and select in the kingdom, they beg to announce that they purpose commencing to execute orders the first week in October, upon the following terms:—

	£	s.	d.
25 pairs of extra fine first-rate Show flowers,	5	0	0
12 „ do. do. do.	2	10	0
25 „ of fine Show flowers, . .	3	0	0
12 „ do. do. . . .	1	10	0
25 „ of extra fine Show Pinks, . .	1	4	0
12 „ do. do. . . .	0	12	0

The selection being left to Y. & Co.

They beg further to state that, having a peculiar mode of packing the above plants, so as to insure their safe delivery in any part of the United Kingdom per Post, for the information of parties at a distance, wishing to avoid the expense of Carriage, Package, &c., they will send them free of postage, at the extra charge of 2*s.* per doz. pair.

A Post-office order, or reference, is respectfully requested from unknown correspondents.

Catalogues may be had on application, by enclosing two postage stamps.

NEW SUPERB FUCHSIAS.

Youell & Co. beg respectfully to state, that they continue sending out, per Post (free), their Superb Collection of Fuchsias, at the rate of 21*s.* per doz.

Great Yarmouth Nursery, Sept. 8, 1842.

ROSES.

MESSRS. PAUL and SON, CHESHUNT, HERTS, beg to inform Rose Amateurs and the Public in general, that they have just published a NEW CATALOGUE OF ROSES, 24 pages octavo, and which will be forwarded upon application, inclosing four Postage Stamps, post free.

Their Stock of Roses is this season unusually large and fine, and has received an addition of many new and beautiful varieties, and they trust that the moderate rate of charges will induce Rose Cultivators to favour them with their commands, which they pledge themselves shall be executed in the best possible manner.—A remittance, or reference, respectfully solicited from unknown Correspondents.

All Packages delivered free of carriage in London.

Cheshunt, Sept. 7th, 1842.

MAJOR'S BRIDEGROOM PANSY.

H. MAJOR, Knosthorpe, near Leeds, begs to announce that he will be able to send out Healthy Plants of the above beautiful Pansy about the middle of September, at *5s. 6d.* each. H. M. has no hesitation in pronouncing it one of the best Pansies out; it is a large and well-formed flower, of good substance, and of well-defined colours. The centre is pure white, with large mulberry eye; the upper petals present a clean bright purple; the lower petals are deeply belted with rich violet; and the flower has the valuable property of retaining its colours till it begins to decline. The Editor of the *Gardeners' Chronicle* (No. 29) speaks thus of it. "H. Major.—The Pansy you intend to name Bridegroom is a desirable flower; the eye is bold, and the general form of the flower good; the inside is a good white, and the border round the under petals deep and rich."

Plants will be sent by Post free of expense. From unknown correspondents a remittance will be required with the order. A priced list of a few select Pansies may be had on Post-paid application.

September 5, 1842.

THOMAS BROWN begs to draw the attention of Amateurs and Florists to the following Rose-leaf seedling Pinks, three of which have had first-class Prizes awarded them at the Floricultural Society's Exhibition on the 21st June last, and also received first, second, third, and fourth prizes at the Slough open Show, June 24th :—

Eclipse, per pair, *7s. 6d.* Model, per pair, *7s. 6d.*
Garland, do., *7s. 6d.* Acme, do., *7s. 6d.*

With a choice selection of the most approved Show Flowers, also several superb new Pansies, and all the leading kinds in cultivation, strong and healthy plants of which are now ready for delivery. Slough Nursery, Sept. 11, 1842.

UNION ROAD NURSERIES, PLYMOUTH.

WILLIAM E. RENDLE, Nurseryman, Seedsman and Florist, has the pleasure of offering to the Nobility, Amateurs, and the Trade, the following new varieties of

PELARGONIUMS,

raised by P. E. Lyne, Esq., of Lipson, the entire stock of which he has succeeded in obtaining :—

Lyne's Sunrise	£3	3	0	each
,, Duke of Cornwall	3	3	0	,,
,, Lord Ebrington	2	2	0	,,
,, Princess Royal	2	2	0	,,
,, Cynthia	1	10	0	,,
,, Modesty	1	10	0	,,
,, Hamlet	1	10	0	,,
Bassett's Glory of the West	2	2	0	,,

The usual Discount to the Trade.

Strong Plants of Princess Royal and Glory of the West are now ready for delivery. The other sorts will be sent out in October.

Agents in London—Messrs. Warner, Seedsmen, Cornhill, and Mr. Wm. Bristow, Seedsman, Knightsbridge; from whom Plants and descriptions can be procured, and where drawings of some of the sorts may be seen. Descriptions of the Seedling can also be had on application at the Union Road Nursery, Plymouth.

Union Road Nursery, Plymouth, August 3, 1842.

TO GROWERS OF PANSIES.

JAMES MAY begs to inform his Patrons and Friends he has now ready fine Plants of every known first-rate variety, and will feel obliged by early orders. J. M. is sorry, in consequence of his late removal, and the very hot, dry season, he was not able to supply the very numerous orders he received; but hopes now to be able to supply any orders he may be favoured with. The following is a list of a few first-rate kinds, any of which may be had at 21*s.* per dozen, package included, viz.:—Peter Dick, Duke of Cornwall, Lord F. Egerton, Colonel Dundas, Jehu, Triumph, Diana Vernon, Glory of Knosthorpe, Jewess, Paul Pry, Eclipse, Miss Stainforth, Nicol Jarvie, delicata, Goldsmith, Souter Johnny, Van Amburgh, Launcelot, Amulet, Imogene, Sir William Wallace, Mrs. Long, Lady Glenallen, Sir J. R. Reid, Jenny Jones, Sophia, Admirable, Defender, Bianca, Commander, Laura superba, Alarm, majestica, Regulator, alba maculata, Advocate, Queen of the Whites (May's, *the best white known*), Haidee, Champion, Great Western, Mulberry Perfection, &c., &c., &c.

J. M. begs to inform the Public that his Collection of Pansies consists of more than 600 named varieties, many of which may be had at 6*s.*, 9*s.*, to 12*s.* per dozen. Extra fine Pansy Seed, all warranted, collected from the best varieties, which can be sent by Post, free, at 2*s.* 6*d.*, 5*s.*, to 10*s.* per packet.

A remittance respectfully requested from unknown correspondents; if by Post-office order, please to draw upon the Edmonton Post-office, or General Post-office, London.

Pansy Nursery, Tottenham, near London.

ROBINSON'S NOTTINGHAM HERO PICOTEE.

J. F. WOOD, Nurseryman and Florist, of the Coppice, near Nottingham, is commissioned by the Proprietor to dispose of the above splendid Light-edged Purple Picotee, exhibited and named this season at the London Floricultural Society's Show, at 10*s.* 6*d.* per pair. It is a large rose-petalled Flower, and a decided improvement on that universal favourite "Giddens' Vespasian;" and can be recommended as first rate.

The price being moderate, considering the smallness of the stock and quality of the flower, it is indispensable that all favours should be accompanied with a remittance or Post-office order.

SUPERB SEEDLING DAHLIAS OF 1841.

F. AND A. SMITH and Co. beg to invite Amateurs and the Trade generally to inspect their SEEDLING DAHLIAS, Bianca, Sir R. Sale, Rainbow, Duke of Wellington, &c., whilst in growth; and they flatter themselves that they will (from their novelty and superior form) well repay the trouble of a visit, and prevent disappointment. Blooms may also be seen at most of the Seed-shops in London.

The Nursery is situated on the High Road. Omnibuses from the Royal Exchange, and Flower-pot, Bishopsgate-street, pass every quarter-of-an hour—Fare 6*d*.

Hackney, London.

ECONOMIC LIFE ASSURANCE SOCIETY, No. 34, BRIDGE-STREET, BLACKFRIARS, LONDON. Established 1823. Empowered by Act of Parliament, 3 William IV.

Lower rates of premium than those of any other office, that entitle the assured *to participate in the profits*, as follows :—

Age.	15	20	25	30	35	40	45	50
Annual Premium per cent.	1 10 8	1 14 7	1 19 0	2 4 3	2 10 11	2 19 9	3 11 9	4 8 0

The Bonus declared in 1834 amounted upon an average to 16*l.* per cent. on the premiums then paid; and in 1839 a second Bonus was awarded, amounting on the average to 31*l.* per cent. on the premiums paid during the preceding five years.

No extra charge for residence in any part of Europe, nor for proceeding (in a decked, sailing, or steam vessel) from any one Port thereof to another during peace, to Assurers, not being seafaring men by profession. Licenses are granted to go to any part of the world upon terms proportionate to the risks.

Policies on the lives of persons dying by suicide, duelling, or by the hands of justice, are not void as respects the interests of parties to whom they may have been legally assigned.

Assurances may be effected on any and every day.

By order of the Board of Directors,
Campbell James Downer, Secretary.

TO NURSERYMEN, PINE-GROWERS, AND OTHERS.

MESSRS. PROTHEROE & MORRIS are instructed by the Trustees of Messrs. Adamson and Son, Stoke Newington Common, to submit to public competition on the premises, on Monday, Sept. 19th, 1842, and following days, at 11 o'clock, the whole of their celebrated Stock of Pine Plants, Greenhouses, Hothouses, Graperies, Carts, Waggons, and general Farming and Agricultural Implements, and a considerable quantity of Building Materials. The whole comprises about 35,000 feet of Glass, with Brick and Ironwork and Water Apparatus complete; about 6,000 Fine plants of the first quality, and well-known established Stock; a considerable number of Cucumber, Melon, and other Frames and Lights; the stock of Greenhouse and other Plants, Garden Pots, &c.

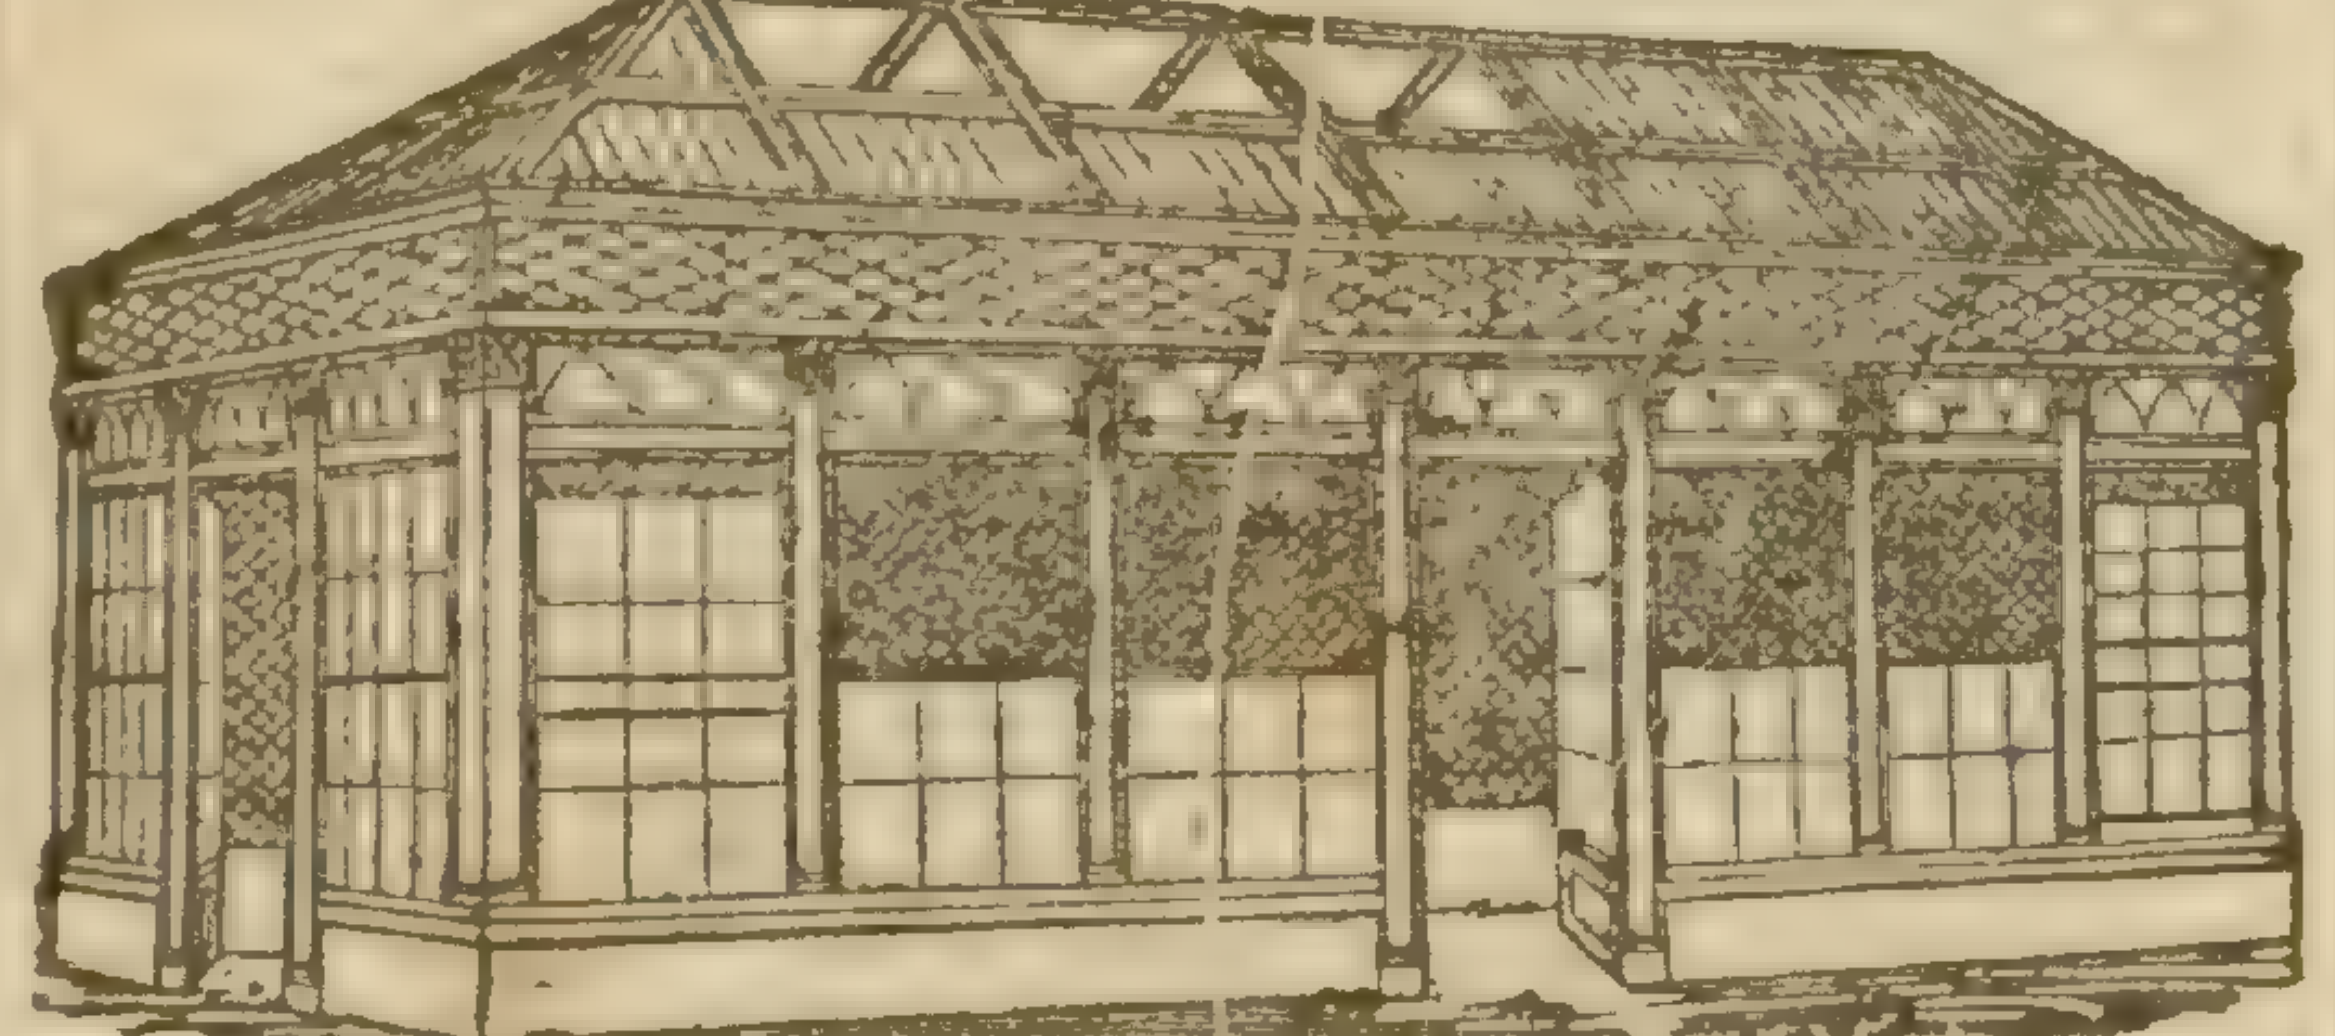
May be viewed a week prior to Sale. Catalogues may be had of the principal Seedsmen, on the premises, and of the Auctioneers, American Nursery, Leytonstone.

The whole of their valuable Nursery and other Stock will be disposed of by public Auction about the third week in October next, of which timely notice and particulars will be given.

BELGRAVE NURSERY.

MESSRS. PROTHEROE & MORRIS are instructed by Mr. J. Rogers, to offer to Public Auction, on Monday the 26th Sept. 1842, and following days, on the Premises, Eaton-square, Pimlico, in consequence of the lease having expired—The Glass and Erections of several Greenhouses and Pits, Brickwork, about 300 feet of 6-inch Waterpipe, a quantity of Flints suitable for Rockwork, and a large quantity of York Paving; also the whole of the Nursery Stock, consisting of Fine large bearing Standard Mulberries, Almonds, Acacias, Limes, Poplars, Bignonias, Catalpa, Lilac, Cytisus, Laburnum, fine Hollies, Laurels, Privets, Box, Roses, Laurustinus, Aucubas, Bays, Scarlet and White Rhododendrons, Cedars of Lebanon, Evergreen Oaks, Arbor-vitæ, Cypress, Daphnes, Jasmines, a large quantity of Ivys in pots from 3 to 8 feet, Large Privet Hedges, Box Edging, Thrift, &c.; Pinks, Carnations, Herbaceous Plants, &c. &c.

May be viewed a week prior to the Sale.—Catalogues to be had on the premises, of the principal Seedsmen in London, and of the Auctioneers, American Nursery, Leytonstone.



HORTICULTURAL BUILDING AND HEATING BY HOT WATER.

J. WEEKS and Co., Architects, &c., Gloucester-place, King's-road, Chelsea, Hothouse Builders and Hot-water Apparatus Manufacturers, beg leave to inform the Nobility and Gentry that their business, which has been extensive throughout the country for many years, is entirely confined to the BUILDING OF HORTICULTURAL ERECTIONS of every description, and the HEATING of them by HOT WATER.

CONICAL and other BOILERS of all sizes; their largest consumes but a small quantity of fuel, only requiring attention once in 10 hours, and will heat a range of Forcing Houses 300 ft. in length.

Their improved plan of BOTTOM HEAT FOR PITS, by means of an open trough under the bed, is now being universally adopted.

References may be had, and their works seen at most of the Nobility and Gentlemen's Seats in the country, nearly the whole of the London Nurseries, and a great variety of Horticultural Erections and Hot-water Apparatus, Models, Plans, Estimates, &c., at their Horticultural Manufactory, Gloucester-place, Chelsea, near Sloane-square.

HOT-WATER APPARATUS FOR HEATING HORTICULTURAL BUILDINGS, DWELLING-HOUSES, CHURCHES, and MANUFACTORIES, upon improved principles, and at very moderate charges, erected by DANIEL and EDWARD BAILEY, 272, HOLBORN.

D. and E. Bailey having devoted much time to the consideration of this subject, and had much experience in the erection of apparatus for the above-mentioned purposes, have, by improvements suggested in their practice, rendered their mode of heating not only very efficient, but very simple, and have combined durability in the apparatus with economy in the charge. They have erected apparatus in England, Scotland, and Ireland, for many noblemen and gentlemen, and have had the honour to be employed by the Horticultural Society of London, in executing the works of their splendid Conservatory, lately erected at Chiswick.

D. and E. Bailey also construct in metal all descriptions of Horticultural Buildings and Sashes, and invite noblemen, gentlemen, and the public to an inspection of their various drawings and models, at 272, Holborn, where they have the opportunity of exhibiting, amongst other metal works, an extremely complete and convenient kitchen apparatus, or range, adapted for the continued supply of hot water, and an arrangement of the oven more complete than has hitherto been brought before the public.

D. and E. Bailey were the first to introduce metallic curvilinear houses to horticulturists, and can refer to the Conservatory attached to the Pantheon as one of their works, besides many others in this country and on the Continent.

D. and E. Bailey have prepared a quantity of the Galvanic Plant Protectors, which are now ready for immediate delivery; they beg to introduce to public notice a new Trough Pipe, for Orchidaceous or other Houses where vapour is constantly, or at intervals, required, and which may be seen at their Manufactory.

HOT-WATER APPARATUS, for Horticultural and other Buildings.—STEPHENSON and Co., Agents for the Old Park Iron-works, and Manufacturers, 61, Gracechurch-street, London, solicit an inspection of their improved Conical Boiler. (See Editor's description, *Gardeners' Chronicle*, March 12, p. 175.) To Amateurs these Boilers will be found invaluable. They are complete without furnaces or setting in brickwork, movable at pleasure, very ornamental in appearance, and require attention only once in 14 or 15 hours, price 5*l.* 5*s.* and upwards. Further particulars, with plans and estimates for heating any description of building, may be obtained as above; where also may be seen the improved Wrought-iron Boiler, as applied with Chanter's Smoke-consuming Furnaces at Chatsworth, and many other of the Nobility's Seats. Iron Fencing, Hurdles, Bedsteads, Ornamental Wire-work, Garden Implements, &c. &c. The trade supplied with Hot-water Socket-pipes.

N.B.—Wayte's New Patent Land-pressers and Drills.

EDWARD BECK, MANUFACTURER IN SLATE, Isleworth, Middlesex, respectfully informs Horticulturists, that his IMPROVED SLATE TUBS for Orange Trees and Conservatory Plants, mounted upon rollers, Slate Cisterns, Shelves, and Edgings for garden paths, may be seen in use at his house upon application to the gardener.

JOHN SEYMOUR will be glad to engage himself to any Nobleman or Gentleman as Gardener. He is well acquainted with the management of the Forcing, Kitchen, and Flower-garden Departments; and can have an excellent Character from the Honourable and very Rev. W. Herbert, with whom he has lived six years. He is 40 years of age, married, and has two children, the youngest 4½ years old.—Apply to Mr. Seymour, Carlton Hall, Selby, Yorkshire; or Mr. C. Farnes, 128, St. John Street, West Smithfield, London.

WANTS a SITUATION as GARDENER, in a single-handed place, or where a Man is kept, a respectable Man, aged 28; he has two years' good character from his late Master. Direct, Post-paid, to A.B., at J. and J. Fairbairn's, Nurserymen and Seedsmen, Clapham.

WANTS A SITUATION as GARDENER, a respectable Young Man, aged 28, who has a perfect knowledge of the Forcing, Flower, and Kitchen Gardens, and can be well recommended from the Situation he has just left, from which he can have two and a half years' undeniable character. He has likewise lived in the first of families. Direct to E. H., 2, Ingleton-street, North Brixton, Surrey.

WANTS a SITUATION as BAILIFF, or BAILIFF and GAMEKEEPER, an active Man, well understanding the business in all its branches; also the Management of Cattle and Marketing; with four years' character from his last place. He has a Wife, who understands the Dairy and Poultry.—Address J. M., 20, New Manor-street, King's Road, Chelsea.

WIRE-WORK, HOT-WATER APPARATUS, GREEN-HOUSES, &c.

ST. THOMAS BAKER, MANOR-HOUSE, MANOR-PLACE, KING'S-ROAD, CHELSEA, Manufacturer of INVISIBLE WIRE FENCE, to resist Grazing Stock, and rendered Rabbit-proof. WIRE-WORK in Trainers, Arches for Walks, Bordering, Flower-stands, Pheasantries, &c. HORTICULTURAL BUILDINGS, Green and Hothouses, Conservatories, &c. The same heated by HOT-WATER APPARATUS, on improved and economical principles.

Parties waited on in Town or Country, and Drawings and Estimates free. Work for the Trade as usual.

Ready for the Press, and shortly will be Published,

A COMPREHENSIVE PRACTICAL TREATISE, or a New Era in the CULTURE OF THE VINE UNDER GLASS, as to its earlier Precocity, &c. &c. Giving a plain, comprehensive, practical detail of the Author's Practice of propagating the Vine; Formation of Borders with proper composts; Planting the same on Scientific Principles, so as to bring it to a permanent bearing state some years earlier than usually practised; Summer and Winter Pruning; Temperature, in all its stages through the season; Thinning of the Fruit, reduced to fixed principles; on the colouring of the same; with a thorough Preventive of that bane of all success, Shaking and Shivering of the Footstalks and Fruit. Giving a complete Course of Culture, from the embryo bud to the permanent bearing of the plant, as practised by himself, carefully collected from great study. A Guide to the Amateur, the Tyro, and rising generation of Gardeners.—By JAMES ROBERTS, Gardener to Matt. Wilson, Esq., Eshton Hall, near Skipton, Yorkshire.

THE GARDENER AND PRACTICAL FLORIST, No. II., contains—Geraniums and Geranium-Growers; Thompson on the Heartsease; Hints to Young Florists; Culture of the Horse-Radish; Properties of Flowers and Plants; The Tulip; The Wages of Gardeners; Culture of the Dahlia; Horticultural Shows, their effect on Science and Morals, by a Country Clergyman.

⁂ The Gardener *is published weekly, price* 3*d*., *and in monthly parts, price* 1*s*.; to be had or ordered of all Booksellers and Newsmen. London: R. Groombridge, Paternoster-row; where all Advertisements are received.

ADVERTISEMENTS for the GARDENER and PRACTICAL FLORIST must be forwarded to the Publisher, R. Groombridge, Paternoster Row, one week previous to their intended appearance.

No. 2 is now ready; to be continued weekly, price 3*d*., and may be had or ordered of all Booksellers and Newsmen.

In Monthly Nos., 8vo, with Four beautifully-coloured Plates.
Price 2*s*. 6*d*.

PAXTON'S MAGAZINE OF BOTANY.

The Number for September, 1842, contains highly-finished drawings of *Combretum grandiflorum*, *Làtage Hoveæfòlia*, *Malva campanulata*, and *Péntstemon gentianoides*, var. *splendens*; likewise Papers on Gardening as a science; on Grouping Ornamental Plants; and Suggestions for Training Cacti. Floricultural Notices of new and beautiful Plants figured in the leading Botanical Periodicals for August; together with a complete Calendar of Monthly Operations for the Garden.

This work comprises, monthly, four admirably-coloured plates, and twenty-four pages of interesting and useful letter-press. The admirers of flowers are requested to observe—

1. That all the drawings are taken from nature, and are consequently made from plants which have flowered in Britain.

2. That, with few exceptions, they are all done by one artist, whose abilities are of the highest order, and who travels himself to the places where the plants are in flower.

3. That they are lithographed by the same individual, and, being coloured in a superior manner, have all the spirit and elegance, and much of the finish, of the original drawing.

4. That about one-half of the drawings are from plants which have never before been figured in this country, the rest representing the most popular novelties, as well as the more neglected, though sometimes far handsomer, old species; the majority being such as can be cultivated by every one possessing a flower-border and a greenhouse or frame.

It may, in conclusion, be safely asserted that, both for the beauty of its embellishments, and the utility of its contents, this work is well adapted to the wants of all who delight in gardening; and as the improved system of having the plates lithographed commenced with the present year, and as it is intended that each volume shall now be perfect in itself, the present is a desirable opportunity for those who wish to become subscribers.

London: W. S. Orr and Co., Paternoster-row.

THE MECHIAN DRESSING-CASE, the most portable ever invented, only six and three-quarter inches long, three and a quarter wide, and three-fourths of an inch deep, the size of a pocket-book, contains one pair of Mechi's ivory-handled peculiar steel razors, his magic strop and comb, badger-hair shaving-brush, his patent castellated tooth-brush, and a neat nail-brush; price only 25*s*. The same with hair-brush and soap-dish, 35*s*. To military men, and as a steam-boat or travelling companion, this invention must prove invaluable, the articles therein being of the first quality. An immense variety of other dressing-cases for both gentlemen and ladies, either in fancy woods or leather, at all prices, from 20*s*. to 30 guineas.—At Mechi's Cutlery and Dressing-case Manufactory, No. 4, Leaden-hall-street, London, four doors from Cornhill. An extensive stock of leather writing-cases, work-boxes, bagatelle-tables, razors, razor-strops, Sheffield plated goods, tea-trays, tea-caddies, &c., cheaper than any house in London. Every article warranted; money returned if not approved.

HORTICULTURAL SOCIETY OF LONDON.

NOTICE IS HEREBY GIVEN, that the MEETINGS OF THE SOCIETY in Regent-Street are DISCONTINUED till Tuesday, October the 4th, in consequence of the Meeting-room being under repair.

The Gardeners' Chronicle.

SATURDAY, SEPTEMBER 10, 1842.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

Tuesday, Sept. 13 . . South London Floricultural . 1 P. M.
— — 20 . . Floricultural . . . . . . 2 P. M.
Saturday, Sept. 24 . Royal Botanic . . . . . $3\frac{3}{4}$ P. M.

COUNTRY SHOWS.—Sept. 13, Wingham. 14, Royal Berkshire, Warwick. 15, Croydon, Hoddesdon, Kingston, Shrewsbury. 16, Roxburghshire, Louth, Salt Hill, Manchester. 20, Elham. 21, Nottingham, Faversham, Thornbury. 23, Norwich. 24, Wexford.

THE effect of nitrate of soda upon some kinds of crops, on some kinds of land, has been so clearly proved to be beneficial that no doubt now remains upon the subject. We have ourselves seen its action on Grass, on Fir-trees, on common shrubs, and on many common cultivated vegetables, and in all cases when pure, and judiciously applied, it has proved worthy of its reputation. But we have also seen it produce injury even in minute doses. Rhododendrons, for instance, appear to suffer from its action, and many things perish outright. This is no more than was to be expected; for in plants, as in animals, what is food for one is poison for another.

But there are some apparent exceptions to this, and they deserve to be inquired into. A correspondent at Putney writes to us thus:—

"In compliance with your recommendation, I last Spring applied a solution of nitrate of soda to several young coniferous plants. Some of them were *feeble*, and others were *vigorous*; but they are all now either dead or dying. I followed your instructions exactly, both as to quantity and mode of administering it, and should like to know whether other experimenters in the same line (if any have been made) have found a similar result. The names of the deceased are—Pinus Menziésii, P. Gerardiana, P. pátula, Abies Clanbrasiliensis, A. Fráseri, A. Smithiana, and Larix péndula. It was also applied to a Gárrya ellíptica, which had been removed and di dnot look very healthy. It has also shared the same fate."

We have another letter now before us, in which the writer assures us that he has applied it carefully to plants of many different kinds, but without any perceptible effect upon their growth or blooming.

Now, there may be two reasons for these results: the one, that the soil already contains so much saline matter that the addition of more is useless; the other, that the substance called nitrate of soda was *something else*. There seems much reason to suppose that this agent is greatly adulterated. It is said that sulphate of soda is used for this purpose: but as that salt seems to act much in the same manner as the nitrate, it may not be mischievous. It is certain that common salt is mixed with it largely. Dr. Madden found in three different samples of nitrate of soda as much as 14, 25, and 26 per cent. respectively of common salt. He adds that, as the samples were contained in the bags in which they were imported, there was no reason for questioning the honesty of the seller, but that the adulteration had probably been effected prior to its being shipped for Britain.

It is plain that, under such circumstances, results would be conflicting; for he who gives his crops real nitrate of soda applies to them a very different substance from that which consists of common salt to the extent of one quarter of its whole weight; at that rate of adulteration every rod of ground will have a quarter of a pound of common salt, when the usual quantity of nitrate of soda is used. It appears that all samples of this agent contain *some* common salt; but the wholesale dealers should have it analysed, and ought to mark every bag with its per-centage of adulteration, as is done with bags of saltpetre: then the gardener and farmer would know what he is doing; and the foreign dealer who commits the fraud would discontinue his adulteration when he found that he had no sale for it.

The presence of salt in nitrate of soda is easily ascertained by throwing it into the fire. If it crackles, it is mixed; for pure nitrate burns without crackling, with a kind of hissing noise. A rough estimate of the amount of adulteration may be formed by observing how much crackling takes place.

WE learn that Count Hompesch, a Belgian gentleman, has taken out a patent for the preparation of a manure more powerful and cheaper than any yet invented. His plan is said to consist in fixing all the volatile parts of night-soil and other such substances by means of the ashes of the oolitic shale of Portland. The shale is employed in the first place as a source from which oil, turpentine, and other substances are extracted: the residue goes to the preparation of the manure, which is to be converted somewhere on the Isle of Dogs, and sold in a dry state in the form of bricks. As the materials to be thus employed are inexhaustible, and at present almost valueless, it is expected that the preparation of the fertiliser in question will become a matter of great national importance.

As people have become too wise to wonder at sugar being made from old rags, so will they be equally prepared to hear that oil, and tallow and soap, are to be fabricated from the hardened mud of the coal-mines; for such is "shale."

FEW persons, conversant with the cultivation of the Vine, are unacquainted with the fact, that some of the finest Grapes which have of late years been produced in this country have been grown by Mr. Richard Crawshay. We have received many inquiries concerning the manner in which that gentleman manages his Vines, and in what respect his treatment of them differs from that of other persons. A recent visit to his brother, Mr. Geo. Crawshay, of Colney Hatch, enables us to point out some of the principal features of his cultivation, which we find to be much at variance with the system generally adopted.

In the first place, the Grapes are grown without the aid of fire-heat, so that the expense incurred is trifling; and, instead of having rich borders of several yards in width facing the vineries and lying in a comparatively useless state, or looking unsightly with straw, as is generally the case, the walks are allowed to run close up to the houses, with, as we are assured, no preparation beneath of the ordinary soil, which is of a strong loamy texture. We would not have it inferred from this that we consider a border properly prepared to be of no benefit; we merely state what Mr. Crawshay has effected without that powerful auxiliary. But what is yet more at variance with the opinion of many writers is, that the laps between the squares of glass, instead of being either close to each other, or filled with putty, are so far apart that in many places we could insert our fingers between the panes. Attention to the latter point, and having the floor of the vinery paved with common red flags or tiles, Mr. Crawshay considers to be most essential in growing Grapes to perfection without the assistance of fire-heat.

Although few will doubt the propriety of having closely-glazed houses for early forcing, because severe frosts or piercing winds, penetrating through the aperture, would be destructive to the tender shoots, yet, in the present case, we perfectly agree with Mr. Crawshay. Every one is aware of the oppressive sensation felt upon entering a closely-glazed house, more especially if shut up for the evening; whereas, in a house glazed after the above manner, no disagreeable effect is at any time produced, because there is always a free circulation of air between the squares of glass; and Mr. Crawshay contends that this purity of atmosphere is as essential to the welfare of the Vine as it is beneficial to a human being. On entering one of his Vineries with a south-west aspect, when the sun is shining full upon it, a refreshing air meets you, with the thermometer indicating a temperature of only 75°.

The use of the paved floor is this: in the early stage of the Vine's growth water is liberally thrown down on the floor to create vapour, and this treatment is continued until the berries are supposed to be stoned; after which, it is gradually withheld; and when the colouring process commences, it is altogether discontinued; so that by the time the Grapes approach maturity, the floor becomes dry, and during the cool nights of autumn continues to give off slowly to the interior of the house the heat which it absorbs during the day.

But there are other points in which Mr. Crawshay's treatment is peculiar. The stems of the Vines are trained up the rafters about a yard apart. Every season the young wood is pruned back nearly close to the original stem, so that, even upon minute inspection, scarcely a bud is visible. This may be one reason why the wood is of such uniform size, not a single watery shoot being observable in any of the houses. After the pruning is completed, a free circulation of air is allowed, by means of the front sashes and top lights, and thus the breaking of the Vines is considerably retarded; in fact, it is rendered later than upon the open walls. In general, the Vines do not begin to push until the latter part of April, and it is only in the first week of May that the houses are closed at night. Air is then admitted less freely during the day; the Vines are frequently syringed, and abundance of water is thrown down upon the floors, to keep up a constant supply of moisture in the atmosphere.

When the Vines are in bloom, the houses are closed earlier in the afternoon, and the syringe is of course dispensed with, but is again made use of a few times after the Grapes are thinned, to wash off the remains of dead flowers and dust, as well as to assist in restoring the leaves to their proper position. Air is then given more freely during the day in *wet* as well as in dry weather; for it is the opinion of Mr. Crawshay that the spots upon Grapes, commonly called "pitting," are caused by the stagnation of the atmosphere which is consequent upon keeping a Vinery closed for several days during wet weather. As we before stated, no water is admitted into the house after the colouring process has commenced; but abundance of air is left on through the night as well as during the day.

Through the whole period of their growth no fire-heat is applied; but when the Grapes are perfectly ripe, and the autumn frosts commence, an Arnott's stove is used to preserve the temperature of the house above the freezing point. Thus but a trifling expense is incurred beyond the bare attention necessary to ensure success; and the fruit so produced may, with care, be kept in perfection until February. It is fruit, too, of which every *gardener* might be proud. The bunches, it is true, are not so large as we have seen; but in lieu of that they are compact and regular; and *very few* persons can produce berries of such a size. Not a trace of the red-spider is visible upon any of the leaves, and the wood is already in the best possible condition for another season.

ON BUDDING.

HAVING observed in some late Papers of the *Chronicle* some allusions to the different opinions upon budding, I venture to forward to you those which practice has induced me to form upon that subject.

The bud will sometimes take although the heart appears to be gone; it will sometimes adhere and start quickly, although more wood be left in the shield than will allow the sides to lie flat down; but the evident desideratum is that no more of the wood adjacent to the eye be left than shall secure its close attachment to the shoot upon which it may be placed, nor any less than may suffice to retain the growing principle, the limit of which must be defined by a combination of theory and practice, and at present, I believe, remains a problem to be solved.

Many buds have I inserted in early days in which the eyes have not been sufficiently swollen, and no produce has come forth; and many a bud have I inserted in the hope that the cambium would fill the vacant hole, which fear told me was too large, yet which a scanty supply of buds induced me to retain, but all in vain; for though the bark adhered, the eye was lost, and many a woody bud inserted thus has become dry before it could adhere. I believe the great secret to be—taking the bud in its proper state, *i. e.*, full-formed (not too near the base of the stock, from which it will part with difficulty, nor too near the top, because insufficiently ripe), and to insert it when the receiving plant and the weather are in a favourable state to continue the elaboration of those juices necessary to form a junction. The period of year is, comparatively speaking, immaterial; I have inserted buds at all times, and have now in my possession a plant that was worked on 21st October, ten years ago.

Shoots that grow angularly, and are nearly the same size all the way up, afford better buds than such as are produced on long rapid-growing branches; the buds of the latter are seldom well defined, and if inserted at all hollow in the centre are sure to go blind.

The difference of trouble in separating buds from varieties of Roses is in no case, perhaps, so remarkable as in the Maria Leonida and Bracteata odorata alba; though so much alike as scarcely to be distinguishable except from their difference of vigour, the former seems to require the gouge to take out the bud successfully, whilst in the latter there is no difficulty. I may here observe, that this instrument is very effective in saving buds of rare sorts that do not part readily and draw the eyes; whilst it gives little trouble and almost invariable success.

The leading error in budding Roses appears to be in attempting to make the Wild Briar subservient to purposes for which it is not adapted, viz., to make it carry such sorts as, flowering but once and almost stagnating at other periods, cannot by any mode of pruning be made to keep the plant both healthy and productive.

In other shrubs, such as the Cytisus budded upon the Laburnum, where from some cause, I believe unknown, many of the varieties will not live above a few years, the graft commonly dies, while the stock recovers and breaks at the summit; whereas in the Rose stock, the stagnation of sap in the stem leaves the plant to renew itself, either by breaking low down or by suckers.

A fruitful cause of mischief in worked Roses is the habit of cutting in the wild shoots, in order to force the buds inserted in them to break the same season; by which eventually little is gained, except in peculiar seasons and under favourable circumstances; whilst the newly-inserted bud, instead of being enveloped in fresh wood hardier in its character than its own, remains more defenceless in the winter than if it were interwoven, as it were, with the layers produced from the whole of the wild shoot with its ripened leaves.

There can, I suppose, be little doubt that the Lamarque Rose, on account of its size, the beauty of its colour, its fragrance, the rapidity of its growth, its long continuance in bloom, and the general beauty of the plant, exceeds all others; yet this Rose has been much undervalued because delicate in winter.

The situation of my garden is much exposed in every way, yet five hundred plants were moved this year, many of them the Lamarque, and the losses were few, considering the lateness of the removal; and I attribute this in a great measure to my endeavours to protect the delicate buds, by enclosing them within the wood proceeding from the unshortened shoots of the stock. In delicate sorts, this advantage is, I believe, of permanent duration. The plants of Jaune Desprez and Lamarque, though several years old, though dying back almost home (in many instances quite), from the united effects of late removal, unfavourable winter, introduction to a much worse soil, and exposure at the rise of the sap (the latter, perhaps, more injurious to the plant in question than any other), recovered, with hardly an exception, and flowered very abundantly.

The common material for securing the buds (the bark of the Lime-tree) is not elastic, and either compresses during rain, or gets loose in dry weather; whilst worsted yields considerably in the first of these instances, and sustains a moderate pressure in the second. There is one advantage to be derived if the plants are worked in the spring, when the swelling of the bark is not so rapid as in autumn: the ligature may be left (till it be finally taken off) unloosened without destroying the inserted bud; or if the operator be nice in his work, the ligature, if white worsted, instead of being loosened, may be replaced by a green one; and thus such plants as have been attended to, and such as require revision, will at once be seen. I have this year scarcely loosened a ligature, though I have removed several altogether; and I am not aware that I have lost a single eye from this cause.

I observe in one of your Papers a query, as to the propriety of allowing a leaf, as well as a leafstalk, to remain with the inserted bud. I have found this beneficial, if the weather be moist, and the sap flow freely; in which case the leaf has been preserved alive, and an action set up so close to the inserted bud, as frequently to make it start during the current season, and grow vigorously. If the weather become dry, the leaf dies; but I have never been able to ascertain that any greater injury has resulted from it than if the leaf had not been left on.

The differences between the varieties of the wild Stock court observation from your correspondent. Some can only with difficulty be compelled to retain the new head, from an inclination to change their leader perpetually; some have vigour, others require to be surrounded by the freest growers; but I have ever found, that to obtain the three great advantages of free flower, fine flower, and health in the tree (in which latter, I include both shape and promise for the coming year), the utmost attention is requisite in pruning.—*A Practitioner.* [We trust this excellent correspondent will oblige us with his experience in pruning Roses.]

ON THE PREPARATION OF MUSHROOM SPAWN.

The first operation to be performed in the production of Mushrooms is to make the spawn, which is done as follows:—Take from the high road the droppings of horses' and other dung ground into dust, and about April or May add two-thirds of firm cow-dung, and thoroughly incorporate them, but in doing this do not use water; the more this mixture is trodden and beaten together the better. After it is well mixed let it remain in some dry shed or outhouse for a week or ten days, then beat it over again; and if the spawn is intended to be kept for some years, a small portion of fresh loam must be added. It may now be formed into square bricks, using some of the dry road-dust to keep it from sticking to the hands and boards on which it is worked; make the bricks about eight or nine inches long, three or four broad, and two inches thick; lay them out of doors to dry, but be careful to prevent rain falling upon them. When they are dried so that they yield to a gentle pressure of the finger, place them in a convenient shed in layers, then take some spawn that has been obtained from any old dunghill or hotbed, and strew some small pieces between the layers, and where there is a sufficient quantity cover the heap up with dry stable litter, and let it remain for ten or twelve days; then look at it, and films of spawn like spider's web will be seen even on the outside of the litter. All the bricks should now be turned over, and any that are are not impregnated should be placed in contact with the spawn. In making up the pile be careful to place a dry brick in the middle and a moist one on the outside, and then cover it up as before with the long litter, and let it remain twelve or fourteen days. If the weather is warm you will find the heap as white as a sheet of paper, and the whole mass converted into Mushroom spawn, and in many places where any moisture is in the bricks numberless young Mushrooms will appear issuing from those bricks; these must, however, be checked by taking the bricks up and placing them in a thoroughly dry place, where a current of air will stop their growth, otherwise the spawn will be spent and rendered useless. This is the cause of much disappointment, and frequently happens with spawn that is bought, because it is sometimes improperly made, and has been badly preserved in a damp cold place, by which means the spawn, if ever so good, becomes exhausted. The great secret of success is to keep the spawn perfectly dry and sweet, when it may be preserved for years if these directions are followed strictly.—*George Gordon.*

ENTOMOLOGY.—No. XXXIII.

The Antler Rose Saw-fly, *Cladius difformis.*—Amongst the various insects which are attached to Rose-trees, there are several Saw-flies, whose larvæ, by feeding upon the leaves and pith, very materially assist in affecting the growth and destroying the beauty of that favourite flower. One of them which is particularly fond of the China Rose has been actively engaged for many weeks this summer in demolishing the leaves of that species, which it selects from all the other varieties, and will even eat them, although withered, in preference to the fresh foliage of the Provence Rose.

When a Rose-tree is attacked by these caterpillars, multitudes of holes soon make their appearance in the leaves, which keep daily increasing in number, and places are likewise eaten out of the margins (figs. 1 and 2); yet nothing is to be seen of the cause, unless we look under the leaf, where we shall find a smallish caterpillar, either stretched out or curled up, and holding by its feet to the eaten edge (fig. 1). These caterpillars, which are distinguished from all lepidopterous larvæ, such as butterflies, moths, &c., by the greater number of their feet, are not quite half an inch long: they are nearly cylindrical, tapering a little to the tail: they are bright green, and covered with short upright hairs, with a darker line down the back, and one of a deeper tint down each side; the head is horny and fulvous, with two minute black dots on the sides, like eyes; they have twenty feet, namely, six pectoral true feet, twelve abdominal membranous or false feet, and two anal feet, which do not assist the animal in walking. Having arrived at their full growth, they spin a web, either between the contiguous leaves, or in a fold, by drawing the sides of a leaf slightly together; but sometimes it is attached to the stem only at a fork of the branches: in this web they form a yellowish-white cocoon, somewhat oval (fig. 3), which is very thin and transparent, being formed of threads united by a gummy substance, so that when finished it is impervious to wet, and shines as if a snail had crawled over it; occasionally two cocoons are formed under one web, and it seems probable that these may produce male and female flies. In these cocoons the green larvæ rest a short time, losing, it is said, their fourteen false legs, and eventually changing to a pupa: the flies are hatched in twelve or thirteen days. One which I received the 25th July, about which period the caterpillars were most abundant, spun up in a few days, and the Saw-fly hatched the 11th of August.

The saw-flies which issue from these cocoons no longer bear the appellation of Tenthredo, but are now separated from that extensive group, and form a genus called Cladius *, of which there are six or seven British varieties; but the Rose species, which, from the curious form of the masculine horns, I have called "The Antler Rose Saw-fly," is named by Panzer C. difformis: it is black and shining; the antennæ are composed of nine joints and pubescent; in the male the third joint is hooked internally at the base, and produces a long branch externally at the apex; the fourth and fifth are similar in structure; but in the sixth the branch is very short, and it is wanting altogether in the remainder: in the female the horns are simple and tapering; the four wings are iridescent and slightly stained with a smoky tint; the stigma is brown, as well as the nervures, which form many cells, by which the group is in a great measure characterised; there are one marginal and four submarginal cells in the superior wings, but the little basal one being often obliterated, there are in fact only three of these in many specimens: the legs are ochreous; the thighs black, excepting the tips. Fig. 4 represents the male, the crossed lines showing the natural dimensions.

Cladius difformis was esteemed a rare insect 20 or 30 years ago; but now it is found from the end of May to the middle of August, in the gardens around London, and from its inhabiting Combe and Darent woods, as well as various other parts of the country, from Northumberland to Dorsetshire, it seems not improbable that the larvæ will feed upon the Dog-rose or some of our native species.

It would not, perhaps, be an easy matter to get rid of these troublesome caterpillars, except by hand-picking and shaking the branches over a cloth; for as they keep on the under surface of the leaves, no application, except fumigating with sulphur, would fairly reach them; it is possible that sprinkling hellebore powder over the leaves would annoy them, but it would not, I apprehend, free our Roses from their numerous and successive broods.

We have already alluded to five or six other species of Saw-flies which injure the Roses. One of them was pointed out to us last year in a garden, where it had given a very curious appearance to a considerable number of single or white Roses, I believe, growing on a border under some Elm-trees; all the leaflets at a distance looked like little fingers, and on examining them I found both margins of the leaves curled underneath, and within the scrolls were some saw-fly caterpillars, about half an inch long, green and pubescent, with brown heads. I placed some of the branches in water in cages, but failed to obtain the Saw-flies from them. In July of the present year I observed the same appearance in a Dog-rose by a grove near Selborne, but the larvæ in the curled leaves were whitish; this, however, might arise from their being much younger. It would be very interesting to ascertain the species of Saw-fly whose caterpillars cause this remarkable and blighted aspect of the Rose-leaves, which might be done by some one in the country taking the trouble to rear them.—*Ruricola.*
